         1) For any repeated magnitude of control signal, from either an increasing or decreasing direction, the final control element shall take a repeated position within 0.5 percent of full travel regardless of force required to position the final element.
      e. Sensitivity:
         1) Controls shall respond to a setpoint deviations and measured variable deviations within 1.0 percent of full scale.

f. Performance:
1) All instruments and control devices shall perform in accordance with the manufacturers' specifications.

D. Discrete circuit configuration:
1. Configure discrete control circuits to fail safe, on loss of continuity or loss of power.
2. Alarm contacts: Fail to the alarm condition.
3. Control contacts fail to the inoperative condition unless otherwise indicated on the Drawings.

E. Grounding:
1. Analog signal cables shields shall only be grounded at a single point in the loop. Unless otherwise noted, ground signal cable shields at control panel.
2. For communication and data line signal cable shields and drain wires should be grounded at both ends of the cable.
3. Insulate the shielding and exposed drain wire for each signal cable with heat-shrink tubing.
4. Terminate the signal cable shield on a dedicated grounding terminal block.
5. Provide isolating amplifiers within control panels for field equipment possessing a grounded input or output, except when the panel circuit is galvanically isolated.

2.8 ACCESSORIES

A. Provide flow conditioning devices or other required accessories if necessary to meet the accuracy requirements in the Contract Documents.

B. Nameplates:
1. Provide a nameplate for each controller, instrument transducer, instrument power supply, solenoid, or any other control device located either in the field or within panels.
2. All nameplates shall be of identical style, color, and material throughout the facility.
3. Device nameplates shall include:
a. Designations as indicated on the Drawings and identified on the Process and Instrumentation Drawings.
1) Device tag and loop number ID (e.g., FIT-60.011).
2) PLC ID (e.g., PLC-11).
3) Power information (e.g., PCM-11, 120 VAC).
b. White lettering on a black background, laminated plastic.
4. All instruments shall be equipped with Type 316 stainless steel nameplate with the instrument tag stamped in 3/8-inch letters and connected to the instrument using Type 316 stainless steel wire.

2.9 MIXES (NOT USED)

2.10 FABRICATION (NOT USED)

2.11 FINISHES (NOT USED)

2.12 SOURCE QUALITY CONTROL

A. Provide all equipment that is new, free from defects, and standard products produced by manufacturers regularly engaged in the production of these products that bear all approvals and labels as required by the Specifications.

B. Arrange with all manufacturers of the equipment and fabricators of panels and cabinets, to allow the Owner and Engineer to inspect and witness the testing of the equipment at the site of fabrication:
   1. Equipment includes the cabinets, special control systems, flow measuring devices, and other pertinent systems and devices.

C. Source Test is specified in the Commissioning for Instrumentation and Controls Section.

PART 3 EXECUTION

3.1 EXAMINATION

A. The ICSC is encouraged to attend a pre-bid conference and examine the premises completely before bidding. It is the ICSC's responsibility to be fully familiar with the existing conditions and local requirements and regulations.

B. Review the existing Site conditions and examine all shop drawings for the various items of equipment in order to determine exact routing and final terminations for all wiring and cables.

C. Provide a complete instrumentation and control system:
   1. Install all extra conduits, cables, and interfaces as may be necessary to provide a complete and operating electrical, and process control and instrumentation system.

3.2 PREPARATION (NOT USED)

3.3 INSTALLATION

A. Equipment locations indicated on the Drawings may change due to variations in equipment size or minor changes made by others during construction:
   1. Verify all dimensions as indicated on the Drawings:
      a. Actual field conditions govern all final installed locations, distances, and levels.
   2. Review all information indicated on the Drawings, including architectural, structural, mechanical, instrumentation, and the accepted electrical, instrumentation, and mechanical shop drawings, and coordinate Work as necessary to adjust to all conditions that arise due to such changes.
   3. Make minor changes in location of equipment before rough in, as directed by the Owner or Engineer.

B. Perform all related Electrical Work in accordance with the applicable sections of the Electrical Specifications.

C. The PCIS configurations are diagrammatic:
   1. The locations of equipment are approximate unless dimensioned.
   2. Where Project conditions require, make reasonable changes in locations and arrangements.

D. Field instruments installation:
   1. Install field instruments as specified in the Contract Documents, API RP 550 and RP 551, and the manufacturer’s instructions.
   2. Mount field instruments so that they can be easily read, readily approached, and easily serviced, and so they do not restrict access to mechanical equipment:
      a. Mount field instruments on a pipe stand or local panel, if they are not directly mounted, unless otherwise indicated on the Drawings.

b. Provide sun shields for all field electronic instruments located outdoors.

3. Make connections from rigid conduit systems to field instruments with PVC coated flexible conduit:
   a. Type of flexible conduit required for the area classification:
      1) Area classification as specified in the Common Work Results for Electrical Section.
   b. Maximum length of 18 inches.
4. Connect field instruments with cable as specified in the Electrical Specifications, except when the manufacturer requires the use of special cable, or otherwise specified in this Section:
   a. Special cable applications shall be in accordance with the NEC.
5. Verify the correctness of each installation:
   a. Polarity of electric power and signal connections.
6. Ensure all process connections are free of leaks.
7. Provide a power disconnect switch for each 120 VAC powered instrument which does not have a built-in power disconnect:
   a. Disconnect enclosure suitable for the area classification:
      1) As specified in the Common Work Results for Electrical Section.

E. Equipment tie-downs:
   1. Anchor all instruments, control panels, and equipment by methods that comply with seismic and wind bracing requirements, which apply to the Site.
   2. All control panels, LCS/VCPs, LCPs, RTUs, PCMs, etc., shall be permanently mounted and tied down to structures.

F. Instrument tagging:
   1. As specified in the Identification for Electrical Systems Section.
   2. Provide all field-mounted instruments with nameplates:
      a. Nameplates engraved with the instrument's full tag number as indicated on the Drawings:
         1) Affix tags with stainless steel wire fasteners.
   3. Provide all back of panel instruments with nameplates:
      a. Engraved with the instrument's full tag number as indicated on the Drawings:
   4. Provide all front of panel instruments with a nameplate:
      a. Engraving to include the following:
         1) Instrument's full tag number.
         2) Service description.
      b. Nameplates:
         1) Secure nameplates to the panel with stainless steel screws.
         2) Use an accepted adhesive if screws would violate the NEMA or other ratings of the enclosure.

G. Cable and conductor termination:
   1. Terminate all cables and conductors on terminal blocks.
   2. Terminal block enclosures:
      a. Suitable for the area classification as specified in the Common Work Results for Electrical Section.

H. Surge protection:
   1. Provide outdoor field instrument loops with voltage surge protection units installed on the instruments and the panel.
   2. Individually fuse each 4 to 20 milliamperes direct current loop with a 1/2-ampere fuse between power supplies and receiver surge protectors.
   3. Provide voltage surge protection for 4 wire transmitters and analyzers:
      a. Protect both power source and signal loop.

3.4 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.5 REPAIR/RESTORATION (NOT USED)

3.6 RE-INSTALLATION (NOT USED)

3.7 COMMISSIONING

A. As specified in the Commissioning Section.

B. Owner Training:
   1. Demonstration requirements are specified in the Commissioning for Instrumentation and Controls Section.

3.8 FIELD QUALITY CONTROL

A. Inspection:
   1. Allow for inspection of PCIS installation as specified.
   2. Provide any assistance necessary to support inspection activities.
   3. Engineer inspections may include, but are not limited to, the following:
      a. Inspect equipment and materials for physical damage.
      b. Inspect installation for compliance with Drawings and Specifications.
      c. Inspect installation for obstructions and adequate clearances around equipment.
      d. Inspect equipment installation for proper leveling, alignment, anchorage, and assembly.
      e. Inspect equipment nameplate data to verify compliance with design requirements.
      f. Inspect cable terminations.
      g. Inspect/witness instrument calibrations/verifications.
   4. Inspection activities conducted during construction do not satisfy inspection requirements specified in the Commissioning for Instrumentation and Controls Section.

B. Instrument Installation Inspection:
   1. Provide any assistance necessary to support inspection activities.
   2. Inspections may include, but are not limited to, the following:
      a. Inspect equipment and materials for physical damage.
      b. Inspect the installed arrangement, lay lengths, orientation, piping obstructions, etc., that could affect the instruments accuracy or repeatability.
      c. Inspect installation for compliance with Drawings and Specifications.
      d. Inspect installation for obstructions and adequate clearances around equipment.
      e. Inspect equipment installation for proper leveling, alignment, anchorage, and assembly.
      f. Inspect equipment nameplate data to verify compliance with design requirements.
      g. Inspect cable terminations.
      h. Inspect/witness instrument calibrations/verifications.
   3. Inspection activities conducted during construction do not satisfy inspection requirements specified in the Commissioning for Instrumentation and Controls Section.
   4. Field acceptance testing: (Functional Testing) is specified in the Commissioning for Instrumentation and Controls Section. Additional general requirements are specified in Commissioning Section.

C. Installation supervision:
   1. Ensure that the entire PCIS is installed in a proper and satisfactory manner. At a minimum, the ICSC shall provide the following services:

a. Installation resources:
    1) Coordinate with the Contractor regarding installation requirements of the Contract Documents.
b. Provide technical assistance to installation personnel by telephone:
    1) Furnish installation personnel with at least 1 copy of the accepted submittals, including all installation details.
c. Periodic inspections during the construction period.
d. A complete check of the completed installation to ensure that it is in conformance with the requirements of the equipment manufacturer and the Contract Documents.
e. Field verify accuracy and calibration of all instruments.

3.9 ADJUSTING

A. Control valves:
    1. Stroke all control valves, cylinders, drives and connecting linkages from the control system as well as local control devices and adjust to verify proper control action, hand switch action, limit switch settings, torque settings, remote control actions, and remote feedback of valve status and position.
    2. Check control valve actions and positioner settings with the valves in place to ensure that no changes have occurred since the bench calibration.

B. Make all revisions necessary to the control system software, as directed by the Engineer.
    1. It is understood that the Contractor knows and agrees that changes will be required in the control system software during the Source Testing, Functional Testing, Process Operational Period, Process Start-Up, and during the Project Correction Period.

3.10 CLEANING

A. Vacuum clean all control panels and enclosures before process start-up and again after final completion of the project.

B. Clean all panel surfaces.

C. Return to new condition any scratches and/or defects.

D. Wipe all instrument faces and enclosures clean.

E. Leave wiring in panels, manholes, boxes, and other locations in a neat, clean, and organized manner:
    1. Neatly coil and label all spare wiring lengths.
    2. Shorten, re-terminate, and re-label excessive spare wire and cable lengths, as determined by the Engineer.

F. As specified in other sections of the Contract Documents.

3.11 PROTECTION

A. Protect all Work from damage or degradation until date of Substantial Completion.

3.12 SCHEDULES (NOT USED)

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 271000

CONTROL STRATEGIES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes:
   1. Contractor-developed loop description submittal requirements.
   2. General programming requirements.
   3. Common control functions:
      a. General control and monitoring functions to be provided throughout the PCS system.
         1) These requirements apply to all systems, and supplement the specific loop descriptions in the Specific Control Strategies Section and information indicated on the Drawings.

1.2 REFERENCES

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.3 DEFINITIONS

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Hardwired control: Control circuitry that does not utilize software to initiate functionality.

C. Hardwired interlocks: A safety or protective feature that will interrupt operation of the equipment in all operating modes with no required operator intervention.

D. Software interlocks: A safety or protective feature that will interrupt operation of the equipment when the PLC has control.

E. Slew rate: Rate of change in respect to time.

F. Clamp: Imposed upper and lower limits on setpoints to eliminate entries outside the allowable control parameters.

G. Watchdog timer: Timers imposed to test components such as discrete I/O to verify the health of the card.

1.4 SYSTEM DESCRIPTION (NOT USED)

1.5 SUBMITTALS

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.6 QUALITY ASSURANCE (NOT USED)

1.7 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.8 PROJECT OR SITE CONDITIONS (NOT USED)

1.9 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 COMMISSIONING (NOT USED)

1.15 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.1 MANUFACTURERS (NOT USED)

2.2 EXISTING PRODUCTS (NOT USED)

2.3 MATERIALS (NOT USED)

2.4 MANUFACTURED UNITS (NOT USED)

2.5 EQUIPMENT (NOT USED)

2.6 COMPONENTS (NOT USED)

2.7 ACCESSORIES (NOT USED)

2.8 MIXES (NOT USED)

2.9 FABRICATION (NOT USED)

2.10 FINISHES (NOT USED)

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.1 EXAMINATION (NOT USED)

3.2 PREPARATION (NOT USED)

3.3 INSTALLATION (NOT USED)

3.4 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. General programming requirements:
   1. Use variable names or aliases derived from tag and loop identification on the P&IDs for all process values.
      a. Submit names for Owner approval.
      b. Unless otherwise noted, utilize floating-point format for all PLC algorithms and calculations.
      c. Provide PLC logic to convert raw input values into engineering units in a floating-point format.
   2. Store all adjustable parameters in the PLC, and configure so that an operator with sufficient security access can change the parameters from the LOI or HMI. Update and display the current value at all locations, regardless of where the last change was made.
   3. Reusable PLC code blocks:
      a. Develop and use new standard user defined function blocks (UDFBs) and user defined types (UDTs) where appropriate. One instance of each standard code block shall reside in each PLC and shall be referenced in main routines and subroutines.
      b. New code blocks that the Contractor would like to use as a standard shall be submitted to Owner for review and approval.
   4. Documentation:
      a. All control logic shall be completely annotated including all rungs, instructions, and tags.
      b. Each routine shall have a title and a detailed description of the control strategy represented by the control logic. Where parameters are passed to the routine, all parameters shall be defined in the routine description.
      c. Analog tag descriptions representing process variables shall include the engineering unit range of the analog variable.
      d. Digital tag descriptions shall include the On and Off state labels.
      e. Complete, grammatically correct sentences and terminology, consistent with water treatment processes, shall be utilized in the development of rung and routine descriptions.
      f. All equations developed in the process logic shall be fully documented in the rung or routine description. A description of each constant and variable utilized in the equation shall be defined including engineering units.
   5. Program slew rates for setpoints to limit the effect of updated setpoints on the process:
      a. Provide for control setpoints and manual speed and position selections.
      b. Store new setpoints in one register, and gradually ramp the actual setpoint register at the slew rate until it reaches the new value.
      c. Provide operator access to change slew rates from the HMI.
   6. Saved setpoints:
      a. Provide an operator selection to save all setpoint values.
      b. Where possible use a DFB or AOI to provide an operator selection to restore all setpoints to the initial start-up value.
      c. Provide an operator selection to restore all setpoints to the last saved value.
   7. Store a copy of all adjustable parameters and accumulated and integrated totals in PCS:
      a. Upon re-loading of the PLC program, re-load these values to the PLC from PCS or processor memory card.
      b. PLCs provide a minimum 2 week data storage to provide for data accumulation and later communication to the Historian in the event of a network interruption.

8. Calculated values:
    a. Program calculations such that division by zero errors cannot occur.
    b. Prevent calculations from generating values that exceed the limits of the equipment or data type structures (integers) internal to the PLC.
    c. Configure counting functions (start counts and operation counts) to allow a minimum of 10,000 counts, and to roll-over to zero at an even decimal interval (1 followed by 4 or more zeros).
    d. Configure integrating functions to accurately accumulate the maximum rate from the instrument/equipment (totalizers, run time meters) for 30 years. Utilize manufacturer AOI/DFBs etc. where possible.
9. Timers:
    a. Provide programmable settling and proving timers in control sequences as required for starting and stopping of equipment to allow the process to settle down before proceeding with any additional control functions.
        1) The settling timers may be overridden by setting the timer to 0 seconds.
10. Control Panel status:
    a. Design the PLC system to function as a stand-alone unit that performs all of the control functions described in this Section completely independent from the functions of the PCS system PC-based operator interfaces:
        1) Failure of the PCS system shall not impact data acquisition, control, scaling, alarm checking, or communication functions of the PLC.
    b. Furnish a minimum of 1 screen that depicts the status of all enclosures containing PLCs, communication equipment, UPS or I/O in the control system, including but not limited to the following:
        1) PLC cabinet over-temperatures from high temperature switch.
        2) Intrusion status on all enclosures equipped with intrusion switches.
        3) AC power failure:
            a) Monitor ahead of UPS.
        4) DC power supply failure:
            a) For redundant power supplies, alarm when either power supply or the diode bridge fails.
        5) UPS failure signal.
        6) UPS Low Battery signal.
        7) Digital bus network Coupler and or Gateway failure signal.
        8) Ethernet Switch failure signal.
11. PLC system communication status:
    a. Furnish a minimum of 1 screen to display all communication errors and status within the PCS:
        1) Communication between PCS and PLCs, PLC to PLC, PLC to RIO and PLC and or PCS to VCP.
        2) 4-20 mA HART interface cards.
        3) Digital bus network status:
            a) Profibus scanners.
        4) Modbus Gateway modules.
        5) Display status of each node, and summary of failures over the past 60 minutes.
    b. Generate a communications alarm if any communication fault is detected or there is no response from a node for more than a user specified time.
    c. In the event of communications loss:
        1) Continue normal operation at each PLC.
        2) Where control parameters are received over a communications link:
            a) If a link fails where process elements use the remote value for closed-loop control, hold operating status, speed and position, of the process elements at their last state before the communication alarm, unless other I/O local to that PLC indicates shutdown or over-ride conditions:

(1) Ensure that the operator can control the process using PCI\S HAND mode at the local LOI.

b) If a link fails where process elements use the remote value to determine setpoints, continue to operate using the last value received:

(1) Provide a manual over-ride entry at the local LOI to allow an operator to enter a different value for any such remote signal.

(2) Generate an alarm whenever an over-ride value is in use.

12. 4-20 mA Hart interface cards:

a. Provide the following HART protocol information for each populated channel on the card:

1) Process variable values:

a) Primary process variable (analog): 4-20 mA current signal.

b) Primary process variable (digital): Digital value in engineering units.

c) Percent range: Primary process variable expressed as percent of calibrated range.

d) Loop current: Loop current value in milliamps.

e) Secondary process Variable 1: Digital value in engineering units available from multivariable devices (if applicable).

2) Host commands:

a) Set primary variable units.

b) Set upper range.

c) Set lower range.

d) Set damping value.

e) Set message.

f) Set tag.

g) Set date.

h) Set descriptor.

i) Perform loop test: Force loop current to specific value.

j) Initiate self-test: Start device self-test.

k) Get more status available information.

3) Status and diagnostic alerts:

a) Device malfunction: Indicated device self-diagnostic has detected a problem in device operation.

b) Configuration changed: Indicates device configuration has been changed.

c) Cold start: Indicates device has gone through power cycle.

d) More status available: Indicates additional devices status data available.

e) Primary variable analog output fixed: Indicates device in fixed current mode.

f) Primary variable analog output saturated: Indicates 4-20 mA signal is saturated.

g) Secondary variable out of limits: Indicates secondary variable value outside the sensor limits.

h) Primary variable out of limits: Indicates primary variable value outside the sensor limits.

4) Device identification:

a) Instrument tag: User defined, up to 8 characters.

b) Descriptor: User defined, up to 16 characters.

c) Manufacturer name (code): Code established by HCF and set by manufacturer.

d) Device type and revision: Set by manufacturer.

e) Device serial number: Set by manufacturer.

f) Sensor serial number: Set by manufacturer.

5) Calibration information:

a) Date: Date of last calibration, set by user.

b) Upper range value: Primary variable value in engineering units for 20 mA point, set by user.
c) Lower range value: Primary variable value in engineering units for 4 mA point, set by user.
d) Upper sensor limit: Set by manufacturer.
e) Lower sensor limit: Set by manufacturer.
f) Sensor minimum span: Set by manufacturer.
g) PV damping: Primary process variable damping factor, set by user.
h) Message: Scratch pad message area (32 characters), set by user.
i) Loop current transfer function: Relationship between primary variable digital value and 4-20 mA current signal.
j) Loop current alarm action: Loop current action on device failure (upscale/downscale).
k) Write protect status: Device write-protect indicator.

C. Common control functions:
1. Incorporate common control functions into all control loops and devices and into the control programming, whether or not specifically shown in the specific control descriptions or elsewhere in the Contract Documents.
2. Alarms:
a. Generate alarms within the PLC logic.
b. Indicate alarms at the LOI and HMI. Enable acknowledgement from either the HMI or the LOI.
c. Generate high, high-high, low, and low-low level alarms where indicated:
1) Provide an alarm reset deadband for each analog value to prevent excessive repeated alarms.
2) Provide logic and timers to inhibit analog alarms based on process events. For example, inhibit low flow alarms when a pump is stopped, or has not been running long enough to establish flow.
d. Flash all alarm and fail conditions and their respective indicators on the PCS graphic screens and local indicating lights until the condition is acknowledged by the operator, even if the alarm condition is no longer present.
e. Once the alarm is acknowledged by an operator, display alarm conditions in a steady state (not flashing) while the alarm condition is still present:
1) Flash with a cycle rate of 1/2 second on and 1/2 second off.
f. Once the alarm has been cleared and the operator has acknowledged the alarm or fail condition, turn the graphic alarm indicator off.
g. For all alarms that do not have inherent timers, provide an operator-adjustable proving timer to limit nuisance alarms, continuously adjustable from zero seconds to 100 minutes. The initial setting of proving timers shall be zero seconds:
1) The PLC shall start the timer when it first detects an alarm condition, and shall only activate the alarm after the timer has expired.
2) If the alarm condition clears while the timer is running, the timer shall reset, and the alarm shall not be activated.
h. Use interlocks and proving timers to prevent alarms from operating due to power loss, except for loss of power alarms.
i. Furnish an alarm silence pushbutton at each PCM, LOI, or LCP with an audible alarm to signal the PLC to turn off the audible alarm until the next alarm occurs.
j. Lamp test: Furnish lamp test pushbuttons at each control panel with more than 10 pilot lights, that illuminates all pilot lights on the panel:
1) The lamp test may sequence through blocks of lights.
2) Minimum on time for each lamp during lamp test 15 seconds.
k. Horns and Beacons:
1) Activate PCM horn and beacon on all critical alarms and on other alarms as defined by the Facility Alarm Philosophy.
2) Deactivate PCM horn and beacon when PCM reset pushbutton is activated.

3) Silence PCM horn when PCM silence pushbutton is activated.

l. Dual analog instruments:
1) For applications where 2 or more analog instruments are measuring the same process variable:
a) Generate an operator adjustable percent deviation alarm.
b) Allow operator to take each instrument out of service when an instrument is out of service.

3. Where a reset is shown for counts, totals and times maintained in the PLC:
a. Provide a reset selection on the HMI screen that displays the value.
b. Provide a preset function on the HMI to allow an operator-entered value to become the current accumulated total.
c. Limit access to the reset and preset functions to operators with suitable security level.
d. Log the value before reset, operator, time, and date of reset in the PCS archive.
e. Log the value before preset, preset value, operator, time, and date of preset in the PCS archive.

4. Where start counts are indicated on the Drawings, or required in this Section, count starts for each piece of equipment (off to on transitions of running status) in the PLC:
a. Display total starts on PCS screens, and provide a reset function.
b. Where indicated, calculate number of starts for each day:
1) Display current day and previous day starts on PCS displays.
2) Do not reset daily start count when overall count is reset.
3) Archive starts for each day through PCS.

5. Where run time accumulation is indicated on the Drawings, or required in this Section, integrate accumulated run time to the nearest 0.1 hour whenever the running status input indicates that the equipment is running:
a. Display total run time in hours on PCS screens.
b. Where indicated, calculate total run time for each day:
1) Display current day and previous day run time on the HMI to the nearest 0.1 hour.
2) Do not reset daily run time when overall time is reset.
3) Archive run time for each day through PCS.

6. For all monitored analog values:
a. Convert all values to engineering units in floating-point format within the PLC.
b. Flows and Weights:
1) Totalize flows in the PLC logic:
2) Where totalized flows are input to a discrete input, count input pulses and multiply by the volume per pulse.
3) Where no totalizer input is shown, integrate the analog input over time.
4) Display totals on the HMI and LOI.
5) Archive totals to the historical database through PCS.
c. Generate an alarm whenever an over-ride value is in use.
d. Calculate hourly, daily, and monthly averages:
1) Calculations shall be performed by the PLC.
2) Display averages on the HMI, and archive through PCS.
e. Calculate minimum and maximum values each day, and month:
1) Calculations may be performed by the PLC or PCS.
2) Display minima and maxima on the HMI, and archive through PCS.
f. Generate an alarm whenever an over-ride value is in use.

7. Analog data processing:
a. Engineering units conversion:
1) Use engineering units for all analog point values. Convert analog inputs to engineering units.
b. Analog magnitude checking:
1) Provide upper and lower limits to prevent operator-entered values (setpoints, etc.) from falling outside acceptable limits.

8. Tank and vessel levels:
    a. Display all tank and vessel levels as both a level (typically in feet) and a volume (typically in gallons):
        1) Some individual displays may be only level or volume, when agreed to by the Owner and Engineer during screen meetings.
    b. Monitor rate of change of volume on all tanks and vessels:
        1) Establish the maximum withdraw rate at which the volume should decrease (all pumps or feeders operating at maximum output). Generate an alarm whenever the volume decreases faster than this rate.
        2) Establish the minimum fill rate at which the volume should increase when filling. Generate an alarm whenever the volume increases faster than this rate. Verify tank and vessel level is fluctuating to verify the validity of the IO register. If it is determined the register is not active or failed in a manner that leaves a stagnant value generate an alarm.
9. I/O filtering and processing:
    a. Analog input filtering:
        1) For each analog input provide an adjustable first order filter, for the purpose of smoothing out spikes and other noise for analog transmitter input signals. By default, configure analog inputs with no filtering affect.
        2) Monitor analog input signal quality:
            a) Over range: The input value is above the normal range (typically over 21 mA).
            b) Under range: The input value is below the normal range (typically under 3 mA, indicating a probable broken connection).
            c) Generate alarms for over or under range inputs.
            d) Do not use over or under range values for control or calculation purposes:
                (1) Where a second instrument is provided to monitor the same condition (a redundant instrument, or additional instruments furnished for averaging or different operating modes), and has a valid signal, use that input for control.
        3) Digital input filtering (proving timer):
            a) Provide an adjustable time delay function (0-10 seconds) on discrete input for the purpose of de-bouncing.
            b) By default, discrete inputs shall be configured with de-bounce timers set to zero seconds.
10. Instrument scaling (HMI/LOI):
    a. Provide 1 or more maintenance screens to display ranges and trigger points for all field instruments:
        1) For analog instruments, use input scaling values in the PLC to determine minimum and maximum calibration points.
11. PCS HAND-OFF-AUTO:
    a. Where indicated, provide HAND-OFF-AUTO and START-STOP selections in the PCS, accessed from an LOI or HMI for operators with sufficient security, to provide the following operating modes:
        1) PCS AUTO: The normal, automatic control mode of the strategy which allows full PLC control in response to process conditions and programmed sequences.
        2) PCS HAND: Enables PCS Manual control where control decisions are made by an operator through the PCS START-STOP, OPEN/CLOSE, or other selections as indicated.
        3) PCS OFF: Automated PCS control is disabled and PLC calls for all associated equipment to stop and valves to close or go to their identified safe state.

4) Program the PLC so that switching a strategy between AUTO and HAND (either direction) occurs with a smooth transition. Keep running or position status unchanged when control is switched to HAND until a change is requested using the operator selections (START, STOP, OPEN, CLOSE). Keep running and position status unchanged when control is switched to AUTO until the control logic determines a change is required.

12. Interlocks:
    a. Implement software interlocks where indicated to place equipment in a safe condition in response to impending hazardous process conditions. Apply software interlocks when equipment is operating in PCS AUTO or PCS HAND:
13. Permissives:
    a. Implement software permissives where indicated to prevent equipment from starting in an unsafe condition.
    b. Apply software permissives when equipment is operating in PCS AUTO or PCS HAND.
14. Process control algorithms:
    a. Jog and hold: Unless otherwise indicated, use jog and hold control algorithms where possible:
        1) When the error between process variable and setpoint is beyond a setpoint deadband:
            a) Jog valve or ramp speed in the required direction for a preset “Jog Time” or until the process variable reaches or passes the setpoint.
            b) Then hold speed or position through a setpoint “Hold Time.”
            c) Continue alternating jog and hold until the error is less than the deadband.
        2) Provide operator access to Jog Time and Hold Time setpoints from the HMI.
    b. PID algorithms: Use where indicated, or where necessary to provide fast response:
        1) Provide a PID faceplate with the following displays and functions for each PID control algorithm:
            a) Display Output, CV.
            b) Display Setpoint, SP.
            c) Display Process Variable, PV.
            d) Allow for operator selection of Automatic or Manual control of the output.
            e) Under Manual control of output allow the operator to enter the desired output value.
            f) Allow for input of the 3 Proportional, Integral, and Derivative tuning parameters.
            g) Configure PID loops to prevent reset windup when controlled equipment is operating in Manual (local or PCS), or when the equipment has reached a physical limit.
            h) When controlled equipment is being operated in remote PCS HAND, configure the PID function to track the process variable to provide a smooth transfer between Manual and Automatic modes.
            i) Provide selectable slew rates with adjustable setpoints to allow the PID algorithm to slowly ramp to its final value to minimize system disturbance.
15. Equipment alternating and sequencing:
    a. Distribute number of starts and run time equally between identical equipment.
16. Motor control:
    a. Monitor the device’s LOCAL-OFF-REMOTE (LOR) switch (the hard-wired switch at the MCC, drive or equipment) to determine when the PLC has control of the associated equipment:
        1) Display current REMOTE status on the PCS screens.
    b. Monitor the device’s running status from the starter auxiliary or run status input:

1) Display the current status (running or stopped) on the PCS screens.
2) Use status to calculate total run time and daily run time, and to count total starts and daily starts.
3) Provide time stamp for each start.
4) For motors 200 HP and greater, provide software to prevent exceeding the manufacturer's recommended maximum starts per hour.

c. When equipment control has been given to the PLC as reported by the LOCAL-OFF-REMOTE switch, allow selection of PCS AUTO or PCS HAND control modes based upon operator selection using the PCS screens.

d. Starting, stopping and running when the device LOR is in LOCAL:
1) With the LOR switch in the LOCAL position, the motor is controlled by the START and STOP pushbuttons.
2) With the LOR switch in the OFF position, the motor is prohibited from running.
3) With the LOR switch in the REMOTE position, the motor is controlled remotely.

e. Starting, stopping and running when the device LOR is in REMOTE:
1) When the motor is expected to be running (PLC has issued a START or RUN due to process conditions or operator selection), LOR is in REMOTE, and the device is not reported to be running, start an operator adjustable "Control Activation" timer:
a) Provide "Control Activation" timers for each piece of controlled equipment:
(1) If the LOR and required running status do not change, and the PLC does not receive running status within the "Control Activation" time period:
(a) De-activate the output.
(b) Place the device in a "Failed" state.
(c) Generate a "Failed to Respond" alarm.
2) When the motor is not expected to be running (PLC has issued a STOP or removed the RUN output), LOR is in REMOTE, and the device is reported to be running, start the "Control Activation" timer:
a) If the LOR and required stopped status do not change, and the PLC does not lose the running status within the "Control Activation" time period:
(1) Keep the RUN output off or the STOP output on.
(2) Place the device in a "Failed" state.
(3) Generate a "Failed to Respond" alarm.
3) Re-establish PLC control of a device in a "Failed" state only after the following:
a) An operator turns the device's LOR switch out of REMOTE, and back to REMOTE (i.e., REMOTE input to the PLC cycles off and back on).

f. Where motor winding high temperature switches or RTD temperature elements are shown, generate an alarm when high temperature is sensed (contact opens or temperature above the high alarm setpoint), but do not stop the motor unless otherwise indicated.

g. Motor equipped with current detection shall shut down and report a "failed" status on detection of high current.

h. Control two-speed motors similar to other motors, except as listed below:
1) Motor states are RUN-FAST, RUN-SLOW, and STOP.
2) Start all two-speed motors in the RUN-SLOW state. If or when the high speed is required (RUN-FAST operator selection or process conditions), transition to RUN-FAST after a designated time.

3) When transitioning from RUN-FAST to RUN-SLOW, remove the RUN-FAST output or issue a STOP, then wait for a “Fast to Slow” time delay before energizing the RUN-SLOW or START-SLOW output.

i. Speed control:

1) Modulate speed on VFD-driven motors using jog and hold, or PID control algorithms to maintain process conditions as described in the specific loop descriptions.

2) Operate speed control within a pre-defined range:

a) Minimum speed as determined by equipment manufacturer. The higher of:

(1) Minimum motor speed to maintain adequate cooling for the type of load driven (constant or variable torque).

(2) Minimum equipment speed, such as minimum speed to deliver flow or to deliver minimum flow for equipment cooling or lubrication.

b) Maximum speed 100 percent (60 hertz) or as identified by equipment manufacturer.

3) Where multiple equipment may operate together to maintain the same process condition:

a) Provide an operator selection for starting sequence.

b) Start the first equipment at a preset starting speed.

c) When one or more equipment is running and the speed control algorithm reaches a preset “Start Next” speed value (initially 95 percent of speed range) through a preset time delay:

(1) Start the next available equipment at the preset starting speed.

(2) Ramp up the started equipment and ramp down the previously running equipment to the mid operating speed (adjustable in the PLC). Determine preset values for each condition based on equipment and system characteristics to provide approximately the same total flow or process condition with the new load running at the mid speed (for example if one pump is running and the second pump will be added, then the total flow of both pumps running at mid operating speed should be approximately the same as flow of one pump at Start Next speed).

(3) Once both equipment reach the mid operating speed, resume the speed control algorithm for those equipment.

(4) Operate all equipment at the same speed following the output of the speed control algorithm.

d) When two or more pieces of equipment are running, monitor for a “Stop Next” condition:

(1) Where flow rate is monitored, use a preset “Stop Next” flow rate for each possible number and combination of equipment:

(a) Determine initial “Stop Next” speed based on the flow that can be provided with one fewer piece of equipment running at a speed slightly below the “Start Next” speed.

(2) When the “Stop Next” condition exists through a preset time delay:

(a) Ramp speed of running equipment except for the equipment to be stopped up to a preset value based on the number of items running. Determine preset values for each condition based on equipment and system characteristics to provide approximately the same total flow or process condition with one fewer load running (typically slightly below the preset “Start Next” speed) while ramping speed of equipment to be stopped down to the preset minimum speed.

(b) Operate all remaining equipment at the same speed following the output of the speed control algorithm. Stop the load once it reaches minimum speed.

17. Gate and valve control:
    a. Monitor the device's LOCAL-STOP-REMOTE (LSR) switch(es) (the integral switch in the actuator or hard-wired switch at the local control station):
        1) Display current REMOTE status on PCS screens.
    b. Start an "Open Activation" timer whenever the device is expected to be open (PLC has issued an OPEN command in PCS AUTO, or OPEN was selected in PCS HAND):
        1) Initially set "Open Activation" time to twice the normal opening time.
        2) If the LSR position and open command do not change, and the PLC does not receive fully open status feedback within the "Open Activation" time period:
            a) De-activate the open output.
            b) Place the device in a "Failed" state.
            c) Generate a "Failed to Open" alarm.
    c. Start a "Close Activation" timer whenever the device is expected to be closed (PLC has issued a CLOSE command in PCS AUTO, or CLOSE was selected in PCS HAND):
        1) Initially set "Close Activation" time to twice the normal closing time.
        2) If the LSR position and close command do not change, and the PLC does not receive fully closed status feedback within the "Close Activation" time period:
            a) De-activate the close output.
            b) Place the device in a "Failed" state.
            c) Generate a "Failed to Close" alarm.
    d. Limit the number of open/close /commands so that it does not exceed the manufacturer requirements.
    e. For modulating valves (valves controlled from either a 4-20 mA signal or digital communications command) with position feedback, start a "Position Error" timer whenever the position feedback differs from the required position command by more than a setpoint error when the LSR is in REMOTE:
        1) For analog modulating devices, error is determined by position feedback differing from position command by more than the setpoint error.
        2) For discrete modulating devices, error is determined by feedback not changing in the correct direction, or changing at less than a setpoint rate, when the OPEN or CLOSE PLC output is active.
        3) Initially set the "Position Error" time to 60 seconds.
        4) If the LSR position does not change, and position error stays outside of the setpoint error through the "Position Error" time period:
            a) Place the device in a "Failed" state.
            b) Generate a "Position Fail" alarm.
    f. Provide separate time delay settings for each function and for each device.
    g. If the valve position inputs indicate an invalid state (i.e., valve open and closed at the same time), place the device in a "Failed" state and generate an "Invalid State" alarm.
    h. Re-establish PLC control of a device in a "Failed" state only after one of the following:
        1) An operator turns the device's LSR switch out of REMOTE and back to REMOTE (i.e., REMOTE input to the PLC cycles off and back on).
    i. For all alarm conditions, control other devices (as stopping pumps, etc.) as stated in the individual loop descriptions to make the system safe.
    j. For discrete modulating valves (valves positioned to intermediate positions to control process values through discrete OPEN and CLOSE outputs), count the number of actuations (OPEN or CLOSE commands) per hour in the PLC:

1) Display count on the HMI.

3.5 REPAIR/RESTORATION (NOT USED)

3.6 RE-INSTALLATION (NOT USED)

3.7 FIELD QUALITY CONTROL (NOT USED)

3.8 ADJUSTING (NOT USED)

3.9 CLEANING (NOT USED)

3.10 DEMONSTRATION AND TRAINING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

SECTION 272060

LEVEL MEASUREMENT: ULTRASONIC

PART 1 GENERAL

1.1 SUMMARY

A. Section includes:
   1. Ultrasonic level instruments.

B. Provide all instruments identified in the Contract Documents.

1.2 REFERENCES

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.3 DEFINITIONS

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Specific definitions:
   1. FDT: Field Device Tool.
   2. DTM: Device Type Manager.

1.4 SUBMITTALS

A. Furnish submittals as specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Provide complete documentation covering the traceability of all calibration instruments.

1.5 QUALITY ASSURANCE

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials, etc.
   2. Physical conditions:
      a. Installation and mounting requirements.
      b. Location within the process.
      c. Accessories: Verify that all required accessories are provided and are compatible with the process conditions and physical installation.

C. Notify the Engineer if any installation condition does not meet the instrument manufacturer’s recommendations or specifications.

D. Manufacture instruments facilities certified to the quality standards of ISO Standard 9001 - Quality Systems - Model for Quality Assurance in Design/Development, Production, Installation, and Servicing.

1.6 DELIVERY, STORAGE, AND HANDLING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.7 PROJECT OR SITE CONDITIONS

A. Project environmental conditions as specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1. Provide instruments suitable for the installed site conditions including, but not limited to, material compatibility, site altitude, site seismic conditions, humidity, and process and ambient temperatures.

1.8 WARRANTY

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.9 MAINTENANCE

A. Furnish all parts, materials, fluids, etc. necessary for operation, maintenance, and calibration purposes throughout the warranty period. Deliver all of these supplies before project substantial completion.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. One of the following or equal:
1. Ultrasonic level sensor with 4-wire remote transmitter:
a. Endress+Hauser, Prosonic S FDU Series Sensor with FMU Series Transmitter.
b. Siemens, Echomax Series sensor with HydroRanger 200 Series Transmitter.
c. Pulsar, dB Series Sensor with Ultra 3 transmitter.
2. Ultrasonic level sensor with 2-wire integral transmitter:
a. Siemens, SITRANS Probe.
b. Endress+Hauser, Prosonic M FMU Series.
c. Pulsar Intelligent Transducers.
d. Pulsar devices.

2.2 MANUFACTURED UNITS

A. Ultrasonic level measurement with 4-wire remote transmitter:
1. General:
a. Continuous non-contact level measurement device with remote transmitter using ultrasonic echo sensing. The transducer generates an ultrasonic pulse in the range of 12 to 50 kHz and measures the time required for the pulse to travel to the process surface and return. The distance is calculated from the send and receive times. Each 4-wire level transmitter system includes, but is not limited to:
1) Ultrasonic transducer.
2) Signal cable.
3) Transmitter.

2. Performance requirements:
    a. Accuracy:
        1) 0.25 percent of range.
    b. Repeatability:
        1) 0.1 percent of range.
3. Ultrasonic transducer:
    a. Encapsulated in chemical- and corrosion-resistant material as indicated on the Instrument Data Sheet or Instrument Index.
    b. Class I Division 1 for transducer only.
    c. Operating temperature range: -5 to 122 degrees Fahrenheit (-20 to 50 degrees Celsius).
    d. Operating relative humidity range: 5 to 95 percent.
    e. Functions:
        1) Temperature compensation.
    f. Mounting: As indicated in the Contract Documents.
    g. Sensors shall be rated for NEMA 6P submergence. Sensors shall have mechanical decoupling between sensor membrane and outer housing. Sensors shall be provided with automatic build up compensation to provide self-cleaning when condensation may occur. Sensors shall be provided with internal heating elements and separate power supplies for these elements when freezing condensation may occur.
4. Transmitter:
    a. Level-indicating transmitter:
        1) Indicator: Liquid crystal display with approximately 0.50-inch display scaled to read in engineering units.
        2) Sensitivity: Able to ignore momentary level spikes or momentary loss of echo and indicate loss of echo condition on indicating transmitter unit.
        3) Ability to allow for signal profiles and echo mapping:
            a) Provide manufacturer's software for re-mapping the signal.
    b. Functions:
        1) Level measurement.
        2) Tank volume.
        3) Flow measurement.
    c. Power supply:
        1) 120 VAC.
        2) Power consumption: 36 VA maximum.
    d. Outputs:
        1) Isolated 4 to 20 milliamperes DC
        2) Relay outputs:
            a) Minimum 6 Form A or Form C contacts.
            b) Rated 5 amps at 250 VAC.
            c) Programmable.
        3) Enclosure: NEMA Type 4X.
        4) Mounting: As indicated in the Contract Documents.
        5) Operating temperature range from -5 to 122 degrees Fahrenheit (-20 to 50 degrees Celsius); relative humidity of 10 to 100 percent.
        6) Power supply shall be 90-253 VAC, or 10.5-32 VDC.
        7) The transmitter shall have automatic volume calculation for horizontal or vertical tanks with 32 point linearization; pre-programmed linearization tables for flumes and weirs; back water detection for submerged flow conditions; sludge detection; synchronization of pulses between two ultrasonic units used in same tank; automatic sensor detection; alternating pump control; rake/screen control.
        8) There shall be at least 3 integral totalizers and 3 daily counters with the ability for simultaneous measurement of level and flow in storm water

overflow basin with only 1 sensor; EE prom memory backup; temperature compensation; average, difference and sum calculations.

B. Ultrasonic level measurement with 2-wire integral transmitter:
   1. General:
      a. Continuous non-contact level measurement device with integral transmitter using ultrasonic echo sensing.
      b. The transducer generates an ultrasonic pulse in the range of 12 to 70 kHz and measures the time required for the pulse to travel to the process surface and return. The level is measured based on constant velocity of sound in air with temperature compensation to adjust for velocity changes relative to temperature.
      c. Each 2- or 3-wire level transmitter system includes, but is not limited to:
         1) Ultrasonic transducer with integral transmitter.
   2. Performance requirements:
      a. Accuracy:
         1) 0.25 percent of range.
      b. Repeatability:
         1) 0.2 percent of range.
   3. Transducer (Integral):
      a. Encapsulated in chemical- and corrosion-resistant material as indicated on the Instrument Data Sheet or Instrument Index.
      b. Operating temperature range: -5 to 122 degrees Fahrenheit (-20 to 50 degrees Celsius).
      c. Operating relative humidity range: 5 to 95 percent.
   4. Transmitter:
      a. Functions:
         1) Single-level measurement.
         2) Programmable for:
            a) Level.
            b) Tank volume.
      b. Power supply:
         1) 24 VDC, 2-wire loop powered.
         2) Power consumption: 6 VA maximum.
      c. Outputs:
         1) Isolated 4 to 20 milliamperes
      d. Indicator: Liquid crystal display with approximately 0.50-inch display scaled to read in engineering units.
      e. Sensitivity: Able to ignore momentary level spikes or momentary loss of echo and indicate loss of echo condition on indicating transmitter unit.
      f. Enclosure:
         1) NEMA Type 4X.
      g. Mounting: As indicated in the Contract Documents.

2.3 ACCESSORIES

A. Mounting brackets: As indicated on the Drawings.

B. Provide sunshades for outdoor installations.

2.4 SOURCE QUALITY CONTROL

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Factory calibrate each instrument with a minimum 3-point calibration or according to manufacturer’s standard at a facility that is traceable to NIST.

1. Submit calibration data sheets to the Engineer at least 30 days before shipment of the instruments to the project site.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine the installation location for the instrument and verify that the instrument will work properly when installed.
   1. Notify the Engineer promptly if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

3.2 PREPARATION (NOT USED)

3.3 INSTALLATION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Coordinate the installation with all trades to ensure that the mechanical system has all necessary appurtenances including weld-o-lets, valves, etc. for proper installation of instruments.

3.4 FIELD QUALITY CONTROL

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.5 ADJUSTING

A. As specified in the Commissioning for Instrumentation and Controls Section.

B. Turn on turbulent surface software feature for all installations measuring surfaces lacking a placid surface. This would include but not be limited to level measurements in mixed media filters and potentially wet wells.

3.6 CLEANING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.7 DEMONSTRATION AND TRAINING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.8 PROTECTION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.9 SCHEDULES

A. The provided information does not necessarily include all required instruments. Provide all instruments identified in the Contract Documents:
   1. Instruments may be as indicated on the Drawings, specified in the Specifications, or both.

END OF SECTION

SECTION 273020

FLOW MEASUREMENT: MAGNETIC FLOWMETERS

PART 1 GENERAL

1.1 SUMMARY

A. Section includes:
   1. Full-body magnetic flowmeters.

B. Spare Parts:
   1. **PROVIDE SPOOL LENGTHS EQUIVALENTS FOR ALL MAG METERS WHERE NO BYPASS EXISTS. SPOOLS TO BE LABELED WITH TAGS FOR IDENTIFICATION.**

C. Provide all instruments identified in the Contract Drawings.

1.2 REFERENCES

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. International Organization for Standardization (ISO):
   1. 9000 - Quality management systems -- Fundamentals and vocabulary.
   2. 17025 - General requirements for the competence of testing and calibration laboratories.

C. National Institute of Standards and Technology (NIST).

D. NSF International (NSF).

1.3 DEFINITIONS

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.4 SUBMITTALS

A. Furnish submittals as specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Include sizing information from the manufacturer that includes:
   1. Chart of the measurement error from zero to maximum measured volumetric flow range indicated in data sheets.
   2. Indication of all input parameters and their values used in the calculations.

1.5 QUALITY ASSURANCE

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials, etc.
   2. Physical conditions:
      a. Installation and mounting requirements.

b. Location within the process.
c. Accessories: Verify that all required accessories are provided and are compatible with the process conditions and physical installation.

C. Notify the Engineer if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

1.6 DELIVERY, STORAGE, AND HANDLING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.7 PROJECT OR SITE CONDITIONS

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.8 WARRANTY

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.9 MAINTENANCE

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. One of the following or equal:
1. Endress+Hauser: Promag 53.
2. Rosemount – 8700.
3. Krohne - IFC.
4. Toshiba - LF

2.2 MANUFACTURED UNITS

A. Magnetic flowmeter:
1. General:
a. Magnetic flowmeters obtain the flow velocity by measuring the changes of induced voltage of the conductive fluid passing across a controlled magnetic field.
b. Complete zero stability shall be an inherent characteristic of the flowmeter system.
c. Include for each magnetic flow metering system:
1) A metering tube with electrodes (sensor).
2) Signal cable.
3) Transmitter integral or remote as indicated on the Drawings.
4) Flowmeter grounding rings.
2. Performance requirements:
a. Accuracy:
1) 0.25 percent of flow rate from 10 to 100 percent of full-scale for velocities ranging between 1.9 to 10 feet per second.
b. Repeatability:
1) 0.25 percent of rate.
3. Element:

a. Metering tube:
    1) Constructed of carbon steel or Type 304 stainless steel (unless specifically noted otherwise) with flanged connections to match with piping material.
    2) Liner material in conformance with:
        a) Manufacturer's recommendations for the intended service.
        b) NSF certified for all drinking water applications.
    3) Electrodes type and material in conformance with:
        a) Manufacturer's recommendations for the intended service.
        b) Utilize a minimum of 2, self-cleaning electrodes.
    4) Meter terminal housing NEMA Type 4X, unless installed in locations such as vaults that will experience submergence. In those applications NEMA 6P is required.
        a) Unless specifically noted otherwise in the instrument data sheets.
    5) Meter coating consisting of epoxy painted finish.
    6) Components:
        a) 2 grounding rings:
            (1) Which are in conformance with the manufacturer's bore and material recommendation for the meter's intended service.
            (2) Designed to protect and shield from abrasion of the liner's edge interface at the meter's end.

4. Transmitter:
    a. Power supply:
        1) Power consumption: 60 VA maximum.
    b. Outputs:
        1) As noted in the instrument data sheets.
        2) For all instruments with 4 to 20 mA HART or digital bus protocol, provide a Device Type Manager (DTM) certification by FDT group.
    c. Microprocessor-based signal converter/transmitter.
    d. Utilize DC pulse technique to drive flux-producing coils.
    e. Contain a 6-digit display for flow rate, percent of span, and totalizer.
    f. Operator keypad interface.
    g. Integral zero return to provide consistent zero output signals in response to an external dry contact closure.
    h. Integral low flow cut-off zero return.
    i. Programmable parameters including:
        1) Meter size.
        2) Full-scale flow rate.
        3) Magnetic field frequency.
        4) Time constant.
    j. Data retention for a minimum of 5 years without auxiliary main or battery power.
    k. Self-diagnostics and automatic data checking.
    l. Protected terminals and fuses in a separate compartment which isolates field connection from electronics.
    m. Ambient operating temperature limits of -5 to 140 degrees Fahrenheit (-20 to 60 degrees Celsius).

2.3 ACCESSORIES

A. Provide stainless steel tags for each instrument. Tags shall be labeled as specified in the Contract Documents.

B. Provide sunshades for all transmitters located outdoors.

C. Provide galvanic isolation gaskets, nylon/Teflon™ flange bolt insulation bushings and nylon washers on all meters installed on pipes with cathodic protection.

2.4 SOURCE QUALITY CONTROL

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Factory calibrate each flow metering system at a facility that is traceable to the NIST. ISO-17025 accredited test facility with certified accuracy traceable to NIST.

C. Evidence of accreditation shall originate from a national verification agency such as A2LA.

D. A real-time computer generated printout of the actual calibration date indication actual velocities and as read values of the flow tube.
   1. Flow calibration report of the manufacturers flow lab calibration procedure shall be shipped with the meter system.
   2. Minimum calibration shall be a 3 point calibration including 1, 3, and 10 feet per second velocities for every meter and transmitter system.
   3. Manufacturer shall archive all calibration reports for future reference.

PART 3 EXECUTION

3.1 EXAMINATION (NOT USED)

3.2 PREPARATION (NOT USED)

3.3 INSTALLATION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. For instruments located outdoors or where instrument elements and transmitters are separated by conduit located outside the building envelope, provide surge protection devices at the transmitters.

3.4 FIELD QUALITY CONTROL

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Provide manufacturer’s services to perform installation inspection.

3.5 ADJUSTING

A. Field Verification:
   1. Verify factory calibration of all instruments in accordance with the manufacturer’s instructions.
   2. The transmitter and sensor to include a method to verify flow meter performance to the original manufacturer specifications.
   3. Verification should be traceable to factory calibration using a third party, attested onboard system pursuant to ISO standards.
   4. The verification report should be compliant to common quality systems such as ISO 9000 to prove reliability of the meter specified accuracy.
   5. Return factory calibrated devices to the factory if they do not meet the field verification requirements for calibration.

3.6 CLEANING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.7 DEMONSTRATION AND TRAINING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Demonstrate performance of all instruments to the Engineer before commissioning.

3.8 PROTECTION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.9 SCHEDULES

A. Provide all instruments identified in the Contract Documents:
   1. Instruments may be indicated on the Drawings, specified in the Specifications, or both.
   2. Contractor shall coordinate the selection of the material, ranges, span, and accessories and options with the process being measured to ensure a complete and operating system.

END OF SECTION

SECTION 273400

INSTRUMENTATION AND CONTROLS – ANALYTICAL DEVICE

PART 1 GENERAL

1.1 SCOPE OF WORK

A. This section covers the furnishing, installation, and services for the field-mounted analyzers as detailed on the Drawings.

1.2 MAINTENANCE

B. Accessories

1. All mounting hardware required for pipe stand, surface, or other mounting shall be provided.

2. Each instrument shall be provided with a manufacturer installed stainless steel tag identifying the instrument tag number.

PART 2 PRODUCTS

2.1 DISSOLVED OXYGEN ANALYZER (LUMINESCENT-TYPE SENSOR) / TSS

A. Electrode Cartridge/Sensor Assembly

1. Type: Continuous monitoring of dissolved oxygen using a luminescent membrane excited with blue light pulses.

2. Function/Performance:

a. Accuracy: plus or minus 0.1 ppm (DO<1 ppm); plus or minus 0.2 ppm.

b. Repeatability: 0.005 ppm.

c. Measuring Range: 0 to 20 ppm.

d. Sensitivity: plus or minus 0.05 percent of span.

e. Measuring Range: 0 to 50 degrees C.

f. Materials on Construction: Probe, noryl and 316SS; sensor, polybutyl methacrolate.

g. Warranties: Probe, 3 years; Sensor, 1 year.

3. Accessories Required:

a. One spare sensor cap for each set of ten or less sensor assemblies provided.

b. Sufficient cable for installation between the sensor and analyzer/controller as indicated on the Drawings.

c. One mounting bracket per sensor for fixing the sensor assembly to hand railing or other fixed support.

2. Manufacturer(s):

a. Hach LDO / SOLITAX sensor assembly.

b. YSI

c. Equal.

B. Analyzer/Controller

1. Type: Microprocessor-based controller compatible with sensor furnished.

2. Function/Performance:

a. Accuracy: plus or minus 0.1 percent of span.

b. Repeatability: plus or minus 0.05 percent of span.

c. Response Time: 60 seconds to 90 percent of value on step change.

d. Temperature Range: -40 to 60 degrees C.

e. Output: Two 4-20 mA outputs and three programmable Form C alarm contact outputs rated for 5A at 230 VAC.

f. Temperature Compensation: Compensation over the temperature range of the instrument.

g. Diagnostics: On screen instructions and display of self diagnostics.

h. Display: Digital indicator displaying concentration in ppm and temperature of the medium.

3. Physical:

a. Converter shall be suitable for surface or pipe stand mounting.

b. Enclosure shall be NEMA 4X (IP67).

c. Power requirements: 120 VAC/60 Hz.

4. Manufacturer(s):

a. Hach sc200 Controller.

b. YSI

c. Equal.

PART 3 EXECUTION

END OF SECTION

SECTION 274070

PRESSURE MEASUREMENT: SUBMERSIBLE

PART 1 GENERAL

1.1 SUMMARY

A. Section includes:
   1. Submersible pressure transmitters.

B. Provide all instruments identified in the Contract Documents.

1.2 REFERENCES

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.3 DEFINITIONS

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.4 SUBMITTALS

A. Furnish submittals as specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Provide complete documentation covering the traceability of all calibration instruments.

1.5 QUALITY ASSURANCE

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials etc.
   2. Physical conditions:
      a. Installation and mounting requirements.
      b. Location within the process.
      c. Accessories: Verify that all required accessories are provided and are compatible with the process conditions and physical installation.

C. Notify the Engineer if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

D. Provide instruments manufactured at facilities certified to the quality standards of ISO 9001.

1.6 DELIVERY, STORAGE, AND HANDLING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.7 PROJECT OR SITE CONDITIONS

A. Project environmental conditions as specified in the Common Work Results for Process Control and Instrumentation Systems Section.
   1. Provide instruments suitable for the installed site conditions including, but not limited to, material compatibility, site altitude, site seismic conditions, humidity, and process and ambient temperatures.

1.8 WARRANTY

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.9 MAINTENANCE

A. Furnish all parts, materials, fluids, etc. necessary for operation, maintenance, and calibration purposes throughout the warranty period. Deliver all of these supplies before project substantial completion.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Submersible level measurement with 2-wire integral transmitter:
   1. One of the following or equal:
      a. Druck, PTX-1830 (clear water)/ PTX-1290 (wastewater).
      b. Or equal.

2.2 MANUFACTURED UNITS

A. Submersible level measurement with 2-wire integral transmitter:
   1. General:
      a. Pressure is measured through a diaphragm-type measuring cell and converted to linear pressure measurement.
      b. Each submersible pressure transmitter system shall include:
         1) Signal cable, including pressure compensation tube.
         2) Transducer probe with integral transmitter.
         3) Transmitter cable termination box.
   2. Performance requirements:
      a. Accuracy:
         1) 0.3 percent of range.
      b. Repeatability:
         1) 0.25 percent of full scale.
      c. Rangeability:
         1) 3:1.
   3. Element:
      a. Sensor housing shall be Type 316L stainless steel or titanium with ceramic, teflon-coated, or titanium diaphragm.
      b. Protective cap shall be manufacturer’s recommended material, chemically resistant to process fluid.
      c. Slip resistant extension cable with pressure compensation tube with Teflon filter.
      d. Enclosure for probe and transmitter assembly shall be NEMA Type 6P.
   4. Transmitter:
      a. Power supply:

1) 24 VDC: 2 wire loop powered.
2) Power consumption: 18 VA maximum.

b. Outputs:
1) Isolated 4 to 20 milliamperes DC.

c. Without display.

d. Ambient operating temperature limits of -10 to 70 degrees Celsius (-14 to 158 degrees Fahrenheit).

e. Transmitter shall be integral to probe housing.

5. Transmitter cable termination box:
a. NEMA Type 4X.
b. Equipped with filter or desiccant chamber to eliminate moisture from the pressure compensation tube.
c. Termination for signal wires and pressure compensation tube.

2.3 ACCESSORIES

A. Type 316L stainless steel mounting clamp with Type 304 stainless steel mounting screws.

B. Provide cable clamp and strain relief.

C. Provide computer cable adapter with Windows® software.

D. Provide remote display with backlight or loop indicator with backlight as indicated on the Drawings and as specified in the Control Systems: Panels, Enclosures, and Panel Components Section.

E. Provide sunshade for outdoor installations.

2.4 SOURCE QUALITY CONTROL

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Factory calibrate each instrument with a minimum 3-point calibration or according to Manufacturer's standard at a facility that is traceable to the NIST.
1. Submit calibration data sheets to the Engineer at least 30 days before shipment of the instruments to the project site.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine the installation location for the instrument and verify that the instrument will work properly when installed.
1. Notify the Engineer promptly if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

3.2 PREPARATION (NOT USED)

3.3 INSTALLATION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Coordinate the installation with all trades to ensure that the mechanical system has all necessary appurtenances including weld-o-lets, valves, etc. for proper installation of instruments.

3.4 FIELD QUALITY CONTROL

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.5 ADJUSTING

A. As specified in the Commissioning for Instrumentation and Controls Section.

3.6 CLEANING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.7 DEMONSTRATION AND TRAINING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.8 PROTECTION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.9 SCHEDULES

A. The provided information does not necessarily include all required instruments. Provide all instruments identified in the Contract Documents:
   1. Instruments may be indicated on the Drawings, specified in the Specifications, or both.

END OF SECTION

SECTION 276040

TEMPERATURE MEASUREMENT: RTD

PART 1 GENERAL

1.1 SUMMARY

A. Section includes:
   1. RTD temperature instruments.

B. Provide all instruments identified in the Contract Documents.

1.2 REFERENCES

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.3 DEFINITIONS

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Specific definitions:
   1. RTD - Resistance temperature detector.

1.4 SUBMITTALS

A. Furnish submittals as specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Provide complete documentation covering the traceability of all calibration instruments.

1.5 QUALITY ASSURANCE

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials, etc.
   2. Physical conditions:
      a. Installation and mounting requirements.
      b. Location within the process.
      c. Accessories: Verify that all required accessories are provided and are compatible with the process conditions and physical installation.

C. Notify the Engineer if any installation condition does not meet the instrument manufacturer’s recommendations or specifications.

D. Provide instruments manufactured at facilities certified to the quality standards of ISO 9001.

1.6 DELIVERY, STORAGE, AND HANDLING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.7 PROJECT OR SITE CONDITIONS

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.8 WARRANTY

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.9 MAINTENANCE

A. Furnish all parts, materials, fluids, etc. necessary for operation, maintenance, and calibration purposes throughout the warranty period. Deliver all of these supplies before project substantial completion.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. One of the following or equal:

1. Process Measurement:
    a. Emerson, Rosemount 3144P transmitter with Series 214C sensor.
    b. Siemens, SITRANS T.
    c. Foxboro, Model RTT20.

2.2 MANUFACTURED UNITS

A. Process measurement:
1. General:
    a. Temperature measuring instrument shall include an RTD temperature element, transmitter, and thermowell.
2. Performance requirements:
    a. Accuracy:
        1) Within 0.25 percent of calibrated span.
    b. Repeatability:
        1) 0.25 percent of full scale.
    c. Sensor lead wire compensation: Maximum zero shift of 0.2 percent of the temperature range.
3. Element:
    a. 100-Ohm platinum thin film resistance temperature detector (RTD).
    b. 3-wire.
    c. Hermetically-sealed, and enclosed in Type 316 stainless steel outer sheath.
    d. Single element temperature sensor shall be spring-loaded.
4. Transmitter:
    a. Microprocessor based.
    b. Compatible with 3-wire and 4-wire RTD inputs:
    c. Local display:
        1) 5-digit LCD.
        2) Scaled in engineering units.

d. Power supply:
    1) 24 VDC - loop powered.
e. Outputs:
    1) Isolated 4 to 20 milliamperes DC with HART communication protocol.
f. Transmitter enclosure:
    1) NEMA Type 7.
g. Transmitter mounting:
    1) As specified on the Instrument Data Sheets or Instrument Index.
    2) Connection to thermowell: 1/2-inch NPT.
    3) Provide all necessary hardware for transmitter mounting.

2.3 ACCESSORIES

A. Thermowell:
    1. Unless otherwise noted, provide a thermowell with each RTD.
    2. Process connection: As identified on instrument data sheet.
    3. Thermowell material: Type 316L stainless steel
    4. Stem style: As identified on instrument data sheet.
    5. Immersion depth:
        a. Minimum 3 inches or 10 times the diameter of the thermowell, whichever is larger.
        b. Where pipe diameter is inadequate for appropriate immersion depth, install thermowell in an elbow on the axis of the pipe.
        c. As identified on instrument data sheet.

B. Provide sunshades for outdoor installations.

2.4 SOURCE QUALITY CONTROL

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Factory calibrate each instrument with a minimum 3-point calibration or according to Manufacturer’s standard at a facility that is traceable to the NIST.
    1. Submit calibration data sheets to the Engineer at least 30 days before shipment of the instruments to the project site.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine the installation location for the instrument and verify that the instrument will work properly when installed.
    1. Notify the Engineer promptly if any installation condition does not meet the instrument manufacturer’s recommendations or specifications.

3.2 PREPARATION (NOT USED)

3.3 INSTALLATION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Coordinate the installation with all trades to ensure that the mechanical system has all necessary appurtenances including weld-o-lets, valves, etc. for proper installation of instruments.

C. Apply thermally conductive silicone grease to the sensor tip before insertion in thermowell.

3.4 FIELD QUALITY CONTROL

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.5 ADJUSTING

A. As specified in the Commissioning for Instrumentation and Controls Section.

3.6 CLEANING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.7 DEMONSTRATION AND TRAINING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.8 PROTECTION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.9 SCHEDULES

A. The provided information does not necessarily include all required instruments. Provide all instruments identified in the Contract Documents:
   1. Instruments may be indicated on the Drawings, specified in the Specifications, or both.
   2. Contractor shall coordinate the selection of the material, ranges, span, and accessories and options with the process being measured to ensure a complete and operating system

END OF SECTION

SECTION 277100

CONTROL SYSTEMS: PANELS, ENCLOSURES, AND PANEL COMPONENTS

PART 1 GENERAL

1.1 SUMMARY

A. Section includes:
   1. Design, fabrication and assembly of all instrumentation enclosures, control panels and components provided under this contract, including but not limited to:
      a. Custom built instrumentation and control panels, including all enclosures for hand stations controllers, low voltage power distribution and marshalling panels.
      b. Control panels furnished as part of equipment systems specified in other Divisions, such as vendor control panels (VCPs) and chemical feed panels.
      c. Control components.
      d. Control panel installation.

B. Provide all control panels identified in Contract Documents.

1.2 REFERENCES

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Institute of Electrical and Electronics Engineers (IEEE):

   6. 1077 - Standard for Supplementary Protectors for Use in Electrical Equipment.
   7. 1283 - Standard for Electromagnetic Interference Filters.

8. 1449 - Standard for Surge Protective Devices.

1.3 DEFINITIONS

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Specific definitions:
   1. The term “panel” in this Section is interchangeable with the term “enclosure.”

1.4 SUBMITTALS

A. Provide submittals as specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Provide a control panel hardware submittal for each control panel and enclosure being provided on this project, including but not limited to:
   1. Product data:
      a. Enclosure construction details and NEMA type.
      b. Manufacturer's literature and specification data sheets for each type of equipment to be installed within or on the panel or enclosure.
   2. Shop drawings:
      a. Scaled, detailed exterior panel (front and side views) and interior panel layout showing equipment arrangement and dimensional information:
         1) Provide draft for review and approval by Engineer. The Engineer has the authority to substantially alter initial panel layouts.
      b. Complete nameplate engraving schedule.
      c. Structural details of fabricated panels.
   3. Calculations:
      a. Provide installation details based on calculated shear and tension forces:
         1) Calculations shall be signed and sealed by a Professional Engineer licensed in the state where the cabinets and panels will be installed.
      b. For assembled enclosures and other equipment with a weight of 200 pounds or more, provide calculations for:
         1) Weight including panel internal components.
         2) Seismic forces and overturning moments.
         3) Shear and tension forces in connections.
      c. Cooling calculations, including but not limited to:
         1) Highest expected ambient temperature for the enclosure's location.
         2) Internal heat load.
         3) Exposure to direct sunlight.
         4) Dimensions of the enclosure in inches.
         5) Maximum allowable temperature inside the enclosure, based on the lowest operating temperature limit of the installed components.

C. Seismic design:
   1. Seismic panel construction:
      a. Seismic anchorage: Provide seismic design calculations and installation details for anchorage of all panels, enclosures, consoles, etc. to meet seismic requirements:
         1) Stamped by a Professional Engineer registered in the state where the project is being constructed.
      b. For floor-mounted freestanding panels weighing 200 pounds or more (assembled, including contents), submit calculations, data sheets, and other information to substantiate that panel, base, and framing meet minimum design strength requirements and seismic requirements as specified in the Seismic Design

Criteria Section. Calculations shall be signed and sealed by a Professional Engineer licensed in the state where the cabinets and panels will be installed.

1.5 QUALITY ASSURANCE

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Assemble panels, enclosures, and rack systems along with all internal and external devices, wiring, equipment, and materials in a facility that is recognized by UL to assemble and certify UL-labeled control panels:
   1. Provide all components and equipment with UL 508 listing.
   2. All control panels shall be UL 508A labeled, unless the equipment in the panel and the design in the contract documents cannot be reasonably modified to meet the requirements for UL 508A labeling:
   3. Provide fuses for all equipment that is not UL or UR listed.
   4. Install all intrinsically safe circuits and equipment in accordance with UL698A.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Project environmental conditions as specified in the Common Work Results for Process Control and Instrumentation Systems Section.
   1. Provide instruments suitable for the installed site conditions including, but not limited to, material compatibility, site altitude, site seismic conditions, humidity, and process and ambient temperatures.

1.7 PROJECT OR SITE CONDITIONS

A. As specified in the Common Work Results for Process Control and Instrumentation Section.

1.8 SEQUENCING (NOT USED)

1.9 SCHEDULING (NOT USED)

1.10 WARRANTY

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.11 SYSTEM START-UP (NOT USED)

1.12 OWNER'S INSTRUCTIONS (NOT USED)

1.13 COMMISSIONING (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. As listed below in the individual component paragraphs.

B. Provide instruments and other components performing similar functions of the same type, model, or class, and from 1 manufacturer.

2.2 SYSTEM DESCRIPTION

A. Panel dimensions:
   1. Minimum dimensions are scalable from or as indicated on the Drawings and are based upon manufacturer's non-certified information. It is the responsibility of the Contractor or manufacturer to design and size all panels:
      a. Size panels to provide space for all equipment, wiring, terminations, and other items in the panel, including space for future build out.
      b. Panel sizes that substantially deviate (within 3 inches in any dimension) from the sizes indicated on the Drawings must be approved by the Engineer.
      c. Maximum panel depth: 30 inches, unless otherwise indicated.

B. Structural design:
   1. Completed and installed panel work shall safely withstand seismic requirements at the project site as specified in the Common Work Results for Electrical Section. Enclosures and internal equipment shall be braced to prevent damage from specified forces.

2.3 EXISTING PRODUCTS (NOT USED)

2.4 MATERIALS

A. Construct and finish enclosures using materials capable of withstanding the mechanical, electrical, and thermal stresses, as well as the effects of humidity and corrosion that are likely to be encountered in normal service:
   1. Enclosures shall have the following properties:
      a. NEMA Type 1: Steel.
      b. NEMA Type 4: Steel with gasketed door, raintight.
      c. NEMA Type 4X: Type 316 stainless steel (unless Type 304 is indicated on the Drawings).
      d. NEMA Type 4X: Polycarbonate or fiberglass reinforced polyester (FRP) in corrosive areas where stainless steel is incompatible.
      e. NEMA Type 12: Steel with gasketed door, dusttight.
      f. NEMA Type 7: Cast aluminum.

B. Bolting material:
   1. Commercial quality 1/2-inch diameter, stainless steel hex-head Grade 5 bolts, nuts, and washers, with unified coarse (UNC) threads.
   2. Carriage bolts for attaching end plates.
   3. All other bolted joints shall have S.A.E. standard lock washers.

2.5 MANUFACTURED UNITS

A. Panels/enclosures:
   1. Manufacturers: One of the following or equal:
      a. Rittal.
      b. nVent/Hoffman.
      c. Saginaw Control & Engineering.
   2. Panel assembly:
      a. General guidelines for panel fabrication include:
         1) Continuous welds ground smooth.
         2) Exposed surfaces free of burrs and sharp edges.

3) Base formed of heavy channel iron, either galvanized or powder coated, minimum 1/2-inch holes at 12-inch spacing to accommodate anchoring of freestanding enclosures to floor.

b. Construct enclosure and mounting panel using stretcher-level quality sheet metal having minimum thickness not less than the following sizes (U.S. Standard Gauge):

Enclosure Height (inches)	Minimum Enclosure Steel Thickness (gauge)	Minimum Back Mounting Panel Thickness (gauge)
Wall-mounted up to 48	14	14
Up to 57	12	12
57 - 69	12	10
69 - 82	12, except 10 on back	10
82 or more	10	10

1) Use heavier sheet metal to meet seismic requirements at the project site or when required due to equipment requirements.

c. Construct supporting frame structure with angled, channeled, or folded rigid section of sheet metal, rigidly attached to and having essentially the same outer dimensions as the enclosure surface and having sufficient torsional rigidity to resist the bending moments applied via the enclosure surface when it is deflected.

d. Provide stiffeners for back mounting panels in enclosures larger than 4 feet. In addition, secure the panels in place by collar studs welded to the enclosure.

e. Door construction:
   1) Turned-back edges suitably braced and supported to maintain alignment and rigidity without sagging.
   2) Sufficient width to permit door opening without interference with rear projection of flush-mounted instruments.
   3) Heavy-gauge stainless steel hinges.
   4) For NEMA Type 12, Type 4, and Type 4X, provide oil-resistant neoprene sealing gasket and adhesive to seal cover to enclosure.
   5) Gasket installed to seal against roll lip on the enclosure opening.

f. Latches:
   1) For panels, provide each door with a 3-point latching mechanism and locking handle with rollers on the ends of the latch rods. Latch rods shall be connected to a common door handle, hold doors securely, and form a compressed seal between door and gasket, at the top, side, and bottom.
      a) Provide padlock for each enclosure with padlock provisions.
   2) Include an oiltight key-locking, 3-point latching mechanism on each door:
      a) Provide 2 keys per panel.
      b) All locks keyed alike.
   3) For large NEMA Type 4 and NEMA Type 4X cabinets not available with 3-point latching hardware, provide multiple clips and padlock hasps.

g. Panel cut-outs:
   1) Cut, punch, or drill cutouts for instruments, devices, and windows. Smoothly finish with rounded edges.
   2) Allow a minimum of 3-inch envelope around all displays, controllers, and monitors.
   3) Reinforce around cut-outs with steel angles or flat bars for the following:
      a) Large panel cutouts; for example, openings for local operator interfaces.

b) Pilot device groupings, where the removed metal exceeds 50 percent of the available metal.

3. In addition to the requirements specified above, the following requirements for NEMA Type 4X powder coated stainless steel enclosures apply:
   a. Minimum 14-gauge, Type 304 stainless steel.
   b. Captive stainless steel cover screws threaded into sealed wells.
   c. Inside finish: White polyester powder coating.
   d. Specifically designed for use with flange-mounted disconnect handles where required or as indicated on the Drawings.
4. Outdoor panels. Supplementary requirements for panels located outdoors are as follows:
   a. All enclosures located outdoors shall be explicitly designed and rated for outdoor service by the manufacturer.
   b. Door hardware: 316 Stainless steel.
   c. Provide factory installed rain canopy and sun shield for all enclosures with operator interface panels.
   d. Bases: Heavy channel, gasketed stainless steel bases, flanges up, for anchoring to pad.

B. Arrangement of components:
1. Arrange panel internal components for external conduit and piping to enter into panel either from above or below.
2. Arrange panel instruments and control devices in a logical configuration, associating pushbutton and selector switches with related readout devices, or as indicated on the Drawings.
3. Mount internal control components on an internal back panel. Devices may be mounted on the side panel only by special permission from the Engineer.
4. All control panel mounted operator interface devices shall be mounted between 3 feet and 5 feet above finished floor.

C. Overcurrent protection:
1. Main overcurrent device:
   a. Where the electrical power supply voltage to the control panel is more than 120 VAC, provide the panel with a flange-mounted disconnect handle operating a molded-case circuit breaker and provide a control power transformer for 120-VAC circuits:
      1) Door-mounted disconnect handles are not acceptable.
      2) Mechanically interlock the disconnect switch with the control enclosure doors so that no door can be opened unless the power is disconnected, and the disconnect switch cannot be closed until all doors are closed.
      3) Provide means to defeat the interlock.
      4) Lockable in the off position.
   b. Control panels supplied with 120 VAC:
      1) Provide an internal breaker with the line side terminals covered by a barrier.
      2) Provide a nameplate prominently positioned on the control panel identifying the location of the power source and a warning statement requiring the source to be disconnected before opening the door to the enclosure.
2. Provide circuit breakers as specified in the Low Voltage Molded Case Circuit Breakers Section.
3. Selection and ratings of protective devices:
   a. Interrupting ratings: Not less than the system maximum available fault current at the point of application.
   b. Voltage rating: Not less than the voltage of the application.
   c. Select current rating and trip characteristics to be suitable for:
      1) Maximum normal operating current.
      2) Inrush characteristics.

3) Coordination of the protective devices to each other and to the source breaker feeding the panel.

d. Circuit breakers, fuses, and motor overcurrent protection devices used for branch circuit protection must be UL 508A compliant.
   1) Circuit breakers listed under UL 1077 Standard for Supplementary Protectors that do not comply with UL 508A requirements are not acceptable.
   2) Miscellaneous, miniature, and micro fuses listed under UL 248 Part 14 that do not comply with UL 508A requirements are not acceptable.
   3) Manual motor controllers provided with an instantaneous-trip overcurrent mechanism listed under UL 508 that do not comply with UL 508A requirements are not acceptable.

4. Provide a separate protective device for each powered electrical device:
   a. An individual circuit breaker for each 120-VAC instrument installed within its respective control panel and clearly identified for function.
   b. An individual fuse for each PLC discrete output. Provide with individual blown fuse indication external of the I/O card:
      1) Size external fuse to open before any I/O-card-mounted fuses.
   c. Individual discrete inputs shall use a 1/2-ampere fuse.
      1) Control loops shall use a 5-ampere fuse.
   d. Install protective devices on the back mounting panel and identify by a service nameplate in accordance with the wiring diagrams.
5. Fuses for 4-to- 20 milliamperes signals:
   a. Provide durable, readily visible label for each fuse, clearly indicating the correct type, size, and ratings of replacement fuse:
      1) Label shall not cover or interfere with equipment manufacturer's instructions.
   b. An individual 1/2-ampere fuse for each 4-to-20 milliamperes analog loop powered from the control panel.
   c. Provide fuses rated for the voltage and available short-circuit current at which they are applied.
   d. Manufacturers: One of the following or equal:
      1) Ferraz Shawmut.
      2) Littelfuse.
      3) Bussmann.
6. Fuse holders:
   a. Modular type:
      1) DIN rail mounting on 35-millimeter rail.
      2) Touch-safe design: All connection terminals to be protected against accidental touch.
      3) Incorporates blown-fuse indicator.
      4) Plug-in style fuse terminals and fuse plugs are not acceptable.
   b. Provide nameplate identifying each fuse:
      1) As specified in the Identification for Electrical Systems Section.
   c. Manufacturers: One of the following or equal:
      1) Phoenix Contact, UT4-HESI Series.
      2) Allen-Bradley, 1492-FB Series B.
7. Control circuit breakers:
   a. DIN rail mounting on 35-millimeter rail.
   b. Manual OPEN-CLOSE toggle switch.
   c. Rated for 250 VAC.
   d. Interrupting rating: 10 kiloampere (kA) or available fault current at the line terminal, whichever is higher.
   e. Current ratings: As required for the application.
   f. Provide nameplate identifying each circuit breaker:
      1) As specified in the Identification for Electrical Systems Section.
   g. Manufacturers: One of the following or equal:

1) Phoenix Contact, TMC Series.
2) ABB.
3) Allen-Bradley.
4) Square D.

8. Electronic circuit protectors:
   a. Used where a NEC Class 2 power circuit is required to protect devices with NEC Class 2 power supplies.
   b. DIN rail mounting on 35-millimeter rail.
   c. Rated for 24 VDC.
   d. 4 channels to feed 4 independent power feeds to separate devices.
   e. Output current ratings: As required for the application.
   f. LED input status indication.
   g. LED failure status of each channel indication.
   h. Fail contacts.
   i. Provide nameplate identifying each circuit electronic circuit protector module:
      1) As specified in the Identification for Electrical Systems Section.
   j. Manufacturers: One of the following or equal:
      1) Rockwell Automation 1692-TD014.
      2) Puls PISA11 series.

D. Conductors and cables:
   1. Power and control wiring:
      a. Materials: Stranded, soft annealed copper.
      b. Insulation: 600 volts type MTW.
      c. Minimum sizes:
         1) Primary power distribution: 12 AWG.
         2) Secondary power distribution: 14 AWG.
         3) Control: 16 AWG.
      d. Color:
         1) AC power (line and load): Black.
         2) AC power (neutral): White.
         3) AC control: Red.
         4) AC control: Orange for foreign voltages.
         5) DC power and control (ungrounded): Blue.
         6) DC power and control (grounded): White with Blue stripe.
         7) Ground: Green.
   2. Signal cables:
      a. Materials: Stranded, soft annealed copper.
      b. Insulation: 600 volts, PVC outer jacket.
      c. Minimum size: 18 AWG paired triad.
      d. Overall aluminum shield (tape).
      e. Copper drain wire.
      f. Color:
         1) 2-Conductor:
            a) Positive (+): Black.
            b) Negative (-): White and red.
         2) 3-Conductor:
            a) Positive (+): Black.
            b) Negative (-): Red.
            c) Signal: White.
      g. Insulate the foil shielding and exposed drain wire for each signal cable with heat-shrink tubing.

E. Conductor identification:
   1. Identify each conductor and cable with unique wire numbers as specified in the Identification for Electrical Systems Section.

2. Readily identified without twisting the conductor.

F. General wiring requirements:
   1. Wiring methods: Wiring methods and materials for panels shall be in accordance with the NEC requirements for General Purpose (no open wiring) unless otherwise specified.
   2. Install all components in accordance with the manufacturer's instructions included in the listing and labeling.
   3. Provide a nameplate on the cover of the control panel identifying all sources of power supply and foreign voltages within the control panel.
   4. Provide transformers, protective devices, and power supplies required to convert the supply voltage to the needed utilization voltage.
   5. Provide power surge protection for all control panels.
   6. Provide signal surge protection within control panels for each analog I/O, discrete I/O, and data line (Copper Ethernet, Coax, Fieldbus signals) that originates from outdoor devices.
   7. Provide non-metallic ducts for routing and organization of conductors and cables:
      a. Provide wiring separation plan.
      b. Size ducts for ultimate build-out of the panel, or for 20-percent spare, whichever is greater.
      c. Provide separate ducts for signal and low-voltage wiring from power and 120-VAC control wiring:
         1) 120 VAC: Grey colored ducts.
         2) 24 VDC: White colored ducts.
   8. Cables shall be fastened with cable-mounting clamps or with cable ties supported by any of the following methods:
      a. Screw-on cable tie mounts.
      b. Hammer-on cable-tie mounting clips.
      c. Fingers of the nonmetallic duct.
   9. Wire ties:
      a. No wire ties inside wire duct.
      b. Use Panduit Cable tie installation tool, with tension control/cutoff.
      c. Verify cut ends are cut flush filed smooth after installed.
   10. Provide supports at the ends of cables to prevent mechanical stresses at the termination of conductors.
   11. Support panel conductors where necessary to keep them in place.
   12. Wiring to rear terminals on panel-mount instruments shall be run in nonmetallic duct secured to horizontal brackets run adjacent to the instruments.
   13. Conductors and cables shall be run from terminal to terminal without splice or joints. Exceptions:
      a. Factory-applied connectors molded onto cables shall be permitted. Such connectors shall not be considered as splices or joints.
   14. The control panel shall be the source of power for all 120-VAC devices interconnected with the control panel including, but not limited to:
      a. Solenoid valves.
      b. Instruments both mounted in the control panel and remotely connected to the control panel.

G. Provide power circuits for all Contractor and Vendor-furnished PLC cabinets in accordance with the PLC and Instrument Power wiring diagrams Indicated on the Drawings or as specified.

2.6 EQUIPMENT (NOT USED)

2.7 COMPONENTS

A. Thermal management:
   1. Provide heating, cooling, and dehumidifying devices in order to maintain all instrumentation and control devices to within a range as specified in the Common Work Results for Process Control and Instrumentation Section.
   2. Air conditioner:
      a. Provide solid-state cabinet coolers or air conditioning units on all outdoor panels containing electronic components such as local operator interfaces, panel instruments, programmable logic controllers, or remote I/O.
      b. Provide filters on intake and exhaust openings.
      c. Increase panel sizes as needed to accommodate cooling units.
      d. Enclosure rating: NEMA Type 4X.
      e. Closed-loop design.
      f. Power supply: 120 VAC.
      g. Manufacturers: The following or equal:
         1) Kooltronic, GuardianX DP Series.
         2) ICEqube, Blade series or IECEx/ATEX for Zone 1 & 2.
   3. Heating:
      a. Provide all panels located in areas that are not climate controlled with thermostatically controlled strip heaters, except where all of the following conditions apply:
         1) The panel is not supplied with 120 VAC power.
         2) There are no electronics or moisture-sensitive devices in the enclosure.
         3) The panel is smaller than 38 inches high.
   4. Heat exchanger:
      a. Closed-loop design ensuring separation of ambient air and clean air inside the cabinet.
      b. Filterless design to facilitate easy cleaning of the core.
      c. Mounting: As indicated on the Drawings.
      d. Manufacturers: The following or equal:
         1) Noren, CC Series.
         2) ICEqube, Blade series.
   5. Enclosure temperature switch:
      a. Provide wall-mounted bimetallic switch transmitter (to measure internal cabinet temperature in all enclosures) containing electrical components such as PLCs, RTUs, RIO, and VFDs.
      b. Sensor and electronic enclosure.
      c. Accuracy: Within 2 degrees Fahrenheit.
      d. Single contact:
         1) Manufacturers: One of the following or equal:
            a) nVent/Hoffman ATEMNC.
            b) Pfannenberg FLZ.
      e. Dual contact:
         1) Manufacturers: The following or equal:
            a) nVent/Hoffman ADLTEMP.
   6. Status relays and discrete inputs for switches, power supplies, and fieldbus devices (if applicable):
      a. Provide as indicated on the Drawings or as specified.
   7. Fan ventilation:
      a. Provide nVent/Hoffman fan speed control:
         1) Provide 2 door/cabinet-mounted vent fans for every 72 inches of cabinet width.
         2) Provide finger-guard kit.

3) Filter kit with 2 spare filters for each intake fan.
4) Provide bezel and gasket kit.
5) Provide fan shroud.
6) Automatically adjust fan speed depending on remote temperature sensor input.
7) 120 VAC, 60 hertz.
8) NEMA Type 5-15R cord connections.

B. Pilot devices:
1. General:
a. Provide operator pushbuttons, switches, and pilot lights, from a single manufacturer.
b. Size:
1) 30.5 millimeters.
c. Heavy duty.
d. Pushbuttons:
1) Contacts rated:
a) NEMA Type A600.
2) Furnish 1 spare normally open contact and normally closed contact with each switch.
e. Selector switches:
1) Contacts rated:
a) NEMA Type A600.
b) Knob type.
2) Furnish 1 spare normally open contact and normally closed contact with each switch.
3) Provisions for locking in the OFF position where lockout provisions are indicated on the Drawings.
f. Pilot lights:
1) Type:
a) LED for interior installations.
2) Push to test.
3) Lamp color:
a) On/Running/Start: Red.
b) Off/Stop: Green.
c) Power: White.
d) Alarm: Amber.
e) Status or normal condition: White.
f) Opened: Red.
g) Closed: Green.
h) Failure: Red.
2. Indoor and outdoor areas:
a. NEMA Type 4/13.
b. Manufacturers: One of the following or equal:
1) Allen-Bradley, Type 800T.
2) Schneider Electric, Class 9001, Type K.
3) General Electric, Type CR104P.
4) IDEC, TWTD Series.
3. Corrosive areas:
a. NEMA Type 4X.
b. Corrosion resistant.
c. Exterior parts of high-impact strength fiberglass-reinforced polyester or multiple-layer epoxy-coated zinc.
d. Manufacturers: One of the following or equal:
1) Cutler Hammer, Type E34.
2) Schneider Electric, Class 9001, Type SK.

3) Allen-Bradley Type 800H.
4) IDEC, TWTD Series.

4. Hazardous (Classified) Areas/Class I Division 2:
   a. NEMA Type 4X.
   b. Corrosion resistant.
   c. Exterior parts of high-impact strength fiberglass-reinforced polyester or multiple-layer epoxy-coated zinc:
      1) All contacts contained within a hermetically sealed chamber:
         a) Pushbuttons.
         b) Selector switches.
         c) Push-to-test contacts on pilot lights.
      2) UL listed and labeled for Class I Division 2 areas.
   d. Manufacturers: One of the following or equal:
      1) Cutler Hammer, Type E34.
      2) Allen-Bradley, Type 800H.
5. Hazardous (Classified) Areas/Class I Division 1:
   a. Corrosion resistant.
   b. Exterior parts of high-impact strength fiberglass-reinforced polyester or multiple-layer epoxy-coated zinc:
      1) All contacts contained within a hermetically sealed chamber:
         a) Pushbuttons.
         b) Selector switches.
         c) Push-to-test contacts on pilot lights.
      2) UL listed and labeled for Class I Division 1 areas.
   c. Manufacturers: One of the following or equal:
      1) Cutler Hammer, Type E34.
      2) Allen-Bradley, Type 800H.

C. Signal isolators and converters:
   1. Furnish signal isolators that provide complete isolation of input, output, and power input:
      a. Minimum isolation level: 1.0 kilovolts AC/50 hertz for at least 1 minute.
      b. Adjustable span and zero.
      c. Accuracy: Within 1.0 percent of span.
      d. Ambient temperature range: -4 degrees to 149 degrees Fahrenheit.
   2. Manufacturers: One of the following or equal:
      a. Phoenix Contact, Mini Analog Pro.
      b. Acromag, 1500, 600T, 800T, Flat Pack, or ACR Series.
      c. Action Instruments, Q500 Series or Ultra SlimPakII.
      d. AGM Electronics, Model TA-4000.
      e. Moore Industries, MIT 4-Channel.

D. Relays:
   1. General:
      a. For all types of 120-VAC relays, provide surge protection across the coil of each relay.
      b. For all types of 24-VDC relays, provide a free-wheeling diode across the coil of each relay.
      c. For plug in type relays, provide a relay base from the same manufacturer as the relay manufacturer.
   2. General purpose:
      a. Magnetic control relays.
      b. NEMA ratings:
         1) 300 volts.
         2) 10 Amps thermal continuous test current.
         3) 60 Amps make.

4) 6 Amps break.
c. Plug-in type.
d. LED indication for energization status.
e. Coil voltages: As required for the application.
f. Minimum poles: DPDT.
g. Touch-safe design: All connection terminals to be protected against accidental touch.
h. Enclose each relay in a clear plastic heat and shock-resistant dust cover.
i. Quantity and type of contact shall be as indicated on the Drawings or as needed for system compatibility.
j. Relays with screw-type socket terminals.
k. Provide additional (slave/interposing) relays when the following occurs:
1) The number or type of contacts shown exceeds the contact capacity of the specified relays.
2) Higher contact rating is required in order to interface with starter circuits or other equipment.
l. DIN rail mounting on 35-millimeter rail.
m. Ice-cube-type relays with retainer clips to secure relay in socket.
n. Integrated label holder for device labeling.
o. Manufacturers: One of the following or equal:
1) Potter and Brumfield: Type KRP or KUP.
2) IDEC: R* Series (* = H, J, R, S, U).
3) Allen-Bradley: Type 700 HC.
4) Square D: Type K.

3. Terminal block relays:
a. Magnetic control relays.
b. For use as an interposing relay for PLC based discrete I/O signals.
c. NEMA ratings:
1) 250 volts.
2) 6 Amps continuous.
3) 1,500 volt-amperes make.
d. Plug-in type.
e. LED indication for energization status.
f. Coil voltages: As required for the application.
g. Minimum poles: SPDT.
h. Touch-safe design: All connection terminals to be protected against accidental touch.
i. Quantity and type of contact shall be as indicated on the Drawings or as needed for system compatibility.
j. Relays with screw-type socket terminals.
k. DIN rail mounting on 35-millimeter rail.
l. Integrated label holder for device labeling.
m. Manufacturer: One of the following or equal:
1) Phoenix Contact PLC Series.
2) Eaton XR TBR Series.
3) IDEC RV8H Series.
4) Allen-Bradley Type 700 HL TBR Series.

4. Latching:
a. Magnetic-latching control relays.
b. NEMA ratings:
1) 300 volts.
2) 5 Amps continuous.
3) 360 volt-amperes make.
4) 320 volt-amperes break.
c. Plug-in type.
d. DIN rail mounting on 35-millimeter rail.

e. Coil voltage: As required for the application.
f. Minimum poles: 2 PDT; as required for the application. Plus 1 spare pole.
g. Touch-safe design: All connection terminals to be protected against accidental touch.
h. Clear cover for visual inspection.
i. Provide retainer clip to secure relay in socket.
j. Manufacturers: One of the following or equal:
1) Square D, 8501, Type K.
2) IDEC, RR2KP Series.

E. Terminal blocks:
1. DIN rail mounting on 35-millimeter rail.
2. Rated for 15 amperes at 600 volts.
3. Screw terminal type.
4. Provide mechanism to prevent wire connection from loosening in environments where vibration is present. This mechanism shall not cause permanent deformation to the metal body.
5. Finger-safe protection for all terminals for conductors.
6. Construction: Polyamide insulation material capable of withstanding temperature extremes from -40 degrees to 221 degrees Fahrenheit.
7. Terminals: Plainly identified to correspond with markings on the diagrams:
a. Permanent machine-printed terminal identification.
8. Disconnect-type field signal conductor terminals with socket/screw for testing.
9. Identify terminals suitable for use with more than 1 conductor.
10. Position:
a. So that the internal and external wiring does not cross.
b. To provide unobstructed access to the terminals and their conductors.
11. Provide minimum 25-percent spare terminals.
12. Manufacturers: One of the following or equal:
a. Phoenix Contact, UT4 Series.
b. Allen-Bradley, 1492 Series.

F. DIN rail grounding:
1. Grounding terminal blocks used exclusively for bonding each DIN rail section to panel grounding busbar shall:
a. Mount to DIN rail via grounding foot with mounting screw.
b. Connect to the panel grounding busbar shall be via a green insulated conductor sized in accordance with NEC.
c. Not be used for grounding signal cable shields.
2. Screw terminal type.
3. DIN rail mounting on 35-millimeter rail.
4. Provide mechanism to prevent wire connection from loosening in environments where vibration is present. This mechanism shall not cause permanent deformation to the metal body.
5. Finger-safe protection for all terminals for conductors.
6. Terminals: Plainly identified to correspond with markings on the diagrams:
a. Permanent machine-printed terminal identification.
7. Manufacturers: One of the following or equal:
a. Phoenix Contact, USKLG Series.
b. Allen-Bradley, 1492-JG Series.

G. Wire duct:
1. Provide flame retardant plastic wiring duct, slotted with dust cover.
2. Type:
a. Wide slot.
b. Narrow slot.

c. Round hole.

3. Manufacturers: The following or equal:
   a. Panduit.
   b. Phoenix Contact.
   c. Thomas & Betts.
   d. Iboco.

H. DIN rail:
1. Perforated steel.
2. 35 mm width.
3. 15 mm deep.
4. Provide 2-inch offset using one of the following:
   a. Offset brackets.
   b. Preformed standoff DIN Rail Channel.

I. Surge protection devices (SPD):
1. 120 VAC control panel power SPD:
   a. Provide SPD for panel 120 VAC power entrances:
      1) Non-faulting and non-interrupting design.
      2) Provide line to neutral and neutral to ground surge protection.
   b. Provide surge protection at secondary of main circuit breaker:
      1) Surge protection is not required for 120 VAC circuits that are only used for panel lights and receptacles.
      2) For panels receiving power at 480 VAC, provide surge protection on the 120 VAC control power transformer secondary.
   c. DIN rail mounting.
   d. Attach wiring to the SPD by means of a screw-type cable-clamping terminal block:
      1) Gastight connections.
      2) Visual status indication of MOV status on the input and output circuits.
      3) Dry contact rated for remote status indication.
   e. Approvals:
      1) Tested in accordance with IEC 61643-11.
      2) Tested in accordance with UL 1283.
      3) Tested in accordance with UL 1449.
      4) Surge protection minimum requirements: Withstand a minimum 10-kA test current of an 8/20 µs waveform in accordance with IEEE C62.41.1 Category C Area.
   f. Manufacturers: One of the following or equal:
      1) Phoenix Contact, Type SFP Filter.
      2) ASCO, Model 277.
2. 24 VDC control panel power SPD:
   a. Provide SPD for 24VDC power circuits.
   b. Provide surge protection at DC power supply output.
   c. DIN rail mounting.
   d. Attach wiring to the SPD by means of a screw-type cable clamping terminal block:
      1) Optical status indicator.
      2) Dry contact rated for remote status indication.
   e. Approvals:
      1) Tested in accordance with IEC 61643-11.
   f. Manufacturers: One of the following or equal:
      1) Phoenix Contact, Plugtrab PLT-SEC-T3-24-FM-UT.
3. Panel mounted control, signal, and data line SPD:
   a. General:

1) This section applies to SPD located in a control panel, field panel, network junction box, or marshalling panel.
2) Approvals:
    a) Tested in accordance with IEC 61643-21.
    b) Tested in accordance with UL 497B.
3) SPD shall consists of 2 parts:
    a) Base module:
        (1) DIN rail mounting.
            (a) Grounded to DIN rail via mounting rail foot.
    b) Plug protection module:
        (1) Replacing a plug shall not require the removal of any wires nor interrupt the signal.
4) Provide indirect shield ground style SPD unless otherwise noted.
5) Provide ability to locally identify and indicate SPD health.
6) SPD shall be provided with controller module with dry contact for remote status monitoring of SPD device health.
7) SPD modules shall be compatible with signal, communication bus type, data type, or control power being protected.
8) Provide dedicated SPD for each signal, communication bus type, or data line being protected.

b. Manufacturers: One of the following or equal:
1) Phoenix Contact, Plugtrab PT-IQ Series.
2) Dehn, Blitzductor XTU Series.

4. Copper Ethernet SPD:
a. Protects network equipment from lightning or other surge events.
b. Suitable for Gigabit networks.
c. Compatible with shielded Cat 6 cabling with shielded RJ-45 ports.
d. Compliant with PoE standards IEEE 802.3af and 802.3at.
e. Nominal discharge surge current: 10 kA.
f. Approvals:
1) Tested in accordance with IEC 61643-21.
2) Tested in accordance with UL 497B.
g. Manufacturers: One of the following or equal:
1) Phoenix Contact, DT-LAN-CAT6+.
2) Weidmuller, VDATA CAT6.
3) Eaton/MTL, ZoneBarrier.

5. Field device mounted SPD:
a. Conduit entry mounting.
1) Provide parallel or through wiring configurations as required by the application.
    a) Use parallel wiring configuration if there is an available cable gland at the device.
    b) Use through wiring configuration if there is no available cable gland at the device.
2) Provide Screw connections compatible with field device.
b. NEMA 4X 316 stainless steel material housing.
c. Approvals:
1) Tested in accordance with IEC 61643-21.
d. 4-wire field device:
1) Module shall provide simultaneous protection of signal cable, communication bus, or data line, and power supply line.
    a) Maximum continuous voltage:
        (1) DC:
            (a) Signal: 32 VDC.
            (b) Power supply: 255 VDC.

(2) AC:
(a) Signal: 22.6 VAC.
(b) Power supply: 255 VAC.
2) Manufacturers: The following, engineer knows of no equal:
a) Endress+Hauser, HAW569-CB2C.
e. 2-wire or 3-wire field device:
1) Module shall provide protection for the signal cable, communication bus or data line.
2) Manufacturers: One of the following or equal:
a) Endress+Hauser, HAW569 Series.
b) Phoenix Contact, Surgetrab S-PT Series.
c) Eaton/MTL, TP Series.

J. Power supplies:
1. Design power supply system so that either the primary or backup supply can be removed, repaired or replaced, and returned to service without disrupting the system operation.
2. Convert 120 VAC to 24-volt DC or other DC voltages required or as required for the application.
3. Provide redundant backup 24 VDC power supply units to automatically supply the load upon failure of the primary supply.
4. Provide power supply arrangement that is configured with several modules to supply adequate power in the event of a single module failure in either a 1+1 or N+1 configuration as required:
a. Provide automatic switchover upon module failure.
b. Alarm contacts monitored by the PLC.
5. Provide protective isolation between power supply units either by means of Diodes, Diode Modules, MOSFET Modules, or use power supplies with built in redundancy. Power supplies with built in redundancy must actively isolate each power supply and be designed as such.
6. Sized to provide 40-percent excess rated capacity.
7. UL 508C listed to allow full-rated output without de-rating.
8. Provide fuse or short-circuit protection.
9. Provide a minimum of 1 set of dry contacts for each power supply configured to change state on failure for monitoring and signaling purposes.
10. Output regulation: Within 0.05 percent for a 10-percent line change or a 50-percent load change.
11. Operating temperature range: 32 degrees to 140 degrees Fahrenheit.
12. Touch-safe design: All connection terminals to be protected against accidental touch.
13. DIN rail mounting on 35-millimeter rail:
a. Mount the power supply in the proper orientation as recommended by the manufacturer to ensure adequate thermal dispersion without derating the power supply.
14. Provide self-protecting power supplies with a means of limiting DC current in case of short circuit.
15. Manufacturers: One of the following or equal:
a. Fully redundant:
1) Phoenix Contact, Quint Power Supply with SFB technology.
a) Phoenix Contact, Quint.
2) IDEC, PS5R Series:
3) Sola.
4) PULS.
b. Redundancy module:
1) Phoenix contact, o-ring redundancy module.

2.8 ACCESSORIES

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Provide panels with an inside protective pocket to hold the panel drawings. Ship panels with 1 copy of accepted Shop Drawings including, but not limited to, schematic diagram, connection diagram, and layout drawing of control wiring and components in a sealed plastic bag stored in the panel drawing pocket.

C. Provide 15-inch floor stands or legs where needed or as indicated on the Drawings.

D. Provide a folding shelf for enclosures that contain programmable controllers. The shelf shall be mounted on the inside surface of the door, capable of supporting a laptop computer.

E. Provide nameplate to each panel as indicated on the Drawings:
   1. Provide as specified in the Identification for Electrical Systems Section on all internal and external instruments and devices.
   2. Provide a nameplate with the following markings that is plainly visible after installation:
      a. Manufacturer's name, trademark, or other descriptive marking by which the organization responsible for the panel can be identified.
      b. Supply voltage, phase, frequency, and full-load current.
      c. Power source or circuit ID.
      d. Short-circuit current rating of the panel based on one of the following:
         1) Short-circuit current rating of a listed and labeled assembly.
         2) Short-circuit current rating established utilizing an approved method.

F. Provide a window kit where indicated on the Drawings or where a transmitter with display is mounted inside a control panel. The window shall meet the following requirements:
   1. Safety plate glass.
   2. Secured by rubber locking seal.
   3. Allow full viewing of devices issuing visual process data or diagnostics.

G. Lighting:
   1. Provide 1 luminaire for each section, on the interior of the panel, spaced evenly along the top-front of the enclosure door opening(s):
      a. Covered or guarded.
      b. Provide On-Off door-activated switches where indicated on the Drawings.
      c. 120-volt, single-phase, 15-amp style plug.
      d. Provide 4,000 K, 900 Lumens - LED fixture.
         1) Provide additional fixtures for every 36 inches of width.

H. Receptacles:
   1. Provide 1 duplex receptacle located every 6 feet of enclosure width, spaced evenly along the back mounting panels.
   2. GFCI, 120-volt, single-phase, 15-amp style plug.
   3. Provide circuit breaker or fuse to limit receptacle draw to 5 amperes.

I. Grounding:
   1. Provide the following:
      a. Grounding strap between enclosure doors and the enclosure.
      b. Equipment grounding conductor terminals.
      c. Provide equipment grounding busbar with lugs for connection of all equipment grounding wires.

d. Bond multi-section panels together with an equipment grounding conductor or an equivalent grounding busbar.

2. Identify equipment grounding conductor terminals with the word “GROUND,” the letters “GND,” the letter “G,” or the color green.
3. Signal cable shields shall only be grounded at a single point in the loop. Unless otherwise noted, ground signal cable shields at control panel.
4. Ensure the continuity of the equipment grounding system by effective connections through conductors or structural members.
5. Design so that removing a device does not interrupt the continuity of the equipment-grounding circuit.
6. Provide an equipment-grounding terminal for each incoming power circuit, near the phase conductor terminal.
7. Size ground wires in accordance with NEC and UL Standards, unless noted otherwise.
8. Unless otherwise noted, connect all exposed, noncurrent-carrying conductive parts, devices, and equipment to the equipment-grounding circuit.
9. Connect the door stud on the enclosures to an equipment-grounding terminal within the enclosure using an equipment-bonding jumper.

J. Provide sunshades and insulation for all outdoor installations.

2.9 MIXES (NOT USED)

2.10 FABRICATION (NOT USED)

2.11 FINISHES

A. Finishes:
1. Metallic (non-stainless):
a. Metal surfaces of panels shall be prepared by chemical cleaning and mechanical abrasion in accordance with the finish manufacturer’s recommendations to achieve a smooth, well-finished surface.
b. Scratches or blemishes shall be filled before finishing. One coat of zinc phosphate shall be applied per the manufacturer’s recommended dry-film thickness and allowed to dry before applying the finish coat.
c. Finish coat shall be a baked polyester-urethane powder, aliphatic air-dry polyurethane, or epoxy enamel to meet NEMA rating specified application.
d. Exterior of enclosures located outdoors shall be UV-resistant polyester powder coating. Total dry film thickness shall be 3 mils, minimum.
2. Stainless steel:
a. Stainless enclosures shall be provided with a Number 4 brushed finish - not painted.

B. Colors:
1. Exterior color of panels mounted indoors shall be manufacturer’s standard light gray.
2. Exterior of panels mounted outdoors shall be manufacturer’s standard white.
3. Panel interiors shall be manufacturer’s standard white.

2.12 SOURCE QUALITY CONTROL

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine the installation location for the instrument and verify that the instrument will work properly when installed.
   1. Notify the Engineer promptly if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

3.2 PREPARATION (NOT USED)

3.3 INSTALLATION

A. Install enclosures so that their surfaces are plumb and level within 1/8-inch over the entire surface of the panel; anchor securely to wall and structural supports at each corner, minimum. Direct attachment to drywall is not permitted.

B. Install the enclosure per guidelines and submitted installation instructions to meet the seismic requirements at the project site.

C. Provide floor stand kits for wall-mounted enclosures larger than 48 inches high.

D. Provide concrete housekeeping pads for freestanding enclosures.
   1. Refer to the structural typical details.

E. Install gasket and sealing material under panels with floor slab cutouts for conduit:
   1. Undercoat floor-mounted panels.

F. Provide a full-size equipment-grounding conductor in accordance with NEC included with the power feeder. Terminate to the incoming power circuit-grounding terminal.

G. All holes for field conduits, etc. shall be cut in the field. There shall be no additional holes, factory cut holes, or hole closers allowed. Incorrect holes, additional holes, or miscut holes shall require that the entire enclosure be replaced.

H. Protect all wiring from sharp edges and corners.

I. Control panels that are adjacent to motor control centers shall be fully wired to the motor control centers using wireways integral to the motor control center or additional conduits as needed. These interconnections are not shown or reflected on the Conduit Schedule but shall be shown on the Loop Drawings prepared by the Contractor.

J. Provide individually fused analog input module points with blown-fuse indicator lights, mounted external of the module on the output terminal strip.

K. Side panels:
   1. Side panels shall be kept free off all control equipment and devices. Any deviation must be sent to the engineer in writing asking for a deviation.

3.4 ERECTION, INSTALLATION, APPLICATION, AND CONSTRUCTION (NOT USED)

3.5 REPAIRS/RESTORATION (NOT USED)

3.6 RE-INSTALLATION (NOT USED)

3.7 FIELD QUALITY CONTROL

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.8 ADJUSTING (NOT USED)

3.9 CLEANING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.10 DEMONSTRATION AND TRAINING (NOT USED)

3.11 PROTECTION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.12 SCHEDULES (NOT USED)

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 277200

CONTROL SYSTEMS: PROGRAMMABLE LOGIC CONTROLLERS

PART 1 GENERAL

1.1 SUMMARY

A. Section includes:
1. Programmable logic controller (PLC) based control systems hardware.
2. Development software to be used with the specified PLC hardware.

1.2 REFERENCES

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Institute of Electrical and Electronics Engineers (IEEE).

1.3 DEFINITIONS

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Specific definitions:
1. CPU: Central processing unit.
2. I/O: Input/Output.

C. Specific definitions:
1. Development operating software: The software provided by the PLC manufacturer for use in programming the PLC.
2. Application software: The software that is programmed specifically for the Project.

1.4 SYSTEM DESCRIPTION

A. Provide all PLC hardware as indicated on the Drawings and as specified in this Section.

1.5 SUBMITTALS

A. Furnish submittals as specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Product data:
1. CPU:
a. Processor type.
b. Processor speed.
c. Memory.
d. Internal processor battery backup time.
2. I/O modules:
a. Type.
b. Standard wiring diagram.

C. Calculations:

1. Submit calculations or documented estimate to verify that memory requirements of this Section are met, including spare requirements. If possible, use PLC manufacturer's calculation or estimating worksheet.
2. Submit calculations to verify that spare I/O requirements of this Section are met.
3. Submit calculations to verify that PLC power supply requirements of this Section are met.

D. Product data:
1. Programming languages.
2. Operating system requirements.

E. Control logic:
1. Fully annotated copy of programmed PLC logic.
2. Cross-referenced index of all PLC registers or points.

F. Provide application software for the specific Project process requirements.
1. Fully annotated copy of programmed PLC logic in its native format.
2. Cross-referenced index of all PLC registers or points.

1.6 QUALITY ASSURANCE

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Provide PLC hardware manufactured at facilities certified to the quality standards of ISO 9001.

C. Additional requirements:
1. Provide PLC system components by a single manufacturer:
a. Third-party communication modules may be used only for communication or network media functions not provided by the PLC manufacturer.
2. Use PLC manufacturer approved hardware, such as cable, mounting hardware, connectors, enclosures, racks, communication cable, splitters, terminators, and taps.
3. All PLC hardware, CPUs, I/O devices, and communication devices shall be new, free from defects, and produced by manufacturers regularly engaged in the manufacture of these products.

1.7 DELIVERY, STORAGE, AND HANDLING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.8 PROJECT OR SITE CONDITIONS

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.9 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 COMMISSIONING (NOT USED)

1.15 MAINTENANCE

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. In addition to the spare parts requirements specified in the Common Work Results for Process Control and Instrumentation Systems Section.
   1. CPU: 1 spare for each type of CPU in the system.
   2. I/O cards: 3 spares for each type of I/O card in the system.
   3. Power supplies: 2 spares for every power supply in the system.
   4. Network/communications cards: 1 spare for every network or communications card in the system.
   5. Remote adapter: 1 spare for every remote adaptor in the system.
   6. Chassis: 1 spare for each chassis size in the system.
   7. Communication cable: 1 spare for each type of cable used in the system.

C. Installed spare requirements:
   1. I/O points:
      a. Provide total of 25 percent spare I/O capacity for each type of I/O at every PLC and remote inputs and outputs (RIO).
      b. Wire all spare I/O points to field terminal blocks in the same enclosure the PLC resides in.
   2. PLC backplane capacity:
      a. Provide 25-percent or 3 spare backplane slots, whichever is greater, in all racks containing I/O.
   3. PLC memory:
      a. Provide 50-percent spare program volatile memory.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. One of the following or equal:
   1. Rockwell Automation:
      a. CompactLogix.
   2. Modicon:
      a. M580.
      b. Momentum.
      c. M340.
   3. General Electric:
      a. RX3i.
      b. VersaMax.
      c. VersaMax Micro.

B. The PLC programming software system shall be manufactured by PLC hardware manufacturer:
   1. Rockwell Software:
      a. RSLogix 5000.

b. Studio 5000.
2. Modicon:
a. Unity Pro.
3. General Electric, Proficy Machine Edition with Logic Developer - PLC.

2.2 EXISTING PRODUCTS (NOT USED)

2.3 MATERIALS (NOT USED)

2.4 MANUFACTURED UNITS

A. Programmable logic controller:
1. Construction:
a. Furnish plug-in modular system.
b. Provide PLCs capable of operating in a hostile industrial environment without fans, air conditioning, or electrical filtering:
1) Temperature: 0 to 60 degrees Celsius.
2) RFI: 80 to 1,000 MHz.
3) Vibration: 10 to 500 hertz.
4) Humidity: 0 to 95 percent.
c. Provide internal power supplies designed to protect against overvoltage and frequency distortion characteristics frequently encountered with the local power utility.
d. Design the PLC system to function as a standalone unit that performs all of the control functions described in this Section completely independent from the functions of the HMI system PC-based operator interfaces:
1) Failure of the HMI system shall not impact data acquisition, control, scaling, alarm checking, or communication functions of the PLC.
2. CPU:
a. Configure each CPU so that it contains all the software relays, timers, counters, number storage registers, shift registers, sequencers, arithmetic capability, and comparators necessary to perform the specified control functions.
b. Capable of interfacing with all discrete inputs, analog inputs, discrete outputs, analog outputs, and communication cards to meet the specified requirements.
c. Capable of supporting and implementing closed-loop floating-point math and PID control that is directly integrated into the CPU control program.
3. Memory:
a. Non-volatile memory: On-board complementary metal-oxide-semiconductor (CMOS), electrically erasable programmable read-only memory (EEPROM), PCMCIA, compact flash card, or SD card.
b. Supply with sufficient memory to implement the specified control functions plus a reserve capacity as specified with the requirements of this Section:
1) Reserve capacity:
a) Totally free from any system use.
2) Programmed in a multi-mode configuration with multiple series or parallel contacts, function blocks, counters, timers, and arithmetic functions.
4. Programming:
a. Provide a system where processors are programmed by:
1) Portable laptop computer both locally and via the PLC control network.
5. PLC power supply:
a. Input: 120 VAC.
b. Mounted in the PLC housing or as indicated on the Drawings.
c. Sized to power all modules mounted in that housing including an average module load for any empty housing slots plus 50 percent above that total.
6. PLC input/output, I/O modules:
a. General:

1) Compatible with all of the PLCs being furnished under the contract and by the same manufacturer as the PLCs.
2) Provide I/O modules that:
    a) Isolate in accordance with IEEE Surge Withstand Standards and NEMA Noise Immunity Standards.
    b) Provide A/D and D/A converters with optically or galvanically isolated inputs and outputs.
    c) Accept dual-ended inputs.
3) The use of common grounds between I/O points is not acceptable.
4) Provide modules that are removable without having to disconnect wiring terminals:
    a) Utilize a swing-arm or plug-in wiring connector.
5) Provide at each PLC the I/O modules for the following:
    a) Designated future I/O points contained in the I/O Lists and/or shown on the P&IDs, control schematics, or described in the control strategies.
    b) Installed spare capacity in accordance with the requirements of this Section.
    c) Wire all spares provided to the field terminal strip.
6) Condition, filter, and check input signals for instrument limit conditions.
7) Filter, scale, and linearize the raw signal into an engineering-units-based measurement.
8) Alarm measurements for high, low, rate-of-change limits, and alarm trends.
9) Provide external fuses mounted on the field connection terminal block for all discrete input, discrete output, and analog input I/O points.
10) When multiple cards of the same I/O type are provided and parallel equipment, instrumentation, or redundant processes exist, distribute I/O among cards to ensure that a single card failure will not render an entire process unavailable.

b. Discrete input modules:
1) Defined as contact closure inputs from devices external to the input module.
2) Provide inputs that are optically isolated from low-energy common-mode transients to 1,500 volts peak from users wiring or other I/O modules.
3) Individually isolated inputs.
4) With LEDs to indicate status of each discrete input.
5) Input voltage: 120VAC.
6) Provide input module points that are individually fused with blown-fuse indicator lights, mounted external of the module on the output terminal strip:
    a) Coordinate external fuse size with the protection located on the module, so that the external fuse opens first under a fault condition.

c. Discrete output modules:
1) Defined as contact closure outputs for ON/OFF operation of devices external to the output module:
    a) Triac outputs may be used, with the permission of the Engineer. Care must be used in applying this type of module to ensure that the leakage current through the output device does not falsely signal or indicate an output condition.
2) Optically isolated from inductively generated, normal mode and low-energy common-mode transients to 1,500 volts peak.
3) LEDs to indicate status of each output point.
4) Output voltage: 120VAC.
5) Individually isolated outputs.

d. Analog input modules:
1) Signal type: Provide 4-20 mA for most applications; other levels are acceptable to interface to vendor control panels.
2) Analog-to-digital conversion: Minimum 12-bit precision with the digital result entered into the processor.

3) The analog-to-digital conversion updated with each scan of the processor.
4) Individually isolated each input.
5) Coordinate the size of the external fuse with the protection located on the module, so that the external fuse opens first under a fault condition.

e. Analog output modules:
1) Signal type: Provide 4-20 mA for most applications; other levels are acceptable to interface to vendor control panels.
2) Individual isolated output points each rated for loads of up to 1,000 ohms.

f. Specialty I/O modules:
1) Resistance temperature detector (RTD) input module:
a) Channels per module: 4 minimum.
b) RTD types accepted:
(1) 100-ohm platinum.
(2) 200-ohm platinum.
(3) 500-ohm platinum.
(4) 1,000-ohm platinum.
(5) 100-ohm nickel.
(6) 200-ohm nickel.
(7) 500-ohm nickel.
(8) 10-ohm copper.
c) Provide input module that accepts 2-, 3-, or 4-wire RTD.

g. Network communications modules:
1) General:
a) Install communications modules in the PLC backplane.
2) Ethernet:
a) Ports: 1RJ-45.
b) Communication rate: 100 Mbit/s.
3) Provide all network taps, connectors, termination resistors, drop cables, and trunk cables necessary for remote I/O communications.

7. PLC backplane housing:
a. Mount the PLC power supply, CPU, communications module, and I/O modules in a suitable standard PLC backplane or housing.
b. Provide spare slots in each PLC and RIO location in accordance with the requirements of this Section.
c. Provide a blank slot filler module for each spare slot.

B. PLC programming software:
1. Furnish operating software capable of monitoring and/or controlling the PLCs via the PLC data network:
a. Contain diagnostics to collect troubleshooting and performance data and display it in easy to understand graphs and tables.
b. Monitor devices at each drop on the PLC data network for proper communications.
c. Provide the ability to program all PLCs on the PLC data network from the Engineer’s console.
2. PLC programming laptop/desktop operating system:
a. Microsoft Windows 10.
3. The PLC programming software shall be suitable for the PLCs specified above.
4. PLC programming software for all programming, monitoring, searching, and editing:
a. Usable both on-line, while connected to the PLC, and off-line.
b. The operating software shall display multiple series and parallel contacts, coils, timers, counters, and mathematical function blocks.
c. Capable of disabling/forcing all inputs, outputs, and coils to simulate the elements of the ladder logic; forced elements shall be identifiable by means of color change.

d. Include a search capability to locate any address or element and its program location.
e. Display at the EC, PLC status information, such as faults and communication errors and amount of memory remaining.

5. The PLC programming software shall support the following programming languages:
   a. Ladder Diagram.
6. Generate a PLC program printout, which is fully documented, through the PLC programming software:
   a. Fully documented program listings include, as a minimum, appropriate rungs, address, and coils shown with comments to clarify to a reader what that segment of the program accomplishes on an individual line-by-line basis.
   b. Include a sufficient embedded comment for every rung of the program explaining the control function accomplished in said rung.
   c. Use a mnemonic associated with each contact, coil, etc. that describes its function.
   d. Utilize the tag and loop identification as contained in the P&IDs:
      1) If additional internal coils, timers, etc. are used for a loop, they shall contain the loop number.
   e. Provide a cross-reference report of program addresses.
7. Software functions automatically without operator intervention, except as required to establish file names and similar information:
   a. Furnish the operating system software that is the standard uncorrupted product of the PLC manufacturer with the following minimum functions:
      1) Respond to demands from a program request.
      2) Dynamic allocation of the resources available in the PLC. These resources include main memory usage, computation time, peripheral usage, and I/O channel usage.
      3) Allotment of system resources based on task priority levels such that a logical allocation of resources and suitable response times are ensured.
      4) Queuing of requests in order of priority if one or more requested resources are unavailable.
      5) Resolution of contending requests for the same resource in accordance with priority.
      6) Service requests for execution of one program by another.
      7) Transfer data between programs as requested.
      8) Management of all information transfers to and from peripheral devices.
      9) Control and recovery from all program fault conditions.
      10) Diagnose and report real-time hardware device errors.
8. Program execution:
   a. Application software - program execution scheduled on a priority basis:
      1) A multilevel priority interrupt structure is required.
      2) Enter into a list of pending programs a program interrupted by a higher priority program:
         a) Resume its execution once it becomes the currently highest priority program.
      3) Schedule periodic programs.
      4) Base the allocation of resources to a time-scheduled program on its relative priority and the availability of resources.
9. Start-up and restart:
   a. Provide software that initializes and brings a PLC or any microprocessor-based hardware unit from an inactive condition to a state of operational readiness.
   b. Initialization:
      1) Determination of system status before start-up of initializing operating system software and initializing application software.
      2) Loading of all memory-resident software, initializing timers, counters, and queues, and initialization of all dynamic database values.

10. Shutdown:
    a. Where possible, provide orderly shutdown capability for shutdowns resulting from equipment failure, including other PLC processor failures, primary power failure, or a manually entered shutdown command.
    b. Upon loss of primary power, a high-priority hardware interrupt initiates software for an immediate, orderly shutdown.
    c. Hardware is quickly and automatically commanded to a secure state in response to shutdown command or malfunction.
    d. Alarm PLC failure at the operator interface level.
11. Diagnostics:
    a. Furnish diagnostic programs with the PLC software package to detect and isolate hardware problems and assist maintenance personnel in discovering the causes for system failures.
    b. Use the manufacturer's standard diagnostic routines as much as possible.
    c. Furnish diagnostic software and test programs for each significant component in the control system.
    d. As a minimum, provide diagnostic routines to test for power supply, central processing unit, memory, communications, and I/O bus failures.
12. Calendar/time program:
    a. The calendar/time program to update the second, minute, hour, day, month, and year and transfer accurate time and date information to all system-level and application software.
    b. Variations in the number of days in each month and in leap years must be handled automatically by the program.
    c. The operator must be able to set or correct the time and date from any operator interface, only at the highest security level.
13. Algorithms:
    a. Implementation of algorithms for the determinations of control actions and special calculations involving analog and discrete data.
    b. Algorithms must be capable of outputting positional or incremental control outputs or providing the product of calculations.
    c. Algorithms must include alarm checks where appropriate.
    d. Provide, as a minimum, the following types of algorithms:
        1) Performs functions such as summing several variables, raising to a power, roots, dividing, multiplying, and subtracting.
        2) A switch algorithm, which reads the current and value from its input address and stores it as the value of its output address. 2 types of switches shall be accommodated: 2 outputs with 1 input and 1 output with 2 inputs.
        3) A 3-mode proportional-integral-derivative, PID, controller algorithm, with each of the 3 modes independently adjustable, supports both direct and reverse-acting modes.
        4) Lead, lag, dead time, and ratio compensators.
        5) Integration and totalization of analog process variables.
14. Furnish a comprehensive database for the analog inputs, calculated values, control modules, and outputs:
    a. In addition, provide spare database points for future expansion.
15. One integrated database can be utilized for all types of analog points or separate databases for each type; in either case, the database for each point must include all specified aspects.
16. All portions of the database must be available for use by the display, report, and other specified software modules.
17. All of the data fields and functions specified below must be part of the point definition database at the operator interface. Provide the capability to define new database points through the point display specified below as well as modifying defined points through these displays. This point definition and modification must include all of the

features and functions defined below. The analog database software must support the following functions and attributes:

a. Analog input signal types:
    1) Provide software at the remote terminal units (RTUs) and PLCs to read variable voltage/current signals and pulse duration/frequency type analog input signals.
b. Input accuracy:
    1) Inputs must be read with an accuracy of within 0.05-percent full-scale or better.
    2) Data conversion errors must be less than 0.05-percent full-scale.
    3) Pulse accumulation error less than or equal to 1 count of actual input count at a scan rate of once per minute.
    4) Maintain for a minimum of 1 year the system accuracy stated above without adjustments.
c. Blocking:
    1) Provide mechanisms to inhibit or block the scanning and/or processing of any analog input through the operator interface.
    2) For any input so blocked, the operator may manually enter a value to be used as the input value.
d. Filtering:
    1) For each analog input, provide a first order lag digital filter with an adjustable filter factor.
e. Linearizing:
    1) Where analog inputs require square root extraction or other linearization, provide a mechanism to condition the filtered data before the process of scaling and zero suppression takes place.
f. Calculated values:
    1) Provide means to allow for pseudo-inputs calculated by algebraic and/or Boolean expressions utilizing real inputs, other calculated values, constants, etc.
    2) These values must be handled the same as real inputs in terms of record-keeping, alarming, etc.
g. Scaling and zero suppression:
    1) Provide a conversion program to convert input values into engineering units in a floating-point format.
h. Alarms:
    1) Provide an alarm program to check all analog variables against high-high, high, low, and low-low alarm limits.
    2) When an analog value exceeds a set limit, it must be reported as an alarm based on individually set priority level for each alarm point.
    3) Provide an adjustable hysteresis band in order to prevent excessive alarms when a variable is hovering around an alarm limit.
    4) Must be possible to inhibit alarms based on external events, e.g., lock-out low pump flow alarm when the pump is off.
i. Averages:
    1) Provide a program to calculate and store hourly, daily, and monthly averages of analog variables.
    2) Continuously compute averages, e.g., the average for the current period to the present point in time must be stored in memory and available for use in displays, etc.
    3) Update hourly averages each minute or at the polling interval for the selected variable.
    4) Update daily averages at least once each hour and calculate using the results of the hourly averages.
    5) Update monthly averages at least once each day and calculate using the results of the daily averages.

6) At the end of each averaging period, store the average values for the period on the hard disk for historical record-keeping and reset the present period average register to the present value of the variable.
7) The active database must include the present period average and previous period average for each variable and averaging period.

j. Totals:
1) Provide a program to calculate and store hourly, daily, and monthly totalization of analog variables.
2) Assign a scaling factor to each variable to convert to the appropriate units based on a 1-minute totalizing interval.
3) Assign a separate factor for each totalizing interval.
4) Variables for which totalization is inappropriate must have scaling factors of zero.
5) At the end of each totalizing period, store the totalized values for the period on the hard disk for historical record-keeping and reset the present period totalization register to zero.
6) The active database must include the present period total and previous period total for each variable and totalizing period.

k. Engineering units:
1) Provide software to allow the system and the operator to convert all the measured analog variables to any desired engineering units.
2) The operator must be able to view displays and generate reports of any measured variable in one or more engineering units such as flow in gpm, mgd, cfs, and acre-feet per day.
3) Pre-program the conversion of the engineering units, and, if not pre-programmed, the operator must be able to program new engineering unit conversions by using simple methods, e.g., multiplication of the database attributes by a constant.
4) The programming method must be at a level and compatible with the specified training of the operator and the Owner's personnel.
5) New conversions must not require the services of a special programmer and/or special, high-level, programming training.

l. Control modules:
1) For each control function configured, whether processed at the RTU, PLC, or operator interface, maintain a file of necessary data including input values, setpoints, constants, intermediate calculated values, output value and limit clamps, etc.
2) Input and output assignments, setpoints, and constants must be adjustable by the operator through the operator interface.
3) Provide control algorithms for manual control with output values adjustable by the operator.

m. Analog outputs:
1) Analog outputs must be maintained as part of the database.
2) These outputs must be adjustable manually by the operator through the operator interface or through automatic control algorithms.

18. Some of the above functions may be better accomplished in the data acquisition and graphic display software package; it is the responsibility of the ICSC to optimize the location of the various functions between all software packages.

C. General control functions:
1. Analog control functions:
a. PID, lead/lag, signal select, alarm, limit, delay, and time base.
b. Furnish the control system complete with a library of mathematical/calculation software to support averaging, weighted average, addition, subtraction, multiplication, division, square root extraction, exponential, AND, OR, NAND, NOR, XOR, and NXOR functions.

c. All math utilities must be linkable to process data points or manual inputs via control block configuration.
d. By linking control blocks to data points, the math library must support system unit conversion and calculation requirements.

2. Discrete control functions:
   a. AND, OR, NOT, EXCLUSIVE OR, comparators, delays, and time base.
3. Software support:
   a. Retain in firmware all control and logic functions at each RTU and PLC and in RAM at the operator interface.
   b. Call each function as required by the configured controls to perform the intended function.
4. Control and status discrepancies:
   a. Generate a discrepancy/fail alarm for any pump, valve, or final control element if a discrepancy exists between a system or operator command and the device status.
      1) For example, the system commands to start (call), and the pump fails to start (run status report back), within predetermined operator-programmable time delay (time disagree), then a discrepancy (fail) alarm shall be generated.
   b. Involuntary change in the device's status must also generate an alarm:
      1) For example, a pump starts when not commanded to do so, or a pump shuts down while running even though it still has a command to run.
   c. Each command, status, and alarm must cause the color of the symbol to change.
   d. Because many discrete final control elements have a cycle time in excess of the scan interval, provide each control output with an associated delay period selected to be longer than the operating period of the control element:
      1) Delay periods for each final control element must be adjustable at the operator interface.
      2) List all time delays in the final documentation.
5. Some of the above functions may be better accomplished in the data acquisition and graphic display software package; it is the responsibility of the ICSC to optimize the location of the various functions between all software packages.

D. Control configuration:
1. Provide software to allow control strategies to be developed, and their operation initiated through the operator interface.
2. Provide standardized control point displays for defining the control functions including the function type, input/output addresses, setpoints, tuning constants, etc.
3. Provide a mechanism to link separate control functions together into an integrated control strategy.
4. Provide a mechanism to download operational/control setpoints developed at any operator interface to any PLC or RTU for operational implementation.
5. Provide a mechanism to define and implement operational/control setpoints locally at the PLC or RTU, and to upload them to the operator interface for operational record-keeping.
6. Perform control configurations on-line at the operator interface; the PLC or RTU may be taken off-line when being configured or downloaded.

2.5 EQUIPMENT (NOT USED)

2.6 COMPONENTS (NOT USED)

2.7 ACCESSORIES (NOT USED)

2.8 MIXES (NOT USED)

2.9 FABRICATION (NOT USED)

2.10 FINISHES (NOT USED)

2.11 SOURCE QUALITY CONTROL

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

PART 3 EXECUTION

3.1 EXAMINATION (NOT USED)

3.2 PREPARATION (NOT USED)

3.3 INSTALLATION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Utilize personnel to accomplish or supervise the physical installation of all elements, components, accessories, or assemblies:
   1. Employ installers who are skilled and experienced in the installation and connection of all elements, components, accessories, and assemblies.

C. All components of the control system including all data network cables are the installation responsibility of the ICSC unless specifically noted otherwise.

D. General:
   1. The control system logic program shall reside at the PLC level.

E. Use the tag and loop identifications found on the P&IDs for all tags used and/or assigned as part of the application software work provided by the ICSC.

F. Program the PLC logic using the following language(s):
   1. Ladder Diagram.

3.4 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION

A. Provide a minimum of 4 CD/DVD copies of the following:
   1. Application software:
      a. Finalized fully annotated copy of programmed PLC logic in its native format.
      b. Cross-referenced index of all PLC registers or points.

3.5 REPAIR/RESTORATION (NOT USED)

3.6 RE-INSTALLATION (NOT USED)

3.7 FIELD QUALITY CONTROL

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.8 ADJUSTING (NOT USED)

3.9 CLEANING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.10 DEMONSTRATION AND TRAINING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Tailor training specifically for this Project that reflects the entire control system installation and configuration.

C. Perform training by pre-approved and qualified representatives of the ICSC and/or manufacturer of the PLC hardware and programming software:
   1. A representative of the ICSC may perform the PLC hardware training only if the representative has completed the manufacturer's training course for the PLC hardware.
   2. A representative of the ICSC may perform the PLC programming software training only if the representative has completed the manufacturer's training course for the PLC programming software.

3.11 PROTECTION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.12 SCHEDULES (NOT USED)

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 277330

CONTROL SYSTEMS: NETWORK MATERIALS AND EQUIPMENT

PART 1 GENERAL

1.1 SUMMARY

A. Section includes:
   1. Materials and equipment used in process control and LAN networks including:
      a. Network switches.
      b. Media converters.
      c. Routers.
      d. Patch panels and other data network hardware.
      e. Related accessories.

1.2 REFERENCES

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Institute of Electrical and Electronics Engineers (IEEE):
   1. 802.1X – Standard for Local and Metropolitan Area Networks—Port-Based Network Access Control.
   2. 802.3 - Standard for Ethernet.
   3. 802.3ab - Standard for Information Technology - Telecommunications and information exchange between systems - Local and Metropolitan Area Networks - Part 3: Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer Specifications - Physical Layer Parameters and Specifications for 1000 Mb/s Operation over 4 pair of Category 5 Balanced Copper Cabling, Type 1000BASE-T.
   4. 802.3u - Standards for Local and Metropolitan Area Networks: Supplement - Media Access Control (MAC) Parameters, Physical Layer, Medium Attachment Units, and Repeater for 100Mb/s Operation, Type 100BASE-T (Clauses 21-30).
   5. 802.11b - Standard for Information Technology - Telecommunications and information exchange between systems - Local and Metropolitan networks - Specific requirements - Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) specifications: Higher Speed Physical Layer (PHY) Extension in the 2.4 GHz band.

   1. 568-C.3 - Optical Fiber Cabling Components Standard.

D. Underwriters Laboratories, Inc. (UL).

1.3 DEFINITIONS

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.4 SUBMITTALS

A. Furnish submittals as specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Product data:
   1. Include information on all network equipment.
   2. Manufacturer’s operation and installation instructions.

C. Shop drawings:
   1. Complete set of drawings including but not limited to:
      a. System block diagram showing relationship and connections between devices provided under this Contract. Include manufacturer and model information, and address settings.
      b. Network riser diagram.
      c. Network port diagram, which physically locates all ports within the facility, and identifies their patch panel and switch port.
      d. Construction drawings for all equipment cabinets, including dimensions, identification of all components, preparation and finish data, and nameplates.
      e. Electrical connection diagrams.
      f. Complete grounding requirements.
   2. Furnish data sheets for each component together with a technical product brochure or bulletin:
      a. Manufacturer's model number.
      b. Project equipment tag.
   3. Complete and detailed bills of materials broken up by each cabinet. Each bill of material item will include the following:
      a. Quantity.
      b. Description.
      c. Manufacturer.
      d. Part numbers.

D. Test reports:
   1. As specified in Sections:
      a. 17950 - Commissioning for Instrumentation and Controls.
   2. Signed test results as described in this Section.
   3. Test results shall include:
      a. Narrative describing the test procedures followed.
      b. Block diagram of test set up.
      c. Manufacturer’s information on test equipment used.
      d. Detailed test results.
      e. A narrative summarizing the results of the testing and identifying any further action required.

E. Operating manuals:
   1. Complete installation, operation, calibration, and testing manuals as specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

F. Record drawings:
   1. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.
   2. Electrical connection diagrams shall be revised to reflect any changes made in the field and submitted as record drawings.

1.5 QUALITY ASSURANCE

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.6 DELIVERY, STORAGE, AND HANDLING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.7 PROJECT OR SITE CONDITIONS

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.8 SEQUENCING (NOT USED)

1.9 SCHEDULING (NOT USED)

1.10 WARRANTY

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.11 SYSTEM START-UP (NOT USED)

1.12 OWNER'S INSTRUCTIONS (NOT USED)

1.13 COMMISSIONING (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.1 MANUFACTURERS (NOT USED)

2.2 SYSTEM DESCRIPTION

A. Provide all network equipment identified in the Contract Documents.

2.3 EXISTING PRODUCTS (NOT USED)

2.4 MATERIALS (NOT USED)

2.5 MANUFACTURED UNITS

A. Ethernet switches:
   1. Managed Process Rack Mount Ethernet switches:
      a. Manufacturers: One of the following, no equal:
         1) Rockwell, Stratix 5410.
         2) Cisco, IE 5000.
         3) Redlion, NT24k.
         4) Hirshmann, MACH.
      b. Properties:
         1) Hardware:
            a) Power supply:
               (1) Provide redundant power supplies.
               (2) 24 VDC, 1,100 watts per power supply.

2) Performance:
   a) Switching capacity: 88 Gbps.
   b) Gigabit throughput.
   c) 10/100/1000Base-T RJ-45 Copper Ports (quantity as indicated on the Drawings).
   d) Ports will auto negotiate speed duplex and MDIX.
   e) Capable of performing basic switching without special programming or configurations. Additional features available through software setup includes but not limited to:
      (1) SNMP
      (2) VLAN.
      (3) QoS.
   f) IGMP Snooping with Ethernet I/P plug and play compatibility.
   g) 802.1d, 802.1w, 802.1D RSTP.
   h) Rapid Spanning Tree protocol.
3) Environment:
   a) Operating temperature range: 32 to 113 degrees Fahrenheit.
   b) Humidity: 5 to 95 percent, non-condensing.
   c) Elevation: Up to 10,000 feet.
4) Electrical:
   a) Maximum power consumption: 291 watts.
5) Connector type:
   a) Copper: RJ-45.
      (1) Quantity of copper and fiber ports as required to provide connections as indicated on the Drawings: As required to provide the number of connections required plus 20 percent spare ports of each type used.
6) Mounting:
   a) Provide hardware for hardware.
      (1) DIN Rail mounting.
      (2) As indicated on the Drawings.

2. Managed Process Floor Ethernet switches:
   a. Manufacturers: One of the following, no equal:
      1) Hirschmann, BRS-40.
      2) Red Lion, N-Tron, 7000.
      3) Rockwell, Stratix 5700.
      4) Cisco, IE2000.
   b. Properties:
      1) Hardware:
         a) Power supply:
            (1) Provide redundant power supplies.
            (2) 24 VDC, 170 watts per power supply.
         b) No fans or moving parts.
      2) Performance:
         a) Enclosure:
            (1) All metal housing.
            (2) 15g Shock for 11ms minimum.
         b) 10/100BASE-TX RJ-45 Copper Ports (quantity as indicated on the Drawings).
         c) 100BASE-FX SC or ST Fiber Duplex Ports (quantity as indicated on the Drawings).
         d) 1,000BASE-T RJ-45 Copper Ports (quantity as indicated on the Drawings).
         e) 1,000Base-SX LC Duplex Fiber Ports (quantity as indicated on the Drawings).

f) Capable of performing basic switching without special programming or configurations. Additional features available through software setup includes but not limited to:
(1) SNMP.
(2) VLAN.
(3) QoS.
(4) Port Mirroring.
(5) DHCP Server
g) IGMP Snooping with Ethernet I/P plug & play compatibility.
h) 802.1d, 802.1w, 802.1D RSTP.

3) Environment:
a) Operating temperature range: 32 to 140 Degrees Fahrenheit.
b) Humidity:10 to 95 percent, non-condensing.

4) Connector type:
a) Fiber: LC.
b) Copper: RJ-45:
(1) Quantity of copper and fiber ports as required to provide connections as indicated on the Drawings: As required to provide the number of connections required plus 20 percent spare ports of each type used.

5) Mounting:
a) DIN Rail mounting.

B. Media converters:
1. Copper to fiber transceiver:
a. Manufacturers: One of the following or equal:
1) N-Tron.
2) Transition Networks.
3) Phoenix Contact.
b. Transceiver shall be used to convert from Half/Full Duplex Ethernet to multimode fiber Ethernet 100BASE-FX:
1) Meets requirements of IEEE 802.3 Ethernet standard.
2) Supports Half/Full Duplex.
3) Connector type:
a) Fiber: SC.
b) Copper: RJ-45.
4) Power supply:
a) 110 VAC, 60 hertz.
b) 24 VDC, 6 watts.
5) Mounting:
a) Provide mounting hardware.
b) DIN rail mounting, unless otherwise indicated on the Drawings.
2. Modular media converter systems:
a. Manufacturers: The following or equal:
1) Transition Networks.
b. Use for the installation of multiple media converters into a standard 19-inch EIA rack.
c. Provide 19-slot chassis for the installation of media conversion modules.
d. Provide power supply to support media converter modules from 120 VAC power supply.
e. Provide mounting hardware for installation into standard electronic equipment rack.
f. Chassis height: 2U Rack Units.
g. Media converter module:
1) Port 1:

a) 100BASE-FX.
b) SC/LC.
2) Port 2:
a) 10/100BASE-TX.
b) RJ-45.
3) Power:
a) From main chassis.
4) Diagnostics:
a) Power Indicating LED.
b) Port Activity Indicating LED.

C. Patch panels:
1. General:
a. Fiber:
1) All optical fibers shall be provided with strain relief and terminated at a fiber patch panel. Final connections between the patch panel and the fiber optic network equipment shall be made via fiber optic patch cords.
2) All fibers, active and dark, shall be terminated at the patch panels.
3) Interconnect and patch panel housings shall provide space for excess fiber and provide strain relief for the fiber cable.
4) Fiber cables shall be installed such that the outer sheath of the cable is carried into the interconnect enclosure or patch panels before breaking out buffer tubes.
b. Copper:
1) Final connections between the patch panel and network equipment shall be by patch cords.
2) All premises cables shall be terminated at the patch panels.
3) Cables shall be installed such that the outer sheath of the cable is carried into the interconnect enclosure or patch panels before breaking out conductors.
4) Maintain twist of broken out conductors per EIA/TIA standards.
2. Rack mounted Copper Patch panels:
a. Manufacturers: One of the following or equal:
1) Hubbell Speedgain.
2) Siemon HD.
3) Lucent Systemax.
4) Panduit.
b. Copper patch panels and connectors shall meet the following (minimum) requirements:
1) Category 6.
2) RJ-45 patch cord termination:
a) Punch Down Block.
b) Performance tested modular jack, capable of being re-terminated up to 20 times.
3) Mounting: 19-inch rack mount.
4) UL listed and UL-C certified.
5) Support network line speeds in excess of 1 and 10 gigabit per second and be backward compatible with Category 5e cables.
6) Accessories:
a) Removable rear cable management bracket.
b) Rear individual port labels.
c) Front color coded individual port labels.
c. Provide copper patch cables as required to support all network devices.
d. Provide 4 spare straight through patch cables.
e. Provide 1 spare cross over cable.
3. Rack mounted fiber patch panels:

a. Manufacturers: One of the following or equal:
1) Panduit.
2) Corning cable systems.
b. Fiber patch panels shall meet the following (minimum) requirements:
1) Use for combination of splicing and termination of fiber-optic building cable or outside plant cables.
2) 1RU and 2RU height fully enclosed shelves.
3) Slide-out, tilt-down tray.
4) Interchangeable modules.
5) Accessories:
a) Hinged front doors.
b) Front cable management trough.
c) Top cover panel.
c. Modules for modular shelves shall meet the following (minimum) requirements:
1) Interchangeable modules available in LC for multimode and single mode solutions.
2) Adapters color coded per TIA/EIA 568C.3
4. Cabinet style fiber patch panels:
a. DIN rail mounted:
1) Use for the termination of a single cable inside of cabinets, in small enclosures or as indicated on the plans.
2) DIN rail mounted cable interconnects shall be provided as complete units including the housing, the connector panels and the fiber connectors.
3) DIN rail mounted cable interconnects shall provide physical protection for both the incoming cable and the outgoing patch cords.
4) Capacity:
a) As shown on the plans, minimum 6 connections.
5) Accessories:
a) Blanks for unused connector panels.
6) Manufacturers: One of the following or equal:
a) Hirschmann, MIPP.
b) DINSpace, SNAP XL.

D. Network racks:
1. Networking closed 4-post cabinets:
a. Manufacturers: One of the following or equal:
1) Rittal.
2) Hoffman.
3) Panduit.
b. Properties:
1) Integral keyboard and mouse drawer.
2) CPU cabinet with locking front door.
3) CRT cabinet with locking front door.
4) Louvered rear door.
5) Power strip.
6) Corded fan kit.
7) Furnish shelves as needed.
8) Furnish writing surface.
9) Furnish cable keeper/organizer.
10) NEMA 1.

E. [KVM Console with LCD:
1. Manufacturers: One of the following or equal:
a. Raritan.
b. APC; Schneider Electric.
c. Tripp-Lite NetCommander.

2. Properties:
    a. Operating System: Compatible with Windows, Linux, and all other major operating systems.
    b. Display: 19 inch.
    c. Resolution: 1920 by 1080 or 1,280 by 1,024.
    d. Keyboard: Full size keyboard with integrated number pad.
    e. Mouse: PS/2 and USB Compatible.
    f. Rack Height: 1U.
    g. Operating temperature: 0 to 40 degrees Celsius.
    h. Power consumption: Not to exceed 40 watts.
        1) Port count to match as indicated on the Drawings.]

2.6 EQUIPMENT (NOT USED)

2.7 COMPONENTS (NOT USED)

2.8 ACCESSORIES

A. Provide duplex patch cords to connect the interface cards provided with the associated patch panels.

B. Furnish accessories as specified in the Control Systems: PCS Computer Equipment Section.

2.9 MIXES (NOT USED)

2.10 FABRICATION (NOT USED)

2.11 FINISHES (NOT USED)

2.12 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.1 EXAMINATION (NOT USED)

3.2 PREPARATION (NOT USED)

3.3 INSTALLATION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Provide installation and configuration for the managed Ethernet switches. Provide configuration of the Ethernet switch network for a complete, functioning plant control system as indicated on the Drawings and as specified in this Section:
    1. Refer to SCADA block diagrams for all new network connections.

C. All racks shall be level and plumb.

D. Install Velcro wrap on all cable bundles within the network rack/enclosure.

E. All cables and equipment shall be installed in strict conformance with the manufacturer’s recommendations:

1. Cables shall be installed avoiding sharp bends.
2. Install cable using lubricant designed for cable pulling.
3. Cable ties or other cable supports shall be installed without crimping the LAN cables.
4. Install LAN cables without splices.
5. Installed bend radii shall not exceed 4 times the cable diameter.
6. Terminated all pairs at the jack and the patch panel.

F. Install cables a minimum of 40 inches away from electrical motors and transformers.

G. Install cables a minimum of 12 inches away from fluorescent lighting.

H. Individual pairs will be untwisted less than 1/2-inch at termination points.

I. All cables and terminations shall be labeled with cable designations as specified in Section 16075 - Identification for Electrical Systems.

J. Each data port shall be individually labeled with its patch panel/switch port ID:
1. Labeling must be printed - no handwritten labels will be allowed.

K. At the completion of the wiring installation, provide the following documentation:
1. A plan-view of the premise(s) showing the jack numbering scheme.
2. A printed certification report for the entire wiring installation showing compliance with all EIA/TIA specifications for data cable.
3. Reports such as those generated by Fluke DSP cable certification equipment meet this requirement.
4. Each device with a unique IP address shall be individually labeled with its IP address. The labeling must be printed; handwritten labels will not be allowed.

3.4 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.5 REPAIR/RESTORATION (NOT USED)

3.6 RE-INSTALLATION (NOT USED)

3.7 FIELD QUALITY CONTROL (NOT USED)

3.8 ADJUSTING

A. Perform all firmware installations, configuration and other set up, as required, to place the network into proper operation.

3.9 CLEANING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.10 DEMONSTRATION AND TRAINING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. After completion of the cable system tests and before placing the system in operation, power up all devices installed on the LAN and verify communication between the devices.

C. Verify that all equipment is operable on the network simultaneously. Confirm that all network device communications settings are properly configured.

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 277331

COMPUTER SYSTEM HARDWARE

PART 1 GENERAL

1.1 SCOPE OF WORK

A. Each server, workstation, and laptop shall be backed up after completion of the 30-Day Test and shall be turned over to the Owner.

PART 2 PRODUCTS

2.1 GENERAL

A. The use of a manufacturer's name and model or catalog number is for the purpose of establishing the standard of quality and general configuration desired.

B. The System shall be designed and constructed to withstand the demands of real time process management and control.

C. All equipment furnished shall be designed and constructed so that in the event of power interruption, or temperatures exceed operational range, the systems specified hereunder shall go through an orderly shutdown with no loss of memory, and resume normal operation without manually resetting when power is restored.

D. All software licenses required to achieve the functionality described in the Specifications and Drawings shall be provided.

E. Provide the latest make/model of the equipment specified herein at time of purchase. The procedure for submitting and releasing the computers shall be as follows:

1. The System Integrator shall submit on equipment as part of the Hardware submittal.

2. The computers shall be reviewed to ensure that the requirements of the specifications are met. If necessary, the System Integrator shall resubmit in order to get the requirements specified herein approved.

2.2 LIGHT DEMAND SERVER

A. Light demand tower chassis server/workstation shall be suitable for running small database applications. Expected use is to be CPU and RAM intensive.

B. Processor: Intel Xeon, 4-core/8-thread (3.0GHz minimum) or 8-core/16-thread, (2.0 GHz minimum), 15M cache or greater, Hyper-threading. Motherboard shall have a second socket capable of accepting an equal processor.

C. Memory: 8GB or greater, ECC, RDIMM, Single Rank. Motherboard shall be capable of supporting multiple rank memory with additional channels for scalability.

D. Internal Drives

1. Operating System Drive: 250GB drive, 7.2K RPM, SAS/SATA, 6Gbps or greater, 3.5in, cabled.

2. Storage RAID 1 (Mirror), Two identical drives, 1TB or greater, 7.2K RPM, SAS/SATA, 6Gbps or greater, 3.5in, cabled.

E. Video Graphics capable of 1920x1080 resolution @ 60Hz, VGA/DVI output

F. Networking: Dual-port NIC capable of up to 1Gbps

G. Optical Drive: DVD+/- RW, SATA, Internal

H. I/O Ports: Minimum of six USB 2.0/3.0 ports

I. Peripherals

1. Generic USB 104 key Keyboard

2. Two-button USB optical mouse with scroll wheel

3. Monitor: 24-inch LCD flat-panel, capable of 1920x1080 resolution @ 60Hz with adjustable height stand

J. Power Supply: 500W minimum supplied by 120VAC/60Hz

K. Operating System: Latest release of Windows Server

L. Software

1. Backup Software

2. Document Reader/Editor (Microsoft Office)

3. PDF Reader

M. Typical Server

1. Dell PowerEdge T430 Tower Server

2. HPE ProLiant ML150 Gen9

2.3 PROGRAMMING LAPTOP

A. Portable laptop computer shall be suitable for running all programming software, and simulators necessary to develop the control system.

B. Processor: Intel Core i5/i7, Quad-core, 2.3GHz or greater, 6MB cache or greater.

C. Memory: DDR4, 4GB or greater.

D. Internal Drive: 256GB or greater SSD.

E. Video Graphics capable of 1920x1080 resolution @ 60Hz

F. Networking: Wireless 802.11AC Dual-Band, Ethernet port capable of up to 1Gbps.

G. Optical Drive: DVD+/- RW, Internal

H. I/O Ports: Minimum of four USB 2.0/3.0 ports

I. Interface devices: 15” Monitor with 1920x1080 resolution, 104 key Keyboard

J. Operating System: Latest release of Windows for desired programming software

2.4 LIGHT DUTY GRAPHIC PRINTERS

A. Multi-function printer capable of Print, Scan, Copy

B. Printing Technology: Laser (color)

C. Print Quality: 600 dpi (dots per inch) color

D. Media Type: Envelopes, Plain Paper, Labels

E. PC Connection Availability: USB 2.0, WiFi, Ethernet, Compatible Drivers

F. Monthly Duty Cycle: up to 30,000 pages per month

G. Printing Speed: up to 10 pages per minute

H. Typical Printer:

1. Dell Color Multi-functional Printer E525W
2. HP OfficeJet 3830 All-in-One Printer
3. Lexmark MS317dn

I. Supplies

1. Provide 1 box, minimum 500 sheets, of Laser Print Paper, 8 1/2" x 11", 24 Lb
2. Provide 2 spare toner cartridges of each color.

PART 3 EXECUTION

3.1 GENERAL

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 227332

HMI SYSTEM SOFTWARE

PART 1 GENERAL

1.1 SCOPE OF WORK

A. This Section describes the requirements for the Human Machine Interface (HMI) software.

PART 2 PRODUCTS

2.1 HUMAN MACHINE INTERFACE (HMI) SOFTWARE REQUIREMENTS

A. General Requirements

1. The HMI software shall be the latest version of one of the following packages and shall be compatible with the operating system supplied with the computers:

a. Proficy HMI/SCADA – iFIX by GE Fanuc.

b. InTouch by Wonderware.

c. GENESIS by ICONICS.

d. Vijeo Citect by Schneider Electric

e. VT SCADA by Trihedral

f. Or equal

2. The HMI software shall have a distributed, client/server system architecture based on OPC and Component Object Technology (COM). This architecture shall employ a local area network (LAN) as the method for communicating among stations, allowing 'client' nodes to be added to view the HMI graphics and data resident on 'server' nodes. The HMI software shall be capable of displaying data from and writing values directly to other nodes from the HMI SCADA server without the need to duplicate the data in the local HMI system.

3. In addition to the client/server networking described in Paragraph 2.01-A-2, the HMI software shall support the use of terminal services. The user shall be able to have multiple configurations (view-only, view, and configure) without the need to purchase or install separate configurations.

4. There shall be a redundant pair of SCADA servers responsible for the collection of data from the field devices and the distribution of all data to the HMI clients. Upon failure of the primary server the backup shall resume normal operations within 15 seconds without manual intervention. Means shall be provided to allow historical data and alarm log collection without interruption regardless of server switchover. The system shall have the ability for the primary node to come online and be

integrated into the system with no action required by the user, once it is available again. The primary and the backup SCADA server will support the following tasks:

a. The status of which node is the active server shall be provided to the graphics package (for use in dynamic connections for operator indication).

b. Real time Data synchronization – Any data which has been configured for animation or program execution purposes and which does not get updated from the process data, shall also be synchronized from the primary to backup.

c. Alarm Synchronization – The alarm queues and alarm acknowledgment information shall be synchronized between the primary and backup SCADA.

5. The HMI software shall support alarm synchronization between all server and client nodes. All HMI Client nodes shall display and update the master database held on the SCADA servers and shall display the same alarm information at the same time. It shall not be necessary to acknowledge any alarm at more than one HMI workstation. The system shall have the ability such that acknowledging an alarm at any workstation shall acknowledge that alarm at all workstations.

6. No HMI client shall communicate directly with the field devices. Data for client display nodes shall be collected from the currently online SCADA server. The runtime client nodes shall include full read/write and supervisory control capabilities. The number of client licenses shall be as shown on System Architecture Drawing.

7. The software shall be licensed to collect unlimited I/O points and have no licensing restrictions on the number of connected HMI clients. The software shall be licensed to provide an unlimited number of graphic displays and to allow an unlimited number of operator logins available.

8. The primary and backup I/O Servers shall be supplied with full development software installed whereas the clients shall be supplied with run-time or view packages. It shall be possible for personnel with adequate security clearance to perform all configuration tasks from the servers.

9. The software package shall include an I/O driver capable of performing all scanning of PLC data tables for transferring analog and discrete data to and from the PLC. Scan periods shall be adjustable to ensure that the PC/PLC communications is scanning at the fastest possible time increment, without data degradation. All communications between the PLCs and the operator interface software shall use the Local Area Network (LAN) directly.

10. The HMI software shall permit manual data entry through any of the terminals. This data shall consist of laboratory inputs and entering or changing such things as alarm limits, setpoints, or constants. Confirmation shall be required via the respective display prior to actual entry into the process memory. Data entry and confirmation shall be available without using a keyboard.

11. The HMI software shall provide an open architecture that allows interaction with other programs. It shall provide a mechanism for other programs to access

individual data elements and fields within the database in real time. File transfer mechanisms are not acceptable; the access shall be direct to the memory-resident databases held on the SCADA Servers.

12. The following shall be supported:

    a. ODBC. The HMI software shall support Open Database Connectivity (ODBC) for sharing data from its database to any other ODBC compliant database through SQL queries, via an ODBC dynamic-link library (DLL) driver for real-time data and alarm information. At a minimum the database shall support communication to Microsoft Access, SQL Server, and Oracle.

    b. OLE for Process Control (OPC). The HMI software shall be both an OPC client for communicating to any OPC complaint server as well as an OPC server to serve data to any OPC complaint client.

    c. Visual Basic for Applications (VBA). The HMI software shall have VBA embedded as part of the development environment. VBA support shall be used for pre built scripts & custom scripts. It shall also support search and replace and the ability to copy all forms modules and scripts from one object to the next.

    d. OCX or ActiveX. The HMI software shall support the ability to have any third party OCX (ActiveX control) placed into its container. All third party controls shall have the right to behave like any object created by the HMI software. The HMI software shall contain any bad or misbehaving OCX or ActiveX control and be able to shutdown the control without shutting down the graphic picture, system, or Node.

13. The HMI software shall support a minimum of 45,000 separate point identifiers (tags) with each tag name being a minimum of 30 characters long.

14. The HMI software shall support real-time SQL database connectivity.

B. Graphic Displays

1. The graphic display package shall provide a means of creating and displaying color object-oriented graphic displays that will be used by the operator to monitor and control the process. Real-time values being read from the field devices shall be capable of being displayed in a variety of user-configurable formats.

2. Graphic displays shall be standard Microsoft Windows files and shall be able to be stored on the system disk, a floppy diskette, virtual (RAM) disk or file server, based on user-entered selections. There shall be no limit (other than physical disk size) to the number of displays that can be developed and accessed on-line.

3. Support for displays larger than the size of the monitor shall be provided. If used, graphics should be dynamically re-sized or scroll bars shall be provided to allow the user to move to other areas of the display. Also, support for using Multi Display Screens for viewing graphics shall also be available without any complex configurations or with minimal programming.

4. The graphic display package shall be supplied with a library of common graphic objects and symbols that can readily be incorporated into operator displays.

5. If the HMI manufacturer offers a specialized water/wastewater package that includes unique symbols and functions to improve graphics development, the package shall be provided.

6. The graphic display package shall be capable of importing graphics from other drawing packages such as CorelDRAW and AutoCAD.

7. The graphic display package shall be capable of importing graphics from Microsoft Windows clipboard.

8. The graphic editor shall be menu driven, and contain standard geometric symbols such as lines, circles, rectangles, etc., making creation, modification and copying of graphics a simple task. The graphic editor shall be provided with "wizards" and other scripting functions to reduce screen development time.

9. Animation connections shall be constructed using an intuitive Point and Click interface for point configuration without additional user configuration.

10. The graphic editor shall have capability of multiple dynamics of differing type to be applied to the same object (e.g., a size dynamic, and a color dynamic both added to a rectangle).

11. A method shall be provided for allowing graphics objects or groups of objects to be re-used easily. It shall allow the developer to insert native language prompts that request appropriate tag or other animation information whenever the object or grouped object is reused in another graphic display. These objects, either single or grouped, shall be intelligent, Windows wizard-like objects, so that it is possible to have a single prompt request and substitution. A method shall be provided to update all these wizards used in the application if the Master object from the library is updated.

C. Trend System

1. Dynamic trend displays shall plot at least eight user selectable analog values in an x-y format, with each plot using a unique color. Trends shall be plottable using current or historical information, with the ability to trend backward or forward from that time reference using a single command. The user shall be able to request exact numeric values for any point in the trend by moving the mouse to the point in the graphic. The trend displays shall use shading to emphasize when a particular point crosses a reference value.

2. The trending system shall be capable of creating transparent trends so that real-time and historical data can be directly compared.

3. It shall be possible to display each trend pen with a different y-axis scale complete with engineering units.

4. It shall be possible to "zoom" in on data as highlighted by an operator selectable

window.

5. It shall be possible to export all trend information to a data file that is readily accessible from standard spreadsheet packages.

6. It shall be possible to display historical data, data from text files generated with standard spread sheet software packages, and SQL linked data from relational databases all on the same trend.

D. Database

1. The database development package shall include the ability to add tags that provide access and control of all PLC data by bit and register.

2. Various input/output hardware assignments, as well as processing functions, shall be assigned to named tags or “function blocks." Multiple tags can be tied together to perform more complex functions. As an alternative, the database may be built by browsing third party OPCServers, and selecting the required tags. It shall not be necessary to type or otherwise manually enter any part of the OPC tag or addressing information to build the database. The database building tool shall support the import of OPC Tag groups as a single action, as well as individual tags.

E. Alarm and Event System

1. The software package shall perform alarm monitoring of discrete and analog inputs/outputs. Alarms shall be capable of being assigned to one of three severity categories with each category producing a distinct sound via the System speaker.

2. In order to logically divide a process into smaller units, the system shall allow for named individual alarm areas to be defined. These alarm areas shall be definable on an individual tag level. All alarm areas shall be accessible by each tag.

3. The alarm condition shall be specified as a discrete input or output change of state, analog values above and below limits, high or low analog rate-of-changes as defined in the database, or failed communication link.

4. The System shall print a descriptive message with a time stamp and user ID on the alarm printer or to an alarm file whenever any of the following events occur:

   a. Alarm

   b. Alarm acknowledgment.

   c. Data entry into a tag.

   d. Restarting the HMI software.

F. Error Detection, Recovery, and Diagnostics

1. The software driver shall provide on-line diagnostics that display the current status and operation of the local area network and its nodes. The diagnostic display shall include the LAN adapter status for the machine showing the display, as well as the

current number of messages, errors and retries.

2. The HMI software shall automatically detect and recover from any network condition or software problem that results in a failure of communications between the HMI client and the SCADA server(s) or between the SCADA server and I/O devices. It shall be possible to log all connection/disconnection events of sessions between the SCADA server and clients.

3. If network communications errors are detected, the software shall automatically indicate that the data (on graphic displays, in historical files, etc.) is no longer valid and shall replace the invalid data with user defined characters or pre-defined status text. The HMI software shall automatically attempt to re-establish communications, and, if successful, shall then replace the characters with valid data. This capability shall be built-in to the software and shall not require any user programming or other user-dependent actions to implement.

G. Print Facilities

1. The operator interface software shall support at least one alarm/event printer and one report printer. Printers shall support both USB and/or parallel ports for printing.

H. Historical Data

1. The System shall provide for archival of all historical data. Data shall be archived for long-term storage and retrieval. The long-term historical data to be archived shall be stored in an OBDC compliant file format to facilitate access to operator activity, system events, alarm messages, and point values using relational-database compatible software for data analysis, reporting and archiving. Short- term historical data (less than 90 days) may be stored in a format readily accessible to the HMI software.

2. The system shall be capable of logging all system activity such as command and macro usage, operator comments, system errors, system messages, and communication network errors, if selected by the operator/system administrator.

3. The System shall provide for automatic purging of short-term historical data files.

4. Data Quality: Data Quality flags shall be provided to indicate the quality of all data points stored in any data archive.

5. Manual Input Data Handling: This data shall consist of additional values not obtainable by the SCADA system such as laboratory analysis for use in reports. All manually entered data shall be entered and stored in the appropriate engineering units.

I. Security

1. The HMI software shall provide a minimum of four levels of security to prevent unauthorized usage or modification of the system.

2. Operator interface functions such as commands, macros, graphic displays, OLE

objects, and point IDs shall be capable of each being assigned a separate security level.

3. After a predetermined time of no operator activity, which is adjustable by the system administrator, the operator workstation shall default to the lowest system security.

4. The software package shall provide the ability to "lock" a user into the runtime graphics environment. Specifically, disabling any combination of the following shall be supported:

   a. Starting other applications.

   b. Switching to other applications that may be running.

   c. Exiting from the software package.

   d. Keystrokes (i.e. <Ctrl><Alt><Delete>, <Alt><Tab>)

   e. Switching to graphics configuration mode.

J. I/O Device Communications

1. A software driver shall be supplied to communicate with every type of device shown on the systems architecture drawings. The communications driver shall be configurable on-line.

2. The use of Microsoft OPC 2.0 or later shall be supported. The OPC Server shall have the capability to be used for PLC communication.

3. The device communications program shall perform error checking on messages such as lost response (time-out) and data error (checksum, LRC, CRC, etc.). If communications errors are detected, the software shall automatically indicate that the data (on graphic displays, in historical files, etc.) is no longer valid. The invalid data shall be replaced with user-defined characters or pre-defined text. The HMI software shall automatically attempt to re-establish communications, and, if successful, shall then replace the characters with valid data. These capabilities shall be built-in to the software and shall not require any user programming or other actions to implement. Failover to a user-configurable back-up port shall be provided as a function of the driver.

4. The software driver shall include a diagnostic program capable of running on-line or off-line that can monitor message rates from the communication program. The diagnostic program shall display the number of new messages, retries, time-outs, any occurrences of error, and the specific error code.

2.2 ALARM DIALERS

A. Software Alarm Dialers

1. General: The software shall be capable of being used with pagers, cell phones, landline phones and most wireless communications. The software shall

communicate directly with the SCADA database. It shall be able to communicate with the HMI software specified in Section 2.01. It shall come equipped with security options.

2. Function: The software shall provide real-time alarm notification over speakers, intercom systems, email, pagers and telephones.

3. Manufacturer: The software shall be the latest version of the following:

   a. WIN-911 software by Specter Instruments.

   b. AlarmWorX-MMX software by ICONICS.

   c. SCADAlarm software by Wonderware.

   d. Or equal

4. Physical Hardware: The software shall be accompanied by a compatible modem, as recommended by the manufacturer, to allow the software and computer to dial pagers and phone systems.

2.3 SCADA HISTORIAN SOFTWARE

A. General

1. SCADA Historian software shall be a separate software package from the HMI. It shall run on a server as shown on the System Architecture Drawing.

2. SCADA Historian software shall store time series data.

3. Use of the SCADA Historian to serve data to HMI client trend screens shall be acceptable if this is a native feature of the SCADA Historian.

4. The Historian software shall be licensed to collect at least 500 I/O points and have at least 5 connected HMI clients. If redundant SCADA servers are used, the historian shall be capable of collecting data from either server in the event of a server failure. Any additional licensing required to provide support for redundancy shall be provided.

B. Data Storage

1. Data shall be directly stored in a standard enterprise database management system (DBMS). Data must be directly stored in the DBMS, i.e., not passed through systems such as Microsoft Access and linked via ODBC or other mechanism into the DBMS. To insure stable operation of the network, the architecture shall incorporate native utilization of the enterprise database platform including stored procedures, triggers, and tuned indexes will allow for your facility.

2. The DBMS shall feature high-speed data collection and retrieval, precise time stamp resolution, and multiple time zone support.

3. The DBMS shall have a fault-tolerant architecture including the ability to ‘store and

forward' and automatically reconnect.

4. Where redundant historical servers are included in the project design, all software licenses shall be included to provide full redundant functionality for those servers.

5. Historian software shall be the latest version of the following:

   a. Proficy Historian by GE Fanuc.

   b. IndustrialSQL by Wonderware.

   c. PI Historian System by OSIsoft

   d. Or equal

2.4 REPORTING SOFTWARE

A. General

1. Reporting software shall be a separate software package from the HMI. It shall run on a server as shown on the drawings.

2. Reporting software shall be licensed to allow at least two concurrent users and development for at least ten report templates.

3. Additional licenses, if required for the reporting package, shall be provided to include support for the selected HMI software.

4. Reporting software shall be provided with a minimum of 1 year of support from the manufacturer.

B. Reports

1. The process report generation software shall provide the means to process and store data for historical records. Software shall be flexible so that contents of the reports can be easily modified. The software shall provide for collecting, processing and storing values.

2. Reporting software shall be the latest version of the following:

   a. OPS SQL by OPS Systems.

   b. ReportWorX by ICONICS.

   c. XLReporter by SyTech.

   d. Operator10 by AllMax

   e. Or equal.

3. An interface shall be provided to the HMI software/SCADA Historian provided in 2.01 and 2.03 of this Specification for automatic collection of daily/hourly/15

minute/one minute summarized data from historical file. Interfaces shall run with no user intervention and shall be able to be run as an NT Service.

4. The following data collection functions shall be provided:

   a. The instantaneous values may be collected based on the change value of the data point.

   b. The instantaneous values shall be averaged every 15 minutes. For some state reports, this 15-minute data will be retained.

   c. The 15 minute averages shall be maintained for 72 hours.

   d. The 15 minute averages shall be reduced to hourly averages and maintained for 60 days.

   e. The hourly averages shall be reduced to daily averages and maintained for 18 months.

5. For each 24-hour period, the maximum and minimum values and totalized value for flow signals shall be maintained for 18 months.

6. All averages shall have the capability of being archived to removable media.

7. Capability shall be provided to obtain log information on demand for screen display and archival to removable media.

8. The reporting software shall be able to interface with the HMI Software and SCADA Historian Software and shall be compatible with the operating system supplied with the computers.

9. A calculation extension capability shall be provided to perform calculations on data that have been accumulated for report generation. Calculations shall include:

   a. Standard operators (+,-,*,/).

   b. Functions (abs, retrieve forward or backward any day, exponential and logs, reciprocal, round, if-then-else, averages, and summations for daily, moving, weekly, monthly, and fiscal periods).

   c. Difference (with specified rollover or without).

C. Calculations shall provide the capability to calculate loadings, percent removals, MCRT, and CT at a minimum. Results can be calculated daily, hourly, or minutely. These calculated data values shall be stored in the database, thus ensuring the consistency of the data and allowing the same data to be readily available for analysis. Historical equations shall allow definitions of the calculation by date.

1. The reporting system shall generate reports from process and operation data stored in historical files or a database. The reporting software shall retrieve these data upon specifying a time period.

2. The date and time configuration shall be developed to meet the facility requirements. For example, a “day range” may start at 7:00:00 AM and end at 6:59:59 AM instead of midnight.

3. Reports shall be capable of being initiated automatically based upon time of day, month and year, or by event trigger. Reports shall also be capable of being generated manually upon operator’(s) request.

4. When the reports are generated manually, the reporting system shall be able to interface with the operator(s) through the HMI software to generate the needed reports. The operator interface should prompt the user to enter a day, a month and a year to retrieve the data.

5. User interface displays shall allow the operator to define the destination of the report (e.g., display, printer, computer file, email, etc.) and when it is to be printed (e.g., immediately, on demand, or automatically at a specified time).

6. The reporting system shall start automatically when re-starting the workstation to ensure data is not lost during power fail or system fail.

7. The reporting system shall include several security settings that will give permissions to develop and modify data while limiting unauthorized access to data monitoring and/or data entry.

8. It shall be possible to print data quality tags alongside the value.

PART 3 EXECUTION

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 279500

COMMISSIONING FOR INSTRUMENTATION AND CONTROLS

PART 1 GENERAL

1.1 SUMMARY

A. Section includes:
1. Testing requirements that apply to process control and instrumentation systems for the entire Project.

1.2 REFERENCES

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Electronics Industries Alliance (EIA).

C. Telecommunications Industry Association (TIA).

1.3 DEFINITIONS

A. As specified in the Commissioning Section and the Common Work Results for Process Control and Instrumentation Systems Section.

B. Specific definitions:
1. Complete End-to-End Testing (CEET) - Signals are tested from the field device through the PLC program, the network, and all the way to the operator's HMI graphic screens.
2. Loop Validation Tests - Signals are tested from the field device to the PLC.
3. Platform Testing: Testing of the PLC and SCADA/HMI at the manufacturer's shop to demonstrate the program's functionality based upon specified and designed control requirements.
4. PTO: Profibus Trade Organization.

1.4 SYSTEM DESCRIPTION (NOT USED)

1.5 SUBMITTALS

A. General:
1. Reference additional detailed test submittal scheduling and prerequisite requirements as specified in the Sequencing article of the Common Work Results for Process Control and Instrumentation Systems Section.

B. Overall test plan:
1. Develop the PCIS system test submittals in consultation and cooperation with all applicable subcontractors.
2. Develop and submit an overall testing plan for the PCIS. The overall test plan to be reviewed and approved by the Engineer before detailed test plans, procedures, and forms will be reviewed.
3. Describe the test phases as they apply specifically to this Project and each process system.

4. Provide a preliminary testing schedule to show the sequence of tests and commissioning as they apply to each process system and each PLC.
5. Provide a description of factory tests. Describe what equipment will be included, what testing equipment will be used, and the simulator that will be used.
6. Provide examples of proposed forms and checklists.

C. Test procedures:
1. Develop and submit detailed test procedures to show that the integrated SCADA system hardware and software is fully operational and in compliance with the requirements specified in the Contract Documents.
2. Provide a statement of test objectives for each test.
3. Prepare specific procedures for each process system.
4. Describe sequentially the steps to be followed in verifying the correct operation of each process system, including all features described in the loop descriptions, control strategies, and shown in the P&IDs. Implied or generic test procedures are not acceptable.
5. Specify who will perform the tests, specifically what testing equipment will be used (including serial numbers and NIST-traceable calibration), and how the testing equipment will be used.
6. Describe the expected role of the Engineer, as well as any requirements for assistance from Owner's staff.
7. Provide the forms and checklists to be used.

D. Test forms:
1. Submit completed calibration forms, test forms, and checklists.
    a. Test forms shall include the detailed test procedures, or shall include clear references to separate pages containing the complete test procedure applicable to each form. If references to procedures are used, the complete procedure shall be included with each test binder.
    b. Every page of each test form shall include project name, date, time, name of person conducting the test, signature of person conducting the test, and for witnessed tests, place for signature of person (Engineer and Owner) witnessing the test.
    c. Sample test forms at the end of this Section show the minimum required content.
        1) The sample test forms have not been customized for this Project.
        2) Contractor shall develop and submit test forms customized for the Project and meeting the specified test and submittal requirements.

E. FAT procedure additional minimal requirements:
1. Prepare and submit a FAT procedure which includes:
    a. Control system testing block diagram.
    b. Estimated test duration.

F. Details on the simulator construction, components, and operation. Testing binders:
1. Sub-system to be tested, provide and submit a test binder containing all test procedures and individual test forms for the test. References to other documents for test procedures and requirements are not acceptable.
2. Fill out in advance headings and all other information known before the test.
3. Include applicable test plan information, as well as a list of all test prerequisites, test personnel, and equipment.
4. Include or list reference material and provide separately at the time of the test.
5. Record test results and verify that all test requirements and conditions have been met.

G. Test reports:
1. At the conclusion of each test, submit a complete test report, including all test results and certifications.

2. Include all completed test binders, forms, and checklists.
3. Submission, review, and acceptance of each test report is required before the start of the sub-system.

1.6 QUALITY ASSURANCE

A. Test personnel:
1. Furnish qualified technical personnel to perform all calibration, testing, and verification. The test personnel are required to be familiar with this Project and the equipment, software, and systems before being assigned to the test program.

1.7 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.8 PROJECT OR SITE CONDITIONS (NOT USED)

1.9 SEQUENCING (NOT USED)

1.10 SCHEDULING

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

1.11 WARRANTY (NOT USED)

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 EXAMINATION (NOT USED)

3.2 PREPARATION (NOT USED)

3.3 INSTALLATION

A. As specified in the Common Work Results for Process Control and Instrumentation Systems Section.

B. Installation supervision:
1. Provide as specified in the Common Work Results for Process Control and Instrumentation Systems Section.

3.4 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.5 REPAIR/RESTORATION (NOT USED)

3.6 COMMISSIONING

A. Testing and training phase:
   1. Source testing:
      a. Preliminary FAT (Pre-FAT):
         1) The purpose of the Pre-FAT is to provide assurance that the HMI/SCADA system is ready for the full, witnessed FAT, in terms of both stability and functionality.
            a) Debugging of software and troubleshooting of hardware shall occur during and before the pre-FAT, not during the FAT.
            b) Contractor shall fully test the HMI/SCADA system and fix all deficiencies found before the FAT.
         2) Conduct utilizing test procedures approved by Engineer
         3) Owner shall have the right to witness any or all of the Pre-FAT testing and shall be notified in writing 20 days before the start of the pre-FAT.
         4) Submit a letter, signed by the Contractor's project manager or company officer, certifying that integrated system hardware and software has been tested and confirmed to be fully operational and in compliance with the requirements specified in the Contract Documents and is fully ready for the full, witnessed FAT.
            a) Attach the completed pre-FAT test forms, signed by the Contractor's staff.
         5) Engineer approval of the pre-FAT submittal is required before proceeding to FAT.
      b. FAT hardware and communications testing:
         1) Perform tests to show that the integrated system hardware and software is fully operational and in compliance with the requirements specified in the Contract Documents.
         2) The complete PCIS system including operator stations, servers, network equipment, printers, PCMs, PLCs, RTUs, LCPs, CCS, peripherals, communications equipment, and other HMI/SCADA equipment, shall be assembled, connected, and software loaded for a fully functional FAT of the integrated system.
         3) Testing simulation:
            a) Inputs and outputs shall be simulated and proper control and system operation shall be validated.
            b) FAT shall make use of simulators that contain switches, pilot lights, variable analog signal generators, and analog signal level displays, which shall be connected to the I/O points within the HMI/SCADA system.
               (1) The use of jumper wires, terminal block mounted pilot lights, and loose meters to act as or supply the functionality of a simulator shall not be allowed.
               (2) The simulator may consist of a PLC, operating under a HMI/SCADA software package, or other approved software that has its I/O points wired to PLC's I/O points.
               (3) Software operating on a PC may then act as the switches, pilot lights, variable analog signal generators, and analog signal level displays.
         4) Additional source tests are specified in other sections of the Instrumentation and Control Specifications.
         5) Owner shall have the right to witness any or all of the FAT testing and shall be notified in writing 20 days before the start of the FAT.
         6) Verify communications between the hardware and the programmer's software comply with specified requirements.

a) For systems that contain RTUs or remote communications with other devices, the complete communications system must be factory tested, including actual interfacing with telephone company equipment and/or the actual radios used for radio based telemetry systems.

7) Panel inspections:
   a) Inspection forms:
      (1) Provide panel inspection forms as part of the FAT procedures submittal.
      (2) A sample FAT control panel form has been provided at the end of this Section.
8) I/O test:
   a) Test methodology:
      (1) Discrete inputs:
         (a) Apply appropriate input from simulator at panel terminal, observe input card indicator, observe data value at each indicated data address, and observe data received at field wiring terminals or operator interface screen.
      (2) Discrete outputs:
         (a) Issue commands from operator interface screen or PLC, verify output card indicator light, and measure response at field wiring terminals or multimeter.
      (3) Analog inputs:
         (a) Apply appropriate analog input signal at panel terminals on simulator, observe data value at each indicated data address, and observe data properly received at field wiring terminals or operator interface screen.
         (b) Check each point at 0 percent, 50 percent, and 100 percent of scale.
      (4) Analog outputs:
         (a) Enter scaled values in the output buffer file, observe the output data file value, and measure appropriate response at field wiring terminals or multimeter.
         (b) Check each point at 0 percent, 50 percent, and 100 percent of scale.
   b) Test forms to include, but not be limited to the following data:
      (1) PLC and panel number.
      (2) I/O type.
      (3) I/O tag name.
      (4) Rack/slot/number of I/O point.
      (5) Check-off for correct response for each I/O point.
      (6) Comments field.
      (7) Initials of individual performing test.
      (8) Date test was performed.
      (9) Witness signature lines.
9) System configuration test:
   a) Demonstrate and test the setup and configuration of operator stations, servers, development stations, and peripherals.
   b) Demonstrate utility software and functions, such as virus protection, backup, optical drive burning, network monitoring, etc.
   c) Demonstrate the proper operation of peripheral hardware.
   d) Demonstrate general HMI/SCADA functions.
   e) Demonstrate proper operation of log-on and other security access functions.

f) Demonstrate the proper operation of all historical data storage, trend, display, backup, and report functions.
g) Test automatic fail over of redundant equipment.
h) Demonstrate the proper operation of the alarm display and acknowledgement functions.
i) Test forms:
(1) For each test, list the specification page and paragraph of the function demonstrated, and provide a description of the function.
(2) List the specific tests and steps to be conducted.
(3) For each function, list all of the different sub-functions or ways the function can be used, and provide a test check-off for each:
(a) Include signature and date lines.

c. FAT Platform Testing - Control logic test:
1) Verify the PLC, HMI and SCADA, provides monitoring and control functionality based upon specified and designed control requirements.
2) Testing requirements:
a) Demonstrate each function described in the Control Strategies.
b) Demonstrate in detail how each function operates under a variety of operating scenarios.
(1) Test to verify the application of each general control strategy function to each specific control strategy or loop description.
c) Demonstrate the proper operation of the programming and configuration for each control strategy or loop description.
(1) Test each strategy or loop description on a sentence by sentence and function by function basis.
(2) Loops with similar or identical logic must each be tested individually.
(3) Test the boundaries of each numeric operator input by entering values outside of the allowable range.
d) Demonstrate the proper operation of all digital communication links and networks.
(1) Verify each digital communication I/O point.
e) Failure testing: Demonstrate how the system responds to and recovers from abnormal conditions including, but not limited to: equipment failure, operator error, communications subsystem error, communications failures, simulated/forced software lockups, power failure (both utility power and power to HMI and/or SCADA hardware), process equipment failure, and high system loading conditions.
3) Test forms:
a) Submit completed test forms for each loop including but not limited to the fully revised and approved control strategy.
b) Identify the cause and effect as each I/O point is toggled through the simulator.
(1) Identify and track proper and/or improper operation of the loop.
c) Note any deficiencies or operational changes on the forms for correction and documentation:
(1) Include signature and date lines.

2. Installation testing:
a. Calibration:
1) Performed by Contractor and ICSC.
2) Calibrate and adjust all instruments, devices, valves, and systems, in conformance with the component manufacturer's instructions and as specified in these Contract Documents.

3) Replace either individually or within a system, defective elements that cannot achieve proper calibration or accuracy.
    a) Calibration for discrete devices:
        (1) Calibrate and adjust devices for reliable operation and to avoid nuisance tripping.
    b) Calibration for ultrasonic and radar level devices:
        (1) Provide Echo Transmission and signal quality on level transmitters including guided and unguided units.
            (a) Submit printout of the actual transmission and parameters.
        (2) Adjust mounting, as required, to obtain accurate readings.
        (3) Post mounting: Provide any additional calibration required by manufacturer.
    c) Calibrating analog transmitters:
        (1) Components having adjustable features are to be set accurately for the specific conditions and applications of this installation.
        (2) Test and verify that components and/or systems are within the specified limits of accuracy.
        (3) Calibration points:
            (a) Calibrate each analog instrument at 0 percent, 25 percent, 50 percent, 75 percent, and 100 percent of span, using test instruments with accuracies traceable to NIST.
        (4) Field verify calibration of instruments including units that have been factory-calibrated to determine whether any of the calibrations are in need of adjustment.
    d) Analyzer calibration:
        (1) Calibrate and test each analyzer system as a workable system after installation. Follow the testing procedures directed by the manufacturers' technical representatives.
        (2) Submit completed instrument calibration sheets for every field instrument and analyzer.
        (3) Calibration tags:
            (a) Attach a calibration and testing tag to each instrument, piece of equipment, or system.
            (b) Sign the tag when calibration is complete.
    e) Calibration for industrial networking test equipment:
    f) Submit calibration documentation.

b. Loop check:
    1) Performed by the Contractor.
    2) Cabling installed, terminated, and labeled.
    3) Perform continuity check of wiring to each field device through intermediate devices to field terminals in the cabinet.
    4) Complete loop check form for each device.
    5) Submit loop check test results before proceeding to the next step.

c. Loop validation tests:
    1) Performed by the Contractor, ICSC, and manufacturer's representative, working together, and witnessed by the Owner or Owner's representative.
    2) Perform tests on the signal from each field device through intermediate devices to the I/O module on the PLC.
        a) The PLC may or may not be connected to the network.

d. Complete End-to-End Testing (CEET):
    1) Performed by Contractor, ICSC, manufacturer's representative working together, with assistance from the OWNER or the inspection staff, as needed.
        a) The participants need to be dedicated full-time to CEET.

b) ICSC will provide staff to verify input signals at, and create output signals from, an HMI or Engineering Workstation.
c) Contractor and ICSC will be responsible for creating field signals and verifying proper operation of final control elements.

2) Prerequisites:
a) CEET cannot begin until the successful completion of the preceding tests:
(1) Calibration.
(2) Loop check.
(3) Loop validation tests.
(4) LAN cable post-testing.
(5) Industrial network testing.

3) Testing description:
a) This testing is to ensure all I/O signals operate to the intent of the design from the field device to the HMI and all other auxiliary controls and indicators in the PCS.
b) Connect PLC to the network to test signals from the field device through the PLC program, the network, and to the operator's HMI graphic screens. The outputs will be energized for a duration long enough to verify proper operation of the final control element.
c) SCADA screens:
(1) Test and record operator commands and signal readouts to each operator device where there is more than one operator interface point.
(2) For each signal, perform separate tests for SCADA computer screens, local operator interface (LOI) screens, and local control panels.
(3) Retest any loop following any necessary corrections.

4) Check control loops under simulated operating conditions by causing a range of input signals at the primary control elements and observing appropriate responses of the respective control and monitoring elements, final control elements, and the graphic displays associated with the HMI/SCADA system.
a) Use actual process inputs wherever available.
b) Issue commands from the HMI/SCADA system and verify proper responses of field devices.
(1) Test SCADA system inputs from field device to SCADA system operator workstations.
(a) Track responses through trend charts in the HMI/SCADA system.
(2) Test SCADA system outputs from SCADA operator workstations to field devices and equipment.

5) Discrete device testing:
a) Exercise each field device providing a discrete input to the HMI/SCADA system in the field and observe the proper operation shall be observed at the operator workstation:
(1) Test limit switches, set limits mechanically, and observe proper operation at the operator workstation.
(2) Exercise starters, relay contacts, switch contacts, and observe proper operation.
(3) Calibrate and test instruments supplying discrete inputs, and observe proper operation.
b) Test each device accepting a discrete output signal from the HMI/SCADA. Perform the appropriate operator action at the SCADA

operator stations (including LOIs, if present) and confirm the proper operation of the field device:

(1) Stroke valves through outputs from the HMI/SCADA system, and confirm proper directional operation. Confirm travel limits and any feedback signals to the HMI/SCADA system.

(2) Exercise motors starters from the HMI/SCADA system and verify proper operation through direct field observation.

(3) Exercise solenoids and other field devices from the HMI/SCADA system and verify proper operation through direct field observation.

6) Analog device testing:

a) Apply continuously variable up and down analog inputs to verify the proper operation and setting of discrete devices (signal trips, etc.).

b) Apply provisional settings on controllers and alarm setpoints.

7) Analog input:

a) Exercise each field device monitoring the analog signal, through the HMI/SCADA system.

(1) Apply simulated sensor inputs corresponding to 0 percent, 25 percent, 50 percent, 75 percent, and 100 percent of span for networks that incorporate analog elements, and monitor the resulting outputs to verify compliance to accuracy tolerance requirements.

8) Analog output:

a) Exercise each field device requiring an analog command signal, through the HMI/SCADA system.

(1) Vary the output from the PLC HMI/SCADA system and measure the end device position, speed, etc. to confirm the proper operation of the device for the supplied analog signal.

(2) Manually set the output from the HMI/SCADA screen at 0 percent, 25 percent, 50 percent, 75 percent, and 100 percent and measure the response at the final device and at any intermediate devices.

9) Submit completed test forms.

a) Discrete instrument input devices:

(1) Switch setting, contact action, and dead band.

(2) Valve position switches:

(a) Response in the PLC as the valve is stroked from the PLC.

(b) Field observed actual valve position, and valve indicator position as the valve is stroked from the PLC.

(3) Operator interface switches (control stations and other pilot devices) and associated response.

(4) Starter and drive auxiliary device contact response.

(5) Response of all other discrete inputs to the PLC.

(6) Test equipment used and associated serial numbers.

b) Discrete output devices:

(1) Observed response of field device to the discrete output from the PLC.

(2) Observe the proper operation of Open, Close, Start, Stop, On, Off, etc.

(3) Test equipment used and associated serial numbers.

c) Analog input devices:

(1) Calibration range.

(2) Calibration data: Input, output, and error at each test value.

(3) Analog input associated PLC register address.

(4) Value in PLC register at each test point.
(5) Value displayed at each operator interface station (local operator interface displays and SCADA workstations).
(6) Test equipment used and associated serial numbers.

d) Analog output devices:
(1) Calibration range.
(2) Test value at each test point.
(3) Analog output associated PLC register address.
(4) Control variable value at field device at each test point.
(5) Physical device response at each test point:
(a) Response to be actual valve position, or motor speed, etc.
(6) Test equipment used and associated serial numbers.

10) Failure testing:
a) Demonstrate how the system reacts and recovers from abnormal conditions including, but not limited to:
(1) Equipment failure.
(2) Communications sub-system error.
(3) Power failure.
(4) Process equipment failure.
(5) High system loading conditions.

3. Functional testing:
a. General:
1) Testing to demonstrate proper operation of systems with process equipment operating over full operating ranges under conditions as closely resembling actual operating conditions as possible.
2) Performed by Contractor, ICSC, manufacturer's representative together, with assistance from the OWNER or the inspection staff, as needed.
3) Additional tests are specified in other Instrumentation and Control Sections.
4) Follow approved detailed test procedures and check lists for Functional Test activities.

b. Control logic operational validation:
1) The purpose of control logic validation is to field test the operation of the complete control system, including all parts of the HMI/SCADA system, all control panels (including vendor control panels), all control circuits, all control stations, all monitored/controlled equipment, and final control elements.
2) Demonstrate control functionality shown on the P&IDs, control schematics, and other drawings, and specified in the loop descriptions, control strategies, Electrical Specifications, and Mechanical Equipment Specifications.
3) Test in detail on a function-by-function and sentence-by-sentence basis.
4) Thoroughly test hardware and software functions:
5) Including all hardwired and software control circuit interlocks and alarms.
6) Test final control elements, controlled equipment, control panels, and ancillary equipment under startup, shut down, and steady-state operating conditions to verify all logic and control is achieved.
7) Control logic validation tests to include, but not limited to: a repeat of all control logic tests from the FAT, modified and expanded to include all field instruments, control panels, circuits, and equipment.

c. Loop tuning:
1) Optimally tune all electronic control stations and software control logic incorporating proportional, integral, or derivative control. Apply control signal disturbances at various process variable levels and adjusting the gain, reset, or rate settings as required to achieve proper response.

2) Verify the transient stability of final control elements operating over the full range of operating conditions, by applying control signal disturbances, monitoring the amplitude and decay rate of control parameter oscillations and making necessary controller adjustments as required to eliminate excessive oscillatory amplitudes and decay rates. As a minimum, achieve 1/4-wave amplitude decay ratio damping (subsidence ratio of 4) under the full range of operating conditions.
3) If excessive oscillations or system instability occur, as determined by the Engineer, continue tuning and parameter adjustments, or develop and implement any additional control algorithms needed to achieve satisfactory control loop operation.
4) Functional validation sheets:
   a) Document each Functional test on an approved test form.
   b) Include on the form, functions which can be demonstrated on a loop-by-loop basis:
      (1) Loop number and P&ID number.
      (2) Control strategy, or reference to specification tested.
      (3) Test procedures: Where applicable, use the FAT function-by-function, sentence-by-sentence loop test checklist forms modified to meet the requirements of the Functional test. Otherwise, create new forms.
   c) For functions that cannot be demonstrated on a loop-by-loop basis (such as overall plant power failure), include on the test form a listing of the specific steps and tests to be conducted. Include with each test description the following information:
      (1) Specification page and paragraph of function demonstrated.
      (2) Description of function and/or text from specification.
      (3) Test procedures: use the FAT loop test checklist forms modified to meet the specific testing conditions of the Functional test.
5) Functional certification:
   a) Provide Manufacturer's Certificate of Installation and Functionality Compliance as specified in the Commissioning Section.
      (1) Including all test forms with test data entered, submitted to the Engineer with a clear and unequivocal statement that all Functional test requirements have been satisfied.

B. Process Start-up Phase:
   1. Process Start-up:
      a. ICSC shall be onsite to support Process Start-up activities and provide functional changes as required.
   2. Process Operation Period:
      a. ICSC shall be available to support Process Operational Period and provide functional changes as required.
   3. PCIS Optimization and Fine-Tuning:
      a. General:
         1) After the Process Operational Period, test PCIS system for additional 60 days as specified in this Section to identify issues and make corrections, as needed.
         2) This is part of the Work that must be completed as a condition of substantial completion and final completion for the entire Project.
         3) The complete PLC control and HMI/SCADA system must run continuously for the duration of the PCIS Optimization and Fine-Tuning.
         4) Test and use the entire process control system under standard operating conditions.
         5) Exercise all system functions.

6) Log failure, any system interruption and accompanying component, subsystem, or program failure including time of occurrence, duration of each failure, failure classification, and cause:
    a) Provide a competently trained technician or programmer on call for the Project Site during all normal working days and hours from the start of the PCIS Optimization and Fine-Tuning until final acceptance of the system.
        (1) Response time to the Project Site: 24 hours or less, for a major failure.

b. SCADA system testing:
    1) Exercise each system function, e.g., status report, alarms, logs, and displays several times at a minimum, and in a manner that approximates "normal" system operation.
    2) Failure of the HMI/SCADA system during testing shall be considered as indicating that the programs and operating system do not meet the requirements of the specifications.
        a) Corrective action is required before restarting the PCIS Optimization and Fine-Tuning.
    3) Only those components, sub-systems, and systems covered in this Section and supplied under this Contract shall be considered for this acceptance test. Problems and failures of other systems shall not be considered as part of this test, except as they display the capabilities of this system to detect failures.
    4) Failures:
        a) Classify failures as either major or minor:
            (1) Minor failure:
                (a) A small and non-critical component failure or software problem that can be corrected by the Owner's operators.
                (b) Log this occurrence but this is not a reason for stopping the test and is not grounds for non-acceptance.
                (c) Should the same or similar component failure occur repeatedly, this may be considered as grounds for non-acceptance.
                (d) Failure of one printer or operator station is considered a minor failure providing all functions can be provided by backup equipment, i.e., alternate printers and operator station, and repairs can be made and equipment returned to service within 3 working days.
            (2) Major failure:
                (a) Considered to have occurred when a component, subsystem, software control, or program fault causes a halt in or improper operation of the system and/or when a technician's work is required to make a repair or to re-initiate operation of the system.
                (b) Cause termination of the PCIS Optimization and Fine-Tuning.
                (c) Start a new acceptance test when the causes of a major failure have been corrected.
                (d) A failure is also considered major when failure of any control system that results in an overflow, underflow, overdose, or underdose condition occurs.
    5) Technician report:
        a) Each time a technician is required to respond to a system malfunction, they must complete a report, which includes details concerning the

nature of the complaint or malfunction and the resulting repair action required and taken.

b) If a malfunction occurs which clears itself or which the operator on duty is able to correct, no report is required or logged as specified above.

c) If a technician has performed work but no report is written, then a major failure is considered to have occurred.

d) Each report shall be submitted within 24 hours to the Engineer and the Owner, or its representative.

3.7 FIELD QUALITY CONTROL (NOT USED)

3.8 RE-INSTALLATION (NOT USED)

3.9 ADJUSTING (NOT USED)

3.10 CLEANING (NOT USED)

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES

A. Example test forms:

1. Example test forms are attached at the end of this Section. They may be used as a starting point for the development of Project-specific test forms for this Project.
2. The example test forms are not intended to be complete or comprehensive. Edit and supplement the forms to meet the requirements for testing and test forms specified in this Section and other Contract Documents.

SECTION 28_21_01

CCTV MONITORING SYSTEM

PART 1 GENERAL

1.1 SUMMARY

A. Design & furnish in coordination with electrical contractor and SCADA integrator a complete CCTV monitoring system. Some system component, wiring, conduits, etc are not shown on electrical Drawings and shall be designed and furnished complete.

B. System shall cover Northside & Southside treatment plants and have full monitoring output to monitors in the Northside Control Room and SCADA system.

C. Supplier to review Drawings and plant layout to become familiar with treatment plant in order to determine the requirements for camera mounting, power, conduit, routing, etc.

D. The system includes CCTV video monitoring equipment and all other related items listed for a complete and functional system.

E. Contractor shall employ the services of a supplier with experience of similar installations. Supplier shall assume full responsibility for the selection of equipment and components required, installation, start-up/testing, and training. Supplier services include:
1. System design.
2. Preparation of detailed system schematics
3. Coordination with electrician and SCADA system provider.
4. Installation of all equipment including providing all necessary mounting accessories.
5. Provide all wiring, conduits, and junction boxes from end devices.
6. Start-up, field debugging, calibrating, configuring and testing of system
7. Integrate security system with any/all proposed components
8. Security system training on care and use of system for Owner's personnel.
9. The system provided shall be turnkey system solutions, wherein each component is seamlessly integrated with overall system.

F. Furnish and install the incidental items not actually shown or specified which are required by good practice to provide a complete and functional system.

G. Provide labor, material and services to complete the permitting, installation, and performance acceptance testing of the complete and functional system.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross

references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

B. Submittal to include proposed camera locations and mounting strategies and should specifically outline any additional poles required.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.
   1. Institute of Electrical and Electronic Engineers (IEEE).
   2. National Electrical Code (NEC).
   3. National Electrical Manufacturers Association (NEMA).
   4. Underwriters' Laboratories, Inc. (UL).

1.5 QUALITY ASSURANCE

A. Contractor shall employ the services of a supplier for programming, calibrating, system start-up and testing.

B. Installer shall demonstrate successful experience designing, installing, commissioning, training and servicing a closed-circuit television systems of the similar size and complexity.

C. Installer shall provide single point of contact for both systems to the Owner and Engineer during the entire construction phase.

D. The security system supplier shall retain a qualified factory trained serviceman to perform the following services:
   1. Inspect and adjust the equipment after installation and ensure that it operates properly and that it is mounted correctly.
   2. Instruct Owner's personnel in the operation and maintenance of the equipment.

1.6 SPECIAL WARRANTY

A. The Manufacturer shall warrant the equipment to be free from defects in material and workmanship for **two years** from date of final payment of the equipment containing the items specified in this Section. Within such period of warranty, the Manufacturer shall promptly furnish all material and labor necessary to return the equipment to new operating condition. Any warranty work requiring shipping or transporting of the equipment shall be performed by the Contractor at no expense to the Owner.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

A. CCTV system including end devices and cameras shall seamlessly integrate with the proposed SCADA & controls system.

2.2 CAMERAS

A. Subject to compliance with the Contract Documents, the following manufacturers are acceptable:
   1. Bosch or approved equal as recommended for installation condition.

B. The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features and functions. Manufacturers listed above are not relieved from meeting these specifications intheir entirety.

C. General:
   1. Provide fixed cameras to cover the site locations with suggested locations as follows for complete coverage:
      a. Southside (8 cameras) to be field located at the following locations:
         1) FEB area (mounted to FEB crane)
         2) FEB lift station (mounted to FEB crane)
         3) Headworks (mounted to headworks cover)
         4) Electrical Building, Internal (wall mount)
         5) General Site (x2) (pole mounts)
         6) Entrance (pole mount)
         7) Generator (pole mount)
      b. Northside (20 cameras) to be field location at the following locations:
         1) Office/Lab/UV/Belt Press (x6) (wall mount)
         2) SBR/EQ/Digester (x2) (mounted to basin cranes / rails)
         3) FEB area (x2) (mounted to crane)
         4) Blower Building, Internal (wall mount)
         5) General Site (x4) (pole mounts)
         6) Headworks (x2) (wall mount / cover mount)
         7) Effluent Lift Station (x2) (mounted to crane / cover)
         8) Entrance Gate (pole mount)
   2. The environmental camera system shall consist of an outdoor camera and housing designed specifically for use in moderate to severe climate conditions and shall include thermostatically controlled heater, window defroster/defogger, sun shroud, viewing window wiper and insulation blanket along with any accessories whichmay be required for a complete environmental camera system.
   3. The camera system shall be able to transmit/receive data
   4. All mounting hardware shall be furnished with the system.

D. Fixed Outdoor Cameras:
   1. Refer to Drawings.
      a. The camera type is for reference only. The Contractor shall provide a camera from the approved manufacturers which meet the following features (adjust for indoor vs outdoor and mounting locations)
   2. Electrical:

a. Input Voltage: Power over Ethernet IEEE 802.3af/802.3at Type 1 Class 3.
b. Maximum Power Consumption: 13 Watts.

3. Connectors: RJ45 10BASE-T/100BASE-TX PoE
4. Mounting Brackets:
5. All mounting brackets shall be of corrosion-resistant construction and shall be load rated to support camera, housing, and accessories specified herein. Mounting heads shall be adjustable.
   a. Mounting shall be suitable for pole, wall, or parapet mounting as shown.
      1) For wall mounting, provide the Axis Pendant Kits for fixed camera; Wall Mount
      2) For parapet mounting, provide the Axis Pendant Kits for fixed camera; Parapet Mount
      3) For corner mounting, provide the Axis Pendant Kits for fixed camera; Corner Mount
      4) For pole mounting, provide the Axis Pendant Kits for fixed camera; Pole Mount
6. Environmental Enclosure:
   a. NEMA 4X rated.
   b. Material: Aluminum inner camera module with encapsulated electronics
   c. Viewing Window: Polycarbonate transparent cover
   d. Operating Temperature: -30° to +50° C
   e. Humidity: 10 – 100% condensing

2.3 VIDEO STORAGE UNIT

A. Subject to compliance with the Contract Documents, the following manufacturers are acceptable:
   1. Refer to Drawings.

B. Storage unit shall be housed in Northside Control Room.

C. The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features and functions. Manufacturers listed above are not relieved from meeting these specifications in their entirety.

D. General:
   1. The video storage unit shall be provided for unattended video recording. Software shall allow for monitoring over an IP network and pulling video data from storage.

E. Features:
   1. 4 Drive Bays.
   2. 4 x 2TB Hard Drives.

F. Physical:
   1. Input Voltage: 100-240 VAC, 50-60 Hz.
   2. Operating Temperature: 5 °C to + 35 °C.
   3. Humidity: 20 – 80% (non-condensing).

G. Network and Connectors:
   1. 10/100/1000 Base-T, RJ-45 Ethernet Connection.
   2. Minimum of two USB ports.

2.4 DESKTOP WORKSTATION

A. Integrate to proposed Work Stations and route all feeds/controls to proposed monitor systems in Northside Control Room.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install all equipment at the locations outlined and in accordance with the manufacturer's recommendations.

B. Coordinate the mounting of equipment and any/all mounting hardware and poles required.

C. Electrical Requirements: electrical wiring and conduit connections to security devices shall be made in accordance with and using components meeting the requirement of Division 26.

D. Install all conduit and cable required for the complete system. Provide pull andjunction boxes as required.

E. Cabling: Cabling and interconnecting wiring shall be as indicated on the Contract Drawings and as required to provide a complete and functional system. Wiring shalluse a consistent color code throughout the systems. Coordinate with existing system to continue the same color code.

F. System Conduit and Raceways: System cables shall be installed in conduit racewaysystems meeting the requirements of Division 26.

G. The system supplier shall provide all supports, bracing, wiring andincidental hardware required for a complete installation.

H. Install cameras, including conduit and cable, in accordance with approved shop drawings and the manufacturer's recommendations.

SECTION 31_00_00

EARTHWORK

PART 1 GENERAL

1.1 SUMMARY

A. Earthwork as required by this section of the Contract Documents and outlined on the Drawings consisting of excavation, embankments and grading as necessary for construction including backfill and disposal of unsuitable, waste, and surplus excavated materials.

B. Provide the services of a licensed Professional Engineer registered in the State of Oklahoma to prepare temporary excavation support system designs and submittals as necessary.

C. Furnish and install temporary excavation support and safety systems, including sheeting, shoring and bracing, to ensure the safety of personnel and protect adjacent structures, piping, etc., and meet appropriate requirements established in the Occupational Safety and Health Administration (OSHA) Safety and Health Regulations, Part 1926, Subpart P-Excavations, Trenching and Shoring, and other applicable regulations.

D. Perform excavation regardless of type, nature, or condition of materials encountered.

E. Excavation, regardless of material encountered, shall conform to the dimensions and elevations indicated on the drawings, and shall include trenching and foundation drainage systems as required beyond the building line of each building and/or structure.

F. Contractor shall make his own estimate of the type, extent and quantity of the various materials to be excavated in order to accomplish the work. No quantities will be outlined on Drawings.

G. There will be no extra compensation for dewatering unless specifically outlined on the drawings or bid proposal. Cost to be included in associated items of work.

H. There will be no addition compensation for rock removal unless specifically outlined on the drawings or bid proposal. Cost to be included in associated items of work.

I. Blasting will not be permitted as a means of excavation

J. Prior to any excavation work, Contractor shall contact OKIE (1-800-CALL-OKIE) as well as all utility Owners within the work site.

K. Any Drawing or Specification that conflicts with this Specification section shall be brought to the attention of the Engineer prior to bid. When no clarification is provided the Contractor is to assume that the more restrictive & expensive product/system/item applies and shall be included in the Contractor's bid.

1.2 RELATED SECTIONS

A. Section 01_00_01 – Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 31_41_33 - Trench Shielding

D. Section 31_23_24 – Utility Earthwork & Backfill

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections if included.

B. Submit testing laboratory reports, as specified or required, to show compliance with specifications for material from off-site locations. The specified tests shall be performed by a certified independent testing laboratory retained and paid by the Contractor.

C. Any submittals required for trench safety plan, dewatering and drainage plans, and similar temporary facilities, will be for reference purposes only and maintained for record purposes in the Engineer files. Submittal of these items will not relieve the Contractor of any responsibility for the adequacy of support, safety, dewatering, and drainage systems.

D. Submit details of excavation plans designed and prepared by a licensed Professional Engineer, who is registered in the State of Oklahoma and has experience in soils engineering, for all structure excavation. The plans shall include details of any proposed shoring systems, systems to protect existing facilities, slope stability monitoring, and the Contractor's means and methods for controlling groundwater. The plans shall be submitted to the Engineer for record purposes prior to proceeding with any excavation work.

1.4 REFERENCE STANDARDS

A. American Association of State Highway and Transportation Officials
   1. AASHTO T-180 - Standard Method of Test for Moisture-Density Relations of Soils Using a 10-lb Rammer and a 18-in. Drop

B. American National Standards Institute/American Society for Testing and Materials (ANSI/ASTM) latest version.
   1. ASTM C33 - Standard Specification for Concrete Aggregate.
   2. ASTM C40 - Standard Test Method for Organic Impurities in Fine Aggregates for Concrete.
   3. ASTM C136 - Standard Test Method for Sieve Analysis of Fine and Coarse Aggregate.
   4. ASTM C150 - Standard Specification for Portland Cement.
   5. ASTM D75 - Sampling Aggregates.
   6. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12 400 ft-lb/ft^3 (600 kN-mm/m^3))

7. ASTM D1557 - Standard Test Methods for Laboratory Compacion Characteristics of Soil Using Modified Effort (56,00 ft-lb/ft^3 (2,700 kN-m/m^3))
8. ASTM D2922 - Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth).
9. ASTM D4253 - Maximum Index Density of Soils Using a Vibratory Table
10. ASTM D4254 - Minimum Index Density of Soils and Calculation of Relative Density.
11. ASTM D4318 - Standard Test Method for Liquid Limit, Plastic Limit and Plasticity Index of Soils.

C. ODOT Standard Specifications for Highway Construction, Latest Edition - Oklahoma, Department of Transportation (ODOT). TxDOT Standard Specifications for Construction and Maintenance of Highways, Streets & Bridges, Latest Edition

1.5 QUALITY ASSURANCE

A. Materials shall be tested and observed as described in the following paragraphs. Allow free access to the work for selection of materials and observation.
1. At all structures, prior to placement of bedding material, concrete working mats, crushed stone base, or concrete fill, the geotechnical engineer shall observe the prepared subgrade to confirm its suitability for supporting the work to be placed thereon. Such observation shall include visual review, and in-place soil density tests as required.
2. Before and during placement of fill and backfill, the soils testing laboratory shall provide at least one density and moisture content test for each 2,500 ft^2 of surface area for each compacted lift of fill or more stringent as may be stated elsewhere.

B. Initial compaction demonstration:
1. Adequacy of compaction equipment and procedures: Demonstrate adequacy of compaction equipment and procedures before exceeding any of following amounts of earthwork quantities:
a. 50 cubic yards of backfill adjacent to structures.
b. 100 cubic yards of embankment work.
c. 100 cubic yards of fill.
d. 50 cubic yards of roadway base material.
e. 100 cubic yards of road fill.
2. Compaction sequence requirements: Until specified degree of compaction on previously specified amounts of earthwork is achieved, do not perform additional earthwork of the same kind.

C. Contractor shall perform all work related to this Section in accordance with the approved Stormwater Pollution Prevention Plan (SWPPP). See Section 01_00_01 – Basic Requirements and Section 31_25_00 Erosion Control.

1.6 INSPECTION OF EXCAVATIONS

A. Do not place reinforcing steel or concrete in the excavation prior to inspection unless the Engineer's Representative has given approval to proceed without inspection.

1.7 DESIGN REQUIREMENTS

A. Plans indicate the existing and the finished grades required for the construction of project. Contractor shall stake out the units and site to establish elevations, and do all other layout work required.

1.8 PROTECTION OF FACILITIES

A. Existing utility lines (either overhead or underground) and pavement dictated to remain shall be kept free of damage from Contractor's operations. If damaged, any utilities or pavement shall be restored at the Contractor's expense.

B. Before the start of earthwork operations, adequately protect utilities, trees, shrubs, and other permanent objects. Repair costs resulting from damage to permanent facilities due to negligence or lack of adequate protection will be charged to the Contractor.

C. Provide surface drainage during the period of construction to protect the work and to avoid nuisance to adjoining property.

D. The Contractor shall conduct his operations in such fashion that trucks and other vehicles do not create a dirt nuisance in the streets. The truck beds shall be sufficiently tight, and shall be loaded in such a manner that objectionable materials will not be spilled onto the streets. Any dirt, mud, or other materials that are spilled onto the streets or deposited onto the streets by the tires of vehicles shall be promptly cleared away by the Contractor.

1.9 PROTECTION AND/OR REMOVAL OF UTILITY LINES

A. The Contractor shall anticipate all underground and above ground obstructions such as, but not limited to, water mains, gas lines, storm and sanitary sewers, telephone or electric light or power ducts, concrete, and debris.
   1. It shall be the responsibility of the Contractor to verify the existence and location of all underground and above ground utilities along the route of the work.
   2. Any such lines or obstructions indicated on the Plans show only the approximate locations and shall be verified in the field by the Contractor.
   3. The Owner and Engineer will endeavor to familiarize the Contractor with all known utilities and obstructions, but this shall not relieve the Contractor from full responsibility in anticipating all underground and above ground obstructions whether or not shown on the Plans.
   4. The omission from or the inclusion of utility locations on the Plans is not to be considered as the non-existence of, or a definite location of existing utilities.

B. The Contractor shall, at his own expense, maintain in proper working order and without interruption of service all existing utilities and services which may be encountered in the work.
   1. With the consent of the Engineer and utility owner such service connections may be temporarily interrupted to permit the Contractor to remove designated lines or to make temporary changes in the locations of services.
   2. The cost of making any temporary changes shall be at the Contractor's expense.

C. The Contractor will take the necessary precautions to protect existing utilities from damage due to his operations.

D. Any damage to the utilities will be repaired at the Contractor's expense.

E. Notify all utility companies involved to have their utilities located and marked in the field.
   1. All underground utilities shall then be uncovered to verify location and elevation before construction begins.
   2. The Contractor shall obtain all necessary permits.

F. Utility Spacing: The spacing for utility lines shall meet the installation requirements and the requirements of ODEQ.

PART 2 PRODUCTS

2.1 WATER

A. Use water from a acceptable source.

2.2 FILL MATERIALS

A. Subgrade material:
   1. Material remaining in place after excavation.
   2. Suitable for slab/foundation subgrade, undisturbed nor over excavated.
   3. Where subgrade soils are soft, loose, or otherwise unsatisfactory, the soil shall be removed and replaced with select fill or soil cement as determined by the Engineer.
   4. Should over-excavation occur beyond lines/grade of plans, the soil shall be replaced with select fill or soil cement as determined by the Engineer.

B. Common Fill material:
   1. Excavated and re-used material or from borrow approved by the Engineer.
   2. Graded free of lumps larger than 3 inches, rocks larger than 2 inches, excessive silts and debris.
   3. Do not use soil containing brush, roots, or similar organic matter.
   4. Conforming to ASTM D2487 Class II or Class III soils with a liquid limit less than 40, and a plasticity index less than 20, but greater than 4.

C. Select Fill material:
   1. Imported borrow material from borrow area approved by the Engineer. Material shall be tested for compliance by the Contractor and test results submitted to the Engineer for approval.
   2. Clayey sand soils free from organic matter with no lumps larger than 1 inch, no rocks larger than ½ inch, nor excessive silts.
   3. Do not use soils containing brush, roots, sod or other organic materials.
   4. Select fill shall conform to ASTM D2487 Class II or Class III and shall have a liquid limit less than 30 with a plasticity index less than 15 but greater than 4
   5. When select fill is used to backfill pipe it shall conform to ASTM D2321 Class II or Class III

D. Top Soil:
   1. Soil suitable for growth of surface cover. Material stripped and stockpiled from site or borrowed from off site.

2. Free from roots, brush, rocks, and other extraneous matter exceeding 1 inch in any direction. Free from weeds
3. Minimum 60% sand, Maximum 30% silts, Maximum 10% clay, no less than 6% and no more than 20% organic matter.
4. Liquid limit range from 15 to 30 and plasticity index from 5 to 40.
5. Submit test data showing compliance with this specification. Include percent weight of constituent material, material particle size, and pH.
6. Testing and Analysis of Subsoil Material: Perform in accordance with ASTM D698.

E. ODOT Aggregate Base Course – Blended aggregate base course meeting the requirements of Oklahoma Department of Transportation (Type "A") in the type specified on the Drawings.

F. Drain Rock material
1. As shown on the Drawings, under structures and behind walls shall be clean, washed, sound durable, well-graded crushed rock, crushed gravel or natural stone gravel.
2. Conforming to ASTM C-33 Size No. 57 coarse aggregate between 1 inch and 1/4 inch.

G. Crushed Rock material (#57, #67, Fine & Course)
1. Crushed rock shall consist of sound and durable particles free from injurious amounts of salt, alkali, vegetable matter, or other material either free or as adherent coating.
2. Gradation shall meet the following requirements for percentage by weight when tested in accordance with ASTM C136:

a. <u>#57 Crushed Rock</u>

Passing 38.1 mm (1-1/2") sieve	100%
Passing 25.4 mm (1") sieve	95-100%
Passing 12.7 mm (1/2") sieve	25-60%
Passing No. 4 sieve	0-10%
Passing No. 8 sieve	0-5%

b. <u>#67 Crushed Rock</u>

Passing 25.4 mm (1") sieve	100%
Passing 19.0 mm (3/4") sieve	90-100%
Passing 9.53 mm (3/8") sieve	20-55%
Passing No. 4 sieve	0-10%
Passing No. 8 sieve	0-5%

c. <u>Fine Crushed Rock</u>

Passing 12.7 mm (1/2") sieve	100%
Passing 9.53 mm (3/8") sieve	95-100%
Passing No. 4 sieve	40-65%
Passing No. 8 sieve	0-10%

d. <u>Coarse Crushed Rock</u>

Passing 38.1 mm (1-1/2") sieve	100%
Retained on 19/1 (3/4") sieve	100%

H. Standard Gravel ("Gravel")

1. Gravel shall consist of uncrushed stones and shall not have by weight more than one percent organic matter, clays, or loam and not more than five percent by weight of any, one or combination of slate, shale, schist, or soft particles of sandstone.
2. Gradation shall meet the following requirements for percentage by weight when tested in accordance with ASTM C136:

a. Standard Gravel

Passing 38.1 mm (1-1/2") sieve	100%
Retained on 19.1 (3/4") sieve	100%

I. Pea Gravel

1. Natural stone; washed, free of clay, shale, organic matter; graded in accordance with ASTM C136 to the following limits:
2. Minimum Size: ¼ inch
3. Maximum Size: ⅝ inch

J. Sand

1. Sand shall consist of clean, hard, durable, uncoated grains, free from lumps, and organic material.
2. Gradation shall meet the following requirements for percentage by weight when tested in accordance with ASTM C136:

a. Embedment Sand

Passing No. 4 sieve	80-100%
Passing No. 8 sieve	65-100%
Passing No. 16 sieve	40-80%
Passing No. 50 sieve	7-40%
Passing No. 100 sieve	2-20%
Passing No. 200 sieve	0-10%

K. Granular Material

1. Granular material shall be free flowing, such as sand or hydraulically graded crushed stone fines, or mixed sand and gravel. Material shall have no more than 10 percent fines and shall be free from lumps, stones over two inches in diameter, and organic matter.

L. Filter Material

1. Where indicated on the Drawings or required in the work, use a mixture of coarse aggregate or fine aggregate for filter material. Proportion the mixture with two parts coarse aggregate to one-part fine aggregate by volume.
2. Coarse aggregate shall consist of gravel, crushed gravel or crushed stone and shall have a gradation limit of three-quarter-inch (3/4") to No. 4 complying with ASTM C33 (Type 7).
3. Fine aggregate shall consist of natural sand and shall comply with the requirements of ASTM C33 for fine aggregate.

2.3 COMPACTION EQUIPMENT

A. Provide compaction equipment of suitable type and adequate to obtain the densities specified.

B. Operate compaction equipment in strict accordance with the manufacturer's instructions and recommendations.

C. Hand-operated equipment shall be capable of achieving the specified densities and shall be required not accessible for other manners of compaction.

2.4 MOISTURE CONTROL EQUIPMENT

A. Provide equipment for applying water of a type and quality adequate for the work; it shall not leak; and be equipped with a distributor bar or other approved device to assure uniform application.

B. Provide equipment for mixing and drying out material consisting of blades, discs, or other approved equipment.

2.5 WATER REMOVAL EQUIPMENT

A. Provide and operate equipment adequate to keep excavation and trenches free of water. Dewatering will not be measured for payment and should be considered subsidiary to contractors work.

2.6 IMPORTED MATERIAL ACCEPTANCE

A. Import when insufficient material is available on-site.

B. Locate and arrange use of a site near the construction area for obtaining borrow material.

C. Additional tests required at the borrow area:

D. Standard Proctor.

E. Remolded permeability (if used for lagoon construction)

F. Atterberg limits.

G. Upon completion of removal of borrow material, grade the site to drain, place topsoil on disturbed areas, and establish grass.

H. If is the contractor's responsibility to accurately determine if adequate material is present at the site prior to bidding.

I. Costs shall be the responsibility of the Contractor.

2.7 MATERIAL ACCEPTANCE

A. Provide samples for testing representative of the actual material to be installed in the work. Take samples from each 2,000 cubic yards of material stockpiled. Depending on the uniformity of the material, Engineer may request more frequent samples.

B. Forward test results to the Engineer at least 10 days before the material is required for use. If tests indicate that the material does not meet Specification requirements, the material shall not be installed in the work.

C. Material which is placed in the work but does not conform to the Specification requirements shall be removed and replaced at the Contractor's sole expense.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verification of conditions:
   1. Character and quantity of material:
      a. Verify character and quantity of rock, gravel, sand, silt, water, and other inorganic or organic materials to be encountered in work to be performed.
      b. Determine gradation and shrinkage, and swelling of soil, and suitability of material for use intended in work to be performed.
      c. Determine quantity of material, and cost thereof, required for construction of backfills, cuts, embankments, excavations, fills, and roadway fills, whether from onsite excavations, or borrow areas or imported materials. Include in cost of work to be performed.
      d. Include wasting of excess material, if required, in cost of work to be performed.

3.2 EXCAVATION SUPPORT SYSTEMS

A. Protection of the excavation against caving or settling of the banks shall be the sole responsibility of the Contractor and shall in accordance with the Trench Excavation Safety Plan. The Contractor shall protect the sides of the excavation by sheeting and bracing as may be necessary. No actions or instructions by the Engineer shall be regarded as the responsibility for security of the surrounding areas. Furnish, put in place, and maintain sheeting and bracing required to support the sides of the excavation and prevent loss of ground which could damage or delay the work or endanger workers, adjacent structures or vehicular traffic. If the Engineer is of the opinion that at any points sufficient or proper supports have not been provided, he may order additional supports put in, and compliance with such order shall not relieve or release the Contractor from the responsibility for the sufficiency of such supports.

B. Sheeting, Shoring and Bracing:
   1. Provide sheeting, shoring, and bracing of excavations at locations shown on the Drawings and where required to properly and safely complete the work. Construct sheeting, shoring, and bracing to prevent the excavation from extending beyond specified or indicated limits, to protect adjacent structures or improvements and

to protect workmen and the public. The design of sheeting, shoring, and bracing shall be the responsibility of the Contractor.

2. Care shall be taken to prevent voids outside the sheeting. If voids are formed, they shall immediately be filled and compacted.
3. After completion of the structure, all sheeting, shoring, and bracing shall be removed unless approval has been granted by the Engineer, in writing, to leave any or all of it in place. The sheeting, shoring, and bracing shall be removed as excavations are backfilled in a manner that will prevent injurious caving of the excavation or damage to the structure.
4. Voids left or caused by removal of sheeting shall immediately be filled with suitable material and compacted.

C. Sheeting and bracing not left in place shall be carefully removed in such manner as not to endanger the construction or other existing structures, utilities, or property. Voids left or caused by withdrawal of sheeting shall be immediately refilled with sand by ramming with tools especially adapted to that purpose, by watering or otherwise as may be directed.

D. The right of the Engineer to order sheeting and bracing left in place shall not be construed as creating any obligation on his part to issue such orders, and his failure to exercise his right to do so, shall not relieve the Contractor from liability for damages to persons or property occurring from or upon the work occasioned by negligence or otherwise growing out of a failure on the part of the Contractor to leave in place sufficient sheeting and bracing to prevent any caving or moving of the ground.

3.3 CLEARING, GRUBBING & SITE PREP

A. Remove all building foundations, slabs, fences, and other structure from within the project limits as required by the plans. Vegetation and all underbrush shall be stripped and removed from the site. Remove all trees that are required for construction. Trees that will not conflict with construction shall remain, as directed by the Engineer. All underbrush shall be removed.

B. Roots, stumps and other debris shall be removed from site. Depressions resulting from removal of stumps, roots and debris shall be filled with suitable materials and compacted to make surface conform to surrounding ground.

C. Timber, logs, stumps, roots, brush and other refuse from clearing and grubbing operations shall be disposed of by the Contractor in a manner approved by the Engineer.

D. Clearing, grubbing and stripping limits shall be as follows unless otherwise specified elsewhere, but not to extend beyond project limits.

1. Excavation Excluding Trenches: 5 feet beyond top of cut slope.
2. Trench Excavation: 4 feet from trench centerline, or one half the actual trench width, plus 2 feet whichever is greater.
3. Fill:
    a. Clearing and Grubbing: 5 feet beyond toe of permanent fill.
    b. Stripping and Scalping: 5 feet beyond toe of permanent fill.
4. Excess Excavation Material Disposal:
    a. Clearing: 5 feet beyond perimeter.
    b. Scalping and Stripping: 5 feet beyond perimeter.
    c. Grubbing: Around perimeter as necessary for neat finished appearance.

5. Structures: 15 feet outside new structures.
6. Roadways: Right-of- way width.
7. Other Areas: As shown on Drawings

3.4 STRIPPING TOPSOIL

A. Remove existing grass and overburden before excavating topsoil.

B. Prior to beginning excavation or fill, strip the topsoil to a depth of at least 6 inches or to a depth sufficient to remove organic material and stockpile for future use.

C. In general, remove topsoil where structures are to be built, trenches dug, and roads, parking lots, walks, and similar improvements constructed within the area presently covered with topsoil.

D. Store topsoil clear of the construction area.

E. Take reasonable care to prevent the topsoil from becoming mixed with subsoil or eroding.

F. Do not remove topsoil until scalping is completed.

G. Do not remove subsoil with topsoil.

H. Stockpile topsoil in sufficient quantity to meet Project needs. Stockpile excess stripping material in an onsite location approved by the Engineer. All excess topsoil at the end of the project shall be disposed of onsite as directed by the Owner.

3.5 GENERAL EXCAVATION

A. Excavation work shall be unclassified and includes removal of all types of materials encountered without exception. Make excavations to lines and grades indicated on the Drawings. Complete excavations within the tolerances specified.

B. Excavations for structures shall be suitably wide for construction of the structures, including excavation supports, dewatering and drainage systems, and working clearances.

C. Excavation shall be performed in-the-dry, and shall be accomplished by methods which preserve the undisturbed state of subgrade soils. Drainage and dewatering systems shall be in place and operational prior to beginning excavation work. In no case shall the earth be plowed, scraped, or excavated by any means that would disturb the finished subgrade. Hand excavation of the final three inches (3") to six inches (6") inches may be required to obtain a satisfactory, undisturbed subgrade. Subgrade soils which become soft, loose, "quick", or otherwise unsatisfactory for support of structures as a result of inadequate excavation, dewatering, or other construction methods shall be removed and replaced with lean concrete fill at no additional cost to the Owner.

D. When excavations have reached the required subgrade, including any allowances for working mats or base materials, but before the placement of working mats, base materials or embankment materials, notify the soils testing laboratory to verify the suitability of the existing subgrade soils for the anticipated foundation and structural loadings. If the existing

subgrade soils are determined to be unsuitable, direction will be provided by the Engineer regarding removal and replacement with suitable materials.

E. Over-excavation beyond the limits and depths required by the Contract Documents shall be replaced by lean concrete or other material acceptable to the Engineer. Such replacement shall be at no additional cost to the Owner

3.6 STRUCTURAL EXCAVATION

A. Contractor shall be solely responsible for trench and excavation safety systems in accordance with ACT 291 of 1993 and OSHA requirements.

B. Identify required lines, levels, and grades.

C. Identify known underground utilities. Contractor will be responsible for locating utilities.

D. The method of excavation is optional; however, no equipment shall be operated in a manner that will endanger existing structures and their integrity.

E. Use excavation support system such as sheet piling wherever necessary.

F. Allow for forms, working space, granular base, and finish topsoil

G. Do not carry excavation for footings and slab deeper than the elevation shown on Drawings after allowing for base material. Over-excavation beyond the limits and depths required by the Contract Documents shall be replaced by lean concrete or other material acceptable to the Engineer. Such replacement shall be at no additional cost to the Owner.

H. If undercutting occurs below the planned dirt grade, the same fill material as specified for backfill shall be placed and compacted to 95 Percent Standard Proctor Density as defined in this Section up to the planned dirt grade in 8-inch lifts. Do not attempt to over compact excessively wet soil. Allow to dry first by scarifying and aerating before remolding.

I. Wherever practicable, cut all footing excavations to neat lines with a tolerance of minus one-inch (-1") to 0-inch (0"), and place concrete to bear against earth sides. Where beams are shown to be monolithic with slabs on ground, shape soil to the profile shown. Excavate a sufficient distance from walls, shafts, or similar elements of structures to allow for placing and removing forms and for inspection.

J. Excavate to the elevations shown on the drawings forming a level undisturbed surface free of mud or other soft material. When the bottom of the excavation, at the elevation shown, is not within the foundation bearing material shown on the drawings or is unsuitable for foundation bearing, notify the Engineer.

3.7 DEWATERING EXCAVATION

A. Remove water during periods when concrete is being deposited, pipe is being laid, and placing of backfill unless water settling is required, and at other times as required for efficient and safe execution of the work.

B. Accomplish removal of groundwater in a manner that will preserve the strength of the foundation soils, will not cause instability of the excavation slopes, and will not result in damage to existing structures.

C. Where necessary to these purposes, lower the water level in advance of excavation, utilizing wells, well points, or similar methods.

D. Maintain the water level in the gravel stratum as measured in piezometers, a minimum of 3 feet below the prevailing excavation level or as needed to prevent bottom heave of the excavation.

E. Open pumping, sumps, and ditches: If these result in boils, loss of fines, softening of the ground or instability of slopes, areas shall not be accepted.

F. Install wells and well points with suitable screens and filters so that continuous pumping of fines does not occur.

G. Operate well points continuously to prevent boils and loss of consolidation.

H. Arrange discharge to facilitate collection of samples by Engineer.

I. Avoid settlement or damage to adjacent property.

J. Dispose of water in a manner that will not damage adjacent property, as approved.

K. No additional payment will be made for dewatering.

3.8 EMBANKMENTS

A. After clearing and grubbing and before placing any fill, proof roll the foundation with a loaded tandem-axel dump truck weighing at least 25 tons to locate any soft or unstable zones. Any unstable soils should be over excavated and replaced with an approved low volume changes soil as approved.

B. Prior to any filling operations, samples of the proposed borrow and on-site materials proposed for use in the embankments should be obtained for laboratory moisture- density testing. The tests will provide a basis for evaluation of field compaction by in-place density tests during fill operations to evaluate those proper levels of compaction, including dry unit weight and moisture content, are being obtained.

3.9 SLABS ON GRADE

A. See Drawings and General Notes for additional requirements for Slabs on Grade. Should the requirements shown on the Drawings/General Notes differ, the more stringent/costly shall apply and be included in the Bid.

B. Subgrade. Scarify to a depth of six inches (8") below the cleared depth. Adjust moisture content within a range of optimum to optimum + 4 percentage points and recompact within a range of 95 to 100 percent maximum density as determined by ASTM D 698. The recompacted subgrade shall be proof-rolled with a pneumatic tired roller in order to detect any soft areas. Soft or wet areas will require removal and replacement with select material

of at least (12") compacted thickness (2 lifts). Depressions from stump removal shall be cleaned of all organic matter and filled with select material.

C. Fill. Upon completion of subgrade preparation, place select material in uniform layers of loose material, six inches (6") in depth, within the moisture and density range specified in 1. above. Previous lifts and/or subgrade should be protected from moisture loss.

D. Compaction:
1. The subgrade and fill material shall be compacted to a minimum of 95 percent and maximum of 100 percent of maximum density at 0 to 4% above optimum moisture as determined by ASTM D698. The methods used to secure the specified compaction and moisture content shall be the Contractor's responsibility. Wet soils shall be worked by plowing, disking, or scarifying and air drying as required to reduce the moisture content to optimum levels.
2. The compacting equipment and method of compaction shall be such that uniform density will be obtained over the entire area and depth of material being compacted. All fill materials deposited in place by scrapers, dump trucks, drag lines or similar equipment shall be thoroughly broken up before being spread into uniform layers.
3. Moisten layers between lifts to achieve bonding.
4. Field density tests shall be performed at a rate of 1 test per each 500 cubic yards (500 cy) of material placed with a minimum of three tests per lift.

E. Vapor Barrier Membrane
1. As soon as practical after final grading, while the base material is still at its optimum moisture content, install a vapor barrier membrane over the prepared surface at all locations. Provide membrane in the widest practical seamless widths.
2. Lay the membrane material continuous with the joints lapped (6") in the direction of the concrete placement. Carefully fit the membrane tight around all penetrations.
3. Before placing concrete, patch all holes and tears in membrane with patches cemented in place with adhesive. Seal around penetrations for conduit, piping, etc., with cold mastic.

3.10 SLABS BELOW GRADE

A. See Drawings and General Notes for additional requirements for Slabs on Grade. Should the requirements shown on the Drawings/General Notes differ, the more stringent/costly shall apply and be included in the Bid.

B. Excavate to (12") above final sub-grade. In order to preserve the in situ moisture of the subgrade, do not excavate the final (12") until prior to the floor slab construction or seal slab, where specified. If the soil at the time of final exposure and concrete placement is not within zero to four percent above optimum moisture content as determined by the Engineer testing laboratory, the top (6") shall be recompacted at the proper moisture level. Soft and wet areas not achieving compaction

C. Fill. Upon completion of subgrade preparation, place select material in uniform layers of loose material, six inches (6") in depth, within the moisture and density range specified in 1. above. Previous lifts and/or subgrade should be protected from moisture loss.

D. Compaction:
1. The subgrade and fill material shall be compacted to a minimum of 95 percent and maximum of 100 percent of maximum density at 0 to 4% above optimum moisture as determined by ASTM D698. The methods used to secure the specified compaction and moisture content shall be the Contractor's responsibility. Wet soils shall be worked by plowing, disking, or scarifying and air drying as required to reduce the moisture content to optimum levels.
2. The compacting equipment and method of compaction shall be such that uniform density will be obtained over the entire area and depth of material being compacted. All fill materials deposited in place by scrapers, dump trucks, drag lines or similar equipment shall be thoroughly broken up before being spread into uniform layers.
3. Moisten layers between lifts to achieve bonding.
4. Field density tests shall be performed at a rate of 1 test per each 500 cubic yards (500 cy) of material placed with a minimum of three tests per lift.

E. Vapor Barrier Membrane
1. As soon as practical after final grading, while the base material is still at its optimum moisture content, install a vapor barrier membrane over the prepared surface at all locations. Provide membrane in the widest practical seamless widths.
2. Lay the membrane material continuous with the joints lapped (6") in the direction of the concrete placement. Carefully fit the membrane tight around all penetrations.
3. Before placing concrete, patch all holes and tears in membrane with patches cemented in place with adhesive. Seal around penetrations for conduit, piping, etc., with cold mastic.

3.11 EMBANKMENTS

A. After performing the proof roll on the subgrade, scarify the exposed subgrade to a depth of 8 inches. Adjust the scarified soil to a workable moisture content that is above its optimum value to not more than 4 percent above optimum, as determined by test method ASTM D-698. Compact the soil to at least 95 percent of its maximum dry density.

B. Compaction:
1. Place loose fill in 8 inches or less thickness. The subgrade and fill material shall be compacted to a minimum of 95 percent and maximum of 100 percent of maximum density at 0 to 4% above optimum moisture as determined by ASTM D698. The methods used to secure the specified compaction and moisture content shall be the Contractor's responsibility. Wet soils shall be worked by plowing, disking, or scarifying and air drying as required to reduce the moisture content to optimum levels.
2. The compacting equipment and method of compaction shall be such that uniform density will be obtained over the entire area and depth of material being compacted. All fill materials deposited in place by scrapers, dump trucks, drag lines or similar equipment shall be thoroughly broken up before being spread into uniform layers.
3. Moisten layers between lifts to achieve bonding.
4. Field density tests shall be performed at a rate of 1 test per each 500 cubic yards (500 cy) of material placed with a minimum of three tests per lift.

3.12 GRANULAR FILL MATERIAL UNDER FACILITIES

A. Place granular material within the influence area beneath slabs, walks, structures, roads, and parking areas, as shown on the Drawings.

B. Do not exceed loose lifts of 6 inches.

C. Compact each lift to not less than 95 percent Modified Proctor Density.

D. Place and compact a 6-inch layer of granular fill to at least 95 percent Modified Proctor density immediately beneath spread footings, slabs on grade, or other concrete structures.

E. Moisten material as required to aid compaction

F. Place material in horizontal lifts and in a manner to avoid segregation.

G. Correct and repair subsequent damage to slabs, piping, concrete structures, facilities, or other structures caused by settlement of fill material.

3.13 BACKFILL AROUND STRUCTURES

A. Place backfill as promptly as practicable after completion of each structure or portion of a structure. The bottom 1/4 of wall height may be backfilled when the walls attain 75 percent of the specified 28-day compressive strength. The remaining wall height may be backfilled when the specified 28-day compressive strength is attained. Remove concrete forms before starting backfill and remove shoring and bracing as the work progresses. Take care to prevent any wedging action of backfill against the structure. Step-cut the slopes at 0.91 m (3') intervals bounding the excavation as required to prevent wedging.

B. Do not place backfill against walls until:
   1. Walls have been cast full height of structure and concrete has reached the specified strength.
   2. Connecting slabs and beams have been cast and concrete has reached the specified strength.

C. Prior to backfilling:
   1. Remove all forms
   2. Clean all trash and debris from the excavation site.

D. After inspection of foundation, walls, and pipes, place backfill symmetrically around structures to prevent eccentric loading of structures.

E. In all cases where embankment or fill is to be placed on ground surface steeper than 1 vertical to 4 horizontal, the surface shall be plowed, benched or broken up in such a manner that fill material will bind with the existing surface. Remove form materials and trash from excavation before placing backfill.

F. Do not operate earth-moving equipment within 5 feet of walls of concrete structures for the purpose of depositing or compacting backfill material.

G. Compact backfill adjacent to concrete walls with hand-operated tampers or similar equipment that will not damage the structure.

H. Backfill water-holding basins only after satisfactory leakage tests have been conducted.

I. Place earth fill in areas not designated to be structural fill or granular fill.

J. Deposit material in maximum 6-inch loose lifts in uniform layers wet or dry the material to 0 to 4 percent above optimum moisture content. Compact with power-driven hand tampers to the prescribed density.
   1. Regular and Select Material. Place in (6") maximum layers, loose measure. Compact to at least 95 percent of maximum soil density as determined by ASTM D 698.
   2. Sand and Filter Material. Place in (6") maximum layers, loose measure. Compact to not less than 70 percent of maximum soil density as determined by ASTM 4253 and 4254.
   3. On-Site Soil for Use as Backfill: On-site soil that is used as backfill shall be compacted to between 92 and 97 percent of the maximum dry density as determined by the Standard Proctor test, ASTM D 698.

K. Guard rails, curbing, signs, lighting, and fencing etc., in the vicinity of the Contractor's operations shall be adequately protected, and if necessary, removed and restored after backfilling. Curbing, fencing, or guard rails which are damaged during construction shall be replaced with material fully equal to that existing prior to construction.

3.14 FILL NOT BENEATH STRUCTURES OR FACILITIES

A. Place earth fill to the lines and grades shown or as noted in the Drawings / General Notes.

B. Place fill material in maximum 6-inch loose lifts and compact each lift to not less than 95 Percent Standard Proctor.

C. Make proper allowance for topsoil where required.

3.15 MOISTURE CONTROL

A. During compacting operations, maintain optimum practicable moisture content required for compaction purposes in each lift of fill.

B. Maintain moisture content uniform throughout the lift.

C. Add water to the material at the site of excavation. Supplement, if required, by sprinkling the fill.

D. At the time of compaction, maintain the water content of the material at optimum moisture content, plus 4 percentage points, except as otherwise specified for embankments.

E. Do not attempt to compact fill material that contains excessive moisture.

F. Aerate material by blading, discing, harrowing, or other methods, to hasten the drying process.

3.16 FIELD DENSITY TESTS

A. Test Methods: ASTM D2922, D1556, D2216, and D3017.

B. Cooperate with testing work by leveling small test areas designated by the Engineer.

C. Should the requirements shown on the Drawings or other specification sections conflict with this section, the more stringent/costly shall apply and be bid by the Contractor.

D. Engineer may order testing of lift of fill at any time, location, or elevation.

E. Field density test shall be performed as follows:
   1. Structure Excavation, Filling and Backfilling
      a. One (1) in-place density test and one (1) in-place moisture test per 600 square yards per lift, but no more than 10 tests per lift and no less than one (1) test per lift.
      b. One (1) in-place density test and one (1) in-place moisture test per 600 square yards per lift in sub-areas enclosed by interior grade beams or interior stem walls prior to placement of fill, but not less than one (1) per lift.
      c. In-place density and moisture tests within the structure (a) may be utilized as the in-place density and moisture tests indicated in (b) if they happen to coincide within the sub-area.
   2. Trench Excavation and Backfilling
      a. One (1) in-place density test and one (1) in-place moisture test per 100 linear feet of trench per lift under structures and paved areas.
      b. One (1) in-place density test and one (1) in-place moisture test per 300 linear feet of trench per lift under grassed or non-traffic areas.
   3. Site Grading:
      a. Excavation, filling and raw sub-grade and base course preparation under paved areas: One (1) in-place density test and one (1) in-place moisture test per 2,000 square yards per lift.
      b. Excavation, filling and raw sub-grade preparation under grassed or non-traffic areas: One (1) in-place density test and one (1) in-place moisture test per 3,000 square yards per lift.
      c. Additional in-place moisture-density tests and relative density tests shall be performed as directed by the Engineer.

3.17 SITE GRADING

A. Perform earthwork to lines and grades as shown on Drawings with proper allowance for topsoil where specified or shown on Drawings.

B. Shape, trim, and finish slopes to conform with the lines, grades, and cross sections shown.

C. Slopes shall be free of loose exposed roots and stones exceeding 3-inch diameter.

D. Round tops of banks to circular curbs, in general, not less than a 6-foot radius.

E. Neatly and smoothly trim rounded surfaces; over-excavating and backfilling to the proper grade are not acceptable.

F. Repair and reestablish grades to required elevations and slopes due to any settlement or erosion that may occur from action of the elements or any other cause prior to final acceptance.

G. Finish site grading shall be reviewed by the Engineer.

3.18 FINISH GRADING

A. Rough grade compacted fill allowing for a maximum amount of natural settlement and compact. Eliminate uneven areas and low spots. Remove debris, roots, branches, stones, etc., in excess of three inches in size. Remove fill material which has been contaminated with petroleum products.

B. Compact areas which are to receive paving or stabilizing base to subgrade elevation, and to at least 95 percent and not more than 98 percent maximum dry density. Moisture shall be between optimum and 4 percent above optimum.

C. Bring compacted fills to required levels, profiles and contours. Make changes in the grade gradually. Blend slopes into level areas.

D. Slope grades away from structures minimum 6 inches in 10 feet unless otherwise indicated on Drawings.

E. Where fill to required subgrade elevation is less than 6 inches, scarify to a depth of 6 inches and compact prior to placement of fill.

F. Cultivate subgrade to a depth of 6 inches where topsoil is to be placed. Repeat cultivation in areas where equipment, used for hauling and spreading topsoil, has compacted subgrades.

3.19 PLACING TOPSOIL

A. Place in minimum four inches depth up to finished grade elevations.

B. Use topsoil in relatively dry state. Place during dry weather.

C. Fine grade topsoil eliminating rough and low areas to ensure positive drainage. Maintain levels, profiles and contours of subgrades. Rake until surfaces are smooth.

D. Remove stone, roots, grass, weeds, debris and other foreign material while spreading.

E. Manually spread topsoil around trees, plants, and building to prevent damage which may be caused by grading equipment.

F. Lightly compact, 90% minimum of maximum dry density as defined by ASTM D698, (Standard Proctor) zero to 4% above optimum moisture, topsoil after placing.

3.20 EXCAVATED MATERIALS

A. Excavated material to be used for backfilling and finish grading shall be placed adjacent to the work, without excessive surcharge on the trench bank and separate from stockpiled

topsoil and grass. Material shall not obstruct free access to valves and hydrants and not obstruct the operation of other contractors working at the site. Obstructing traffic with excavated material will not be allowed.

B. Excess material and material which is unsuitable for backfilling shall be removed from the site by the Contractor.

C. Should conditions make it impracticable or unsafe to stack material adjacent to the trench, the material shall be hauled and stored at a location provided by the Contractor at no additional cost to the Owner.

3.21 DISPOSAL OF EXCESS EXCAVATION

A. Disposal of any material on the project site shall be approved by the engineer. It should not be assumed during bidding that excess material may be disposed onsite unless specifically allowed in the Contract Document.

B. If allowed, dispose of excess excavated materials, not required or suitable for use as backfill or fill, outside of the area of work.

C. Compact excess material as specified for fill, dress the completed disposal area to slopes no greater than 4:1 (horizontal: vertical), and slope to drain.

3.22 SETTLEMENT AND FINAL GRADE REQUIREMENTS

A. The finished surface shall not vary more than 0.10 foot from the established grade and cross section and shall be free of depressed areas where water would pond.

B. Settlement in backfill, fill, or in structures built over the backfill or fill, that may occur within the 1-year guarantee period in the General Conditions shall be considered to be caused by improper compaction methods.

C. Restore structures damaged by settlement to original condition.

3.23 PROTECTION

A. Finish grades of backfills, cuts, excavations, and fills:
   1. Protect newly graded areas from erosion and deterioration by action of the elements.

B. Ditches and gutters:
   1. Maintain ditches and gutters free from detrimental quantities of debris that might inhibit drainage until final acceptance.

END OF SECTION

SECTION 31_05_19

GEOSYNTHETICS FOR EARTHWORK

PART 1 GENERAL

1.1 SCOPE OF WORK

A. Provide synthetic geotextile fabric and geo-grid for stabilizing soil as shown on Drawing and as specified herein.

1.2 DELIVERY, HANDLING AND STORAGE

A. During shipment and storage fabric shall be wrapped in a heavy-duty protective covering to protect fabric from direct sunlight, mud, dust, dirt, and debris.

B. Protect geo-grid from damage.

PART 2 PRODUCTS (NOT USED)

2.1 GEOTECTILE FABRICS

A. Fabric: US Fabrics 135NW 5.0 oz Non woven, needle punched polypropylene, composed of strong rot-proof synthetic fibers and be a pervious sheet of synthetic fibers oriented into a stable network so that fibers retain their relative position with respect to each other. Edges of fabric shall be finished to prevent outer yarn from pulling away from fabric.

B. Geogrid: Tensar TX5 or approved equal
   1. Geogrid shall be placed at the interface of the subgrade and base material as indicated on the Drawings.
   2. Geogrid shall be installed in accordance with the installation guidelines provided by the manufacturer or as directed by the Engineer.
   3. Geogrid may be temporarily secured in place with ties, staples, pins, sand bags, or backfill as required by fill properties, fill placement procedures, weather conditions, or as directed by the Engineer.
   4. If 2 rolls of geogrid are to be placed side by side or end to end, overlap them based on the California Bearing Ratio (CBR) as recommended by the manufacturer. Care should be taken to ensure that the geogrid sections do not separate at the overlaps during construction.

C. Provide certificates from producer, supplier or an approved independent testing laboratory certifying that the fabric complies with the requirements of this Section.

PART 3 EXECUTION

3.1 PLACEMENT

A. Engineer shall inspect the placement of geotextile fabric prior to coverage of granular base course materials.

B. Subgrade shall be prepared as specified in other sections, unless the material within isolated areas is of a nature that will not readily compact. In this case, subgrade within these isolated areas shall be graded to the lines, grades, and cross sections as shown on Drawings.

C. Geotextile fabric shall be oriented such that the toll length runs parallel to the centerline. Adjacent rolls shall be overlapped a minimum of 3 feet, and shall be tied together at 15 foot intervals using suitable plastic ties. Care shall be taken to ensure that the geo-grid sections do not separate during construction. Placement of geo-grid around corners may require cutting and diagonal lapping. Geotextile fabric and geo-grid shall be pinned at the beginning of roll, but shall be left free elsewhere to relieve wrinkles or folds in the material during placement of base material.

D. Base course shall be spread by end dumping and grading the material to the thickness as shown on Drawings. Construction traffic shall not be allowed on reinforcement system until a minimum thickness of 4 inches of base course is in place.

END OF SECTION

SECTION 31_23_23.33

FLOWABLE FILL

PART 1 GENERAL

1.1 SCOPE OF WORK

A. Installation of flowable fill in areas indicated on the drawings.

1.2 SUBMITTALS

A. Submit a flowable fill mix design prior to installation

PART 2 PRODUCTS

2.1 DESIGN REQUIREMENTS

A. Compressive strength not less than 50 psi at 3 days or 75 psi at 28 days.

B. Strength shall not exceed 300 psi at 28 days.

C. Properties will be lab measurement only and will not be tested in the field.

2.2 MATERIALS REQUIREMENTS

A. Consist of a mixture of Portland cement (Type I), granular material/fine aggregate, fly ash, and water.

B. Fine aggregate shall meet ODOT standards with 100% passing the 3/8 sieve and no more than 15% passing the #200 sieve.

C. Air-entraining admixtures and performance enhancers may be submitted for approval if specified by Engineer or are necessary for specific project requirements

D. Mixture shall consist of the following approximate proportions.

1.	Portland Cement (Type 1)	50 lbs/CY
2.	Fine Aggregate	3,400 lbs/CY
3.	Fly Ash (Class F)	250 lbs/CY
4.	Water as needed to provide flowable self-leveling properties	

PART 3 EXECUTION

3.1 INSTALLATION

A. The temperature of the flowable fill mix, as it is manufactured and delivered, shall be at least 50° F.

B. Twenty-four hours shall elapse from start to start of each subsequent placement.

C. No placement of flowable fill will be allowed if the anticipated air temperature will be 35° F (17° C) or less in the 24-hour period following proposed placement.

D. During placement operations around manholes and in utility trenches, care shall be used to avoid dislocating any pipes due to fluid pressure from the flowable fill by even placing of the material. Any pipes within the backfill area should be considered for securing to avoid buoyant effect of flowable fill.

E. When flowable fill is used in pavement cuts, the fill shall be placed to the top of pavement. After setting, the flowable fill shall be removed to the bottom of a concrete pavement patch or to the top of the bituminous base course.

END OF SECTION

SECTION 31_23_24

UTILITY EARTHWORK & BACKFILL

PART 1 GENERAL

1.1 SUMMARY

A. Excavating, trenching, backfilling and compacting for water distribution mains, sanitary sewers, manholes and other utility systems and appurtenances, and the disposal of excess excavated material.

B. Provide the services of a licensed Professional Engineer registered in the State of Oklahoma to prepare temporary excavation support system designs and submittals as necessary.

C. Furnish and install temporary excavation support and safety systems, including sheeting, shoring and bracing, to ensure the safety of personnel and protect adjacent structures, piping, etc., and meet appropriate requirements established in the Occupational Safety and Health Administration (OSHA) Safety and Health Regulations, Part 1926, Subpart P-Excavations, Trenching and Shoring, and other applicable regulations.

D. Perform excavation regardless of type, nature, or condition of materials encountered.

E. Excavation, regardless of material encountered, shall conform to the dimensions and elevations indicated on the drawings.

F. There will be no extra compensation for dewatering unless specifically outlined on the drawings, bid proposal or Basic Requirements. Cost to be included in associated items of work.

G. There will be no addition compensation for rock removal unless specifically outlined on the drawings, bid proposal or Basic Requirements. Cost to be included in associated items of work.

H. Blasting will not be permitted as a means of excavation

I. Prior to any excavation work, Contractor shall contact OKIE (1 800-CALL-OKIE) as well as all utility Owners within the work site.

J. Backfill shall include the refilling and consolidation of the fill in the trenches and excavations up to the surrounding ground surface or road grade at crossing. The backfill from the trench bottom to 12-inches above the top of the pipes and conduit when laid to the grade including the bedding layer sustaining the pipeline as shown on the drawings is termed "embedment". Backfill above the embedment is termed "final backfill".

K. Should the requirements shown on the Drawings or other specification sections conflict with this section, the more stringent/costly shall apply and shall be bid by the Contractor.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 31_41_33 Trench Shielding

D. Section 33_05_09.34

E. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

B. Submit testing laboratory reports, as specified or required, to show compliance with specifications for materials. Certified Test Reports shall be from an independent laboratory paid for by the Contractor. Test reports shall include sieve analysis, soil classification, percentage of wear, Atterberg limits, and soil resistivity tests for embedment material.

C. Any submittals required for trench safety plan, dewatering and drainage plans, and similar temporary facilities, will be for reference purposes only and maintained for record purposes in the Engineer files. Submittal of these items will not relieve the Contractor of any responsibility for the adequacy of support, safety, dewatering, and drainage systems.

D. Submit details of excavation plans designed and prepared by a licensed Professional Engineer, who is registered in the State of Oklahoma and has experience in soils engineering, for all structure excavation. The plans shall include details of any proposed shoring systems, systems to protect existing facilities, slope stability monitoring, and the Contractor's means and methods for controlling groundwater. The plans shall be submitted to the Engineer for record purposes prior to proceeding with any excavation work.

1.4 REFERENCE STANDARDS

A. American Association of State Highway and Transportation Officials
   1. AASHTO T-180 - Standard Method of Test for Moisture-Density Relations of Soils Using a 10-lb Rammer and a 18-in. Drop

B. American National Standards Institute/American Society for Testing and Materials (ANSI/ASTM) latest version.
   1. ASTM C33 - Standard Specification for Concrete Aggregate.

2. ASTM C40 - Standard Test Method for Organic Impurities in Fine Aggregates for Concrete.
3. ASTM C136 - Standard Test Method for Sieve Analysis of Fine and Coarse Aggregate.
4. ASTM C150 - Standard Specification for Portland Cement.
5. ASTM D75 - Sampling Aggregates.
6. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12 400 ft-lb/ft^3 (600 kN-mm/m^3))
7. ASTM D1557 - Standard Test Methods for Laboratory Compacion Characteristics of Soil Using Modified Effort (56,00 ft-lb/ft^3 (2,700 kN-m/m^3))
8. ASTM D2922 - Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth).
9. ASTM D4253 - Maximum Index Density of Soils Using a Vibratory Table
10. ASTM D4254 - Minimum Index Density of Soils and Calculation of Relative Density.
11. ASTM D4318 - Standard Test Method for Liquid Limit, Plastic Limit and Plasticity Index of Soils.

C. ODOT Standard Specifications for Construction and Maintenance of Highways, Streets, and Bridges (2014) - Oklahoma, Department of Transportation (ODOT).

1.5 QUALITY ASSURANCE

A. Materials shall be tested and observed as described in the following paragraphs. Allow free access to the work for selection of materials and observation.
   1. Before and during placement of fill and backfill, the soils testing laboratory shall provide at least one density and moisture content test for each 2,500 ft^2 of surface area of trench/backfill for each compacted lift of fill or more stringent as may be stated elsewhere.

B. All work outlined in accordance shall be in full conformance with the approved Stormwater Pollution Prevention Plan (SWPPP). See Section 00_01_01 – Basic Requirements.

1.6 SPECIAL DESIGN REQUIREMENTS

A. Earthen backfill material shall be Class III or Class IV as outlined in Table 2 of ASTM D2321.

B. Pipe bedding materials shall be Class II as outlined in Table 2 of ASTM D2321.

1.7 INSPECTION OF EXCAVATIONS

A. Do not place reinforcing steel or concrete in the excavation prior to inspection unless the Engineer's Representative has given approval to proceed without inspection.

1.8 DESIGN REQUIREMENTS

A. Plans indicate the grades required for the construction of project. Contractor shall stake / layout work required.

1.9 PROTECTION OF FACILITIES

A. Existing utility lines (either overhead or underground) and pavement dictated to remain shall be kept free of damage from Contractor's operations. If damaged, any utilities or pavement shall be restored at the Contractor's expense.

B. Before the start of earthwork operations, adequately protect utilities, trees, shrubs, and other permanent objects. Repair costs resulting from damage to permanent facilities will be borne by the Contractor.

C. Provide surface drainage during the period of construction to protect the work and to avoid nuisance to adjoining property.

D. The Contractor shall conduct his operations in such fashion that trucks and other vehicles do not create a dirt nuisance in the streets. The truck beds shall be sufficiently tight, and shall be loaded in such a manner that objectionable materials will not be spilled onto the streets. Any dirt, mud, or other materials that are spilled onto the streets or deposited onto the streets by the tires of vehicles shall be promptly cleared away by the Contractor.

1.10 PROTECTION AND/OR REMOVAL OF UTILITY LINES

A. The Contractor shall anticipate all underground and above ground obstructions such as, but not limited to, water mains, gas lines, storm and sanitary sewers, telephone or electric light or power ducts, concrete, and debris.
   1. It shall be the responsibility of the Contractor to verify the existence and location of all underground and above ground utilities along the route of the work.
   2. Any such lines or obstructions indicated on the Drawings show only the approximate locations and shall be verified in the field by the Contractor.
   3. The Owner and Engineer will endeavor to familiarize the Contractor with all known utilities and obstructions, but this shall not relieve the Contractor from full responsibility in anticipating all underground and above ground obstructions whether or not shown on the Plans.
   4. The omission from or the inclusion of utility locations on the Drawings is not to be considered as the non-existence of, or a definite location of existing utilities.

B. The Contractor shall, at his own expense, maintain in proper working order and without interruption of service all existing utilities and services which may be encountered in the work.
   1. With the consent of the Engineer and utility owner such service connections may be temporarily interrupted to permit the Contractor to remove designated lines or to make temporary changes in the locations of services.
   2. The cost of making any temporary changes shall be at the Contractor's expense.

C. The Contractor will take the necessary precautions to protect existing utilities from damage due to his operations.

D. Any damage to the utilities will be repaired at the Contractor's expense.

E. Notify all utility companies involved to have their utilities located and marked in the field.
   1. All underground utilities shall then be uncovered to verify location and elevation before construction begins.

2. The Contractor shall obtain all necessary permits.

F. Utility Spacing: The spacing for utility lines shall meet the installation requirements and the requirements of TCEQ.

1.11 SUBSURFACE UTILITY ENGINEERING

A. Provide Subsurface Utility Engineering in accordance with 02_21_20 Subsurface Utility Engineering.

B. Following completion of pipe laying, maintain paved surfaces, unpaved trench surfaces, fences, curbs, sidewalks, and gutters, for a period of twelve (12) months from final acceptance. Material and labor required for the maintenance shall be supplied by the Contractor, and the work shall be done in a manner satisfactory to Owner. Maintenance shall include repair of any trench settlement and any damages to structures or paving due to trench settlement or workmanship.

PART 2 PRODUCTS

2.1 WATER

A. Use water from a source acceptable to Engineer in accordance with Basic Requirements.

2.2 MATERIALS

A. Crushed Rock Material (#57 & fine)
1. Crushed rock shall consist of sound and durable particles free from injurious amounts of salt, alkali, vegetable matter, or other material either free or as adherent coating.
2. Wear shall not exceed 40 percent when tested in accordance with ODOT testing standards.
3. Crushed rock size shall be Class I per ASTM D1487. ASTM C33, size No. 57 or 67 shall be considered Class I material.
4. Gradation shall meet the following requirements for percentage by weight when tested in accordance with ASTM C136:

a. <u>#57 Crushed Rock</u>

Passing 38.1 mm (1-1/2") sieve	100%
Passing 25.4 mm (1") sieve	95-100%
Passing 12.7 mm (1/2") sieve	25-60%
Passing No. 4 sieve	0-10%
Passing No. 8 sieve	0-5%

b. <u>#67 Crushed Rock</u>

Passing 25.4 mm (1") sieve	100%
Passing 19.0 mm (3/4”) sieve	90-100%
Passing 9.53 mm (3/8") sieve	20-55%
Passing No. 4 sieve	0-10%
Passing No. 8 sieve	0-5%

c. Fine Crushed Rock

Passing 12.7 mm (1/2") sieve	100%
Passing 9.53 mm (3/8") sieve	95-100%
Passing No. 4 sieve	40-65%
Passing No. 8 sieve	0-10%

d. Coarse Crushed Rock

Passing 38.1 mm (1-1/2") sieve	100%
Retained on 19/1 (3/4") sieve	100%

e. Fine crushed rock shall be rounded or sub rounded particles. Fine crushed rock with sharp edges will not be accepted.

B. Flowable Fill
1. See Section 31_23_23.33 – Flowable Fill

C. Final Backfill / Select Excavated Material
1. From 12-inches above the top of the pipe or conduit, the trench or excavation shall be backfilled with select material or excavated material free from rocks with any dimension greater than four inches unless otherwise specified or required elsewhere. The top 6-inches shall be the topsoil which has been placed separately.
2. Unless otherwise indicated on the drawings, no material of a perishable, spongy, or otherwise unsuitable nature, or excessively large rock (largest dimension greater than 4 inches), shall be used in backfilling.

D. Select Backfill Material / Select Fill
1. Where select material is shown or specified, use an approved material, free of organic matter and foreign substances, obtained from an approved off-site source. The material shall have a plasticity index between 7 and 15 and a maximum liquid limit of less than 30 as determined by ASTM D4318, and a maximum of 70 percent passing the No. 200 sieve. Prior to bringing any of the proposed material to the site, submit for review by the Engineer, an analysis of the proposed material, including a moisture-density relationship curve prepared in accordance with ASTM D698 by a certified independent testing laboratory employed and paid by the Contractor.

E. Pea Gravel
1. Natural stone; washed, free of clay, shale, organic matter; graded in accordance with ASTM C136 to the following limits:
2. Minimum Size: ¼ inch
3. Maximum Size: ⅝ inch

F. Sand
1. Sand shall consist of clean, hard, durable, uncoated grains, free from lumps, and organic material.
2. Gradation shall meet the following requirements for percentage by weight when tested in accordance with ASTM C136:

Passing No. 4 sieve	80-100%
Passing No. 8 sieve	65-100%
Passing No. 16 sieve	40-80%

Passing No. 50 sieve	7-40%
Passing No. 100 sieve	2-20%
Passing No. 200 sieve	0-10%

G. Top Soil:
1. Soil suitable for growth of surface cover. Material stripped and stockpiled from site or borrowed from off site.
2. Free from roots, brush, rocks, and other extraneous matter exceeding 1 inch in any direction. Free from weeds
3. Minimum 60% sand, Maximum 30% silts, Maximum 10% clay, no less than 6% and no more than 20% organic matter.
4. Liquid limit range from 15 to 30 and plasticity index from 5 to 40.
5. Submit test data showing compliance with this specification. Include percent weight of constituent material, material particle size, and pH.
6. Testing and Analysis of Subsoil Material: Perform in accordance with ASTM D698.

H. Aggregate Base
1. Blended aggregate base course meeting the requirements of Oklahoma Department of Transportation (Type "A").

2.3 COMPACTION EQUIPMENT

A. Provide compaction equipment of suitable type and adequate to obtain the densities specified.

B. Operate compaction equipment in strict accordance with the manufacturer's instructions and recommendations.

C. Hand-operated equipment shall be capable of achieving the specified densities.

2.4 MOISTURE CONTROL EQUIPMENT

A. Provide equipment for applying water of a type and quality adequate for the work; it shall not leak; and be equipped with a distributor bar or other approved device to assure uniform application.

B. Provide equipment for mixing and drying out material consisting of blades, discs, or other approved equipment.

2.5 WATER REMOVAL EQUIPMENT

A. Provide and operate equipment adequate to keep excavation and trenches free of water as outlined in Section 01_00_01 Basic Requirements.

PART 3 EXECUTION

3.1 EXCAVATION SUPPORT SYSTEMS

A. Protection of the excavation against caving or settling of the banks shall be the sole responsibility of the Contractor. The Contractor shall protect the sides of the excavation by sheeting and bracing as may be necessary. No actions or instructions by the Engineer shall be regarded as the responsibility for security of the surrounding areas. Furnish, put in place, and maintain sheeting and bracing required to support the sides of the excavation and prevent loss of ground which could damage or delay the work or endanger workers, adjacent structures or vehicular traffic. If the Engineer is of the opinion that at any points sufficient or proper supports have not been provided, he may order additional supports put in, and compliance with such order shall not relieve or release the Contractor from the responsibility for the sufficiency of such supports.

B. Sheeting, Shoring and Bracing:
   1. Provide sheeting, shoring, and bracing of excavations where required to properly and safely complete the work. Construct sheeting, shoring, and bracing to prevent the excavation from extending beyond specified or indicated limits, to protect adjacent structures or improvements and to protect workmen and the public. The design of sheeting, shoring, and bracing shall be the responsibility of the Contractor.
   2. Care shall be taken to prevent voids outside the sheeting. If voids are formed, they shall immediately be filled and compacted.
   3. After completion of the structure, all sheeting, shoring, and bracing shall be removed unless approval has been granted by the Engineer, in writing, to leave any or all of it in place. The sheeting, shoring, and bracing shall be removed as excavations are backfilled in a manner that will prevent injurious caving of the excavation or damage to the structure.
   4. Voids left or caused by removal of sheeting shall immediately be filled with suitable material and compacted.

C. Sheeting and bracing not left in place shall be carefully removed in such manner as not to endanger the construction or other existing structures, utilities, or property. Voids left or caused by withdrawal of sheeting shall be immediately refilled with sand by ramming with tools especially adapted to that purpose, by watering or otherwise as may be directed.

D. The right of the Engineer to order sheeting and bracing left in place shall not be construed as creating any obligation on his part to issue such orders, and his failure to exercise his right to do so, shall not relieve the Contractor from liability for damages to persons or property occurring from or upon the work occasioned by negligence or otherwise growing out of a failure on the part of the Contractor to leave in place sufficient sheeting and bracing to prevent any caving or moving of the ground.

3.2 CLEARING, GRUBBING & SITE PREP

A. Remove all building foundations, slabs, fences, and other structure from within the project limits as required by the plans. Vegetation and all underbrush shall be stripped and removed from the site. Remove all trees that are required for construction. Trees that will not conflict with construction shall remain, as directed by the Engineer. All underbrush shall be removed.

B. Roots, stumps and other debris shall be removed from site. Depressions resulting from removal of stumps, roots and debris shall be filled with suitable materials and compacted to make surface conform to surrounding ground.

C. Timber, logs, stumps, roots, brush and other refuse from clearing and grubbing operations shall be disposed of by the Contractor in a manner approved by the Engineer.

3.3 STRIPPING TOPSOIL

A. Remove existing grass and overburden before excavating topsoil.

B. Prior to beginning excavation or fill, strip the topsoil to a depth of at least 6 inches or to a depth sufficient to remove organic material and stockpile for future use.

C. In general, remove topsoil where structures are to be built, trenches dug, and roads, parking lots, walks, and similar improvements constructed within the area presently covered with topsoil.

D. Store topsoil clear of the construction area.

E. Take reasonable care to prevent the topsoil from becoming mixed with subsoil or eroding.

F. Do not remove topsoil until scalping is completed.

G. Do not remove subsoil with topsoil.

H. Stockpile topsoil in sufficient quantity to meet Project needs. Stockpile excess stripping material in an onsite location approved by the Engineer. All excess topsoil at the end of the project shall be disposed of onsite or removed from site if inadequate area exists for onsite disposal.

3.4 TRENCH EXCAVATION:

A. Trenches shall be excavated to the lines and grades shown on the Drawings with the centerlines of the trenches on the centerlines of the pipes. Measure for grade at the pipe invert, not at the top of the pipe, because of permissible verification in pipe wall thickness.

B. The sides of all trenches shall be vertical to a point one foot above the top of the pipe. Unless otherwise indicated on the Drawings, the trench width shall be as shown on the drawings within a tolerance of +3 inches. Trench width will be measured at an elevation in the trench which is 12-inches above the top of the pipe when laid to grade.

C. Where the normal trench width below the top of the pipe is exceeded for any reason, the Contractor shall, unless the Engineer determines that the pipe being used is strong enough for the actual trench width, furnish an adequate support for the pipe. This may be accomplished by furnishing a stronger pipe or a concrete cradle, next higher-class embedment or encasement, cap or envelope as approved.

D. The trenches shall be excavated to the required depth allowing for the placement of pipe bedding to the thickness shown on the Drawings. The trench bottom shall form a

continuous and uniform bearing and support for the pipe at every point between bell holes, except that the grade may be disturbed for the removal of lifting tackle.

E. Should the bottom of the trench become an unstable foundation for the pipe through the failure of the Contractor to adequately perform, the Contractor shall remove the unstable material and fill the trench to the proper subgrade with standard crushed rock.

F. Should the undisturbed material encountered at the grade depth constitute, in the opinion of the Engineer, an unstable foundation for the pipe, the Contractor is required to remove such unstable material and fill the trench to the proper subgrade with standard crushed rock. Depth of the standard crushed rock will be determined by the Engineer.

G. Bell (Joint) Holes: At the location of each joint, dig bell (joint) holes of ample dimensions in the bottom of the trench and at the sides where necessary to permit easy visual inspection of the entire joint.

H. Minimum pipe burial to the top outside surface of the pipe barrel shall be 3 feet unless otherwise noted.

I. Procedure: Excavate to indicated or specified depths.
   1. Excavate by open cut method.
   2. Dispose of unacceptable backfill material and provide suitable material for backfill without additional expense.
   3. During excavation, stockpile material suitable for backfilling in an orderly manner far enough from the bank of the trench to avoid overloading, slides, or cave-ins.
   4. Grade as necessary to prevent surface water from flowing into trenches or other excavations.
   5. Cut banks of trench as nearly vertical as practical.
      a. Remove stones as necessary to avoid point-bearing.
      b. Over-excavate wet or unstable soil from the trench bottom to permit construction of a more stable bed for pipe.
      c. Over excavation shall be filled and tamped with clean dry sand or other approved material to the required grade.
   6. Excavate the trench to the proper width as shown.
      a. If the trench width below the top of pipe is wider than specified in this Section or shown, install additional backfill.
      b. No additional payment will be made for additional material or work required for installation.
   7. Accurately grade the trench bottom to provide proper bedding as required for pipe installation.
   8. If any excavation is carried beyond the lines and grades required or authorized, the Contractor shall, at his own expense, fill such space with concrete or other suitable material as directed by the Engineer. No additional payment will be made.
   9. Construct trench in accordance with Trench Safety Plan.

J. Sheeting and Bracing:
   1. Refer to Section 31_41_33 Trench Shielding

K. Water in Excavation:
   1. Keep work free from ground or surface water at all times.

2. Provide pumps of adequate capacity or other approved method to remove water from the excavation in such a manner that it will not interfere with the progress of the work or the proper placing of other work.
3. There shall be no additional compensation dewatering.

L. Trenching Progress:
1. Trenching operations shall not be in excess of 100 feet ahead of pipe laying.
2. In rural areas trenching operations may be extended to 300 feet ahead of pipe laying with approval of Engineer.
3. Not more than two (2) consecutive cross-streets may be closed to traffic at any given time.

M. Existing Lawns and Shrubbery:
1. The Contractor shall take particular care to preserve existing lawns and shrubbery.
2. Make minor pipe alignment changes as may be necessary with approval from the Engineer.

N. Existing Pavement:
1. Existing pavement over trenches shall be removed to a width of 6 inches outside of the trench on each side.
2. Remove to a neat line by sawing method.
3. Remove brick pavement by hand, deliver and stack as directed by the Owner.
4. Where no pay items is included on the Bid Form the payment removal shall be included in other items of work.

3.5 EMBEDMENT:

A. Embedment for coated steel pipe, polyethylene wrapped ductile iron pipe, fiberglass reinforced pipe, and all plastic pipe shall be fine crushed rock.

B. Provide pipe bedding material under all pipe for the full width of the trench. Minimum depth of bedding material below the pipe barrel shall be as shown on the Drawings or as specified.

C. Minimum depth of pipe bedding material under the pipe bell shall not be less than 6 inches under normal trench conditions and not less than 6 inches in rock excavation areas. Minimum depth of pipe bedding material below the pipe shall be as shown on the drawings.

D. Placement:
1. Place the pipe bedding or foundation stabilization material for the full width of the trench in layers not exceeding 6 inches deep and compact each layer, until the material does not yield or move to the grade established for the pipe bedding. Where the distance to stable ground is excessive (more than two (2) feet), the Owner reserves the right to order as an extra, in writing, such other types of foundation or pipe supports as deemed necessary.
2. Particular attention must be given to the area of the pipe zone from the flow line to the spring line of the pipe to ensure that firm support is obtained to prevent any lateral movement of the pipe during the final backfilling of the pipe zone.

E. Compaction:

1. Compact embedment materials using vibration or mechanical tamping. Vibration methods shall limit vibration frequency and amplitude to avoid disturbance of adjacent in-situ soils.
2. All embedment materials, which includes material placed in trench bottom for pipe foundation, and all material within the pipe zone shall be compacted to a minimum of 95% of maximum dry density defined by ASTM D698 for cohesive material. For cohesionless material compact to a minimum of 75% of relative density as determined by ASTM D4253 and D4254, whichever is applicable.

3.6 UTILITY INSTALLATION:

A. Utility Lines: Provide a minimum cover over the top of the pipe as indicated. Avoid interference with other utilities. Provide class of bedding as shown. Install piping and appurtenances as specified.

B. Excavation for Appurtenances: Excavate sufficiently for valves, valve boxes, manholes, junction boxes, and similar structures to leave at least 2 feet clear distance between the outer surfaces and the embankment or timber that may be used to hold and protect the banks.

C. Over excavation: Any over-depth excavation below appurtenances not directed will be considered unauthorized and will be refilled with concrete or approved foundation material, as directed by the Engineer, at no additional cost to the Owner. Over excavation shall include over-depth and over-width excavation.

3.7 BACKFILLING:

A. From 12-inches above the top of the pipe, or as shown on the Drawings, the trench or excavation shall be backfilled with select material or excavated material approved by the Engineer. No excavated material or excessively large rocks (largest dimension greater than 4 inches) or debris of any sort are to be placed into the backfill. No appreciable weight of any sort, other than backfill, shall be allowed on the pipe until it has been covered to such a depth that damage to the pipe or joints will not occur. The top six (6) inches of backfill shall be topsoil free from rock outside of paved area.

B. Excavated material which is unsuitable for backfilling and excess material shall be disposed of.

C. Method of Consolidation:
1. The Contractor shall provide a method of consolidation of material 12-inches or more above the pipe. Backfill material shall be compacted in layers from six to eight inches in thickness of loose fill. This material may be placed mechanically or by other means to provide at least 85% ASTM D698 of maximum dry density at 0 to 4 percent above optimum moisture or the compaction indicated on the Drawings. Where the soil PI is less than 20, the compaction moisture content shall be within ± 4% of optimum. Such material shall be tested and approved by the Engineer before continuing.
2. The initial test section shall be a minimum of 100 lineal feet. Material not meeting required compaction shall be removed and replaced at no additional cost to the Owner. See Item 6 below for deep-fill requirements.
3. Jetting and flooding. Not allowed.

4. Backfill under Road, Concrete Slabs, and Related Items. The backfill for trenches under roads, concrete slabs, and related items shall be flowable fill if no specific detail is included in the Drawings.
5. Fill depths between 15' to 25' shall be compacted to 98% ASTM D 698. Fill depths between 25' to 35' shall be compacted to 100% ASTM D698.

D. Contractor shall backfill pipe to preclude floating of the placed pipe. Should floating occur, the Contractor shall remove and reinstall the pipe to a point beyond the area in question identified.

3.8 CONCRETE THRUST BLOCKING

A. Thrust blocking of concrete shall be provided at changes in pipe diameter (reducers), or direction (e.g., tees, bends, elbows, and crosses), plugs and valves on buried piping with unrestrained joints. Thrust blocking shall be placed against undisturbed trench walls and the pipe in such a manner that the blocking will prevent the pipe from moving when subjected to required test pressure.

B. Concrete thrust blocking shall be in place at least five days prior to testing the pipeline/conduit.

C. See Section 33_05_09.34

3.9 DISPOSAL OF EXCESS MATERIAL:

A. Remove waste and excess excavated material from the construction site as feasible.

B. Legally dispose of material at a licensed site or with written and notarized permission from the property owner for a private disposal site.

C. All cost associated with waste material removal and disposal shall be paid for by the Contractor.

3.10 SETTLEMENT AND FINAL GRADE REQUIREMENTS

A. The finished surface shall not vary more than 0.10 foot from the established grade and cross section and shall be free of depressed areas where water would pond.

B. Settlement in backfill, fill, or in structures built over the backfill or fill, that may occur within the 1-year guarantee period in the General Conditions shall be considered to be caused by improper compaction methods.

C. Restore structures damaged by settlement to original condition.

3.11 PROTECTION

A. Finish grades of backfills, cuts, excavations, and fills:
1. Protect newly graded areas from erosion and deterioration by action of the elements.

B. Ditches and gutters:

1. Maintain ditches and gutters free from detrimental quantities of debris that might inhibit drainage until final acceptance.

END OF SECTION

SECTION 31_25_00

EROSION CONTROL

PART 1 GENERAL

1.1 SCOPE OF WORK

A. This section includes implementation of the project's Storm Water Pollution Prevention Plan (SWPPP) and installation, maintenance and removal of erosion and sediment control devices.

B. The Contractor shall furnish all permits, preparation and implementation of a site specific Storm Water Pollution Prevention Plan, notice of intent, notice of termination, labor, equipment, materials, and pay all permit fees as necessary to meet the requirements of the Oklahoma Pollution Discharge Elimination System (OPDES) associated with construction activities under OPDES Construction General Permit for storm water pollution prevention as required by current Federal, State, and Local rules and regulations and any other local agency requirements regarding stormwater discharges and management.

C. The following items shall be submitted for record purposes only. These documents will not be reviewed for compliance with permit requirements. They are including, but not limited to:
1. Storm water pollution prevention plan,
2. Notice of Intent (NOI),
3. Photocopies of permit application fee payment(s), and
4. Notice of Termination (NOT).
5. Notice of Change.

D. The Contractor shall bear sole responsibility for the storm water pollution prevention provisions of this Contact as well as bear sole responsibility for development, implementation, and maintenance of the storm water pollution prevention plan, the best management practices, and the facilities utilized to meet the General Permit requirements. The storm water pollution prevention plan and Notice of Intent shall be completed prior to beginning any work or stockpiling of materials.

E. Regardless of acreage, coverage under the OPDES General Permit is not guaranteed by the submission of an NOI. The Director / staff of the program may require the Contractor to obtain an Individual or Alternative General Permit.

F. The Contractor shall pay all fees, including initial application and renewal fees, associated the OPDES permit application.

G. The Contractor shall pay all costs associated with the development of the storm water pollution prevention plan as well as the implementation, maintenance, monitoring, and inspection of the storm water pollution prevention plan facilities during the construction period.

H. The Contractor shall not begin any construction work until the Contractor has filed a complete Notice of Intent (NOI) with ODEQ. An NOI must be filed with ODEQ at least

seven days prior to commencing construction activities, or if utilizing electronic submittal, prior to commencing construction activities.

I. Upon closeout of the Project, the Contractor shall submit at Notice of Termination (NOT) to the ODEQ using the proper form and provide a copy to the Engineer for record purposes.

1.2 SUBMITTALS

A. Storm Water Pollution Prevention Plan (SWPPP)

B. Notice of Intent (NOI) for Storm Water Discharges Associated with Construction Activity under the OPDES General Permit

C. Construction Site Notice

D. Notice of Termination (NOT) for Storm Water Discharges Associated with Construction Activity under the OPDES General Permit

E. Notice of Change (if applicable)

1.3 REFERENCED STANDARDS

A. Oklahoma Department on Environmental Quality (ODEQ) OPDES General Permit No. OKR10 or latest application permit

1.4 MATERIALS

A. The exact items, quantities, types and locations of the control measures shall be presented in the Storm Water Pollution Prevention Plan.

1.5 CONSTRUCTION METHODS

A. Prior to the start of the construction, the Contractor shall submit to the Engineer, for approval, schedules for accomplishment of the pollution control measures in accordance with the Storm Water Pollution Prevention Plan. The Contractor shall also submit, for approval, proposed methods of pollution control in areas which may be outside the construction limits such as construction and haul roads, field offices, equipment and supply areas, and material sources, as well as plan for disposal of waste materials. Work on the project shall not begin until the schedules for implementation of the controls and methods of operations have been reviewed and approved by the Engineer in writing.

B. The Contractor shall provide control measures to prevent or minimize impact to receiving waters as required by the Plans and/or in a manner approved by the Engineer.

C. In any disturbed area where construction activities have ceased, permanently or temporarily, the Contractor shall stabilize the area by the use of seeding, mulching, soil retention blankets or other appropriate measures within 14 days, unless construction activities are scheduled to resume within 21 days.

D. The Contractor shall effectively prevent and control erosion and sedimentation on the site at the earliest practicable time as outlined in the approved schedule. Control measures,

where applicable, will be implemented prior to the commencement of each construction operation or immediately after the area has been disturbed.

E. The Contractor shall limit the amount of disturbed earth to the areas shown on the Plans in a manner approved by the Engineer. If the Contractor is not able to effectively control soil erosion and sedimentation resulting from construction operations, every effort shall be made to limit the amount of disturbed area at any given time.

F. Should the control measures fail to function effectively, the Contractor shall act immediately to bring the erosion and sedimentation under control by maintaining existing controls or by providing additional controls as directed by the Engineer. When in the opinion of the Engineer the site is adequately stabilized, the control measures shall be removed and properly disposed of by the Contractor.

G. The Contractor shall also conform to the following practices and controls. All labor, tools, equipment and incidentals to complete the work will not be paid for directly but shall be considered as subsidiary work to the various items included in the contract.

1. Disposal areas, stockpiles and haul roads shall be constructed in a manner that will minimize and control the amount of sediment that may enter receiving waters. Disposal areas shall not be located in any wetland, waterbody or streambed. Construction roads may not be located in or cross any waterbody or streambed without prior approval of the Engineer and shall be done in compliance with applicable rules and regulations.
2. Construction operations in rivers, streams, lakes, wetlands and other waterbodies shall be restricted to those areas where it is necessary to perform the work shown on the Plans. Wherever streams are crossed, temporary bridges, timber mats of other structures shall be used, as directed by the Engineer. The use of a work road within a stream channel shall be minimized to the greatest extent practicable.
3. Protected storage for paints, chemicals, solvents, fertilizers and other potentially toxic materials will be provided by the Contractor and on the location approved by the Engineer.
4. Construction staging areas and vehicle maintenance areas shall be constructed by the Contractor in a manner to minimize the runoff of pollutants and their location will be approved by the Engineer. The Contractor shall prevent pollution of receiving waters with petroleum products or other hazardous or regulated substances. When work areas of material sources are located adjacent to a waterbody, control measures such as dikes, gabions or rock berms shall be used to keep sediment and other contaminants from entering the adjacent waterbody. Care shall be taken during the construction and removal of such barriers to minimize down-gradient sedimentation.
5. All waterways shall be cleared as soon as practicable of temporary embankment, temporary bridges, matting, falsework, piling, debris or other obstructions placed during construction operations that are not a part of the finished work.
6. Disturbance of existing vegetation shall be minimized and limited to only those areas approved by the Engineer.
7. Construction entrances shall be stabilized by the use of rock, timber matting or other acceptable techniques to minimize the off-site vehicle tracking of sediment.

H. The project will not be accepted until, in the opinion of the Engineer, the Contractor has established a uniform perennial vegetative cover with a density of 70 percent in all areas not covered by permanent structures, or that equivalent permanent or temporary

stabilization measures (such as riprap, gabions, soil retention blankets, mulching or geotextiles) have been employed.

1.6 MEASUREMENT AND PAYMENT.

A. Temporary erosion, sedimentation and stormwater pollution prevention and control will not be measured for payment but shall be included in other items of work unless a specific pay item is included in the bid schedule.

B. Removal of all control measures not incorporated as permanent control measures shall be performed subsidiary to the various bid items.

C. In case of failure on the part of the Contractor to prevent and control soil erosion, sedimentation and water pollution which may degrade receiving water, the Engineer reserves the right to employ outside assistance or to use State forces to provide the necessary corrective measures. Such incurred direct costs plus project engineering costs will be deducted from any monies due or to become due to the Contractor.

D. Pollution control measures may be applicable to construction work outside the right of way where such work is necessary as a result of roadway related construction such as material source operations, haul roads and equipment storage sites. Pollution control measures outside the right-of-way will not be measured for payment but shall be performed at the Contractor's expense.

PART 2 PRODUCTS

2.1 EROSION CONTROL PRODUCTS

A. Provide for construction, maintenance and removal of erosion control in accordance with SWPPP by a combination of the following installed per ODOT Standards and/or industry standards:
1. Temporary Sediment Control Slope Drains
2. Temporary Sediment Control Bale Barriers
3. Temporary Silt Fence
4. Temporary Silt Dike
5. Temporary Sediment Controls Filters
6. Temporary Sediment Control Basins
7. Nylon Erosion Control Mat
8. Ditch Liner Protection
9. Sodding & Sprigging
10. Mulch
11. Sandbags
12. Geotextile Fabric
13. Other items per approved submittal

PART 3 EXECUTION (NOT USED)

3.1 INSTALLATION

A. Storm Water Pollution Prevention Plan
   1. Develop and implement the project's Storm Water Pollution Prevention Plan (SWPPP) in accordance with the State's General Permit requirements. Prevent water pollution from storm water runoff by using and maintaining appropriate structural and nonstructural BMPs to reduce pollutants discharges to the MS4 from the construction site.

B. Provide for construction, maintenance and removal of erosion control in accordance with SWPPP and installed per ODOT Standards and/or industry standards.

C. Control Measures
   1. Implement control measures in the area to be disturbed before beginning construction, or as directed. Limit the disturbance to the area shown on the Drawings or as directed.
   2. Control site waste such as discarded building materials, concrete truck washout water, chemicals, litter and sanitary waste at the construction site.
   3. If, in the opinion of the Engineer, the Contractor cannot control soil erosion and sedimentation resulting from construction operations, the Engineer will limit the disturbed area to that which the Contractor is able to control. Minimize disturbance to vegetation.
   4. Immediately correct ineffective control measures. Implement additional controls as directed. Remove excavated material within the time requirements specified in the applicable storm water permit.
   5. Upon acceptance of vegetative cover by the City, remove and dispose of all temporary control measures, temporary embankments, bridges, matting, falsework, piling, debris, or other obstructions placed during construction that are not a part of the finished work, or as directed.

D. Do not locate disposal areas, stockpiles, or haul roads in any wetland, water body, or streambed.

E. Do not install temporary construction crossings in or across any water body without the prior approval of the appropriate resource agency and the Engineer.

F. Provide protected storage area for paints, chemicals, solvents, and fertilizers at an approved location. Keep paints, chemicals, solvents, and fertilizers off bare ground and provide shelter for stored chemicals.

G. Installation and Maintenance
   1. Perform work in accordance with the current governing ODEQ General Permit
   2. When approved, sediments may be disposed of within embankments, or in areas where the material will not contribute to further siltation.
   3. Dispose of removed material in accordance with federal, state, and local regulations.
   4. Remove devices upon approval or when directed.
   5. Upon removal, finish-grade and dress the area.

6. Stabilize disturbed areas in accordance with the permit, and as shown on the Drawings or directed.
7. The Contractor retains ownership of stockpiled material and must remove it from the project when new installations or replacements are no longer required.

END OF SECTION

SECTION 31_41_33

TRENCH SHIELDING

PART 1 GENERAL

1.1 SUMMARY

A. Trench and excavation safety system meeting appropriate requirements established in the Occupational Safety and Health Administration (OSHA) Safety and Health Regulations, Part 1926, Subpart P - Excavations, Trenching and Shoring, and other applicable regulations.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections if included.

B. The Contractor shall retain the services of a Professional Engineer, licensed in the State of Oklahoma and having experience in soils engineering, to design and prepare the trench and excavation plans for all trench and excavations. The plans shall include shoring systems, systems to protect existing utilities, slope stability monitoring and dewatering.

C. Submit a plan for all excavations of a depth 5 feet or greater, with a bottom width less than twice the total depth of the excavation, where an existing structure or utility falls within a 2 horizontal to 1 vertical (2:1) slope from the bottom of the excavation.

1.4 QUALITY ASSURANCE

A. Engineers responsible for design of trench safety systems shall be Professional Engineers licensed in the state of Oklahoma.

B. Engineers must demonstrate experience in soil mechanics, structural engineering and design of trench safety systems with a minimum 5 years of experience on similar sized projects.

C. Engineers shall also submit to the Owner certification of professional liability insurance coverage of at least 1,000,000.00. Such coverage must not exclude structural design or trench safety design.

1.5 DESIGN REQUIREMENTS

A. After award, the Contractor shall have a trench and excavation plan prepared. This excavation plan must illustrate proposed trench safety and excavation requirements specifically designed for this project

B. The Contractor is responsible for obtaining additional soil borings and soil analysis as required for design. The trench and excavation plan is to be designed in conformance with OSHA standards and other applicable regulations.

C. No work in trenches or excavations in excess of five feet deep is to be performed until this plan is prepared and implemented.

D. The Contractor shall not deviate from the trench and excavation plan without written authorization from the engineer who prepared the trench and excavation plan. This written authorization shall be signed, dated and sealed by the engineer.

E. Any changes in the trench and excavation plan after initiation of construction will not be cause for extension of time or change order.

F. Contractor accepts sole responsibility for compliance with all applicable safety requirements.

G. The trench and excavation plan does not relieve Contractor from responsibility for any or all construction means, methods, techniques and procedures. Furthermore the Contractor shall indemnify the Owner and Consulting Engineer from any and all claims due to any property damage or bodily injury (including death) that arises from use or misuse of the trench safety and excavation plan, or from Contractor's negligence in performance of the contract work.

1.6 PROTECTION OF FACILITIES

A. Before the start of earthwork operations, adequately protect utilities, structures, trees, shrubs and other permanent objects. Costs resulting from damage to permanent facilities due to negligence or lack of adequate protection will be charged to the Contractor. Excavations near existing structures or utilities must be instrumented to verify no impact to existing facilities.

B. Provide surface drainage during the period of construction to protect the work and to avoid nuisance to adjoining property.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 GENERAL

A. Trench safety system shall be constructed, installed and maintained in accordance with the details shown in the design prepared by the Contractor's licensed Professional Engineer

to prevent death or injury to personnel or damage to structures or utilities in or near these trench excavations.

B. Unless otherwise specified elsewhere, materials excavated from trench to be stored no closer to the edge of trench than one-half the depth of the trench.

3.2 MAINTENANCE

A. The safety system shall be maintained in the condition as specified by the Contractor's Trench Safety Engineer.

B. The Contractor shall take all necessary precautions to ensure the safety systems are not damaged during their use. If at any time during its use a safety system is damaged, personnel shall be immediately removed from the trench or excavation area and the safety system repaired.

C. The Contractor shall take all necessary precautions to ensure no loads, except those included in the safety system design, are imposed upon the excavation.

3.3 INSPECTION

A. Contractor shall make daily inspection of trench safety and excavation system to ensure that the system meets OSHA requirements and the requirements of the trench safety plan.

B. Daily inspection is to be made by qualified personnel. If evidence of possible cave-ins, slides or other conditions of concern is apparent, all work in the trench shall cease until necessary precautions have been taken to safeguard personnel entering trench and protect adjacent structures and utilities.

C. Contractor shall maintain permanent record of daily inspections.

D. The Contractor's Trench Safety Engineer shall make periodic site visits (at the start of each new excavation and at least once per week for all open excavations). Within two (2) days after each visit, the Contractor's Trench Safety Engineer shall make a written report to the Owner certifying that the trench and excavation plan and safety construction practices are being followed. The Contractor's Trench Safety Engineer shall immediately report any unsafe construction practices to the Owner and Contractor.

3.4 REMOVAL

A. Backfilling and removal of trench supports shall progress together from bottom of trench upward.

B. Remove no braces or trench supports until all personnel have evacuated the trench.

C. Backfill trench to within five feet of natural ground prior to removal of entire trench safety system.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 32_31_13

CHAINLINK FENCING & GATES

PART 1 GENERAL

1.1 SCOPE OF WORK

A. The Contractor shall furnish all labor, equipment, and materials to install a chain link fence and gates at the location shown on the drawings.

B. The height of the fence shall be as indicated on the drawings.

C. When existing fence is within the project site and is disturbed by construction activities, fencing will be replaced with fencing as specified herein.

D. If a conflict occurs between this specification and the Drawings or other Specification sections, the most stringent/costly shall be included in the Contractor's bid.

1.2 SUBMITTALS

A. Furnish sets of catalog cuts or detailed drawings for all parts and equipment to be used to construct the fence and gates in accordance with Section 01_33_01 General Submittal Requirements. Shop drawings showing material sizes and weights, fencing heights, mounting details, gates and operators.

1.3 QUALITY ASSURANCE

A. The fence shall be the product of one manufacturer, except for items which do not influence the appearance of the completed fence.

B. The Contractor shall include all supplementary parts necessary or required for a complete and satisfactory installation, as per the intent of the drawings.

C. No used materials shall be used in the construction.

PART 2 PRODUCTS (NOT USED)

2.1 MANUFACTURER

A. Minimum of 5 years of experience manufacturing galvanized coated chain link fencing.

B. Approved Manufacturer or equal:
1. Allied Fence, Inc.
2. American Fence Corp.
3. Anchor Fence, Inc.
4. Master Halco, Inc.

2.2 LINE POST

A. Line post shall be made of 2 3/8" O.D. Schedule 40 Galvanized Pipe; 3.65 lbs/ft.

B. The same kind of material shall be used throughout the project.

C. Posts shall be spaced 10 feet apart and set in concrete 36" deep, 10" diameter or as shown on the Drawings (if Drawings exceed depth / diameter in the Specification.)

2.3 GATE, CORNER, END, & STRETCHER POST:

A. Post shall be made of 3" O.D. Schedule 40 Galvanized Pipe; 5.79 lbs/ft.

B. Posts shall be set in concrete 42" deep, 1'4" diameter or as shown on the Drawings (if Drawings exceed depth / diameter in the Specification.)

2.4 RAILS

A. Top, Bottom, and Middle Rails shall be 1 5/8" diameter Schedule 40 Galvanized Pipe; 2.28 lbs/ft.

2.5 CHAIN LINK FABRIC

A. Fence fabric shall be 9 gauge, 2" mesh, galvanized class III (1.2 oz. zinc per square foot).

B. Both top and bottom selvages twisted and barged

C. There shall be no splice in any roll

D. Excessive roughness, blisters, sal ammoniac spots, bruises, or flaking shall be considered a basis for rejection.

2.6 FITTINGS

A. Tension bands shall be 14 gauge by ¾" spaced 15" apart.

B. Brace bands shall be 12 gauge by ¾".

C. Rail end, and caps shall be pressed steel. Tension bars shall be 3/16" by ¾".

D. Carriage bolts shall be 5/16" by 1-1/2".

2.7 BARB WIRE

A. Barb Wire shall be 4 Pts, 12-1/2 gauge galvanized wire, class I.

2.8 TIE WIRE

A. Tie wire shall be aluminum 9 gauge, 8 1/4" at 14" O.C. on Line Posts; 6 1/2" at 18" O.C. on rails.

2.9 CONCRETE

A. Concrete shall have a minimum compressive strength of 4000 psi at 28 days.

2.10 MOW STRIP

A. Provide mow strip under fence as outlined in the Drawings.

PART 3 EXECUTION

3.1 GENERAL

A. The fence shall be constructed to the line and grade indicated on the Plans. All fencing shall be stretched taut and installed to the required spacing. The finished fence shall be plumb and true to line and ground contour.

3.2 CLEARING FENCE LINE

A. The site of the fence shall be sufficiently cleared of obstructions, and surface irregularities shall be graded so that the fence will conform to the general contour of the ground.

B. The fence line shall be cleared to a minimum width of 2 feet on each side of the fence alignment. All materials cleared or excavated shall be disposed as directed by the Engineer.

C. All holes remaining after grubbing or excavating shall be filled with suitable soil.

3.3 SETTING POSTS

A. All posts shall be spaced as shown on the Plans and set in concrete bases. End, comer, stretcher, and gate posts shall be set 42 inches into a concrete base having a diameter 16 inches.

B. Line post shall be set 36 inches into a concrete base having a diameter of 12 inches.

C. Concrete bases shall be allowed to cure 72 hours before proceeding with installation of wire or gates.

D. The top of the bases shall be 2-3 inches above the final ground surface and slope away from the posts.

E. If bedrock is encountered before reaching the required depth, the excavation shall be continued to the depth required or 18 inches into bedrock, whichever is Jess and shall be a minimum of 2 inches larger than the outside diameter or largest dimension of the post and filled with grout.

F. No extra payment or extension of time shall be granted for rock excavation.

G. Post length shall be adjusted to compensate for reduced setting.

H. Posts shall be set plumb and in alignment. Straight runs between braced posts shall not exceed 330 feet. Additional posts shall be set at each abrupt change in grade. Extra length posts will be required at small depressions where it is not practicable for the fence to follow closely to the contour of the ground. At such ground depressions, the Contractor shall close the space below the bottom of the fence with barbed wire fanned at 6 inch maximum spacing.

I. The wires shall be stretched taut and securely fastened to the post to prevent vertical movement.

J. Completely protect fence posts from concrete splatter during post installation. Posts containing concrete splatter unable to be removed will be subject to replacement.

3.4 MOW STRIP

A. Provide mow strip as outlined in the Drawings. Mow strip to be placed after fence post installation, but before fabric in installed.

B. Completely protect fence posts from concrete splatter during mow strip installation. Posts containing concrete splatter unable to be removed will be subject to replacement.

3.5 INSTALLING CHAIN LINK FENCE

A. Fence shall be stretched uniformly tight by means of an approved mechanical tensioning device.

3.6 CLEANUP

A. The Contractor shall remove from the vicinity of the completed work all tools, buildings, equipment, etc., used during construction.

B. Surplus materials from digging post holes shall be spread over the ground adjacent to the new post to a maximum depth of 1".

C. Remove all foreign substances from fabric posts and exposed hardware prior to completion. This includes, but is not limited to, paint, adhesives, concrete slobber, grease and oil

3.7 GATES

A. Gates shall be constructed as detailed on the Plans. Gates shall be erected to swing 90 degrees from closed to open, and shall be provided with stops as specified or detailed on the Plans.

B. Hinges and diagonal bracing shall be adjusted so that the gates will hang level.

END OF SECTION

SECTION 32_92_00

TURFS & GRASSES

PART 1 GENERAL

1.1 SCOPE OF WORK

A. Preparing ground, fertilizing, mulching, seeding and/or sodding per the description on the drawings and as specified herein.

B. All areas disturbed by construction activities (including Contractor's staging areas) shall be seeded/hydromulched or sodded as specified herein regardless of whether called out on Drawings as follows:
   1. All disturbed areas inside treatment plant fence shall receive slab sod.
   2. Residential yards and/or areas of improved and maintained existing turf shall receive solid slab sod.
   3. All other disturbed areas shall receive seed and hydromulch.

C. Limits of disturbed areas to be grassed include actual ground disturbance plus four (4') feet outside of disturbed area / trench / fenced area.

D. If no pay item(s) are included in the Bid Form, furnishing and installing of turfs and grasses as specified herein shall be included in associated items of work.

E. Grassing shall not be performed until underground utilities, storm drainage structures, surfacing and structures in or adjacent to areas to be planted have been installed, tested, inspected and approved.

F. It is the contractor's responsibility to accurately quantify the amount of each type of grassing to be included in the bid amount.

G. Any conflict in requirements for areas to be grassed the more stringent shall apply and be bid by the Contractor.

1.2 SUBMITTALS

A. Submit in accordance with Section 01_33_01 General Submittal Requirements

B. Certificates:
   1. Submit certification from supplier that each type of product conforms to this Section. Certificate shall accompany product delivery.
   2. Each delivery shall bear a certification tag and label.
   3. Herbicide shall be labeled with manufacturer's name, address and chemical analysis.

1.3 QUALITY ASSURANCE

A. Contractor shall make arrangements to obtain water as needed to supply the seeded and sodded areas with adequate moisture (3" to 4" penetration) for seed germination and plant growth until accepted. All costs for watering shall be borne by the Contractor.

B. Beginning immediately after each area is planted and continuing until final acceptance (6 weeks minimum maintenance regardless of acceptance date) maintain plantings to keep plants in a vigorous and healthy condition.
   a. Watering as necessary to keep top 3 inches of soil moist.
   b. Maintain a grass height less than 4 inches unless otherwise directed by the Owner.
   c. Remove weeds and foreign grass over plant areas at least once per week. Herbicides may be used for this purpose when approved by Owner.
   d. Clean and replace as necessary

1.4 DELIVERY, HANDLING AND STORAGE

A. Fertilizer shall be delivered to site in sealed containers bearing manufacturers' guaranteed statement of analysis.

B. Store fertilizer in weatherproof locations.

C. Furnish and deliver each variety of seed in separate bags or containers; or for native seed mixtures, each mixture should have original label from the supplier listing all species included and the percentage of mixture represented by each species.

D. Keep seed dry during storage.

E. Sod
   1. Delivered to the site well-watered and ready for placement without damage to the root system.
   2. Harvest & deliver sod only after laying bed is prepared for sodding.
   3. Roll or stack to prevent yellowing.
   4. Deliver and lay within 24 hours of harvesting.
   5. Keep moist and covered to protect from drying from time of harvesting to time of laying.

PART 2 PRODUCTS

2.1 MATERIALS

A. Seed
   1. Common Bermuda ("Cynodon Dactylon")
      a. The seed shall be harvested within one year prior to planting
      b. Free of Johnson grass, field bind weed, dodder seed, and free of other weed seed to the limits allowable under the Federal Seed Act and applicable seed laws
      c. The seed shall not be a mixture

d. The seed shall be hulled, extra fancy grade, treated with fungicide and have a germination and purity that shall produce a pure live seed content of not less than 95 percent.
e. Germination rate shall be 85 percent or better
f. Seed shall be labeled in accordance with U.S. Department of Agriculture rules and regulations.
g. Weed content shall be less than 2 percent
h. Seed furnished shall have date of analysis shall within 9 months of the time of delivery to the Project.

2. Italian Ryegrass Seed ("Lolium multiflorum")
   a. Seed shall be harvested within 1-year prior to planting and shall be free of perennial ryegrass seed, other grass seed and weed seed.
   b. Rye grass seed shall have purity of 95 percent or better, treated with fungicide
   c. 90 percent minimum germination rate.

B. Sod
1. Sod shall be alive, healthy and free of insects, disease, stones, undesirable foreign materials and weeds and grasses deleterious to its growth or which might affect its subsistence or hardiness when transplanted.
2. The sod shall be free of yellowed areas.
3. The sod shall be obtained from state certified commercial groves, and harvested no earlier than 24 hours prior to planting.
4. Minimum sod thickness and maximum grass height shall be ¾-inch and 2-inches respectively.
5. Sod shall be machine cut to uniform soil thickness and shall be of equal width and of a size that permits the sod to be lifted, handled and rolled without breaking.
6. Broken or torn sod with uneven ends will be rejected.

C. Fertilizer
1. Fertilizer shall be of an organic or chemical base.
2. Fertilizer shall be a commercial product, uniform in composition, free flowing, with uniform particle size, and minimal dust.
3. Fertilizer which has been exposed to high humidity and moisture or has become caked will not be accepted.

D. Mulch
1. Cellulose Fiber Mulch
   a. Mulch shall be natural cellulose fiber mulch produced from grinding clean, whole wood chips, refined specifically for hydromulch applications.
   b. Mulch fibers shall be free of abrasive or hard containments which would inhibit hydraulic pumping. The mulch fibers shall maintain uniform suspension in water under agitation and shall blend with grass seed, fertilizer, and other additives to form homogenous slurry. Upon application the mulch material shall form a strong, moisture-retaining mat without the need of an asphalt binder. This mat shall have the characteristics of moisture absorption and percolation and shall cover and hold grass seed in contact with the soil.
   c. The wood fiber mulch shall be dyed green to aid visual metering during application. The dye shall be biodegradable and not inhibit plant growth.
2. Straw or Hay Mulch

a. Straw mulch shall be oat, wheat, or rice straw. Hay mulch shall be prairie grass, Bermuda grass, or other hay as approved by the Engineer. The mulch shall be free of Johnson grass or other noxious weeds and foreign materials. The straw mulch will be kept dry and shall not be rotted or molded. A minimum of 50% by weight of the herbage making up the hay shall be 10" in length or longer.
b. Use a tacking agent applied in accordance with the manufacturer's recommendations or a crimping method on all straw or hay mulch operations.
c. Straw or hay mulch shall not be used for hydromulching

E. Tacking Agent (Tackifier)
1. Natural vegetable gum containing gelling and hardening agents that when mixed with water and properly cured, shall form an insoluble network.

F. Herbicide
1. Contractor shall be responsible for using herbicides in a manner consistent with label requirements and precautions.
2. Contractor shall adhere to all Federal, State, and local laws governing herbicide usage.
3. Only registered herbicides having a minimal residual effect shall be used.
4. Adjacent to streams or other aquatic environments only herbicides approved for aquatic environments shall be used.
5. Written authorization of the Engineer is required prior to use of any herbicide.
6. Herbicide used shall be an easy to apply, effective in a short term, chemical agent to inhibit or destroy weed growth, while being harmless to seed and grass being implanted.

PART 3 EXECUTION

3.1 PREPARATION OF SEEDBED

A. Place topsoil (if in area where it has been previously stripped)

B. Scarify existing subgrade to minimum depth of four (4) inches and roll lightly with appropriate roller to consolidate topsoil. Protect topsoil from wind and water erosion until planting is completed.

C. Rake areas to be sodded smooth, free from unsightly variations, bumps, ridges or depressions. Do not vary final grades more than 0.1 feet from finish elevations. No areas shall pond water.

D. Apply fertilizer at specified rate. Apply after raking soil surface and not more than 48 hours prior to grassing. Lightly water to aid in dissipation of fertilizer.

E. Receive acceptance of fine grading from Owner or Engineer prior to grass planting.

3.2 SODDING

A. Sodding shall be performed only during the seasons when satisfactory results can be expected. Frozen sod shall not be used and sod shall not be placed upon frozen soil. Sod may be transplanted during periods of drought with the approval of the Engineer, provided the sod bed is watered to moisten the soil to a depth of at least 4 inches immediately prior to laying sod.

B. Plant sod specified after the area has been completed to the lines and grade as shown on the Drawings with topsoil.

C. Use care to retain native soil on the roots of the sod during the process of excavating, hauling and planting.

D. Keep sod material moist from the time it is dug until planted.

E. Pitchforks shall not be used to handle sod, and dumping from vehicles shall not be permitted. The sod shall be carefully placed by hand, edge to edge and with staggered joints, in rows at right angles to the slopes, commencing at the base of the area to be sodded and working upward. The sod shall immediately be pressed firmly into contact with the sod bed by tamping or rolling with approved equipment to provide a true and even surface, and insure knitting without displacement of the sod or deformation of the surfaces of sodded areas.

F. Where the sod may be displaced during sodding operations, the workmen when replacing it shall work from ladders or treated planks to prevent further displacement. Screened soil of good quality shall be used to fill all cracks between sods. The quantity of the fill soil shall not cause smothering of the grass.

G. Where the grades are such that the flow of water will be from paved surfaces across sodded areas, the surface of the soil in the sod after compaction shall be set approximately one inch below the pavement edge. Where the flow will be over the sodded areas and onto the paved surfaces around manholes and inlets, the surface of the soil in the sod after compaction shall be placed flush with pavement edges.

H. Lay sod with closely fitted joints having no voids and with ends of sod strips staggered. Lay sod within 48 hours of harvesting. Place sod so that the entire area designated for sodding is covered.

I. Fill voids left in the solid sodding with additional sod and tamp.

J. On slopes 2:1 and steeper, lay sod perpendicular to slope and secure every row with wooden pegs at maximum 2 feet on center. Drive pegs flush with soil portion of sod.

K. Prior to placing sod, on slopes greater than 3:1 or where indicated, place Hold/Gro or Roll Lite or equal over topsoil. Securely anchor in place with posts sunk firmly into ground at maximum 16 feet on center along pitch of slope and equal to width of wire mesh horizontally across slopes.

L. Roll and tamp sod so that sod is in complete contact with topsoil at a uniform slope.

M. Watering
1. After sod is laid, irrigate thoroughly to secure six (6) inch minimum penetration into soil below sod.
2. Water lawn areas once a day with ½-inch water for first three (3) weeks after area is sodded.
3. After three (3) weeks period, water twice a week with ¾-inch of water each time unless comparable amount has been provided by rain.
4. Make weekly inspections to determine moisture content of soil.
5. Continue watering until fully grown in.

3.3 SEEDING

A. Seeding will be required on all disturbed or excavated areas no receiving sod

B. The Contractor shall employ a satisfactory method of sowing by use of either approved mechanical hand seeders or mechanical power-driven drills. When delays in operation carry the work beyond the specified planting seasons, or when conditions are such that by reason of drought, high winds, excessive moisture, or other factors, satisfactory results are not likely to be obtained, seeding shall stop. It will be resumed only where the desired results are probable or when approved alternate procedures have been adopted.

C. Broadcast Seeding
1. Broadcast seed in two directions at right angles to each other.
2. Harrow or rake lightly to cover seed.
3. All varieties of seed as well as fertilizer shall be distributed simultaneously provided that each component is uniformly applied with mechanical equipment.
4. Seed and fertilizer mixture distributed as a water slurry, shall be applied within 30 minutes after components are placed in the equipment.
5. After planting, the planted area shall be rolled with a light roller. All rolling of the sloped areas shall be along the contour of the slopes.

D. Drill Seeding
1. All varieties of seed and fertilizer shall be distributed at the same time provided that each component is uniformly applied at the specified rate.
2. Drill seed at a depth of ¼-inch to ⅜-inch utilizing a pasture or rangeland type drill.
3. All drilling shall be along the contour of the slope.
4. The distance between drill rows shall not exceed 12 inches.
5. After planting, the area shall be rolled with a roller integral to the seed drill, or a light drum roller. All rolling of the sloped areas shall be on the contour of the slopes.

E. Mulch
1. Spread mulch material on areas to be planted where construction was completed too late for planting a temporary fall crop or insufficient residues are produced by the fall planting. Mulch the planting areas to control soil erosion and seed loss by wind and water and to promote grass establishment. Apply mulch hay at the rate of 2 tons per acre and spread uniformly so that about 25% of the ground surface is uniformly visible through the mulch. Anchor the mulch hay by treading into the soil with a straight disk type mulch tiller. Perform disking across the slope along contours.

F. Hydromulching
1. At time of seeding, soil to be moist but not muddy and wind velocity shall not exceed 10 miles per hour. Add water if required to moisten soil.
2. Hydraulic mulching shall consist of the mixing of wood fiber mulch, grass seed, fertilizer and other additives with water. It shall be mixed in standard hydraulic mulching equipment to form homogeneous slurry. This slurry shall be sprayed, under pressure, uniformly over the soil surface. The hydraulic mulching equipment shall contain a continuous agitation system that keeps all materials in uniform suspension throughout the mixing and distribution cycles.
3. Using standard hydraulic mulching equipment, the wood fiber mulch, seed and fertilizer slurry shall be applied evenly over the soil surface in a one-step operation. The mixture shall be applied to the area to be seeded within 30 minutes after all components are placed in the equipment.
4. Complete final grading and hydromulch Rye grass seed evenly at rate of 5 pounds per 1,000 square feet with wood cellulose fiber at rate of 50 pounds per 1,000 square feet and fertilizer at the rate of 18 pounds per 1,000 square feet.
5. Complete final grading and hydromulch Bermuda grass seed evenly at rate of 3 pounds per 1,000 square feet with wood cellulose fiber at rate of 50 pounds per 1,000 square feet and fertilizer at the rate of 18 pounds per 1,000 square feet.
6. Add tackifier to mix for slopes steeper than 4:1 at rate of 1 pound per bag of mulch.

3.4 FERTILIZING

A. Pre-Planting Application
1. Uniform application of 10-20-10 (N-P-K) fertilizer at a rate of 25 lbs. per 1,000-sq. ft. will be required for all areas to be seeded.

B. Post Planting Applications
1. For autumn applications a complete fertilizer with 4-1-2 to 3-1-2 (N-P-K) ratio shall be applied. Fertilizer shall contain 30 to 50 percent slow-release nitrogen unless noted otherwise.
2. Seeds: As soon as new growth starts after seeding, grass shall be fertilized every 10 to 14 days with 0.75 to 1.0 lb. nitrogen per 1,000-sq. ft. Applications shall alternate between nitrogen only fertilizer whose analysis is, by weight 21-0-0 or 45-0-0 and a complete fertilizer with a 3-1-2 or 4-1-2 (N-P-K) ratio.

C. Sod:
1. Fertilizer shall be applied every 4 weeks until acceptance at 1.0 lb. nitrogen per 1,000-sq.ft.
2. Apply fertilizer at application rate recommended by soil analysis.
3. Apply fertilizer after smooth raking of topsoil and prior to installation of sod.
4. Apply fertilizer no more than 48 hours before laying sod.
5. Mix fertilizer thoroughly into upper 4 inches of topsoil.

D. Water: Immediately water in fertilizer after each application.

3.5 PLANTING SEASON AND APPLICATION RATE

A. All planting shall be done between the dates specified for each grass type except when specifically authorized in writing by the Owner.

B. Application Rates & Dates

Type	Application Rate (Pounds per acre)	Planting Date
Hulled Bermuda	120	April 1 - Oct. 1
Mixed Bermuda & Rye (Bermuda Hulled)	120	Oct. 1 - April 1
Rye	200	Oct. 1 - April 1

C. The location, planting season, seed type and seeding rate is as follows:
   1. Fall planting
      a. Temporary only
      b. To be followed by spring planting of perennial vegetation as outlined in 1.1
   2. Spring planting
      a. Permanent
      b. Soil temperatures for spring planting should be above 65 degrees Fahrenheit
      c. Cover grass seed by ⅛ to ¼ inches of soil
      d. Seed bed should be rolled with a flat roller weighing from 20 to 40 pounds per square inch following seeding

D. If the schedule is such that Annual Rye Grass is planted, the rye grass shall be removed and an undamaged complete stand of specified grass shall be achieved prior to acceptance.

E. Seeding outside the specified seeding periods may be permitted at the Engineer's option, provided the Contractor is willing to make appropriate modifications to his seeding operations, and will guarantee the crop.

3.6 PROTECTION AND MAINTENANCE OF LAWN AREAS

A. For residential areas, facility sites, or areas designated to be lawn. Establish a dense lawn of permanent Bermuda grass, free from lumps and depressions. It shall be the responsibility of the Contractor to maintain planted areas until an approved stand is established but not less than 45 calendar days. Maintenance shall consist of watering, replanting, mowing, weeding, maintaining existing grades and repair of erosion damage.

B. Mow and edge lawn each time after the lawn has reached a height of 2-1/2 inches to 3 inches. Mow to a height of 2 inches returning the clippings to lawn.

C. Reseed any bare areas within the utility corridor that are greater than 36” across or areas greater than 36” across that contain only weed species. Prior to reseeding, remove all weed species with approved contact herbicide or by mechanical means.

D. Maintain the grassed areas until final acceptance of the project. Maintenance includes, but is not limited to, fertilizer, weed control, reseeding, watering, and mowing. Fertilize and perform weed control when necessary or at least three (3) times annually. Water and mow areas when necessary. Maintain a grass height less than 8 inches within the utility corridor until accepted or otherwise directed by the Engineer.

E. Provide surface repair to ruts, ridges, tracks. Replant areas required for final acceptance.

3.7 WEEDING

A. Keep all seeded areas free from weeds and undesirable grasses until grass is established.

3.8 DISEASE AND INSECT PEST CONTROL

A. Upon discovery of any disease or insect pest infestation, identify or have identified the nature or species of infestation and submit the proposed method of control for approval prior to application of control measures.

3.9 ACCEPTANCE

A. Engineer will determine that a grassed area is established upon fulfillment of the following conditions:
   1. The permanent grass stand uniformly covers the planting area, with no exposed soil areas more than 36” across in any dimension.
   2. The permanent grass stand is free of over-topping weed species which would compete for sunlight, moisture, and nutrients. In addition, no area of pure weed species greater than 36” across in any dimension shall occur within the permanent grass stand.
   3. The majority of the grass plants in a stand shall have a well-established root system (i.e., dense fibrous roots extending to greater than 3 inches in depth below the soil surface) to survive if irrigation is discontinued.

B. At the completion of the maintenance period, the Engineer shall make a final inspection of plants, seeded, and sodded areas. Any areas not found to be in a healthy, growing condition shall be replaced at no charge to the Owner. Grass shall be healthy and growing with close stands.

C. Establish the permanent grass stand before September 1 to preclude having to perform a temporary Fall seeding. In the event a Fall seeding must be performed, follow-up the temporary seeding with a permanent seeding as specified.

3.10 CLEAN UP

A. Remove trash and debris resulting from lawn preparation from site daily as work progresses. Leave paved areas in a broom clean condition by sweeping or hosing.

SECTION 31_01_30.90

BYPASS PUMPING OF SEWER SYSTEMS

PART 1 GENERAL

1.1 SUMMARY

A. Bypass pumping of the existing sewer system as needed.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

B. Submit a detailed plan and description outlining all provisions and precautions that will be taken with regard to the handling of sewer flows. Submit the plan to the Engineer for approval a minimum of 7 days prior to commencing work. Include the following details:

1. Schedule for installation and maintenance of the bypass pumping system
2. Staging areas for pumps
3. Pump sizes, capacity, number of each size, and power requirements
4. Calculations for static lift, friction losses, and velocity
5. Pump curves showing operating range and system head curves
6. Sewer plugging methods
7. Size, length, material, joint type, and method for installation of suction and discharge piping
8. Method of noise control for each pump and/or generator, if required
9. Standby power generator size and location
10. Suction and discharge piping plan
11. Emergency action plan identifying the measures taken in the event of a pump failure or sewer spill
12. Staffing plan for responding to alarm conditions identifying multiple contacts by name and phone numbers (office, mobile)
13. A contingency plan to implement in the event the replacement or rehabilitation has unexpected delays or problems

1.4 ADMINISTRATIVE REQUIREMENTS

A. Coordination
1. Schedule meeting with Owner to review sewer shutdown prior to replacing or rehabilitating any facilities.
2. Owner reserves the right to delay schedule due to weather conditions, or other unexpected emergency within the sewer system.
3. Review bypass pumping arrangement or layout in the field with Owner prior to beginning operations. Facilitate preliminary bypass pumping run with City staff present to affirm the operation is satisfactory to the Owner.
4. After replacement or rehabilitation of facilities, coordinate the reestablishment of sewer flow with Owner's staff.
5. Provide onsite continuous monitoring during all bypass pumping operations using one of the following methods:
   a. Personnel on site
   b. Portable SCADA equipment

PART 2 PRODUCTS

2.1 EQUIPMENT

A. Pumping
1. Provide equipment that will convey 100 percent of wet weather peak flow conditions.
2. Provide fully automatic self-priming pumps. Foot-valves or vacuum pumps are not permitted for priming the system.
3. Pumps must be constructed to allow dry running for periods of time to account for the cyclical nature of sewer flow.
4. Provide 1 stand-by pump for each size to be maintained on site. Place backup pumps on line, isolated from the primary system by valve.
5. If multiple pumps are required to meet the flow requirements, provide the necessaryfittings and connections to incorporate multiple discharges.
6. Noise levels of the pumping system must follow the requirements of the Owner's noise ordinance (if applicable.)

B. Piping
1. Install pipes with joints which prevent the incident of flow spillage.

C. Plugs or Stop Logs
1. Plugs
   a. Select a plug that is made for the size and potential pressure head that will beexperienced.
   b. Provide an additional anchor, support or bracing to secure plug when back pressure is present.
   c. Use accurately calibrated air pressure gauges for monitoring the inflation pressure.
   d. Place inflation gauge at location outside of confined space area. Keep the inflation gauge and valve a safe distance from the plugs.
   e. Never over inflate the plug beyond its pressure rating.
   f. Stop Logs

1) Use stop log devices designed for the manhole or sewer vault structure in use.
2) If applicable, obtain stop logs from Owner that may be used on specific structures.

PART 3 EXECUTION

3.1 PREPARATION

A. Locate the bypass pipelines in area to minimize disturbance to existing utilities andobtain approval of those locations from the Owner.

B. Make preparations to comply with OSHA requirements when working in the presenceof sewer gases, oxygen-deficient atmospheres and confined spaces.

C. Do not begin bypass preparation and operation until Owner approval of the submittals requested per this Specification.

3.2 INSTALLATION

A. Install and operate pumping and piping equipment in accordance to the submittalsprovided per this Specification.

B. Sewer flow stoppage
1. Plugging
a. Use confined space procedures and equipment during installation when necessary.
b. Thoroughly clean the pipe before insertion of the plug.
c. Insert the plug seal surface completely so it is fully supported by the pipe.
d. Position the plug where there are not sharp edges or protrusions that may damage the plug.
e. Use pressure gauges for measuring inflation pressures.
f. Minimize upstream pressure head before deflating and removing.

C. Sewer flow control and monitoring
1. Take sufficient precautions to ensure sewer flow operations do not cause flooding or damage to public or private property. The Contractor is responsible for any damage resulting from bypass pumping operations.
2. Begin continual monitoring of the sewer system as soon as the sewer is plugged or blocked. Be prepared to immediately start bypass pumping if needed due to surcharge conditions.
3. Sewer discharge may be into another sewer manhole or appropriate vehicle or container only. Do not discharge sewer into an open environment such as an open channel or earthen holding facility.
4. Do not construct bypass facilities where vehicular traffic may travel over thepiping.
a. Provide details in the suction and discharge piping plan that accommodate both the bypass facilities and traffic without disrupting either service.

3.3 QUALITY CONTROL

A. Field Tests
   1. Perform leakage and pressure tests of the bypass pumping pipe and equipment before actual operation begins. Have City staff on site during tests.

3.4 CLOSEOUT ACTIVITIES

A. Once plugging or blocking is no longer necessary, remove in such a way that permits the sewer flow to slowly return to normal – preventing surge, surcharging, and major downstream disturbance.

END OF SECTION

SECTION 33_01_33

WASTEWATER LIQUID & SOLIDS REMOVAL & DISPOSAL

PART 1 GENERAL

1.1 SUMMARY

A. Removal and disposal of wastewater liquids and solids from the wastewater treatment facilities.

B. Waste sludge handling & disposal to be removed from the following locations:
   1. Southside Drying Beds prior to beginning initial demolition for Southside Improvements (to be included in bid item for "Demolition (Initial)")
   2. Northside Drying Beds prior to beginning initial demolition for Southside Improvements (to be included in bid item for "Demolition (Initial)")
   3. Southside Stormwater Pond prior to beginning stormwater pond improvements (to be included in the price bid for "Secondary FEB Concrete Lining & Sludge Disposal")
   4. Northside existing treatment units prior to beginning final demolition (to be paid from bid item "Waste Sludge Handling & Disposal from Existing Treatment Units Prior to Final Demolition (Northisde & Southside).")
   5. Southside existing treatment units prior to beginning demolition (to be paid from bid item "Waste Sludge Handling & Disposal from Existing Treatment Units Prior to Final Demolition (Northisde & Southside).")

C. Quantity and character of sludge will vary from location to location and bid price should per for waste sludge handling should be an average price for overall quantity.

D. It is the contractor's responsibility to verify the total amounts in each basin prior to bid.

E. No adjustment in price or unit price will be made based on actual quantities.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 02_41_00 Demolition

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 DEFINITIONS

A. Process Sludge: This material is the liquid volume of existing tankage and mixture of process water, mixed liquor, organic settled solids and sludge that will be transferred by the Contractor to another treatment basin as approved by the Owner. **The transfer of process sludge will be required prior to complete construction activities (demolition and rehabilitation of Southside stormwater pond.)**

B. Waste Sludge: This material includes an undetermined volume and mixture of grit, inorganic settled solids and sludge that will be removed and disposed by the Contractor. **The disposal of waste sludge will be required to complete construction activities (demolition and rehabilitation of Southside stormwater pond.)**

C. Sludge Management Plan (SMP): A plan for removing, processing, treating, storing, transporting, and disposing of mixed liquor, settled solids, partially digested sludge, and sludge in addition to soils intermixed with the various types of sludge.

D. Sludge Disposal / Disposition Plan (SDP): A plan for sludge removed from the treatment facility and disposed of in a landfill.

E. Added Water: This water is added by the Contractor to aide in the removal of, cleaning of, and transport of the existing solids to be removed from the wastewater facilities and disposed of off-site. The added water is the sole responsibility of the Contractor. The volume of added water is not included in the specified volumes of the bid quantities of material to be removed from the wastewater facilities. The Contractor is responsible for all effort and costs required to provide, use, transport, and dispose of added water used in the tasks associated with liquid and solids removal. The Contractor shall include all costs for added water in the base bid quantity prices and the Bid Form Unit Prices for Sludge Removal. The Contractor's use of added water shall not be grounds for a scope change nor a contract change.

F. Sludge Removal: Construction activities to remove mixed liquor, settled solids, partially digested sludge, and sludge from any wastewater treatment facility in an effort to gain access for subsequent construction activities and/or cleaning of a facility to facilitate inspection, repair, demolition, and/or other construction activities as required by the Contract Documents.

G. Treatment Basin: Structures, both existing and new, whose primary function is to hold, treat and/or process wastewater, wastewater solids, and sludge.

H. Project Locations: Facilities from which sludge is to be removed.

1.5 SCHEDULING & SEQUENCING

A. Conduct sludge removal only after schedule has been approved by the Owner and the Contractor has submitted SMP or SDP and received written approval of same from ODEQ Contractor, with Owner's approval, may make use of existing SMP/SDP in place. Coordinate with Owner prior to bid. Sludge removal schedule and sequencing must allow for continued operation of the facilities. If land application is used for disposal, apply sludge only after adequate erosion and sediment controls are in place.

1.6 MEASUREMENT & PAYMENT

A. Process Sludge Handling:
   1. Measurement: Will not be measured. It is considered to the be the full volume of any tankage that is required to be drained to execute construction activities (demolition and rehabilitation of Southside stormwater pond.)
   2. Payment is subsidiary to Demolition. Payment shall be full compensation for the following: equipment, labor, any added water, gas/fuel, sludge and soil testing, spill clean-up, and temporary pumping and piping. Contractor is responsible for all efforts and costs associated with procuring, transport, and final disposal of any added water.

B. Waste Sludge Handling and Disposal for Initial Demolition:
   1. Will not be measured for payment and shall be included in the price bid for demolition.

C. Waste Sludge Handling and Disposal for Final Demolition:
   1. Measurement: The units scheduled for demolition or rehabilitation will be drained of Process Sludge to the minimum level practical. Prior to removal of any Waste Sludge, the Owner, Engineer, and Contractor will agree on that the remaining sludge is of a nature that cannot be processed by the treatment plant. Upon agreement the sludge depth will be measured at each corner and at least one point in the center of the basin. The depth measurements along with the basin plan view area will used to calculate cubic yards of Waste Sludge to be disposed of. No payment will be made for Added Water.
   2. Payment: Payment for sludge disposal will be by the cubic yard of sludge disposed at the Bid Price listed in the Bid Proposal. The Bid Item will be full compensation for removal of waste sludge, dewatering, hauling, landfill tipping fees, permitting, tools, labor and any other incidentals required to complete the work.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 GENERAL

A. The Contractor with coordination from the Owner will be responsible for transferring Process Sludge from one basin to another.

B. Contractor is responsible for removal, handling and disposal of all Waste Sludge, including the material resulting from the tanks' cleaning.

C. Remove Waste Sludge from the existing basins within the limits shown or specified and dispose of the Waste Sludge in accordance with a ODEQ approved SMP or SDP. The Contractor shall also be responsible for removing and handling any waste sludge from the new basins in accordance with an ODEQ approved SMP or SDP as required for his construction activities within these new basins.

D. Contractor is responsible for all expenses related to Process Sludge removal and transfer, which shall be covered under the base bid.

E. Contractor is responsible for maintaining and protecting all roads, drives, dikes, equipment, structures, etc during sludge removal, processing, land application, hauling, and disposal and shall repair any damaged as a result of their work.

F. The Contractor will be required to keep a Daily Record and a Project Record, of the volume of liquid biosolids land-applied each day. The Daily Record will need to be provided to the Project Manager, or his designee, at the end of each workday. The Project Record will need to be provided to the Owner, or designee, at the end of the project.

G. The Contractor will communicate daily with the Engineer to determine which land application site will be used. This discussion is also designed to ensure that the Contractor does not over apply biosolids to any approved application site.

H. The Contractor will be responsible for biosolids sampling, sample preservation, sample delivery, and storage in accordance with methods developed by the City of Shawnee Wastewater Treatment Plant Laboratory Staff or standard practice is no methods have been developed.

I. The Contractor is required to maintain a cooperative and courteous relationship with the landowner while delivering and land-applying sludge, grit, and biosolids. Care shall be taken to leave the fields and roadway in reasonable condition upon project completion.

3.2 PROJECT LOCATION

A. As follows, but not to extend beyond Project limits.
   1. Northside
      a. All existing units
      b. All piping that requires wastewater and sludge removal
      c. All other treatment plant facilities that require dewatering and cleaning to perform the work.
   2. Southside
      a. All existing units
      b. Existing stormwater pond
      c. All piping that requires wastewater and sludge removal
      d. All other treatment plant facilities that require dewatering and cleaning to perform the work.

3.3 TREATMENT BASIN CLEANING

A. Transfer Process Sludge to another basin designated by the Owner and take measurements of Waste Sludge In-Situ prior to commencing cleaning activities.

B. Remove sludge from the Treatment Basins within limits or as specified or directed.

3.4 EQUIPMENT

A. Provide necessary equipment for Process Sludge transfer from on basin to another Owner designated basin.

B. Provide necessary equipment for Waste Sludge removal, transport from the facility to the disposallocation, and final application or disposal.

C. Provide necessary equipment for added water, procurement, transport from the facility to thedisposal location, and final application or disposal.

3.5 DISPOSAL PERMITTING

A. Contractor will be responsible for registration, authorization, and/or permitting of the land application with the appropriate regulatory agencies and shall pay the related regulatory fees.

B. Contractor will maintain all chain of custody forms and provide documentation of all sludgevolumes land applied and the application sites.

3.6 TESTING

A. Contractor will be responsible for obtaining all sludge and soil samples and their required labanalyses for permitting.

B. Contractor will pay for the lab analysis and will include such lab analysis expenses with as part ofthe Work.

3.7 DISPOSAL

A. Apply the sludge and/or added water for beneficial use as fertilizer/soil amendment or dispose ofthe material using a disposal method approved by the appropriate permitting agency.

B. When sludge application is via the subsoil injection method, such application shall be accordingto sound agronomic rates.

C. Contractor is responsible for determining application rates based on cover crops and analyticaltesting of the sludge.

D. Contractor may remove and separately dispose of oil/grease from the sludge prior to land application.

E. Contractor is responsible for providing commercially reasonable handling of sludge once it hasbeen collected, including cleanup of any spills.

F. Contractor is responsible for meeting the dewatering requirements of landfill disposal.

3.8 RECORD KEEPING

A. Maintain records of sludge application and submit records to Engineer, Owner, and regulatingagencies, as required by this specification and any related permits.

3.9 BIDDING QUANTITIES

A. Process Sludge Removal
   1. Will not be measured for payment and will be included in the price bid for demolition.

B. Waste Sludge (initial demolition)
   1. Will not be measure for payment and will be included in the price bid for demolition.

C. Waste Sludge Removal (final demolition)
   1. Contractor is responsible to remove and dispose of the waste sludge volumes listed in the bid proposal from the designated structures to be demolished.
   2. The volume listed is for reference only, payment will be based on the total quantity of Waste Sludge removed from all facilities. No additional payment will be made if quantities removed exceed the estimated quantity listed for any individual facility unless the total quantity is exceeded (both facilities.) If the total quantity removed meets the total estimated, sludge removal will stop until the Owner and Contractor agree to contract modification to handle the remaining Waste Sludge.

END OF SECTION

SECTION 33_05_05.17

MECHANICAL JOINT RESTRAINT

PART 1 GENERAL

1.1 SCOPE OF WORK

A. Restraint devices for mechanical joint fittings and appurtenances conforming to either ANSI/AWWA C111/A2 or ANSI/AWWA C 153 shall conform to the following specifications.

1.2 SUBMITTALS

A. Submit in accordance with Section 01_33_01 General Submittal Requirements

1.3 SYSTEM DESCRIPTION/DESIGN REQUIREMENTS

A. Restraint devices for nominal pipe sizes 3 inch through 48 inch shall consist of multiple gripping wedges incorporated into a follower gland meeting the applicable requirements of AWWA C110

B. The devices shall have a working pressure rating of 350 psi for 3-16 inch and 250 psi for 18-48 inch. Ratings are for water pressure and must include a minimum safety factor of 2 to 1 in all sizes.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Mechanical joint restraint shall be Megalug Series 1100 produced by EBAA Iron Inc. or approved equal.

2.2 MATERIALS

A. Gland body, wedges and wedge actuating components shall be cast from grade 65-45-12 ductile iron material in accordance with ASTM A536.

B. Ductile iron gripping wedges shall be heat treated within a range of 370 to 470 BHN.

2.3 COATING SYSTEM

A. Coating for restraint devices shall be MEGA-BOND by EBAA Iron, Inc. or approved equal.
   1. All wedge assemblies and related parts shall be processed through a phosphate wash, rinse and drying operation prior to coating application. The coating shall consist of a minimum of two coats of liquid thermoset epoxy coating with heat cure to follow each coat.
   2. All casting bodies shall be surface pretreated with a phosphate wash, rinse and sealer before drying. The coating shall be electrostatically applied and heat cured.

The coating shall be a polyester-based powder to provide corrosion, impact and UV resistance.

PART 3 EXECUTION

3.1 INSTALLATION

A. Mechanical joint restraint shall require conventional tools and installation procedures per AWWA C600, while retaining full mechanical joint deflection during assembly as well as allowing joint deflection after assembly.

B. Proper actuation of the gripping wedges shall be ensured with torque limiting twist off nuts.

C. Installation shall be per manufacturer's requirements

END OF SECTION

SECTION 33_05_07.13

UTILITY DIRECTIONAL DRILLING

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Furnish all labor, materials, and equipment required to install utility lines using the horizontal directional drilling method in accordance with the requirements of the Contract Documents.
   1. The pipe size, type, and length shall be as specified herein and as shown on the drawings.
   2. Work shall include, but not be limited to, proper installation, testing, restoration of underground utilities, and environmental protection and restoration.

B. The directional drill shall be accomplished by first drilling a pilot hole along the centerline of the proposed pipe and then enlarging the pilot hole to no more than 1.5 times the outer diameter of the couplings (or the outer diameter of the pipe if no couplings are used) to accommodate the pull back of the pipe through the enlarged hole.

C. Soil borings as required for certain subsurface soil conditions shall be provided by the Contractor within the scope of this project.

D. Contractor to comply with any/all State Department of Transportation permits and shall notify State (if required) before construction in ROW.

E. Where a Permit is required the Contractor shall keep a copy of the permit onsite at all times and it shall be followed strictly and supersede any conflicting areas of this specification.

F. The Contractor must have installed a minimum of 15,000 linear feet of pipe in the last 4 years (24" diameter or greater) using directional drilling operations.
   1. Prequalified contractors who have previously demonstrated the capabilities and qualifications to perform this work include:
      a. Del-Sha Directional Drilling, Van Buren, AR (479-262-2670.)

1.2 SUBMITTALS

A. All submittals shall be in accordance with Section 01_33_01.

B. The Contractor shall submit a list of previous projects completed showing that the Contractor meets the experience requirements of this Specification (See 1.1F.) No exceptions. The list of projects supplied to demonstrate experience requirement shall include:
   1. The Owner of the project.
   2. Type of line installed (e.g. – water, sewer, etc.).
   3. Pipe material, size, and length installed by horizontal directional drilling.

4. Dates of installation.

C. Product data sheets on the materials to be used shall be submitted to the Engineer. Material shall include the pipe, fittings, and any other item that is to be an installed component of the project.

D. Material Safety Data Sheets for all drilling fluid additives shall be submitted to the Engineer.

E. The Contractor shall submit a daily project log of drilling operations at the completion of the project.

1.3 QUALITY ASSURANCE

A. The Contractor must have installed a minimum of 15,000 linear feet of pipe in the last 4 years (24" diameter or greater) using directional drilling operations.
1. The Contractor shall submit a list of previous projects completed showing that the Contractor meets the experience requirements of this section. The list shall include:
a. The Owner of the project.
b. Type of line installed (e.g. – water, sewer, etc.).
c. Pipe material, size, and length installed by horizontal directional drilling.
d. Dates of installation.

B. Notify Engineer and Owner a minimum of three (3) days in advance of the start of work.

PART 2 PRODUCTS

2.1 MATERIALS

A. Pipe materials shall be as specified on the plans and in other specification sections.

B. Steel pipe, ductile iron pipe and PVC pipe may be used as encasement material as shown on the Plans. The nominal inside diameter of the encasement pipe shall be as shown on the Plans
1. Steel Pipe: Encasement pipe shall conform to all requirements set forth Section 33_05_25 Steel Casing Pipe and be of the diameter as specified on the Drawings. Any variation of diameter and wall thickness, as may be required for various types of carrier pipe, shall be approved by the Engineer prior to installation.
2. Ductile Iron Pipe: Encasement pipe shall conform to AWWA C150 and C151. Pipe shall be thickness class 250 or greater, unless otherwise shown on the plans.
3. HDPE Pipe: Encasement pipe shall be DR-13 minimum, unless otherwise shown on plans.
4. PVC Pipe: Encasement pipe shall conform to ASTM D2241 or AWWA C905. Pipe shall be DR 26 or SDR 26, unless otherwise shown on the plans.
5. Casing Spacers: Casing spacers shall be Racii type or approved equal as shown on the Plans. Installation of casing spacers shall be in accordance with the manufacturer's recommendations.

6. End Seals: End seals shall be minimum 1/8" thick synthetic rubber with stainless steel bands. Other methods of sealing the end of the encasement pipe shall be constructed only upon pre-approval by the Engineer.
7. Carrier Pipe: Carrier pipes shall conform to all requirements set forth and be of the diameter and material as specified on the Plans and as indicated in the bid proposal.

2.2 DIRECTIONAL DRILLING EQUIPMENT REQUIREMENTS

A. General

1. The directional drilling equipment shall consist of a directional drilling rig of sufficient capacity to perform the bore and pull back the pipe, a drilling fluid mixing, delivery, and recovery system of sufficient capacity to successfully complete the installation, a drilling fluid recycling system to remove solids from the drilling fluid so that the fluid can be reused (if required), a magnetic guidance system or "walkover" system to accurately guide boring operations, and trained and competent personnel to operate the system.
2. All equipment shall be in good, safe condition with sufficient supplies, materials, and spare parts on hand to maintain the system in good working order for the duration of this project.

B. Drilling Rig
1. The directional drilling machine shall be able to rotate and push hollow drilling pipe into the ground at a variable angle while delivering a pressurized fluid mixture to a guidable drill (bore) head.
2. All hydraulic systems shall be free of leaks.
3. The rig shall have a system to monitor and record maximum pull-back pressure during pull-back operations.
4. There shall be a system to detect electrical current from the drill string and an audible alarm that automatically sounds when an electrical current is detected.

C. The drill head shall be steerable by changing its rotation and shall provide necessary cutting surfaces and drilling fluid jets.

D. Mud motors (if necessary) shall be of adequate power to turn the required drilling tools.

E. Guidance System
1. General
a. An electronic "walkover" tracking system or a magnetic guidance system probe or proven (non-experimental) gyroscopic probe and interface shall be used to provide a continuous and accurate determination of the location of the drill head during the drilling operation.
b. The guidance system shall be capable of tracking at all depths up to fifty feet and in any soil condition including hard rock.

c. It shall enable the driller to guide the drill head by providing immediate information on the tool face, azimuth (horizontal direction), and inclination (vertical direction).
d. The guidance system shall be accurate and calibrated to the manufacturer's specifications.

2. The Contractor shall supply all components and materials to install, operate, and maintain the guidance system.
3. The magnetic guidance system shall be set up and operated by personnel trained and experienced with the system.
4. The Contractor shall be aware of any geo-magnetic anomalies and shall consider such influences in the operation of the guidance system.

F. Drilling Fluid System

1. The Contractor shall use a self-contained, closed, drilling fluid mixing system of sufficient size to mix and deliver drilling fluid as necessary to install the pipe according to the plans and specifications and to prevent damage to existing utilities and improvements.
2. Drilling fluids shall have additives as necessary to carry cuttings away from the bore face, lubricate the pipe installation, and prevent damage to existing utilities and improvements.
3. The delivery system shall be capable of delivering the drilling fluid at the rate necessary to carry cuttings away from the bore face, lubricate the pipe installation, and prevent damage to existing utilities and improvements.

G. Other Equipment

1. Other devices or utility placement systems for providing horizontal thrust other than those previously defined in the preceding sections shall not be used unless approved by the Engineer prior to commencement of the work.

2.3 PERSONNEL REQUIREMENTS

A. All personnel shall be fully trained in their respective duties as part of the directional drilling crew and in safety.

B. One competent and experienced supervisor representing the Contractor and another representing the drilling subcontractor, if such a subcontractor is used, shall be present at all times during the actual drilling operations.

1. A responsible representative who is thoroughly familiar with the equipment and type of work to be performed must be in direct charge and control of the operation at all times.
2. The Contractor and Subcontractor shall have a sufficient number of competent workers on the job at all times to insure the bore is made in a timely and satisfactory manner.

2.4 Personnel who are unqualified, incompetent, or otherwise not suitable for the performance of this project shall be removed from the job site and replaced with suitable personnel.

PART 3 EXECUTION

3.1 GENERAL REQUIREMENTS

A. The Engineer must be notified a minimum of three days in advance of starting work.

B. All work under this specification shall be carried out to the full satisfaction of representatives of the owners of any affected properties, right-of-ways, or facilities.

C. The Contractor shall fully inform himself of all requirements of permits as they pertain to specific project requirements and shall conduct all his work accordingly.

D. All equipment used by the Contractor on Owner's property and right-of-ways may be inspected by the Owner or the Owner's representative and shall not be used if considered unsatisfactory by Owner or Owner's representative.

E. The Contractor shall be fully responsible for all damages arising from his failure to comply with all applicable regulations and the requirements of these Specifications.

F. The Contractor is responsible for determining the length of bore that is appropriate for the pipe material and class specified and shown on the plans. The length to be installed may need to be divided into multiple segments. Indicate the number of segments on the bore plan submitted to the Engineer. Any pipe damaged during installation shall be replaced to the Engineer's satisfaction at the Contractor's expense.

G. The conduit, or encasement, to be installed shall extend to the distances as shown on the Plans.

H. If necessary to prevent cave-ins, sheet, shore or brace pits in accordance with OSHA regulations. All pits shall be closed at the end of each work day if possible. Any pit left open overnight shall be properly barricaded and secured in accordance with OSHA and ODOT regulations.

I. Location of all pits shall be approved by the Engineer.

J. The Contractor shall furnish, for the approval of the Engineer, a plan showing his proposed method of handling, arrangement and positioning of boring equipment, type of equipment to be used, pipe guides, etc., complete in assembled position. The approval of this plan by the Engineer will not relieve the Contractor from his responsibility to obtain the results herein or as shown on the Plans.

K. An approximate 2" pilot hole shall be bored the entire length of the bore and shall be checked for line and grade on the opposite end of the bore from the bore pit. This pilot hole shall serve as the centerline of the larger diameter hole to be bored.

L. Any pipe damaged in boring operations shall be removed and replaced by the Contractor at his expense. The pits or trenches excavated to facilitate boring operations shall be backfilled completely after the boring of the pipe has been completed and approved.

3.2 DRY BORING

A. The boring shall proceed from a pit provided for the boring equipment and workmen. Only workmen experienced in boring operations shall perform the work in accordance with the Engineer approved bore plan. When boring of pipe is begun, the operation shall be carried on without interruption, insofar as practicable, to prevent the pipe from becoming firmly setin the embankment.

B. The use of water or other fluids in connection with the boring operation will NOT be permitted except for a minor amount of bentonite solution required for the cutting head.

C. The conduit shall be installed in the bore hole simultaneously while the bore is being made. Proper care should be taken to secure the joints of the conduit as subsequent sections are installed. A steel rail or timber cradle shall be provided to support and guide the encasement pipe during installation.

D. If, after completion of the bore, there is more than 1" clearance between the outside of the conduit and the bore wall, grouting of this void will be required. If during installation a cave- in occurs within the bore, grouting of the voids will be required between the conduit and the bore wall for the full length of the bore.

E. Bores located within public rights-of-way shall conform to the requirements of the agency having jurisdiction over the right-of-way (ODOT, Railroad, County, City, etc) as to details of construction methods and time of construction. All work necessary to meet the requirements of said agencies shall be considered subsidiary to the installation of the pipeline in the right-of-way. The Contractor shall abide by the more stringent of these specifications, or the specifications of the regulatory agencies.

3.3 WET BORING

A. The boring shall proceed from a pit provided for the boring equipment and workmen. Only workmen experienced in boring operations shall perform the work in accordance with the Engineer approved bore plan. A pilot hole must be successfully completed to the satisfactionof the Engineer prior to back reaming the bore.

B. The use of water or other fluids in connection with the boring operation will be permitted only to lubricate cuttings. Jetting will not be permitted.

C. While boring is being performed, the conduit shall be installed immediately by pulling it in place from opposite the boring machine. Proper care should be taken to secure the joints of the conduit as subsequent sections are installed.

D. If, after completion of the bore, there is more than 1" clearance between the outside of the conduit and the bore wall, grouting of this void will be required. If during installation a cave- in occurs within the bore, grouting of the voids will be required between the conduit and the bore wall for the full length of the bore.

E. Grouting materials and equipment shall be on site bore beginning conduit installation to ensure that grouting, if necessary, begins immediately after conduit is in place.

F. Bores located within public rights-of-way shall conform to the requirements of the agency having jurisdiction over the right-of-way (ODOT, Railroad, County, City, etc) as to details of construction methods and time of construction. All work necessary to meet the requirements of said agencies shall be considered subsidiary to the installation of the pipeline in the right-of-way. The Contractor shall abide by the more stringent of these specifications, or the specifications of the regulatory agencies.

3.4 HORIZONTAL DIRECTIONAL DRILLING OPERATION

A. The Contractor shall provide all material, equipment, and facilities required for directional drilling.
   1. Proper alignment and elevation of the borehole shall be consistently maintained throughout the directional drilling operation.
   2. The method used to complete the directional drill shall conform to the requirements of all applicable permits.
   3. The Engineer will supply to the Contractor copies of all permits the Owner must obtain.

B. If the Contractor is using a magnetic guidance system, the drill path shall be surveyed for any geo-magnetic variations or anomalies.

C. The Contractor shall place silt fence or other erosion control measures between all drilling operations and any drainage path, well, wetland, waterway, or other area designated for such protection if required by the plans, specifications, or state, federal, or local regulations.
   1. Additional protection necessary to contain any hydraulic or drilling fluid spills shall be put in place, including berms, liners, turbidity curtains, and other measures.
   2. A berm, minimum of 12-inches high, shall be maintained around the drill rig, the drilling fluid mixing system, entry and exit pits, and the drilling fluid recycling system to prevent spills into the surrounding environment.
   3. The Contractor shall adhere to all applicable environmental regulations.

D. All recorded readings and plan and profile information shall be made available if requested by the Engineer.

E. At no time shall the deflection radius of the drill pipe exceed the deflection limits of the carrier pipe as specified herein.

F. All drilling fluids and loose cuttings shall be contained in pits or holding tanks for recycling or disposal. No fluids shall be allowed to enter any unapproved areas or natural waterways.

G. Upon completion of the directional drill project, the drilling mud and cuttings shall be disposed of by the Contractor at an approved dumpsite. Pumping equipment and/or vacuum trucks of sufficient size and number shall be in place to convey drilling fluid from containment areas to storage and recycling facilities or disposal.

H. The pilot hole shall be drilled on the bore path with no deviations greater than 5% of the depth or one foot (whichever is less) for water lines and no deviations greater than one inch for sanitary sewer lines.
   1. In the event that the pilot hole does deviate from the bore path more than specified, the Contractor will notify the Engineer and may be required to pull-back and re-drill from a location along the bore path before the deviation.
   2. In the event of a drilling fluid fracture, inadvertent returns, or returns loss during pilot hole drilling operations, Contractor shall cease drilling, discuss options with the Engineer, and then proceed as agreed.

I. The slurry used during pull-back is to be contained at the exit and entry points in pits or holding tanks.

J. The slurry may be recycled for reuse in the hole opening operation or shall be hauled by the Contractor to an approved dumpsite for proper disposal.

3.5 PIPE HANDLING

A. Care shall be taken during transportation of the pipe such that it will not be cut, kinked, or otherwise damaged.

B. Ropes or fabric or rubber protected slings or straps shall be used when handling pipe.
   1. Chains, cables, or hooks inserted into the pipe ends shall not be used.
   2. Two slings spread apart shall be used for lifting each length of pipe.
   3. Pipe or fittings shall not be dropped into rocky or unprepared ground

C. Pipe shall be stored on level ground, preferably turf or sand, which is free of sharp objects that could damage the pipe.

D. The handling of the assembled pipeline shall be in such a manner that the pipe is not damaged by dragging it over sharp and cutting objects.
   1. Slings for handling the pipeline shall not be positioned at pipe joints.
   2. Sections of the pipes with cuts and gouges or excessive deformation shall be removed and replaced.

END OF SECTION

SECTION 33_05_07.33

UTILITY BORING & JACKING

PART 1 GENERAL

1.1 SCOPE OF WORK

A. Utility line crossings roadways & railroads or other items specified on the Drawings using bore, tunneling, or open cut. Cost bid to include vent pipes per ODOT/Railroad requirements.

B. The Contractor performing boring operations on this project must have installed a minimum of 15,000 linear feet of pipe in the last 4 years (24" diameter or greater) using directional drilling operations.
   1. Prequalified contractors who have previously demonstrated the capabilities and qualifications to perform this work include:
      a. Del-Sha Directional Drilling, Van Buren, AR (479-262-2670.)

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 33_05_25 Steel Casing Pipe

D. Section 33_05_07 Utility Directional Drilling

E. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

B. The Contractor shall submit a list of previous projects completed showing that the Contractor meets the experience requirements of this Specification (See 1.1F.) No exceptions. The list of projects supplied to demonstrate experience requirement shall include:
   1. The Owner of the project.
   2. Type of line installed (e.g. – water, sewer, etc.).
   3. Pipe material, size, and length installed by horizontal directional drilling.

4. Dates of installation.

C. Product data sheets on the materials to be used shall be submitted to the Engineer. Material shall include the pipe, fittings, and any other item that is to be an installed component of the project.

D. Material Safety Data Sheets for all drilling fluid additives shall be submitted to the Engineer.

E. The Contractor shall submit a daily project log of drilling operations at the completion of the project.

1.4 REFERENCE STANDARDS

A. AWWA C-206 – "Field Welding of Steel Water Pipe"

B. AWWA C-210 – "Liquid Epoxy Coating Systems for the Interior and Exterior of Steel Water Pipelines"

C. AASHTO M-190 – "Bituminous Coated Corrugated Metal Culvert Pipe and Pipe Arches"

D. AASHTO – Standard Specifications for Highway Bridges, 1989.

E. ASTM A-36 – "Structural Steel"

F. ASTM A-123 – "Zinc (Hot Dipped Galvanized) Coatings on Iron and Steel Productss

G. ASTM A-135 – "Electric - Resistance - Welded Steel Pipe"

H. ASTM A-139 – "Electric - Fusion (Arc) - Welded Steel Pipe"

I. ASTM A-153 – "Zinc Coating (Hot Dip) on Iron and Steel Hardware"

J. ASTM A-307 – "Carbon Steel Bolts and Studs, 60,000 PSI Tensile"

K. ASTM A-449 – "Quenched and Tempered Steel Bolts and Studs"

L. ASTM A-569 – "Steel, Carbon, Hot-Rolled Sheet and Strip, Commercial Quality"

M. ASTM A-570 – "Hot Rolled Carbon Steel Sheet and Strip, Structural Quality"

N. ASTM C-76 – "Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe"

O. ASTM D-4254 – "Test Methods for Minimum Index Density of Soils and Calculation of Relative Density"

1.5 QUALITY ASSURANCE

A. Installer's Qualifications:
1. Installation shall be by a competent, experienced Contractor or sub-contractor.

2. The Contractor performing boring operations on this project must have installed a minimum of 15,000 linear feet of pipe in the last 4 years (24" diameter or greater) using directional drilling operations.
3. Prequalified contractors who have previously demonstrated the capabilities and qualifications to perform this work include:
   a. Del-Sha Directional Drilling, Van Buren, AR (479-262-2670.)
4. The Contractor shall submit a list of previous projects completed showing that the Contractor meets the experience requirements of this section. The list shall include:
   a. The Owner of the project.
   b. Type of line installed (e.g. – water, sewer, etc.).
   c. Pipe material, size, and length installed by horizontal directional drilling.
   d. Dates of installation.

B. Performance Requirements:
1. Lateral or vertical variation in the final position of the pipe casing or tunnel liner from the line and grade established by the Engineer shall be acceptable only to the extent that it does not impact the line and grade of the carrier pip shown on the Plans.

1.6 SYSTEM DESCRIPTION/DESIGN REQUIREMENTS

A. No blasting shall be allowed.

B. Existing pipelines are to be protected.

1. The Contractor shall verify location and elevation of any pipelines and telephone cable before proceeding with the construction and plan his construction so as to avoid damage to the existing pipelines or telephone cables.

2. Verification of location of existing utilities shall be the complete responsibility of the Contractor.

C. Casing Material:

1. Unless specified otherwise, the Contractor shall use steel pipe for all casing pipe.

2. The material specification for casing pipe and tunnel liner are the minimum acceptable.

3. The Contractor shall be fully responsible to insure the materials used are of sufficient strength for the installation method chosen and the soil conditions encountered.

D. Bore And Tunnel Methods:

1. Unless specified otherwise, the Contractor may use boring, and jacking for the installation method of casing material.

2. The Contractor shall be fully responsible to ensure the methods used are adequate for the protection of workers, pipe, property, and the public. Provide a finished product as required.

PART 2 PRODUCTS

2.1 MATERIALS

A. Steel Pipe:
1. Steel casing pipe shall have a minimum yield strength of 35,000 psi.
2. Steel casing pipe to be installed within Railroad Right-of-way shall becoated with coal tar epoxy meeting the requirements of Corp of EngineersSpecification C-200A. Coal tar epoxy shall be installed in two 8 mil coats for a total DFT of 16 mils. Welded joints shall be field coated. All other casing installed outside of Railroad Right-of-way may be uncoated.
3. For additional information see Section 33_05_25 Steel Casing Pipe.

2.2 MIXES

A. Cement Mortar:
1. Consisting of one (1) part cement to two (2) parts clean sand with sufficient water to make a thick workable mix.

B. Pressure Grout Mix:
1. Comprised of 1 cubic foot of cement and 3.5 cubic feet of clean fine sand with sufficient water added to provide a free-flowing thick slurry.
2. If desired to maintain solids in the mixture in suspension, one cubic foot of commercial grade bentonite may be added to each 12 to 15 cubic feet of the slurry.

2.3 MANUFACTURED PRODUCTS

A. Casing Insulators:
1. Use casing insulators for all types of carrier pipe.
2. Insulators shall consist of pre-manufactured steel bands with plastic lining and plastic runners.
3. Insulators shall fit snug over the carrier pipe and position the carrier pipe approximately in the center of the casing pipe, to provide adequate clearance between the carrier pipe bell and the casing pipe.
4. Fasteners for insulators shall be stainless steel.
5. Insulators shall be as manufactured by Advanced Product and Systems, Inc., Model #SSI, or Engineer approved equal.

B. End Seals:
1. All casing shall be sealed.
2. Seals shall be one-piece rubber with stainless steel bands.
3. End seal shall be molded to fit the casing pipe and carrier pipe.

2.4 Advanced Product and Systems, Model #AC or Engineer approved equal.

PART 3 EXECUTION

3.1 GENERAL CONSTRUCTION PROCEDURES

A. Excavation And Backfill of Access Pits
   1. Do not allow excavation over the limits of the bore or tunnel as specified.
      a. Trench walls of access pits adjacent to the bore or tunnel face shall be truly vertical
      b. Shore the trench walls as necessary to protect workmen, the public, structures, roadways, and other improvements.
   2. Excavations within the right-of-way and not under surfacing shall be backfilled and consolidated by tamping in 6" horizontal layers to 95% of maximum density as measured by ASTM D-698.
      a. Surplus material shall be removed from the right-of-way and the excavation finished to original grades.
      b. Backfill pits immediately after the installation of the carrier pipe is completed.
      c. If carrier pipe is not installed immediately after casing pipe installation, the Right-of-Way Owner may require the access pits be temporarily backfilled until installation of carrier pipe.
   3. Where seeding or sodding is disturbed by excavation or backfilling operations, such areas shall be replaced by seeding or sodding as specified.

B. Installing Carrier Pipe in Casings
   1. Pipe to be installed within the casing or tunnel liner shall meet the requirements for this type of pipe as specified.
      a. Where indicated, place, align, and anchor guide rails and/or casing insulators inside the casing.
      b. If guide rails are used, place cement mortar on both sides of the rails.
   2. Pull or skid pipe into place inside the casing.
      a. Lubricants such as flax soap or drilling mud may be used to ease pipe installation.
      b. Do not use petroleum products, oil or grease for this purpose.
      c. If guide rails are used, install pipe and hold down jacks after installation of carrier pipe.
   3. After installation of the carrier pipe, mortar inside and outside of the joints as applicable.
   4. After carrier pipe installation is complete, install required end seals at each end of the casing.

C. Free-Air System:
   1. If required by OSHA standards, free-air systems shall be installed and maintained.

D. Installation of Pressure Grout Mix
   1. Install pressure grout mix in the void space between the outside of the casing pipe or tunnel liner and the excavation.
   2. For bore or jacks with casing pipe, install pressure grout mix immediately upon completion of setting casing pipe.

3.2 CROSSINGS INSTALLED BY BORING

A. Perform the boring from the low or downstream end unless specified otherwise.
   1. The casing bore shall be done by auger type boring method. The casing bore shall not be done by directional drilling unless approved by the Engineer prior to bidding.
   2. Place excavated material near the top of the working pit and dispose of material as required.
   3. The cutter head shall not extend outside the leading end of the pipe. There shall not be extended pauses during the installation of casing below roadways and/or railroads.
   4. Jetting shall not be permitted.

B. In unconsolidated soil formations, a gel-forming colloidal drilling fluid consisting of at least 10% of high grade carefully processed bentonite may be used to consolidate cuttings of the bit, seal the walls of the hole, and furnish lubrication for subsequent removal of cuttings and installation of the pipe immediately thereafter.

C. In locations where the soil formation is other than consolidated rock, insert the casing pipe simultaneously with the boring operation.
   1. This requirement applies to all bored holes of 18" or greater in diameter.
   2. For smaller diameter bored holes, it is desirable that the casing be installed as the boring progresses, but because of differences in soil formations, the time for inserting the casing shall be the Contractor's responsibility.
   3. In the event that caving sand or water bearing materials are encountered, insert the casing pipe simultaneously with the boring operation regardless of the diameter of the bored hole.
   4. In all cases, the security and integrity of the roadway/railroad is the primary concern.
   5. The Contractor shall be held fully responsible for the continued integrity of the structure of the roadway/railroad being crossed, whether or not a casing pipe is inserted simultaneously with the boring operation.

3.3 CROSSINGS INSTALLED BY TUNNELING AND JACKING

A. Jack the pipe from the low or downstream end, unless specified otherwise.
   1. Provide heavy-duty jacks suitable for forcing the pipe through the embankment.
   2. In operating jacks, apply even pressure to the jacks used.
   3. Provide a suitable jacking head and bracing between jacks so that pressure will be applied to the pipe uniformly around the ring of the pipe.
   4. Provide a suitable jacking frame or backstop.
   5. Set the pipe to be jacked on guides, properly braced together, to support the section of the pipe and to direct it in the proper line and grade.
   6. Place the whole jacking assembly so as to line up with the direction and grade of the pipe.
   7. In general, excavate embankment material just ahead of the pipe and material removed through the pipe.
   8. Force the pipe through the embankment with jacks into the space provided.

B. The excavation for the underside of the pipe, for at least 1/3 of the circumference of the pipe, shall conform to the contour and grade of the pipe.

1. Provide a clearance of not more than 2" for the upper half of the pipe.
2. This clearance shall be tapered off to zero at the point where the excavation conforms to the contour of the pipe.
3. Extend the distance of the excavation beyond the end of the pipe depending on the character of the material, but do not exceed 2' in any case.
4. Decrease the distance if the character of the material being excavated makes it desirable to keep the advance excavation closer to the end of the pipe.

C. If desired, use a cutting edge of steel plate around the head end of the pipe extending a short distance beyond the end of the pipe with inside angles or lugs to keep the cutting edge from slipping back onto pipe.

D. When jacking of pipe has begun, carry on the operation without interruption to prevent the pipe from becoming firmly set in the embankment.
1. Remove and replace any pipe damaged in the jacking operations.
2. The Contractor shall absorb the entire expense.

3.4 CROSSINGS WITH CASING INSTALLED BY OPEN CUT

A. This article covers the requirements for the construction of crossings where pipe casing is required for installation by the open cut method.

B. Excavation, backfill, and embedment of casing pipe shall be as specified.

C. Casing shall be bedded in gravel material to the springline of the casing.

D. Contractor shall backfill with select fill material compacted in 8-inch lifts.

E. Contractor shall complete the backfill and repair the pavement section as shown.

F. If settlement occurs, the pavements shall be removed and the trench recompacted at the Contractor’s expense.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 33_05_09.34

CONCRETE THRUST BLOCKS & COLLARS

PART 1 GENERAL

1.1 SCOPE OF WORK

A. Concrete blocking or anchorage for thrust resistance placed at bends, tees, crosses, fire hydrants, plugs, blow-offs, etc. in the supply line.

PART 2 PRODUCTS (NOT USED)

2.1 MATERIALS

A. Concrete strength shall be at least 3,000 psi at twenty-eight (28) days.

B. 3,000 psi sack-crete may be used but must be hydrated prior to placement.

PART 3 EXECUTION

3.1 CONSTRUCTION METHODS

A. Concrete thrust blocks and anchors shall be provided along pipelines subject to internal water pressures in accordance with Thrust Restraint for Ductile Iron Pipe, (DIPRA, 3rd Edition, 1992), the construction details, plan drawings, or as directed by the Engineer. The concrete mix shall be in accordance with ACI 318, 3,000 psi, for thrust collars and thrust blocks. Admixtures are not to be used without the approval of the Engineer.

B. Concrete for thrust blocks shall be placed against undisturbed soil. The excavation shall be hand shaped and free of loose material and water before concrete is placed. Forms shall be used to confine the concrete in areas other than that part that is in contact with undisturbed soil in the direction of the thrust. Steel reinforcement shall be placed as specified on the Plans. No concrete shall be placed around any part of a joint or placed so that it interferes with the removal of any joint accessories such as bolts, followers, threads, collars, couplings, etc. Fire hydrant drains shall not be restricted. The pipe or appurtenances shall be cleaned before placing concrete when the concrete is to be in direct contact with the pipe or appurtenances.

C. The top of the concrete thrust block or collar shall be struck off with a wood straight edge or float. Concrete shall not be placed when the temperature is below 40° F, or below 35° if the temperature is rising unless approved by the Engineer.

D. All placement of concrete must be in the presence of the Engineer or his representative. TheContractor is cautioned that he may be required to remove any concrete placed in the absence of the Engineer or his representative without compensation.

E. Backfill over concrete thrust blocks or collars shall not be placed before the concrete has attained initial set.

F. The area of contact of the thrust blocks and collars shall be sufficient to resist the thrust. This area will vary, depending on the safe bearing value of the soil. No thrust blocks shall be less than eighteen (18) inches thick between the pipeline or appurtenances and undisturbedsoil in the direction of the thrust. Suggested safe bearing values are as follows:

Soil Bearing Capacities

Soil	Bearing Load (lb./sq. ft.)
Muck	0
Soft Clay	1000
Silt	1500
Sandy Silt	3000
Sand	4000
Sandy Clay	6000
Hard Clay	9000

The above values are approximate and will vary considerably and are intended to be used only as a guide. The Contractor is responsible for determining the soil bearing value or taking other action to assure that the bearing area is adequate to restrain the pipe or appurtenances.

G. Where the soil is unstable or in the case of recent fill areas, the following procedures shall apply either singly or in a combination:
1. Thrust blocks shall be of adequate size to restrain pipe or appurtenances by mass alone without depending on horizontal bearing of the soil.
2. The excavation shall extend deep enough to contact firm soil and the block brought up to the pipe or appurtenances and constructed so that the block acts as a beam and will provide restraint required. Such blocks shall be reinforced with steel reinforcing bars.
3. Anchor blocks shall be constructed in a firm soil and tie rods extended to the pipe orappurtenances.

H. Thrust blocks for vertical bends shall be adequate to resist the thrust by mass alone when the thrust is upward.

I. Thrust blocks and collars shall be adequate to restrain the pipeline and appurtenances atthe specified test pressure. The following table lists the resultant thrust at certain fittings at pressure of 100 psi. In order to determine the thrust at the test pressure, these values are tobe multiplied by a factor equal to the test pressure divided by 100.

Resultant Thrust at Fittings at 100 psi Water Pressure

Total Pounds					
Nom. Pipe Dia. (in.)	Dead End	90° Bend	45° Bend	22½° Bend	11¼° Bend

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 33_05_25

STEEL CASING PIPE

PART 1 GENERAL

1.1 SUMMARY

A. Section includes minimum requirements for manufacturing, furnishing and transporting Steel Casing Pipe at the locations shown on the Drawings

B. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. 33_05_07.13 Utility Directional Drilling

C. 33_05_07.33 Utility Boring & Jacking

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

B. ASTM International (ASTM):
1. A139, Standard Specification for Electric-Fusion (Arc)-Welded Steel Pipe (NPS Sizes 4 and Over).

C. American Water Works Association (AWWA):
   1. C203, Coal-Tar Protective Coatings and Linings for Steel Water Pipelines - Enamel and Tape - Hot Applied.

D. Occupational Safety and Health Administration (OSHA)
   1. OSHA Regulations and Standards for Underground Construction, 29 CFR Part 1926, Subpart S, Underground Construction and Subpart P, Excavation.

PART 2 PRODUCTS

2.1 EQUIPMENT, PRODUCT TYPES AND MATERIALS

A. Manufacturers
   1. The manufacturer must comply with this Specification and related Sections.

B. Design Criteria
   1. The Contractor is fully responsible for the design of Steel Casing Pipe that meets or exceeds the design requirements of this Specification and that is specifically designed for installation by the intended trenchless method.
   2. For Steel Casing Pipe utilized for tunneling projects, consider the following:
      a. Design of the casing pipe shall account for all installation and service loads including:
         1) Jacking loads
         2) External groundwater and earth loads
         3) Traffic loads
         4) Practical consideration for handling, shipping and other construction operations
         5) Any other live or dead loads reasonably anticipated
      b. Design shall be sealed and signed by a registered Professional Engineer licensed in the State of Oklahoma.
      c. The allowable jacking capacity shall not exceed 50 percent of the minimum steel yield stress.
   3. Steel Casing Pipe shall have a minimum wall thickness as follows:

Casing Diameter	Wall Thickness
<12”	0.25”
14” - 18”	0.3125”
19” - 22”	0.375”
23” - 28”	0.4375”
29” - 34”	0.50”
35” - 42”	0.5625”
43” - 48”	0.625”

   4. Wall thicknesses exceeding the table above may be used at the sole expense of the Contractor.
   5. Steel Casing Pipe shall be provided with inside diameter sufficient to efficiently install the required carrier pipe with casing spacers as required.
      a. Allowable casing diameters are shown on the Drawings for each crossing.

6. Furnish in lengths that are compatible with Contractor's shaft sizes and allowable work areas.
7. Random segments of pipe will not be permitted for straight runs of casing.
    a. Closing piece segments, however, shall be acceptable.
8. When required by installation method, provide grout/lubricant ports along the pipe at intervals of 10 feet or less.
    a. Ports and fittings shall be attached to the pipe in a manner that will not materially affect the strength of the pipe nor interfere with installation of carrier pipe.
    b. Plugs for sealing the fittings shall be provided by the Contractor and shall be capable of withstanding all external and internal pressures and loads without leaking.

C. Materials
1. Provide new, smooth-wall, carbon steel pipe conforming to ASTM A139, Grade B.
2. Dimensional Tolerances
    a. Furnishing and installing Steel Casing Pipe with dimensional tolerances that are compatible with performance requirements and proposed installation methods that meet or exceed the specific requirements below:
        1) Minimum wall thickness at any point shall be at least 87.5 percent of the nominal wall thickness.
        2) Outside circumference within 1.0 percent or 3/4 inch of the nominal circumference, whichever is less.
        3) Outside diameter of the pipe shall be within 1/8 inch of the nominal outside diameter.
        4) Roundness such that the difference between the major and minor outside diameters shall not exceed 0.5 percent of the specified nominal outside diameter or 1/4 inch, whichever is less.
        5) Maximum allowable straightness deviation of 1/8 inch in any 10-foot length.
3. All steel pipe shall have square ends.
    a. The ends of pipe sections shall not vary by more than 1/8 inch at any point from a true plane perpendicular to the axis of the pipe and passing through the center of the pipe at the end.
    b. When pipe ends have to be beveled for welding, the ends shall be beveled on the outside to an angle of 35 degrees with a tolerance of ± 2½ degrees and with a width of root face 1/16 inch ± 1/32 inch.
4. Steel Casing Pipe shall be fabricated with longitudinal weld seams.
    a. All girth weld seams shall be ground flush.

D. Finishes
1. Provide inside and outside of Steel Casing Pipe with a coal-tar protective coating in accordance with the requirements of AWWA C203.
    a. Touch up after field welds shall provide coating equal to those specified above.

PART 3 EXECUTION (NOT USED)

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 33_05_61

CONCRETE MANHOLES

PART 1 GENERAL

1.1 SCOPE OF WORK

A. Concrete manholes, frames and covers and appurtenances as shown on the Drawings and as specified. Manholes shall be constructed of precast concrete sections or cast-in-place concrete unless otherwise noted elsewhere. All manholes shall be watertight.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 09_91_00.13 Painting of Treatment Plants

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Section 01_33_01 – General Submittal Requirements: Procedures for submittals.

B. Shop Drawings: Indicate manhole locations, elevations, piping, sizes and elevations of penetrations.

C. Product Data: Provide manhole covers, component construction, features, configuration, and dimensions.

1.4 REFERENCE STANDARDS

A. American Association of State Highway Transportation Officials:
   1. AASHTO M306 - Standard Specification for Drainage, Sewer, Utility, and Related Castings.

B. American Society for Testing and Materials (ASTM)
   1. ASTM A48/A48M - Standard Specification for Gray Iron Castings.
   2. ASTM C76 – Standard Specifications for Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe.
   3. ASTM C443 – Standard Specification for Joints for Concrete Pipe and Manholes, using Rubber Gaskets.

4. ASTM C478 – Standard Specification for Circular Precast Reinforced Concrete Manhole Sections.
5. ASTM C497 - Standard Test Methods for Concrete Pipe, Manhole Sections, or Tile.
6. ASTM C913 - Standard Specification for Precast Concrete Water and Wastewater Structures.
7. ASTM C923 – Standard Specifications for Resilient Connectors between Reinforced Concrete Manhole Structures, Pipes, and Laterals.
8. ASTM D2665 – Standard Specification for Poly (Vinyl Chloride) (PVC) Plastic Drain, Waste, and Vent Pipe and Fittings.

1.5 QUALITY ASSURANCE

A. The quality of materials, the process of manufacture, and the finished sections will be subject to inspection and approval by the Engineer. Such inspection may be made at the place of manufacture, or after delivery, or at both places. The materials shall be subject to rejection at any time on account of failure to meet any of the Specification requirements; even though samples may have been accepted as satisfactory at the place of manufacture. Material rejected after delivery to the job site shall be marked for identification and shall be removed from the job site at once. Materials which have been damaged after delivery will be rejected, and if already installed, shall be acceptably repaired, or removed and replaced, entirely at the Contractor's expense.

B. At the time of inspection, the materials will be carefully examined for compliance with the latest ASTM designations specified and these Specifications, and with the approved manufacturer's drawings. Manhole sections will be inspected for general appearance, dimension, blisters, cracks, roughness, soundness, etc. The surface shall be dense and close-textured.

C. Imperfections in manhole sections may be repaired, subject to the approval of the Engineer, after demonstration by the manufacturer that repairs will result in a strong manhole section. Repairs shall be carefully inspected before final approval. Cement mortar used for repairs shall give a minimum compressive strength of 4,000 psi at seven days and 5,000 psi at 28 days, when tested in three inch by six inch cylinders stored in the standard manner. Epoxy mortar may be utilized for repairs subject to the approval of the Engineer.

D. Manhole sections shall be subject to rejection on account of failure to conform to any of the requirements specified herein or having defects as follows.
   1. Variations in any dimensions exceeding the permissible variation allowed in ASTM C478.
   2. A piece broken out of the bell, spigot, tongue or groove in such size that the watertightness of the joint will be impaired.
   3. Any shattering or flaking of concrete or other conditions indicating an improper concrete mix.
   4. Cracks sufficient to impair the strength, durability, or serviceability of the pipe.
   5. Joint Sections with spalls, cracks, fractures, or other imperfections that will adversely affect the performance of the joints

1.6 DELIVERY, HANDLING AND STORAGE

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Handling: Comply with precast concrete manufacturer instructions and ASTM C913 for unloading and moving precast manholes and drainage structures.

C. Storage:
1. Store materials according to manufacturer instructions.
2. Store precast concrete manholes and drainage structures to prevent damage to Owner's property or other public or private property.
3. Repair property damaged from materials storage.

PART 2 PRODUCTS

2.1 PRECAST CONCRETE MANHOLE

A. MATERIALS: Manhole Sections: Reinforced precast in accordance with ASTM C478 with gasketsin accordance with ASTM C923.

B. COMPONENTS
1. Lid and Frame:
a. ASTM A48, Class 30B Cast iron construction, machined flat bearing surface,removable, watertight lid where shown.
b. Lid design; live load rating of 20,000 psi, sealing gasket, molded with "CITY OF [CITY] SANITARY SEWER", or "STORM SEWER" depending the application for the lid.
c. The ring and lid shall weigh a minimum of 350 pounds.
d. Manufacturer: East Jordan Iron Works, Inc., Model V-1420/1480 or Engineerapproved equal.
e. Manhole rings and covers where shown shall be watertight.
2. Base pads shall be precast in accordance with ASTM C478.
3. Bituminous or non-shrink grout forming a watertight seal.
4. Resilient Connectors: A-Lock or Engineer approved equal in accordance with ASTM C-923.

C. CONFIGURATION
1. Shaft Construction:
a. See drawings.
b. Joints shall be sealed with compression seal.
c. Seal shall be Forsheda No. 114 or Engineer approved equal.
2. Shape: Cylindrical.
3. Clear Inside Dimensions:
a. Minimum inside diameter of 48 inches for standard manhole sections.
b. For manhole section other than standard, the minimum inside diameter shall beas indicated on the Drawings.
4. Design Depth: As indicated.
5. Clear Lid Opening: 30 inches in diameter or as indicated.
6. Pipe Entry: Provide openings as indicated or required.
7. Steps: Provide corrosion resistant manhole steps meeting ASTM C478 Sec 11
8. Pipe Connections: Resilient connections cast into the wall of the precast base.
9. Manhole Inverts:
a. Grout inverts after pipes are in place.
b. Bench sides as required.

c. Slope for drainage.

2.2 CAST-IN-PLACE MANHOLES

A. Cast-in-place concrete manholes shall conform to the drawings. The concrete strength shall be 4,000 psi at 28-days for the construction of the base, walls, cone and top slab. The concrete shall be in accordance with Division 03. The concrete shall be vibrated to assure a monolithic structure free from infiltration.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify items provided by other sections of Work are properly sized and located.

B. Verify that built-in items are in proper location, and ready for roughing into Work.

C. Verify elevations of adjacent sewermains

D. Verify excavation for manholes is correct.

3.2 PLACEMENT

A. Manhole shall be constructed to the dimensions shown on the Drawings and as specified. Work shall be protected against flooding and floatation.

B. Excavate to a uniform depth to permit the installation of a minimum of 12 inches of #57 rock material for base pad subgrade.

C. Precast concrete barrel sections shall be set so as to be vertical and with sections in true alignment with a ¼-inch maximum tolerance to be allowed. Joints of precast barrel sections shall be sealed with a rubber "O" ring set in a recess. Lift holes for handling barrel sections shall be filled with non-shrink grout and finished flush with the adjoining surfaces. Allow grout to set for 24 hours before backfilling. Backfilling shall be performed in a careful manner, bringing the fill up evenly on all sides. The Contractor shall install the precast sections in a manner that will result in a watertight joint.

D. Unless otherwise shown on the Drawings, manhole foundations shall consist of a reinforced concrete slab, 12-inch thick minimum, with #5 bars at 12-inch centers each way top and bottom. The foundation shall be a minimum of one foot larger than the outside diameter of the manhole.

E. Adjust elevation of gravel material as required to attain proper grade and alignment of the basesection.

F. Place base pad, set top surface level. Place manhole in accordance with manufacturer's recommendations.

G. Grout precast manhole section into base interior and apply mastic sealer exterior.

H. Place manhole sections plumb and level, trim to correct elevations, anchor to base pad.

I. Cutouts in the bottom sections shall be appropriate for the pipe being laid and shall have identifyingmarkings to facilitate their being used in the correct locations.

J. The connecting pipe for concrete manhole installation with resilient connectors shall be plain end,square cut, spigots, which shall not protrude more than one inch inside the manhole.

K. Stubs for future connections shall be provided at locations shown. Stubs shall be a minimum ofone pipe joint long (13 feet) and terminate in a bell with a plug at the distal end.

L. Grout base of shaft sections to achieve slope to exit piping. Trowel smooth. Contour as required.

M. Set cover frames and covers level without tipping, to correct elevations.

N. Coordinate with other sections of work to provide correct size, shape, and location.

O. Manhole height shall be adjusted by using variable height risers set at the lowest section belownatural grade.

P. Manholes constructed in advance of paving projects shall be constructed with the top of the concrete portion of the manhole 23-inches below the final finished grade. The ring and cover shall be placed on a built-up section of approved grade rings and sealers between rings and other materials.

3.3 INVERTS

A. The bottom of each manhole shall be provided with a "U" shaped channel that is a smooth continuation of the inlet and outlet pipes. In manholes with pipes of different sizes, the tops of thepipes shall be placed at the same elevation, unless otherwise shown on the drawings, and flow channels in the invert sloped on an even slope from pipe to pipe.

B. The surface of the concrete slab shaped to form the invert shall be sloped upward from the edge ofthe invert to the manhole wall.
   1. The upper half of any pipe extending inside the manhole shall be cut substantially flushwith the wall.
   2. Any rough edge shall be smoothed with mortar.

C. Mortar used in manholes shall be mixed in the proportions by volume of 1 part cement to 4 partssand. Mortar shall have a workable consistency, but shall be as dry as feasible.

D. The centerline projection of all pipes shall pass through the centerline of the manhole.

3.4 CONNECTION TO EXISTING MANHOLES:

A. Connection to existing manholes shall not be made until all downstream manholes and sewer lineshave been completed, cleaned, tested, and inspected in accordance with the specification. The Engineer must grant approval prior to connection to existing manholes.

B. Connections to existing manholes shall be made by cutting a hole in the wall of the existing manhole, shaping the bottom of the manhole to fit the invert of the connections, inserting a length of sewer pipe through the opening and filling around the pipe with cement mortar and troweling thecement mortar inside and outside the manhole to a neat finish.
   1. When necessary to satisfactorily perform the work, the flow of sewage shall be blocked ata time of minimum flow.
   2. If necessary to prevent flow back up in the line to the extent that the damage would occur, the Contractor shall maintain the flow level with a trench pump section inserted in the line or in the next upstream manhole.
   3. Discharge shall be made into an appropriate manhole downstream of the construction.
   4. Connections to manholes, mains, and house services shall be made in a thoroughly workmanlike manner to the satisfaction of the Engineer.
   5. All bypass pumping shall be considered subsidiary to the construction of the connectionand shall be provided by the Contractor at no additional expense to the Owner.

3.5 CONNECTION TO EXISTING GRAVITY SEWER MAINS:

A. Connection to existing gravity sewer mains shall not be made until all downstream manhole andsewer lines have been completed, cleaned, tested, and inspected in accordance with the specifications. The Engineer must grant approval prior to connection to existing gravity sewer mains.

B. Contractor shall carefully excavate around existing gravity sewer main and construct manhole base so as not to disrupt service of existing main. Contractor shall take all precautions and actions necessary to protect existing main.

C. Connections to existing main shall be made by excavating around the main constructing themanhole to fit the existing main and the proposed effluent line.
   1. Once the manhole has been properly constructed, cut the existing main, plug the existingmain effluent and direct the flow through the new main.
   2. When necessary to satisfactorily perform the work, the flow of sewage shall be blocked ata time of minimum flow.
   3. If necessary to prevent flow backup in the line to the extent that damage would occur, theContractor shall maintain the flow level with a trench pump inserted in the line or the upstream manhole.
   4. Discharge shall be made into an appropriate manhole downstream of construction.
   5. All bypass pumping shall be considered subsidiary to the construction of connection to existing sewer mains and shall be provided by the Contractor at no additional expense tothe Owner.

3.6 MANHOLES TO BE ABANDONED:

A. Manholes indicated on the Drawings to be abandoned shall be abandoned in accordance withthese specifications and the details of the drawings.

B. Manholes shall not be abandoned until the new interceptor has been completed, tested, inspectedand approved by the Engineer.

C. The Contractor shall plug existing influent and effluent mains, fill lower section to 3’ below natural ground with sand, then backfill the remainder of the manhole with accepted trench backfill material.
   1. Backfill material shall be placed in 8" lifts and compacted to 90% standard proctor or 95%standard proctor when in a pavement section.
   2. The manhole cone and riser shall be removed to an elevation of 3' below natural groundand then properly disposed of off-site.

3.7 MANHOLE ACCESS:

A. Entrance into manholes in excess of four feet deep shall be accomplished by means of a portableladder.

B. Contractor shall provide such ladder as necessary during construction.

C. Comply with appropriate OSHA requirements.

3.8 TESTING

A. Manholes shall be tested for leakage by hydrostatic exfiltration testing or vacuum testing. Manholes shall be tested after installation with all connections in place.

B. Hydrostatic Testing. The maximum leakage for hydrostatic testing shall be 0.025 gallons per foot diameter per foot of manhole depth per hour. For concrete manholes a wetting period of 24 hours may be used prior to testing in order to allow saturation of the concrete. If the manhole fails the hydrostatic test, the manhole shall be repaired and retested until it passes the test.

C. Vacuum Testing. All lift holes and exterior joints shall be plugged with a non-shrink grout. No grout shall be placed in horizontal joints prior to testing. All pipes entering the manhole shall be plugged. Stubouts, manhole boots, and pipe plugs shall be secured to prevent movement while the vacuum is drawn. A minimum 60-inch-lb torque wrench shall be used to tighten the external clamps that secure the test cover to the top of the manhole. The test head shall be placed at the inside of the top of the cone section, and the seal inflated in accordance with the manufacturer’s recommendations. A vacuum of 10 inches of mercury shall be drawn, and the vacuum pump shut off. With all valves closed, the time for the vacuum to drop to 9 inches of mercury shall not be less than 2 minutes. If vacuum tests are used In lieu of hydrostatic tests, the test shall be done both before and after backfilling of the manhole has occurred. If the manhole fails a test, necessary repairs shall be made with a non-shrink grout while the vacuum is being drawn. The test shall be repeated. If the vacuum test is failed twice, the manhole shall be repaired, and a hydrostatic test shall be performed in accordance with paragraph

3.9 CLEANING

A. All new manholes shall be thoroughly cleaned of silt, debris and foreign matter of any kind, prior to final inspection.

END OF SECTION

SECTION 33_05_64

PRECAST REINFORCED CONCRETE VAULT

PART 1 GENERAL

1.1 SUMMARY

A. Precast Reinforced Concrete Vault as required by this section of the Contract Documents, and/or other appropriate sections of Contract Documents.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 31_00_00 Earthwork

D. Section 31_23_24 Utility Earthwork

E. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

B. Manufacturer's Project Data Sheets
1. Manufacturer's product data sheets.
2. Shop drawings of manhole sections, base units and construction details, jointing methods, manhole penetration locations, materials, and dimensions.
3. Summary of criteria used in manhole design including, as minimum, material properties, loadings, load combinations, and dimensions assumed.
4. Manufacturer's certification of compliance with ASTM Standards
5. Frames, hatches, grade, rings and covers.
6. Materials to be used in fabricating drop connections.
7. Materials to be used for pipe connections at manhole walls.
8. Materials to be used for stubs and stub plugs, if required.
9. Materials to be used for lift hole seals.
10. Concrete mix and test results.
11. Signed and sealed drawings by an Oklahoma registered Structural Engineer (SE).

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

1.5 QUALITY ASSURANCE

A. Furnish all labor, materials, equipment, incidentals and transportation necessary for placing precast reinforced concrete vault.

1.6 QUALITY ASSURANCE

A. Design Criteria:
   1. Precast reinforced concrete vault shall conform:
      a. To the requirements of ASTM C857 and C858 for underground precast concrete utility structures.
      b. AASHTO LRFD HL-93 design live loading applied to manhole cover and transition and base slabs.
      c. Dead load of manhole sections fully supported by transition and base slabs.
      d. Be designed for the specific site conditions and construction document requirements.
      e. Be designed to resist buoyant forces due saturated soil.
   2. Wall and slab minimum thicknesses shall be as calculated to resist design forces, but shall not be less than that required for: manufacture and handling; proper embedment of access hatch; proper installation of pipe penetration seal.

B. Test Requirements:
   1. For testing of precast (machine-made) vaults, a minimum of four test cylinders for design compressive strength shall be made for each day's production run of each size and class of culvert section. Strength tests for each production run will be based on the average strength of two cylinders which may be tested any time after completion of the specified curing period. When design strength is attained on the initial test, further tests on that run will not be required. Should the initial test fail to meet the design strength, subsequent tests shall be made at 28 days unless additional test cylinders were made during production of that run. Failure to attain design compression strength by the 28-day test will result in rejection of the run represented by the test. Equipment required for testing for precast (machine-made) vaults shall be furnished by the fabricator. Cylinders for compressive strength tests shall be made in accordance with ASTM C31.

C. Permissible Variations:
   1. Tolerances for precast sections shall conform to ASTM C858.
      a. Deviations from the above tolerances will be acceptable if the sections can be fitted at the plant or job site and it is determined that an acceptable joint can be made. For this condition an acceptable joint is:
         1) When two sections are fitted together on a flat surface, in proper alignment and in the position they will be installed, the longitudinal opening at any point shall not exceed 1 inch. Sections fitted together at the plant and accepted in this manner shall be match-marked for installation.

D. Inspection:
1. The quality of materials, the process of manufacture, and the finished vault shall be subject to inspection and approval by the Owner or an authorized representative at themanufacturing plant. In addition, the vault shall be subject to further inspection by theOwner at the Project Site prior to and during installation.

E. Cause for Rejection:
1. The vault shall be subject to rejection on account of failure to conform to any of the specification requirements. Individual sections of vault may be rejected because of thefollowing:
a. Fractures or cracks in the vault.
b. Defects that indicate imperfect proportioning, mixing and molding.
c. Surface defects indicating honeycombed or open texture.
d. Damaged ends, where such damage would prevent making a structurally sound andwater tight joint.

PART 2 PRODUCTS

2.1 MIXES

A. Concrete: Mixed in a central batch plant or other approved batching facility from which the quality and uniformity of the concrete can be assured. Transit mixed concrete will not be acceptable. Concrete shall be 5000 psi minimum.

2.2 MANUFACTURED PRODUCTS

A. Vault: Materials, manufacture and curing of precast reinforced concrete vault shall conform to ASTM Standards. Vault shall be a precast concrete structure in accordance with the Drawings and Specifications, and shall be manufactured by Oldcastle Precast, 1100 HeritagePkwy, Mansfield, TX 76063-2759, or approved equal.

B. Use various lengths of manhole sections in combination to provide correct height with the fewest joints.

C. Cold Applied Preformed Gaskets:
1. Cold applied preformed gaskets shall be suitable for sealing joints of tongue and groove concrete box sections. The gasket sealing the joint shall be produced from blends of refined hydrocarbon resins and plasticizing compounds reinforced with inert mineral filler and shall contain no solvents, irritating fumes or obnoxious odors. The gasket joint sealer shall not depend on oxidizing, evaporating, or chemical action for its adhesive or cohesive strength, and shall be supplied in extruded rope-form of suitable cross-section. The size of the gasket joint sealer shall be in accordance with the manufacturer's recommendations and sufficient to obtain the squeeze-out as described in Paragraph 3.02.
2. Gasket joint sealer shall be protected by a suitable removable two-piece wrapper. The two-piece wrapper shall be so designed that half may be removed longitudinally without disturbing the other half to facilitate application as noted below.
3. The chemical composition of the gasket joint sealing compound shall conform to therequirements of AASHTO M198-08 1, Type B, Flexible Plastic Gasket (Bitumen).

D. Workmanship and Finish: Vault shall be substantially free from fractures, large or deep cracks and surface roughness. The ends of the vault shall be normal to the walls and centerline of the vault within the limits of Permissible Variations specified above. The vault exterior shall be coated with a bituminous coating for areas to be install below grade.

E. Markings: The following information shall be clearly marked on each section. Markingsshall be indented on the vault or painted thereon with waterproof paint.
1. The load rating and ASTM Designation No. of the vault.
2. The date of manufacture.
3. The name or trade name of the manufacturer.

PART 3 EXECUTION

3.1 EXCAVATION AND EMBEDMENT

A. Excavation and embedment shall conform to the requirements in Section 31_00_00 Earthwork, Section 31_23_24 Utility Earthwork & Backfill & Notes/Details on the Drawings.

3.2 INSTALLATION

A. Laying:
1. Vault sections shall be installed such that the bottom section(s) shall be full sections. Partial sections, if necessary, shall be utilized for the top most section only. Vault covershall be separate from the vault walls.

B. Jointing:
1. Joints using cold applied preformed plastic gaskets shall be made as follows:
   a. A suitable primer of the type recommended by the manufacturer of the gasket joint sealer shall be brush- applied to the tongue and groove joint surfaces and the end surfaces and allowed to dry and harden. No primer shall be applied over mud, sand,dirt or sharp cement protrusions. Clean and dry the surface to the primed when primer is applied.
   b. Before laying the vault in the trench, attach the plastic gasket sealer around the tapered tongue or tapered groove near the shoulder or hub of each joint. Remove the paper wrapper from one side only of the two-piece wrapper on the gasket and press firmly to the clean, dry vault joint surface. Do no remove the outside wrapper until immediately before pushing the vault into its final position.
   c. When the tongue is correctly aligned with the flare of the groove, remove the outside wrapper on the gasket and pull or push home the vault with sufficient forceand power (Back Hoe shovel, chain hoist, ratchet hoist or winch) to cause the evidence of squeeze-out of the gasket material on the side of outside around the complex vault joint perimeter.
   d. When the atmospheric temperature is below 60 F, plastic joint seal gaskets shall either be stored in an area warmed to above 70 F, or artificially warmed to this temperature in a manner satisfactory to the Engineer. Apply gaskets to vault jointsimmediately prior to placing vault in trench, followed by connection to previously laid box section.

3.3 BACKFILL

A. After the vault has been placed, bedded and jointed as specified and approved by the Owner or his authorized representative, perform backfilling in accordance Specifications.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 33_05_97.23

UNDERGROUND UTILITY WARNING TAPE

PART 1 GENERAL

1.1 SCOPE OF WORK

A. Buried tape for utility marker as detailed on the Drawings.
   1. Provide detectable warning tape for all non-metallic pipelines
   2. Provide non-detectable warning tape for all metallic pipelines.

B. Install buried tape for utility marker as described herein to be used for locating pipe. Buried tape shall be installed on all water mains and services, all wastewater lines and sewer mains and all wastewater force mains whether or not specifically detailed in the Drawings.

C. There is no separate payment for the supply and installation of underground utility warning tape and it shall be considered subsidiary to the item for which they pertain.

D. Surface markers are not outlined on the drawings but should be installed in all located as indicated in this section.

1.2 REFERENCE STANDARDS

A. American Public Works Association (APWA):
   1. Uniform Color Code

PART 2 PRODUCTS

2.1 MATERIALS

A. Materials
   1. Detectable Buried Markers
      a. Provide detectable warning tape as follows:
         1) 5.0 mil overall thickness
         2) Width – 3 inch minimum
         3) Weight – 27.5 pounds per inch per 1,000 square feet
         4) Triple Layer with:
            a) Minimum thickness 0.35 mils solid aluminum foil encased in aprotective inert plastic jacket
               (1) 100 percent virgin low density polyethylene
               (2) Impervious to all known alkalis, acids, chemical reagents andsolvents within soil
               (3) Aluminum foil visible to both sides
         5) Locatable by conductive and inductive methods
         6) Printing encased to avoid ink rub-off
         7) Color and Legends
            a) Potable water lines

(1) Color – Blue (in accordance with APWA Uniform Color Code)
(2) Legend – Caution Potable Water Line Below (repeated every 24inches)

b) Raw water lines / sewer lines
(1) Color – Green (in accordance with APWA Uniform Color Code)
(2) Legend – Caution Raw Water Line Below (repeated every 24inches)

2. Non-Detectable Buried Markers
a. Provide non-detectable warning tape as follows:
1) 4.0 mil overall thickness
2) Width – 3 inch minimum
3) Weight – 20 pounds per inch per 1,000 square feet
4) 100 percent virgin low density polyethylene
5) Impervious to all known alkalis, acids, chemical reagents and solventswithin soil
6) Printing encased to avoid ink rub-off
7) Color and Legends
a) Potable water lines
(1) Color – Blue (in accordance with APWA Uniform Color Code)
(2) Legend – Caution Potable Water Line Below (repeated every 24inches)
b) Raw water lines / sewer lines
(1) Color – Green (in accordance with APWA Uniform Color Code)
(2) Legend – Caution Raw Water Line Below (repeated every 24inches)

PART 3 EXECUTION

A. Buried Markers (Warning Tape)
1. Provide detectable warning tape for all non-metallic pipelines.
2. Provide non-detectable warning tape for all metallic pipelines.
3. Install in accordance with manufacturer's recommendations below natural ground surface and directly above the utility for which it is marking.
a. Allow 18 inches minimum between utility and marker.
b. Bury to a depth of 3 feet or as close to the grade as is practical for optimum protection and detectability.

END OF SECTION

SECTION 40_05_00.13

PIPING SYSTEMS TESTING

PART 1 GENERAL

1.1 SUMMARY

A. Provide all necessary labor, materials and equipment, including test pumps and gauges, as well as temporary valves, flanges, piping, etc to perform the testing operations of piping systems as specified herein.

B. All pressure pipe installations shall be hydrostatically tested at 1.5 working pressure or 150 psi, whichever is greater.

C. All gravity pipe installations shall be tested by low pressure air and mandrel (where applicable as specified herein.)

D. All testing shall be done in the presence of, and approved by, the engineer / engineer's representative. Notify engineer five (5) days in advance of testing.

E. If demonstrated workmanship on one or more tests show that lines are sufficiently watertight, the Engineer may waive remaining testing on any given type or section of line.

F. Contractor's Responsibility:
1. Take such precautions as required to prevent damage to lines and appurtenances being tested.
2. Repair any damage resulting from tests.
3. Repair and retest all items which do not pass the tests as specified herein.
4. Conduct all tests in the presence of the Engineer, and to the satisfaction of the Engineer and all State and local authorities having jurisdiction.
5. All necessary pumps, water, pipe connections, meters, gauges, and any necessary apparatus to perform and conduct the tests shall be furnished by the Contractor. Contractor shall furnish all necessary equipment and make all tests at Contractor's expense without separate measurement and payment, but said expense shall be subsidiary to installation of pipe.

G. Water used for testing purposes shall be potable and/or non-potable water. Raw untreated wastewater (sewage) will not be allowed.

H. For HDPE Pipe, see Section 40_04_33.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross

references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

B. Submit record data describing proposed testing methods, procedures, and apparatus for Engineer's record, prior to testing.

C. Conform to any other applicable requirements of Section 01_33_00 – Submittal Procedures.

D. Submit a certified test report for each test to Engineer certifying the location of the joint or section tested, the test pressures at the start and end of each test, duration of the test, leakage and pertinent observations and comments.

1.4 SEQUENCE

A. Clean piping before pressure or leak tests.

B. Test gravity piping underground, including sanitary sewers, for visible leaks before backfilling and compacting.

C. Backfill and compact trench, or provide blocking that prevents pipe movement before testing underground piping with a maximum leakage allowance.

D. Test underground piping before encasing piping in concrete or covering piping with slab, structure, or permanent improvement.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 TESTING OF DRAINS, GRAVITY WASTEWATER, AND OTHER GRAVITY LINES

A. General:
   1. General:
   2. For all pipe, the method of testing shall be either an exfiltration test or a low-pressure air joint test. For any flexible, non-metallic or non-concrete pipe, such as plastic or fiber reinforced plastic pipe or similar flexible pipe materials, a deflection test shall be performed in addition to an exfiltration test.
   3. Do not perform any test until backfill has been completed to within 1' of proposed final grade.

4. Make first test promptly after first joint or section of line is laid and backfilled (as applicable). A section of pipe will normally be a run between two manholes, or between structures.
5. Settlement in backfill during exfiltration tests will be taken as an indication of leakage.

B. Low Pressure Air Joint Test:
1. All finished installations for non-pressure applications shall be tested via low-pressure air testing in accordance with ASTM F1417 and the specifications herein.
2. Isolate the section of non-pressure sewer line to be air tested by inflatable stoppers or other suitable test plugs/caps.
3. Ends of all branches, laterals, tees, wyes, and/or stubs in the test section shall be plugged or capped to prevent air leakage. One of the plugs/caps shall have an inlet tap or other method for connecting the air hose to an air control source.
4. Test ends should be restrained and/or braced during air testing.
5. Add air slowly to the test section until the pressure reaches 4.0 psi. After the test pressure is obtained, regulate the air supply so that the pressure is maintained between 3.5 and 4.0 psi for at least 2 minutes until the air temperature stabilizes and is in equilibrium with the temperature of the pipe walls.
6. Disconnect the air supply and decrease the pressure to 3.5 psi before starting the test.
7. Determine the rate of air pressure loss from 3.5 psi to 2.5 psi.
8. If the rate of air loss is greater than or equal to the table below (from ASTM F1417), the installation is acceptable:

Pipe Diameter, in.	Minimum Time, min:s	Length for Minimum Time, ft	Time for Longer Length, s
4	3:46	597	0.380 L
6	5:40	398	0.854 L
8	7:34	298	1.520 L
10	9:26	239	2.374 L
12	11:20	199	3.418 L
15	14:10	159	5.342 L
18	17:00	133	7.692 L
21	19:50	114	10.470 L
24	22:40	99	13.674 L
27	25:30:00	88	17.306 L
30	28:20:00	80	21.366 L
33	31:10:00	72	25.852 L
36	34:00:00	66	30.768 L
42	39:48:00	57	41.883 L
48	45:34:00	50	54.705 L
54	51:02:00	44	69.236 L
60	56:40:00	40	85.476 L

9. Upon completion of the test, open the bleeder valve and allow all air to escape. Caps/plugs shall not be removed until all air pressure in the test section has been reduced to atmospheric pressure.

C. Deflection Test

1. For all flexible and/or semi-rigid non-metallic, non-concrete pipe such as CCFRP, PE, FRP, PVC, etc., a deflection test shall be performed in addition to any other required leakage tests.
2. No pipe shall be accepted unless the Mandrel passes through verifying that the deflection is less than 5 percent of the internal diameter.
3. Two deflection tests using a mandrel will be required for each pipe segment after installation. The first deflection test shall be performed after the pipe has been completely installed and backfilled where a mandrel shall be pulled through the entire line segment to determine whether the maximum allowable percent of deflection has been exceeded. A second test shall be performed following a minimum of three (3) months after installation and backfill for any section by pulling a mandrel through the entire line to determine whether the maximum allowable deflection percent has been exceeded.
4. The diameter of the mandrel shall be the maximum allowable percent deflection specified less than the inside diameter of the sewer line. The maximum allowable percent deflection shall be based on the nominal diameter. All mandrels and measurements shall be based on the nominal diameter [i.e., 42-inch nominal pipe diameter with a maximum 5 percent deflection requirement will have a maximum allowable 5 percent deflection of 2.1 inches (0.05 x 42 = 2.1); a mandrel outside diameter (minimum) of 39.9 inches (42 -2.1 = 39.9)].
5. In cases where the mandrel may hang due to excess deflection, the pipe shall be uncovered at this point and the conditions shall be corrected. Correction may be by reworking of the embedment and backfill, or by replacing that section of the pipe. This portion of the pipe shall again be backfilled, and the mandrel pulled through again, and this process repeated until the pipe is clear of all obstructions. The test shall be performed without mechanical pulling devices.

3.2 TESTING OF PRESSURE LINES

A. General:

1. The Contractor shall perform a hydrostatic test in accordance with AWWA C600, for ductile iron pipe, and C605, for PVC pipe.
2. For ductile iron pipe conforming to AWWA C150 and C151 the test pressure shall not be less than 1.25 times the working pressure at the highest elevation along the test section and not less than 1.5 times the working pressure at the lowest elevation of the test section. Test pressure shall not exceed thrust restraint design pressures or 1.5 times the pressure rating of the pipe or joint, whichever is less.
3. For PVC pipe conforming to AWWA C900, C905 and C909 the test pressure shall not be less that 1.25 times the working pressure at the highest elevation along the test section unless the pressure exceeds the design pressure limit for any pipe, thrust restraint, valve, fitting or other appurtenance of the test section. Test pressure shall not exceed the design pressure limit for any pipe, thrust restraint, valve, fitting or other appurtenance of the test section.
4. Allow concrete blocking to cure for at least 7 days before testing.
5. Backfill and compact soil behind all blocking.
6. Remove any pressure sensitive equipment which may be damaged by pressure.
7. Backfill over pipe to extent necessary to restrain the piping. Backfill shall extend to within 1-foot of proposed final grade.
8. Contractor may perform informal leak test prior to backfill, but final acceptance shall not be performed until backfill is completed.

9. New Piping Connected to Existing Piping
    a. Isolate new piping with grooved-end pipe caps, blind flanges or other means acceptable to engineer. At no time may pressure testing be completed against a closed valve.
10. Conduct water leakage test after completing hydrostatic pressure tests.
11. Lines which fail to hold the specified test pressure for at least two hours or which exceed an allowable leakage rate specified below, shall be repaired and retested at the Contractor's expense.
12. If changes are made to piping installation after initial testing, such as addition of valves, routing changes, branches, etc., the entire line must be retested.
13. Testing against valves will not be permitted. All sections of pipe to be tested must be blind-flanged.

B. Test Restrictions
1. Test pressure shall be a minimum of 100 psi (regardless of working pressure)
2. Test pressure shall not exceed pipe or thrust-restraint design pressures.
3. The hydrostatic test shall be of at least a 2-hour duration.
4. Test pressure shall not vary by more than ± 5 psi (34.5 kPa) for the duration of the test.
5. Prevent contamination of the Owner's water distribution system.
6. After pipelines or isolated sections of pipelines have been filled with water, increase the pressure to test pressure by means of a pump
7. Open interior valves, including fire hydrants and other appurtenances, during tests.
8. After the specified test pressure has been applied, the entire pipeline shall be checked in the presence of the Engineer giving particular attention to parts of the pipeline and the appurtenances that are exposed.
9. If leaks are apparent, perform corrective work and replace material that is required to remedy the defect and stop the leaks at no extra cost to the Owner.
10. If no leaks were apparent or after corrective work has been completed, the pipelines shall be subjected to a leakage test at the pressure specified with a meter inserted in the test pump discharge line.
11. Corrective work shall be approved by the Engineer.

C. Procedures for Leakage and Hydrostatic Pressure Tests:
1. Slowly fill isolated section of line with water. The pipe shall be filled slowly from the lowest point on the line. Flow velocity during line filling should not exceed 0.25 ft/s.
2. Ensure that all air has been expelled through air and vacuum release valves, taps, or connections shown on Drawings for permanent piping, valves, or accessories. Do not make additional taps solely for air expulsion purposes unless approved by Engineer. No additional compensation will be made for additional taps.
3. Apply specified test pressure based on the elevation of the lowest section of line under test and corrected to elevation of test gauge. Duration of test shall be two hours.
4. Allow concrete pipe to stand full of water at least 12 hours before starting leakage test.
5. At the end of the two hours of the test, the entire route of the pipeline shall be inspected to locate any leaks or breaks. Any defective joints, cracked or defective pipe, fittings, or valves discovered in consequence of this pressure test shall be removed and replaced with sound material in the manner provided and the test shall be repeated until satisfactory results are obtained. Any and all noticeable

leaks shall be repaired regardless of whether the actual leakage is within the allowable range. The pipe shall be retested over a period of two hours.

6. All pipe shall be tested for leakage by a hydrostatic pressure test. Lines shall be filled slowly, with a maximum velocity of 1-foot per second, while venting all air. If permanent air vents have not been installed, the Contractor shall install corporation cocks at all high points to expel air during initial filling and testing of the lines.
7. The duration of each leakage test shall be two hours unless otherwise specified, and during the test the line shall be subjected to a continuous test specified pressure at the lowest elevation.
8. Leakage is defined as the net quantity of water that must be supplied into the newly laid pipe, or any valved section thereof, necessary to maintain pressure within 5 psi of the specified leakage test pressure after the pipe has been filled with water and the air in the pipeline has been expelled. No installation shall be accepted if the leakage is greater than that determined by the following formula:

$$L = \frac{SD(P)^{0.5}}{133{,}200}$$

Where L = allowable leakage, in gallons per hour S = length of pipeline tested in feet
D = nominal diameter of the pipe, inches
P = average test pressure during the leakage test, psig

9. The test pressure shall be applied by means of a pump connected to the pipe and to an approved water container, or other approved method, for accurate measurement. The test pressure shall be maintained (by additional pumping, if necessary) for the specified time. While the line is under pressure, the system and all exposed pipe, fittings, valves, and hydrants shall be carefully examined for leakage. All defective elements shall be repaired or replaced and the test repeated until all visible leakage has been stopped and the allowable leakage requirements have been met.
10. On completion of tests, any newly installed, approved taps shall be tightly plugged with brass fittings.
11. Thoroughly purge all compressed air lines after testing.

3.3 MANHOLE TESTING

A. Manholes shall be tested separately and independently of the wastewater lines. All wastewater lines coming into the manhole shall be sealed with an internal pipe plug before testing. All manholes shall be hydrostatically tested with a maximum loss allowance of 0.025 gallons per foot diameter per foot of head per hour. The testing period shall not be less than one hour. The manhole shall be filled to the top. For concrete manholes a wetting period of 24 hours should be used prior to testing in order to allow saturation of the concrete.

3.4 TESTING OF PROCESS AIR LINES

A. Line segments shall be tested after the final cleaning and inspection has occurred and prior to placing the piping segment into service. Contractor shall coordinate testing with the construction sequencing specification.

B. All process air lines shall be pressure tested at 15 PSI. Contractor shall close valve as necessary to maintain pressure in the section being tested. Contractor shall soap test all field welds and joints. Any visible bubbling of the soap indicates a leak in the weld or joint and shall be repaired prior to placing the piping segment into service. After repairs have been completed, the Owner or Engineer shall perform another visual inspection of the interior of the pipe segment prior to placing in service.

C. Acceptable leakage is 0 psi in 24 hours.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 40_05_06.03

PIPE COUPLINGS

PART 1 GENERAL

1.1 SUMMARY

A. Pipe Couplings as required by this section of the Contract Documents, unless otherwise indicated specifically on individual plans and appropriate sections of Contract Documents.

B. All appurtenances may or may not be required on this project (see Drawings) and include:
1. Bolted, split-sleeve coupling.
2. Bolted, split-sleeve flange adapter coupling.
3. Dismantling joints.
4. Grooved joint couplings.
5. Flanged coupling adapters.
6. Flexible couplings.
7. Restrained flange coupling adapters.

C. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

B. American Society of Mechanical Engineers (ASME):
   1. B31.1 - Power Piping.
   2. B31.9 - Building Services Piping.

C. American Water Works Association (AWWA):

PART 2 PRODUCTS

2.1 PIPE COUPLINGS FOR DUCTILE IRON PIPING

A. Dismantling joints:
   1. Manufacturers: One of the following or equal:
      a. Romac Industries, Inc., Style DJ400.
      b. Smith-Blair, Inc., Series 975.
   2. Materials:

a. Flanged spool:
   1) C207 Schedule 40 steel pipe in accordance with ASTM A 53 for sizes 3 inches to 12 inches.
   2) Steel for pipe in accordance with ASTM A 36 for sizes 14 inches to 72 inches.
b. End ring and body:
   1) For sizes 3 inches to 12 inches, ductile iron in accordance with ASTM A 536.
   2) For sizes 14 inches to 72 inches, steel in accordance withASTM A 36 or A 53.
c. Follower ring: Ductile iron in accordance with ASTM A 536 or steel in accordance with ASTM A 36 or A 576.
d. Bolts and hex nuts:
   1) Aboveground: High strength, low alloy steel in accordance with AWWA C111, xylan coated.
   2) Buried and underwater: Type 316 stainless steel bolts in accordancewith ASTM F 593.
e. Tie rods: High tensile steel in accordance with ASTM A 193 Grade B7.

3. Flange design: Class D steel ring flange in accordance with AWWA C207, compatible with ANSI Class 125 and 150 bolt circles.
4. Coating and lining: Manufacturer's standard fusion bonded epoxy, NSF 61certified.

B. Flanged coupling adapters: 12-inch size and smaller.
1. Manufacturers: One of the following or equal:
   a. Dresser, Inc., Style 227.
   b. Romac Industries, Inc., Style FCA501.
   c. Smith-Blair, Inc., Series 912.
2. Materials:
   a. Flanged body: Ductile iron in accordance with ASTM A 536.
   b. Follower ring: Ductile iron in accordance with ASTM A 536.
   c. Bolts and hex nuts:
      1) Aboveground: High strength, low alloy steel in accordance with AWWA C111, xylan coated.
      2) Buried and underwater: Type 316 stainless steel bolts in accordancewith ASTM F 593.
3. Flange design: Class D steel ring flange in accordance with AWWA C207compatible with ANSI Class 125 and 150 bolt circles.
4. Coating and lining: Manufacturer's standard fusion bonded epoxy, NSF 61certified.

C. Flanged coupling adapters: Greater than 12-inch size:
1. Manufacturers: One of the following or equal:
   a. Dresser, Inc., Style 128-W.
   b. Romac Industries, Inc., Style FC400.
   c. Smith-Blair, Inc., Series 913.
2. Materials:
   a. Flange and flanged body: Ductile iron or low carbon steel having a minimum yield strength of 30,000 pounds per square inch.
   b. Follower ring: Low carbon steel having a minimum yield strength of30,000 pounds per square inch.
   c. Bolts and hex nuts:

1) Aboveground: High strength, low alloy steel in accordance with AWWA C111, xylan coated.
2) Buried and underwater: Type 316 stainless steel bolts in accordancewith ASTM F 593.

3. Flange design: Class D steel ring flange in accordance with AWWA C207compatible with ANSI Class 125 and 150 bolt circles.
4. Coating and lining: Manufacturer's standard fusion bonded epoxy, NSF 61certified.

D. Flexible couplings:
1. Manufacturers: One of the following or equal:
   a. Dresser, Inc., Style 253.
   b. Romac Industries, Inc., Style 501.
   c. Smith-Blair, Inc., Series 441.
2. Materials:
   a. Center rings: Ductile iron in accordance with ASTM A 536.
   b. Follower rings: Ductile iron in accordance with ASTM A 536.
   c. Bolts and hex nuts:
      1) Aboveground: High strength, low alloy steel in accordance with AWWA C111, xylan coated.
      2) Buried and underwater: Type 316 stainless steel in accordance withASTM F 593.
3. Coating and lining: Manufacturer's standard fusion bonded epoxy, NSF 61certified.
4. Center sleeve dimensions: Provide center sleeves with lengths in accordancewith following table:

Nominal Pipe Size	Sleeve Length
3 inch and smaller	Manufacturer's standard
4 inch through 8 inch	7 inches
10 inch through 14 inch	12 inches
Greater than 16 inch	Use steel flexible coupling per Pipe Couplings for Steel Piping

E. Restrained flange coupling adapter:
1. Manufacturers: One of the following or equal:
   a. Romac Industries, Inc., Style RFCA.
   b. Star Pipe Products, 3200 StarFlange.
2. Materials:
   a. Flange and flanged body: Ductile iron in accordance with ASTM A 536.
   b. Follower ring: Lug type restraint system.
      1) Follower ring: Ductile iron in accordance with ASTM A 536.
      2) Restraining lugs: Ductile iron in accordance with ASTM A 536.
         a) Designed to contact the pipe and apply forces evenly.
      3) Restraining bolts:
         a) Ductile iron in accordance with ASTM A 536.
         b) Bolt heads shall be designed to twist off when the proper torquehas been applied.
   c. Bolts and hex nuts:

1) Aboveground: High strength, low alloy steel in accordance with AWWA C111, xylan coated.
2) Buried and underwater: Type 316 stainless steel bolts in accordancewith ASTM F 593.

3. Flange design: Class D steel ring flange in accordance with AWWA C207compatible with ANSI Class 125 and 150 bolt circles.
4. Coating and lining: Manufacturer's standard fusion bonded epoxy, NSF 61certified.
5. Angular deflection: Restrained flange coupling adapter must allow angular deflection after assembly.

F. Grooved joint couplings:
1. Manufacturers:
a. Victaulic Company, Series 31 or equal.
2. Materials:
a. Housings: Ductile iron in accordance with ASTM A 536.
b. Gasket:
1) FlushSeal® type, or equal. Elastomer in accordance withASTM D 2000.
c. Bolts and nuts: Electroplated steel in accordance with ASTM A 449.
d. Coating: As specified in Section 09_96_01.
3. For use with rigid or flexible radius grooved components in accordance withAWWA C606.
4. For connection to IPS steel pipe sizes, Victaulic Style 307.

2.2 PIPE COUPLINGS FOR STEEL PIPING

A. Dismantling joints:
1. Manufacturers: One of the following or equal:
a. Romac Industries, Inc., Style DJ400.
b. Smith-Blair, Inc., Series 975.
2. Materials:
a. Flanged spool:
1) C207 Schedule 40 pipe in accordance with ASTM A 53 for sizes3 inches to 12 inches.
2) Steel for pipe in accordance with ASTM A 36 or A 53 for sizes14 inches to 72 inches.
b. End ring and body:
1) For sizes 3 inches to 12 inches, ductile iron in accordance with ASTM A 536.
2) For sizes 14 inches to 72 inches, steel in accordance withASTM A 36.
c. Follower ring: Ductile iron in accordance with ASTM A 536 or steel in accordance with ASTM A 36 or A 576.
d. Bolts and hex nuts:
1) Aboveground: High strength, low alloy steel in accordance with AWWA C111, xylan coated.
2) Buried and underwater: Type 316 stainless steel bolts in accordancewith ASTM F 593.
e. Tie rods: High tensile steel in accordance with ASTM A 193 grade B7.

3. Flange design: Class D steel ring flange in accordance with AWWA C207compatible with ANSI Class 125 and 150 bolt circles.
4. Coating and lining: Fusion bonded epoxy certified in accordance with NSF 61.

B. Flanged coupling adapters:
1. Manufacturers: One of the following or equal:
   a. Dresser, Inc., Style 128-W.
   b. Romac Industries, Inc., Style FCA501 (10 inch and smaller) orStyle FC400 (12 inch and larger).
   c. Smith-Blair, Inc., Series 913.
2. Materials:
   a. Flange and flanged body: Ductile iron or low carbon steel having a minimum yield strength of 30,000 pounds per square inch.
   b. Follower ring: Low carbon steel having a minimum yield strength of30,000 pounds per square inch.
   c. Bolts and hex nuts:
      1) Aboveground: High-strength, low-alloy steel in accordance with AWWA C111, xylan coated.
      2) Buried and underwater: Type 316 stainless steel bolts in accordancewith ASTM F 593.
3. Flange design: Class D steel ring flange in accordance with AWWA C207compatible with ANSI Class 125 and 150 bolt circles.
4. Coating and lining: Manufacturer's standard fusion bonded epoxy, NSF 61certified.

C. Flexible couplings:
1. Manufacturers: One of the following or equal:
   a. Dresser, Inc., Style 38.
   b. Smith-Blair, Inc., Series 411.
   c. Romac Industries, Inc., Style 511 or Style 400.
2. Materials:
   a. Center sleeve and follower flanges: Ductile iron or low carbon steel having a minimum yield strength of 30,000 pounds per square inch.
   b. Bolts and hex nuts:
      1) Aboveground: High strength, low alloy steel in accordance with AWWA C111, xylan coated.
      2) Buried and underwater: Type 316 stainless steel bolts in accordancewith ASTM F 593.
3. Coating and lining: Manufacturer's standard fusion bonded epoxy, NSF 61certified.
4. Center sleeve dimensions: Provide center sleeves with lengths in accordancewith following table:

Nominal Pipe Diameter	Sleeve Length
2-1/2 inch and smaller	Manufacturer's standard
3 inch through 6 inch	7 inch
8 inch through 14 inch	7 inch
Greater than 14 inches	10 inch

D. Restrained flange coupling adapters:
1. Manufacturers: One of the following or equal:
a. Romac Industries, Inc., Style RFCA
b. Star Pipe Products, 3200 StarFlange.
2. Materials:
a. Flange and flanged body: Ductile iron in accordance with ASTM A 536.
b. Follower ring: Lug type restraint system.
1) Follower ring: Ductile iron in accordance with ASTM A 536.
2) Restraining lugs: Ductile iron in accordance with ASTM A 536.
a) Designed to contact the pipe an apply forces evenly.
3) Restraining bolts: Ductile iron in accordance with ASTM A 536. Bolt heads shall be designed to twist off when the proper torque has beenapplied.
c. Bolts and hex nuts:
1) Aboveground: High-strength, low-alloy steel in accordance with AWWA C111, xylan coated.
2) Buried and underwater: Type 316 stainless steel bolts in accordancewith ASTM F 593.
3. Flange design: Class D steel ring flange in accordance with AWWA C207compatible with ANSI Class 125 and 150 bolt circles.
4. Coating and lining: Manufacturer's standard fusion bonded epoxy certified in accordance with NSF 61.

E. Grooved joint couplings:
1. Model numbers from one manufacturer are shown to indicate type only. Equivalent products of other manufacturers may be submitted for approval.
2. Coating: As specified in Section 09_96_01.
3. Sizes through 12 inch:
a. Rigid type:
1) Housings shall be cast with offsetting angle-pattern bolt pads to provide rigidity and system support and hanging in accordance withASME B31.1 and B31.9.
2) 2 inch through 6 inch: Installation-ready, for direct stab installation without field disassembly, with grade EHP gasket rated to plus 250degrees Fahrenheit.
3) Manufacturer: One of the following or equal:
a) Victaulic Style 107.
b) Victaulic Zero-Flex Style 07.
b. Flexible type:
1) For use in locations where vibration attenuation and stress relief arerequired.
2) Three flexible couplings may be used in lieu of a flexible connector.
3) The couplings shall be placed in close proximity to the source of thevibration.
4) Manufacturer: The following or equal:
a) Victaulic Style 77.
c. Flange adapter:
1) Flat face, ductile iron housings with elastomer pressure responsive gasket, for direct connection to ANSI Class 125 or 150 flanged components.

2) Manufacturer: The following or equal:
a) Victaulic Style 741.

4. Sizes 14 inch through 24 inch:
a. Victaulic AGS series with lead-in chamfer on housing key and wide width FlushSeal® gasket.
b. Rigid type:
1) Housing key shall fill the wedge shaped AGS groove and provide rigidity and system support and hanging in accordance with ASME B31.1 and B31.9.
2) Manufacturer: The following or equal:
a) Victaulic Style W07.
c. Flexible type:
1) Housing key shall fit into the wedge shaped AGS groove and allow for linear and angular pipe movement.
2) Manufacturer: The following or equal:
a) Victaulic Style W77.
d. Flange adapter:
1) Flat face, ductile iron housings with elastomer pressure responsive gasket, for direct connection to ANSI Class 125 or 150 flanged components.
2) Manufacturer: The following or equal:
a) Victaulic Style W741.
5. For sizes 30 inch and larger:
a. Manufacturer: The following or equal:
1) Victaulic Style AGS multiple-segment housing may be used.

F. Bolted, split-sleeve couplings:
1. Provide bolted, split-sleeve couplings where indicated on the Drawings or asan alternative to flexible couplings when approved by the Engineer for each individual case.
2. Split-sleeve type pipe coupling with double arch cross section.
a. Coupling shall be designed to close around the pipe ends, confining the gaskets beneath the arches of the sleeve.
b. A watertight, axial seal is created by tightening the bolts to pull the coupling against the outside wall of the pipe.
3. Coatings:
a. Couplings shall be epoxy-coated on the inner diameter and outer diameter prior to delivery.
b. Buried couplings shall receive additional protection against corrosion that matches the pipe as specified.
4. Couplings: Wall thickness that is adequate for the test pressure.
a. Provide split-sleeve type coupling in an-"expansion x expansion" configuration where indicated on the Drawings.
b. Where restrained pipe joints are required or are indicated on theDrawings, provide split sleeve type coupling in a "fixed x fixed" configuration.
1) Coordinate with coupling manufacturer and pipe supplier to providerestraint rings on pipe.
2) Coupling manufacturer to supply the restraint rings.

c. Where axial pipe expansion must be accommodated or where they are indicated on the Drawings, provide split-sleeve type coupling in a "fixed x expansion" configuration.
   1) Coordinate with coupling manufacturer and pipe supplier to providerestraint ring on fixed side of coupling.
   2) Coupling manufacturer to supply the restraint rings.

d. Axial restraint and angular deflection:
   1) Where axial restraint is required to resist pipe thrust and angular deflection is required to provide flexibility in the piping or where they are indicated on the Drawings, provide split-sleeve type coupling in a"fixed x fixed modified" configuration.
   2) Install coupling with manufacturer's recommended-gap between ends of piping with the shoulders of coupling bearing on the inner restraint rings that are welded to the piping at both ends of coupling.
   3) Coupling shall be designed for an angular deflection of not less thanthe angular defection indicated in the following table unless a larger angular deflection in indicated on the Drawings.

Nominal Pipe Diameter	Allowable Angular Deflection
18 inch and smaller	3 degrees
20 inch	2.5 degrees
24 inch	2 degrees
30 inch	1.75 degrees
36 inch	1.5 degrees
42 inch	1.25 degrees
48 and 54 inch	1 degree
60 inch	0.875 degrees
66 and 72 inch	0.75 degrees

5. Restraint rings:
   a. Provide where required to create a restrained joint.
   b. Coordinate with piping manufacturer.
   c. Shop fabricate pipe with restraint rings that engage the interior edge of thecoupling shoulder.
      1) Weld for restraint ring: Suitable for test pressures indicated in the Piping Schedule as specified in Section 40_05_00.01.
6. Gaskets: The sealing members are comprised of 2 O-ring gaskets. Internal pressure shall not be required to affect the seal. For water service, the gasket supplied shall be Isoprene or Buna-N in accordance with ASTM D 2000 for design pressure within temperature range of minus 20 to 180 degrees Fahrenheit.
   a. Elastomers shall have properties in accordance with ASTM D 2000.
7. Manufacturers: One of the following or equal:
   a. "Expansion x expansion" configuration:
      1) Victaulic, Depend-O-Lok, E x E, Type 2 Coupling.
   b. "Fixed x expansion" configuration:
      1) Victaulic, Depend-O-Lok, F x E, Type 2 Coupling.

c. "Fixed x fixed" configuration:
1) Victaulic, Depend-O-Lok, F x F, Type 2 Coupling.
d. "Fixed x fixed modified" configuration:
1) Victaulic, Depend-O-Lok, F x F, Type 2 Modified Restrained Coupling.

8. Materials:
a. Couplings: Steel in accordance with ASTM A 36.
b. Bolts and nuts: In accordance with ASTM A 325 and ASTM A 563.
9. Pipe preparation:
a. Pipe ends shall be smooth for expansion or contraction requirements.
b. Where thrust restraint is required or is indicated on the Drawings, pipe ends shall include restraint rings affixed for pipe end restraint requirements.
c. The coupling manufacturer shall provide restraint rings that shall be shop welded to the pipe in accordance with the manufacturer's requirements.
d. Follow coupling manufacturer's recommendation for size and amount of welding required to attach the restraint rings to the pipe.

G. Bolted, split-sleeve flanged adapter couplings:
1. Provide bolted, split-sleeve, flanged adaptor couplings where indicated on the Drawings or as an alternative to flexible coupling type flange adaptors when approved by the Engineer for each individual case.
2. Flanged adapter with split-sleeve type coupling with double arch cross section.
a. Coupling shall be designed to confine the gaskets beneath the arches of the sleeve.
b. A watertight, axial seal is created by tightening the bolts to pull the coupling together and seat the gaskets against the outside wall of the pipe and adapter.
3. Coatings:
a. Couplings shall be epoxy-coated on the inner diameter and outer diameter prior to delivery.
b. Buried couplings shall receive additional protection against corrosion that matches the pipe as specified.
4. Couplings: Wall thickness that is adequate for the test pressure specified inthe Piping Schedule.
a. Provide coupling in a "flanged x expansion" configuration where indicated on the Drawings.
b. Where axial pipe movement must be restrained, provide coupling in a "flanged x fixed" configuration.
1) Coordinate with pipe supplier to provide restraint ring on fixed side ofcoupling.
c. Where axial restraint is required to resist pipe thrust and angular deflection is required to provide flexibility in the piping, provide sleeve type coupling in a "flanged fixed x fixed modified" configuration.
1) Install coupling with full 1-1/2-inch gap between ends of pipe with shoulder of coupling bearing on ring welded to pipe at both ends ofcoupling.
2) Coupling shall be designed for an angular deflection of not less thanthe angular deflection indicated in the following table unless a largerangular deflection in indicated on the Drawings.

Nominal Pipe Diameter	Allowable Angular Deflection
18 inch and smaller	3 degrees
20 inch	2.75 degrees
24 inch	2.375 degrees
30 inch	2 degrees
36 inch	1.5 degrees
42 inch	1.375 degrees
48 and 54 inch	1 degree
60 and 66 inch	0.875 degrees
72 and 78 inch	0.75 degrees

1. Restraint rings:
   a. Provide where required to create a restrained joint.
   b. Coordinate with piping manufacturer.
   c. Shop fabricate pipe with restraint rings that engages the interior edge ofthe coupling shoulder.
      1) Weld for restraint ring: Suitable for test pressures as specified in thePipe Schedule as specified in Section 40_05_00.01.
2. Gaskets:
   a. The sealing members are comprised of 2 O-ring gaskets. Internalpressure shall not be required to affect the seal.
   b. For water service, the gasket supplied shall be Isoprene or Buna-N in accordance with ASTM D 2000 for design pressure within temperaturerange of minus 20 to 180 degrees Fahrenheit.
   c. Elastomers shall have properties in accordance with ASTM D 2000.
3. Manufacturers: One of the following or equal:
   a. "Flanged x expansion" configuration:
      1) Victaulic, Depend-O-Lok, F x E, Type 2 Flanged Adapter Coupling.
   b. "Flanged x fixed" configuration:
      1) Victaulic, Depend-O-Lok, F x F, Type 2 Flanged Adapter Coupling.
   c. "Flanged x fixed modified" configuration:
      1) Victaulic, Depend-O-Lok, F x F, Type 2 Modified, Flange AdapterCoupling
4. Materials:
   a. Couplings: Steel in accordance with ASTM A 36.
   b. Bolts and nuts: In accordance with ASTM A 325 and ASTM A 563.
5. Pipe preparation:
   a. Pipe ends shall be smooth for expansion or contraction requirements.
   b. Where thrust restraint is required or is indicated on the Drawings, pipeends shall include restraint rings affixed for pipe end restraint requirements.

c. The coupling manufacturer shall provide restraint rings that shall be shopwelded to the pipe in accordance with the manufacturer's requirements.

d. Follow coupling manufacturer's recommendation for size and amount of welding required to attach the restraint rings to the pipe.

2.3 PIPE COUPLINGS FOR STAINLESS STEEL PIPING

A. Flexible couplings:
1. Manufacturers: One of the following or equal:
a. Dresser, Inc., Style 38.

B. Grooved joint couplings:
1. Manufacturers: One of the following or equal
a. Victaulic Company.
2. Materials:
a. Housings:
1) Ductile iron in accordance with ASTM A 536.
2) Stainless steel in accordance with ASTM A 351.
b. Gasket: Elastomer in accordance with ASTM D 2000.
c. Bolts and nuts:
1) Electroplated steel in accordance with ASTM A 449.
2) Stainless steel in accordance with ASTM F 593.
3. Rigid type:
a. Victaulic Style 89 and W89 (ductile iron housings)
b. Victaulic Style 489 (stainless steel housings)
4. Flexible type: Victaulic Style 77S.

C. Bolted, split-sleeve couplings:
1. Split-sleeve type pipe coupling with a fully stainless steel double arch cross section. Coupling shall be designed to close around the pipe ends, confiningthe gaskets beneath the arches of the sleeve. A watertight, axial seal is created by tightening the bolts to pull the coupling against the outside wall ofthe pipe.
2. Manufacturers: One of the following or equal:
a. "Expansion x expansion" configuration:
1) Victaulic, Depend-O-Lok, E x E, Type 2 Coupling.
b. "Fixed x expansion" configuration:
1) Victaulic, Depend-O-Lok, F x E, Type 2 Coupling.
c. "Fixed x fixed" configuration:
1) Victaulic, Depend-O-Lok, F x F, Type 2 Coupling.
d. "Fixed x fixed modified" configuration:
1) Victaulic, Depend-O-Lok, F x F, Type 2 Modified Restrained Coupling.
3. Materials:
a. Couplings: Stainless steel in accordance with ASTM A 240.
b. Bolts and nuts: In accordance with ASTM F 593 and ASTM F 594.
4. Pipe preparation:
a. Pipe ends shall be smooth for expansion or contraction requirements.
b. Where thrust restraint is required or is indicated on the Drawings, pipe ends shall include restraint rings affixed for pipe end restraint requirements.

c. The coupling manufacturer shall provide restraint rings that shall be shop welded to the pipe in accordance with the manufacturer's requirements.
d. Follow coupling manufacturer's recommendation for size and amount of welding required to attach the restraint rings to the pipe.

2.4 GASKETS FOR FLEXIBLE COUPLINGS AND FLANGED COUPLING ADAPTERS

A. Provide gasket materials for piping applications as follows:
1. Low-pressure and high-pressure air, steam, hot water: EPDM.
2. All other piping applications: EPDM.

2.5 EXTERIOR COATINGS FOR UNDERGROUND AND SUBMERGED APPLICATIONS

A. Manufacturers: One of the following or equal:
1. Tapecoat Company, Inc., T.C. Mastic.
2. Kop-Coat Company, Inc., Bitumastic Number 50.

B. Thickness: Minimum 0.040 inch.

PART 3 EXECUTION

3.1 INSTALLATION

A. In underground and underwater installations, coat the exterior of coupling with aprotective coating after installation.

B. In underground installations, wrap the flexible pipe couplings and flanged coupling adapters with heat shrink sleeves on top of the exterior coatings required above in accordance with AWWA C216. Cross-linked polyolefin wrap or sleeve with a masticsealant, 85-mils total thickness, shall be provided. The heat shrink sleeves shall be as manufactured by Canusa, or equal.

C. Joints and flexible connections shall be installed centered with no angular deflectionunless otherwise indicated on the Drawings.

D. Flexible couplings and flange coupling adapters: Install with gap between pipe endsin accordance with the following table unless a greater gap is indicated on the Drawings. Maximum gap tolerance shall be within 1/8 inch.
1. Install flexible coupling with pipe gap located in middle of center sleeve.
2. Install flanged coupling adapter with end of plain end pipe in middle of flanged coupling body.

Center Ring Length	Gap Dimension and Tolerance
4 inch through 6 inch	3/8 inch
7 inch	5/8 inch
10 inch and greater	7/8 inch

E. Provide harnesses (tie-downs) for flexible couplings unless otherwise indicated on the Drawings with a written note.
   1. Design harnesses (tie-downs) for the test pressures as specified.

F. Grooved joint couplings:
   1. Grooved joints shall be installed in accordance with the manufacturer's latest published installation instructions.
   2. Grooved ends shall be clean and free from indentations, projections, and rollmarks in the area from pipe end to groove.
   3. Gaskets shall be of an elastomer grade suitable for the intended service, and shall be molded and produced by the coupling manufacturer.
   4. The grooved coupling manufacturer's factory trained representative shall provide on-site training for Contractor's field personnel in the use of groovingtools and installation of grooved joint products. The representative shall periodically visit the jobsite and review Contractor is following best recommended practices in grooved product installation. (A distributor's representative is not considered qualified to conduct the training or jobsite visit(s).)

G. Bolted, split-sleeve couplings:
   1. Inspect each coupling to ensure that there are no damaged portions of the coupling.
      a. Pay particular attention to the sealing pad/sealing plate area.
      b. Before installation, thoroughly clean each coupling of any foreign substance which may have collected thereon and shall be kept clean at all time.
   2. Wrenches used shall be of a size and type recommended by themanufacturer.
      a. Bolts and studs shall be tightened so as to secure a uniform gasket compression between the coupling and the body of the pipe with all bolts or studs tightened approximately the same amount.
      b. Final tightening shall be done by hand (no air impact wrenches) and is complete when the coupling is in uniform contact with the outside surface of the pipe all around the circumference of the pipe.
   3. No joint shall be misfit any amount that would be detrimental to the strengthand water tightness of the finished joint.
   4. On the fixed ends of bolted, split-sleeve couplings, the shoulders shall bear onthe restraint rings all around with no gap.
   5. Ends of piping where coupler are installed shall be smooth and free of defects.
      a. Remove weld splatter and grind smooth.
      b. Grind pipe seam welds flush with pipe wall and smooth.

END OF SECTION

SECTION 40_05_07.03

PIPE SUPPORTS

PART 1 GENERAL

1.1 SUMMARY

A. Pipe supports as required by the Drawings and/or as indicated in this or other Specification sections.

B. Pipe supports listed may not be used on this project, see Drawings and other sections of the Contract Documents for specific requirements.

C. Should conflict occur between this Specification section and other sections of the Contract Documents, the most stringent/expensive shall govern. Notify Engineer of conflicts.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

B. ASTM International (ASTM):
1. A 123 – Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Ironand Steel Products.
2. A 380 – Standard Practice for Cleaning, Descaling, and Passivation of Stainless Steel Parts, Equipment, and Systems.
3. A 967 – Standard Specification for Chemical Passivation Treatments forStainless Steel Parts.

C. Manufacturer's Standardization Society (MSS):
1. SP-58 – Pipe Hangers and Supports – Materials, Design, and Manufacture.

PART 2 PRODUCTS

2.1 MATERIALS

A. General:
1. Hot dip galvanized:
a. Hot dip after fabrication of support in accordance with ASTM A 123.
2. Stainless steel.
a. Finish requirements: Remove free iron, heat tint oxides, weld scale, and other impurities, and obtain a passive finished surface.
b. At the shop, perform pickling and passivation on all surfaces inside and out in accordance with ASTM A 380 or A 967.
1) Passivation treatments using citric acid are not allowed.
c. Field welding is prohibited unless specifically allowed by the Owner. All fiend welds shall be passivated.

B. Outdoor areas: Areas exposed to the natural outdoor environment.

C. Indoor areas: Areas exposed to an indoor environment including pipe galleries, channels and tunnels.

D. Submerged to 3 feet or less above water level in a structure, or inside a water bearing structure.

2.2 PIPE SUPPORTS

A. Hanger rods: Sized to match suspended pipe hanger, or as indicated on the Drawings:
1. Manufacturers: One of following or equal:
a. For stainless steel piping:
1) Bergen-Power, Figure 133.
2) Nibco-Tolco, Figure 103.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 140.
2) Bergen-Power, Figure 133.
3) Cooper B-Line Systems, Inc., Figure B3205.

B. Hanger rods, continuously threaded: Sized to match suspended pipe hanger, or as indicated on the Drawings:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Bergen-Power, Figure 94.
2) FM Stainless Fasteners.
b. For steel and ductile iron piping:
1) Anvil International, Figure 146.
2) Bergen-Power, Figure 94.

C. Eye bolts:

1. For stainless steel piping:
    a. Type 316 stainless steel, welded and rated equal to full load capacity of rod.
2. For all other piping, unless indicated on the Drawings:
    a. Welded and rated equal to full load capacity of rod.

D. Welded eyebolt rod:
1. Manufacturers: One of the following or equal:
    a. For stainless steel piping:
        1) Nibco-Tolco, Figure 101.
        2) FM Stainless Fasteners.
    b. For all other piping, unless indicated on the Drawings:
        1) Anvil International, Figure 278.
        2) Bergen-Power, Figure 93.
        3) Cooper B-Line Systems, Inc., Figure B3210.

E. Adjustable ring hangers: MSS SP-58, Type 7 or Type 9 (system dependent):
1. Manufacturers: One of the following or equal:
    a. For stainless steel piping:
        1) Nibco-Tolco, Figure 1C.I.
        2) Bergen-Power, Figure 100SS.
    b. For all other piping, unless indicated on the Drawings:
        1) Anvil International, Figure 97.
        2) Cooper B-Line Systems, Inc., Figure B3172.

F. Adjustable clevis hangers: MSS SP-58, Type 1:
1. Manufacturers: One of the following or equal:
    a. For stainless steel piping:
        1) Cooper B-Line Systems, Inc, Figure B3100 or B3102.
        2) FM Stainless Fasteners, Figure 60.
    b. For all other piping, unless indicated on the Drawings:
        1) Anvil International, Figure 260 or Figure 590.
        2) Bergen-Power, Figure 100.
        3) Cooper B-Line Systems, Inc., Figure B3100 or B3102.

G. Adjustable clevis hangers for insulated pipe: Oversize:
1. Manufacturers: One of the following or equal:
    a. For stainless steel piping:
        1) Nibco-Tolco, Figure 1A.
    b. For all other piping, unless indicated on the Drawings:
        1) Anvil International, Figure 300.
        2) Bergen-Power, Figure 100EL.
        3) Cooper B-Line Systems, Inc. Figure B3108.

H. Single rod hangers for steam pipe: MSS SP-58, Type 43; malleable iron or steelyoke and roller hangers; swivel to allow rotation of yoke on rod:
1. Manufacturers: One of the following:
    a. For stainless steel piping:
        1) Nibco-Tolco, Figure 324.
        2) Cooper B-Line Systems, Inc., Figure B3110.
        3) FM Fasteners, Figure 81.

b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 181.
c. Cooper B-Line Systems, Inc., Figure B3110.

I. Double rod hangers for steam pipe: MSS SP-58, Type 41:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) FM Stainless Fasteners, Figure 71.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 171.
2) Cooper B-Line Systems, Inc., Figure B3114.

J. Brackets: MSS SP-58, Type 32 with back plate; rated for 1,500 pounds:
1. Manufacturers: One of the following:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 30M.
2) Cooper B-Line Systems, Inc., Figure B3066.
3) FM Stainless Fasteners, Figure 98.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 195.
2) Cooper B-Line Systems, Inc., Figure B3066.

K. Brackets, heavy duty: MSS SP-58, Type 33 with back plate; rated for 3,000 pounds:
1. Manufacturers: One of following or equal:
a. Anvil International, Figure 199.
b. Cooper B-Line Systems, Inc., Figure B3067.

L. Standard U-bolt: MSS SP-58, Type 24:
1. Manufacturers: One of the following:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 110.
2) Cooper B-Line Systems, Inc., Figure B3188.
3) FM Stainless Fasteners, Figure 37.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 137.
2) Bergen-Power, Figure 283.
3) Cooper B-Line Systems, Inc., Figure B3188.

M. Riser clamps: MSS SP-58, Type 8:
1. Manufacturers: One of the following:
a. For stainless steel piping:
1) Cooper B-Line Systems, Inc., Figure B3373.
2) FM Stainless Fasteners, Figure 61.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 261.
2) Bergen-Power, Figure 126.
3) Cooper B-Line Systems, Inc., Figure B3373.

N. Pipe clamps: MSS SP-58, Type 4:
1. Manufacturers: One of the following:
a. For stainless steel piping:

1) Nibco-Tolco, Figure 4.
2) Cooper B-Line Systems, Inc., Figure 3140.

b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 212.
2) Bergen-Power, Figure 175.
3) Cooper B-Line Systems, Inc., Figure B3140.

O. Adjustable offset pipe clamp:
1. Manufacturers: One of the following:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 4.
2) Cooper B-Line Systems, Inc., Figure B3149.
3) FM Stainless Fasteners, Figure 63.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 100.
2) Cooper B-Line Systems, Inc., Figure B3149.

P. Offset pipe clamp:
1. Manufacturers: One of the following:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 8.
2) Cooper B-Line Systems, Inc., Figure 3148.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 103.
2) Cooper B-Line Systems, Inc., Figure B3148.

Q. Floor stand or stanchion saddles: MSS SP-58, Type 37. Provided with U-bolt holddown yokes:
1. Manufacturers: One of the following:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 318.
2) FM Stainless Fasteners, Figure 59.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 259.
2) Bergen-Power, Figure 125.
3) Cooper B-Line Systems, Inc., Figure B3090.
c. Threaded pipe stand support stanchion. Match pipe support material.
1) Anvil International, Figure 63T.
2) Beregen Power, (None found)
3) Cooper B-Line Systems Inc., Figure B3088ST.

R. Spring hangers:
1. Manufacturers: One of the following:
a. For stainless steel piping:
1) Bergen-Power, Figure 920.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure B-268, Type G.
2) Bergen-Power, Figure 920.

S. One hole pipe clamps:
1. Manufacturers: One of the following or equal:

a. For stainless steel piping:
   1) Not used.
b. For all other piping:
   1) Anvil International, Figure 126.
   2) Carpenter & Paterson, Figure 237S.

T. Welded beam attachment: MSS SP-58, Type 22:
1. Manufacturers: One of the following:
   a. For stainless steel piping:
      1) Nibco-Tolco, Figure 304.
      2) Cooper B-Line Systems, Inc., Figure 3083.
   b. For all other piping, unless indicated on the Drawings:
      1) Anvil International, Figure 66.
      2) Bergen-Power, Figure 113A or 113B.
      3) Cooper B-Line Systems, Inc., Figure B3083.

U. Heavy pipe clamp: MSS SP-58, Type 4:
1. Manufacturers: One of the following:
   a. For stainless steel piping:
      1) Nibco-Tolco, Figure 4H.
   b. For all other piping, unless called out otherwise on the Drawings:
      1) Anvil International, Figure 216.
      2) Bergen-Power, Figure 298.

V. PTFE pipe slide assembly: MSS SP-58, Type 35 with lateral and vertical restraint:
1. Manufacturers: One of the following:
   a. For stainless steel piping:
      1) Nibco-Tolco, Figure 426.
   b. For all other piping, unless indicated on the Drawings:
      1) Anvil International, Figure 257, Type 3.
      2) Cooper B-Line Systems, Inc., Figure B3893.

PART 3 EXECUTION

3.1 INSTALLATION

A. Properly support, suspend, or anchor exposed pipe, fittings, valves, and appurtenances to prevent sagging, overstressing, or movement of piping; and toprevent thrusts or loads on or against connected pumps, blowers, and other equipment.

B. Field verify support location, orientation, and configuration to eliminate interferencesprior to fabrication of supports.

C. Carefully determine locations of inserts. Anchor to formwork prior to placingconcrete.

D. Use flush shells only where indicated on the Drawings.

E. Do not use anchors relying on deformation of lead alloy.

F. Do not use powder-actuated fasteners for securing metallic conduit or steel pipe larger than 1 inch to concrete, masonry, or wood.

G. Suspend pipe hangers from hanger rods and secure with double nuts.

H. Install continuously threaded hanger rods only where indicated on the Drawings.

I. Use adjustable ring hangers or adjustable clevis hangers, for 4 inch and smallerdiameter pipe.

J. Use adjustable clevis hangers for pipe larger than 4 inches in diameter.

K. Secure pipes with double nutted U-bolts or suspend pipes from hanger rods andhangers.
1. For stainless steel piping, use stainless steel U-bolts.
2. For all other piping, use galvanized U-bolts.

L. Support spacing:
1. Support 2-inch and smaller piping on horizontal and vertical runs at maximum5 feet on center, unless otherwise specified.
2. Support larger than 2-inch piping on horizontal and vertical runs at maximum10 feet on center, unless otherwise specified.
3. Support exposed polyvinyl chloride and other plastic pipes at maximum 5 feeton center, regardless of size.
4. Support tubing, PVC pipe 1-inch and smaller, copper pipe and tubing, fiber-reinforced plastic pipe or duct, and rubber hose and tubing at intervals close enough to prevent sagging greater than 1/4 inch between supports.
5. Do not suspend or support valves, pipe and fittings from another pipe orconduit.

M. Install supports at:
1. Any change in direction.
2. Both sides of flexible pipe connections.
3. Base of risers.
4. Floor penetrations.
5. Connections to pumps, blowers, and other equipment.
6. Valves and appurtenances.

N. Securely anchor plastic pipe, valves, and headers to prevent movement duringoperation of valves.

O. Anchor plastic pipe between expansion loops and direction changes to prevent axial movement through anchors.

P. Provide elbows or tees supported from floors with base fittings where indicated onthe Drawings.

Q. Support base fittings with metal supports or when indicated on the Drawings supporton concrete piers.

R. Do not use chains, plumbers' straps, wire, or similar devices for permanentlysuspending, supporting, or restraining pipes.

S. Supports, clamps, brackets, and portions of support system bearing against copperpipe: Copper plated, copper throughout, or isolated with neoprene or polyvinyl chloride tape.

T. Where pipe is insulated, install over-sized supports and hangers.

U. Install insulation shield in accordance with MSS SP-58, Type 40. Shield shall be galvaized steel unless otherwise specified or indicated on the Drawings.

V. Install riser clamps at floor penetrations and where indicated on the Drawings.

END OF SECTION

SECTION 40_05_12

PIPING SPECIALTIES

PART 1 GENERAL

1.1 SCOPE OF WORK

A. Furnish all labor and materials required and installed complete and ready for operation, all appurtenances as shown on the Drawings and/or as specified herein for project conditions / installation.

B. All items listed in this Specification may or may not be required on this project (see Drawings and other section of Contract Documents.)

C. Should other Specification sections or Drawings reference an alternate manufacturer / model or provide alternate requirements, the more stringent / costly shall govern and be included in Contractor's bid.

D. Section includes:
1. Mechanical Type Wall Seals
2. Service Clamps
3. Dielectric Insulating Gasket Kits for Flanges
4. Dielectric Unions for Copper Tube
5. Flange Bolts and Nuts
6. Anti-Seize Bolting Lubricants
7. Non-Insulating Flange Gasket Materials
8. Sleeve ("Dresser type") Couplings
9. Insulated Sleeve Couplings
10. Flange Coupling Adapters
11. Depend-O-Lok Couplings
12. Harnessing and Restraint
13. Quick Connect Couplings
14. Wall and Floor Fittings
15. Gauges and Accessories
16. Valve Operators (Including Floor Boxes)
17. Strainers
18. Corporation Stops
19. Appurtenances and Miscellaneous Items
20. Emergency Safety Showers and Eyewash Units
21. Stainless Steel Expansion Joints
22. Rubber Expansion Joints
23. Flexible rubber connections.
24. Bellows type expansion joints.
25. Slip type expansion joints.
26. Rubber expansion joints.
27. Expansion joints for chemical services.
28. Vibration control joints.
29. Transition fittings.
30. Pipe saddles.

31. Tapping sleeves.
32. Sight glasses.
33. Spray nozzles.
34. Flange-mounted magnetic type level indicator.

E. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.3 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.4 REFERENCE STANDARDS

A. American National Standards Institute (ANSI): ANSI B2.1.
1. ANSI Z358.1 - American National Standard for Emergency Eyewash and Shower Equipment.

B. American Society for Testing and Materials (ASTM):
1. ASTM A 126 - Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings
2. ASTM A 183 - Specification for Carbon Steel Track Bolts and Nuts
3. ASTM A 278 - Specification for Gray Iron Castings for Pressure Containing Parts for Temperatures Up to 650 degrees F
4. ASTM B 62 - Specification for Composition Bronze or Ounce Metal Castings
5. ASTM B 88 - Specification for Seamless Copper Water Tube
6. ASTM A 536 - Specification for Ductile Iron Castings

C. American Water Works Association (AWWA):
1. AWWA C219 - Bolted, Sleeve-Type Couplings for Plain End Pipe
2. AWWA C606 - Grooved and Shouldered Joints

PART 2 PRODUCTS

2.1 GENERAL

A. Joint, size and material - unless otherwise specified or required:
   1. Joints referred to herein shall be of the same nominal diameter as the pipe or fittings they are connected to.
   2. Appurtenance shall be of the same nominal diameter as the pipe or fittings they are connected to.

B. Ensure that valves and appurtenances have ends/joints that are compatible with, and may be fastened to the adjoining pipe. This may mean furnishing special adaptors as required. These adaptors shall be suitable for direct bury, with proper dielectric insulation and as a minimum, if metallic non-stainless steel or galvanized, coated with two coats of Coal Tar Epoxy.

2.2 MECHANICAL WALL SEALS

A. Mechanical type seals shall consist of an adjustable modular bolted, synthetic rubber and plastic sealing element as shown on Drawings. The sealing element shall be Link- Seal LS-300-C as manufactured by Enpro Industries., or equal.

2.3 SERVICE CLAMPS

A. Service clamps shall have malleable or ductile iron bodies which extend at least 360 degrees around the circumference of the pipe and shall have neoprene gaskets cemented to the saddle body. Bodies shall be tapped for IPS. Clamps shall be of the double strap design.

B. Service clamps shall be IPS service clamps as manufactured by Mueller Co., or equal.

2.4 DIELECTRIC INSULATING GASKET KITS FOR FLANGES

A. Dielectric insulating flange gasket kits shall be installed when dissimilar metal pipe connects to prevent galvanic action. Flange insulation kits shall be installed where a stainless steel flange is mated with flanges constructed of bronze alloys, carbon steel alloys, or nickel alloys (Monel, Hastelloy and Inconel) flanges; where process piping mates with valves and other equipment and appurtenances of dissimilar metals; where exposed piping makes a vertical transitions to buried piping; and where otherwise as shown on the Drawings.

B. Insulating flange gaskets shall be furnished as a kit including the dielectric gasket, bolt sleeves and washers in accordance to the nominal flange size.

C. Each dielectric insulating gasket shall be a full face isolating and sealing gasket, Type "E", 1/8" thick, epoxy-glass retainer with bolt holes cut to match mating flange drilling. The retainer shall contain a precision tapered groove to accommodate the controlled compression of a FKM (Viton) sealing element. The quad-ring seal shall be pressure energized. The epoxy-glass retainer shall have 550-volts/mil dielectric strength and a minimum 50,000 psi compressive strength.

D. Insulating bolt-sleeves shall be manufactured of Mylar having a dielectric strength of not less than 4000-volts/mil.

E. Insulating washers shall be manufactured of G-10 epoxy-glass having a dielectric strength of 400 to 500-volts/mil. Insulating washers shall be installed with metallic backing washers to prevent damage to the epox-glass washers during bolting. The metallic washers shall be constructed of the same material as the bolts.

F. Dielectric insulating flange gasket kits shall be:
   1. Linebacker manufactured by Pipeline Seal and Insulator, Houston, Texas.
   2. Trojan Quad Seal manufactured by Advance Products and Systems, Lafayette, Louisiana.
   3. Jack O-ring gaskets manufactured by Central Plastics, Shawnee, Oklahoma.

2.5 FLANGE BOLTS AND NUTS

A. All flange bolt lengths shall be selected by the Contractor such that three threads, as a minimum, protrude from the hex nut and washer after assembly. Flange bolts for dielectric insulating flange kits shall be fully-threaded along their length. The Contractor is cautioned that flange bolts having smooth shank segments along their length will not fit in Mylar sleeves or molded sleeve washers.

B. Unless specifically stated otherwise, all bolts, nuts, and washers shall be Type 316 stainless steel.

C. ASME B1.1, coarse threads, Class 2A fit, and conform to ASTM A193, Grade B8M.

D. Flange nuts shall have ASME B1.1, coarse threads, Class 2A fit, and conform to ASTM A194 Grade 8M, Type 316 stainless steel, having square or hexagonal heavy dimensions in accordance with ASME B18.2.2.

2.6 ANTI-SEIZE BOLTING LUBRICANTS

A. Flange bolts shall be installed using a nickle-seize lubricant capable of achieving the required bolt torque and sealing stress, and permitting future disassembly with minimal manual input.

B. Anti-seize compound shall be classified as acceptable for potable water by the NSF.

C. Acceptable Manufacturers:
   1. Never-Seez White Food Grade PTFE Lubricant manufactured by Bostik, Wauwatosa, Wisconsin.
   2. Loctite Nickle Anti-Seize Lubricant manufactured by Henkel Technologies, Rocky Hill, Connecticut.

D. Flange bolts shall be adequately degreased of all corrosion inhibiting slush oil and excess nickle anti-seize prior to field application of prime and finish coatings.

2.7 SLEEVE ("DRESSER TYPE") COUPLINGS

A. Sleeve type couplings shall conform to the requirements of AWWA C219, with a pressure rating as indicated on the Drawings. The pressure rating of the couplings shall be at least the field test pressure it is subjected during the pressure testing of the connecting pipeline or the pressure class of the pipeline whichever is higher.

B. The couplings shall be of a gasketed, sleeve-type with diameter to properly fit the pipe. Each coupling shall consist of cylindrical sleeve, two follower rings, two gaskets and a set of bolts and nuts.
   1. Sleeve: Sleeve shall be ASTM A53, ASTM A512, ASTM A513, ASTM A536 Grade 65- 45-12 or carbon steel having a minimum yield strength of 30,000 psi. Sleeve shall be lined with 12 mil DFT fusion bonded epoxy compatible with potable water. Minimum sleeve length shall be five inches for pipe 12-inches and smaller, seven inches for pipe sizes 14-inches thru 24-inches, and 10-inches for pipe larger than 24-inches. Sleeve for stainless steel piping shall be fabricated of ASTM A240, Type 316 stainless steel.
   2. Follower Rings: Ductile Iron ASTM A536 Grade 65-45-12, AISI C1012, AISI C1015 Steel, AISI C1018 Steel or AISI C1020 Steel. Follower rings for stainless steel pipe shall be fabricated of ASTM A240, Type 316 stainless steel.
   3. Bolts and Nuts: Bolts and nuts are as specified in Paragraph 2.07 of this Section.
   4. Gaskets shall be of synthetic rubber suitable for operating conditions.
   5. Finish: Fusion bonded epoxy 12 mil DFT as per AWWA C213.

C. Sleeve type couplings shall have pipe stop removed for exposed piping.

D. Acceptable Manufacturers:
   1. Dresser Industries - Style 38, 138, or 253.
   2. Romac Industries, Inc. - Style 400, 501, or XR501.
   3. Smith-Blair - Model 411.

E. Sleeve type couplings shall be installed where shown on the Drawings and at locations where a disassembly gap is necessary to complete a piping assembly.

F. Contractor at his option may install additional couplings for ease of installations without any additional cost to the Owner.

G. In addition to those locations noted on the Drawings, sleeve couplings shall be provided on piping buried directly under a structure at the structure's expansion joints. Special treatment will be required where pipe is encased in concrete, utilizing minimum 3-inch thick styrofoam placed perpendicular to horizontal centerline coupling.

H. Joint harness shall be provided on all couplings and shall be designed for maximum pressure to which the line will be subjected.

2.8 FLANGE COUPLING ADAPTERS

A. Construction:
   1. Body and follower: Carbon Steel, Ductile Iron ASTM A 536, Grade 65-45-12.
   2. End Ring: Ductile Iron ASTM A536, Grade 65-45-12.
   3. Flange: ANSI Class 125 or 250 flat face. Match class to that of piping system.

4. Bolts and nuts: As per Paragraph 2.06 of this Section.
5. Gaskets shall be of synthetic rubber suitable for operating conditions.

B. Restraining or harnessing system shall be as shown on the contract drawings for flange coupling adaptor.

C. Factory Painting:
1. Apply fusion bonded epoxy-type protective coating system in accordance with AWWA C213, to interior and exterior of adapters. Coating for interior surface shall be NSF 61 approved for potable water. Coating to be Manufacturer's standard epoxy system complete with prime and finish coats minimum of 12 mils DFT for interior and exterior of flange coupling adapters.
2. Do not paint bolts and gaskets.
3. Coatings used on exterior of couplings which will be exposed shall be compatible with specified coating system for piping so that coupling can be painted a common color.

D. Acceptable Manufacturers:
1. Size twelve inches and larger:
   a. Romac Industries, Inc. - Style FC400.
   b. Dresser Style 131.
2. Below twelve inches:
   a. Romac Industries, Inc. - Style FCA501.
   b. Dresser Industries - Style 128-W.
   c. Smith Blair - Style 912

2.9 QUICK CONNECT COUPLINGS

A. Couplings shall be of the cam and groove type consisting of a male adapter conforming to F.S. MIL-C-27487. Male adapters shall be designed to receive a female coupler without requiring threading, bolting, or tools. Connections shall remain tight and leak proof under pressures up to 100 psig. Each adapter shall be furnished with a dust cap complete with an 18-inch long security chain of corrosion resistant material. Couplings shall be as manufactured by Dover Corporation, Ever-tite, or equal.

B. Adapters shall be furnished in accordance with the Drawings or as required by the installation.

2.10 WALL AND FLOOR FITTINGS

A. Wall and floor castings, unless otherwise specified with the individual type of pipe, shall be ductile iron of the style shown on the Drawings with integral exterior water stop, standard models as manufactured by Clow, U.S. Pipe and Foundry, or equal.

B. For plastic pipe or other pipe 2-1/2-inch diameter or less wall and floor fittings shall be ASTM A120, Schedule 40 steel sleeves with exterior steel water stop, all hot dipped galvanized after fabrication.

2.11 VALVE OPERATORS (INCLUDING FLOOR BOXES)

A. The valve Manufacturer shall supply and integrally mount all operators on valves at the factory. The valves and their individual operators shall be shipped as a unit.

B. Unless otherwise noted, valves shall be manually operated; non-buried valves shall have an operating wheel, handle or lever mounted on the operator; buried valves shall have a non-rising stem with an AWWA 2-inch nut.

C. Unless otherwise required by the Owner, all manual operating input shafts shall turn to the left (counter-clockwise) to open the valve.

D. Each operating device shall have cast on it the work (OPEN) and an arrow indicating the direction of operation.

E. Provide valve position indicator for buried valves. Valve box size shall be adequate to accommodate valve position indicator.

F. Floor boxes for operating nuts recessed in concrete floors shall be standard cast iron type, cast-in-place with fastening top by Clow or equal.

G. Chainwheel shall be supplied for all valves larger than 3-inch in diameter whose centerline is 5 ft. or more above the floor for operation of valve. Chainwheel shall be galvanized and chain shall loop within four feet of the floor. Chainwheel diameter shall match that of the handwheel.
   1. Acceptable Manufacturers:
      a. Babitt Steam Specialty, New Bedford, Massachusetts
      b. Roto Hammer Industries, Tulsa, Oklahoma

H. Unless otherwise noted, gear operators shall be provided for: All valves with operating shafts of larger than 8-inch nominal diameter (unless otherwise noted); for all buried valves with their operating shaft mounted horizontally (butterfly, plug, etc.); where specified and/or indicated on the Drawings; and where manual operator effort is greater than 40 ft-lbs. Gear operators shall normally be of the beveled type with output shaft perpendicular to valve shaft, having a removable hand wheel mounted on the output shaft. Gearing shall be machine-cut steel designed for smooth operator. Bearings shall be permanently lubricated, provided to take all thrusts and seals provided to contain lubricants. Housings shall be exclude moisture and dirt. Manual operator input effort to the hand wheel shall be a maximum of 40 ft-lbs. to operate the valve from full open to full close, under line pressure. Gear operators shall indicate valve position and have adjustable stops.

2.12 STRAINERS

A. "Y" Type Strainers:
   1. Manual strainers furnished for pipe diameters smaller than 2 inches in diameter shall be "Y" type, capable of removing solids 0.01 inches diameter and larger. The strainer body shall be of semi-steel construction for steel pipe, and brass or bronze for copper pipe and shall conform to ASTM A278, Class 30. Strainers on plastic pipe shall be of the same material as the pipe. Strainer elements, including woven wire mesh, shall be constructed of stainless steel.

2. Design of the strainer body shall be such that the clean-out plug and screw may be easily removed to permit inspection and cleaning without disassembly of inlet and outlet piping. End connections shall be ANSI screwed pipe threads.
3. Six spare screens shall be furnished for replacement of all "Y" type units at least once. Strainers shall be designed for a maximum operating pressure of 150 psig. They shall be as manufactured by GA Industries, Inc., or equal.

B. Manual Basket Strainers:
1. Manual basket strainers shall be furnished for pipe 2 inches in diameter and larger, as per the Drawings. Strainer body shall be of cast iron construction. Strainer elements shall be constructed of Type 304 stainless steel. Design of the basket strainer body shall be such that the bolted lid and basket may be easily removed for inspection and cleaning without disassembly of inlet and outlet piping.
2. A trap with a blow-off port shall be provided for removing any material that may settle at the bottom. Strainers shall be designed for a maximum operating pressure of 150 psig, and shall be 74-D as manufactured by GA Industries, Inc., or equal.
3. Proper blow off piping with valve shall be supplied, run to nearest drain.

C. PVC Duplex Basket Strainer:
1. Provide and install PVC duplex basket strainer as shown on drawings.
2. Strainer shall be of PVC construction, rated for a working pressure of up to 50 PSI. Baskets shall be removable without the need for tools.
3. Strainer shall be integrally fitted with PVC ball or butterfly valves to enable diversion of flow through either of the two baskets, while the other basket is isolated for cleaning. PVC ball valves shall be provided at each basket drain.
4. Strainer shall have two stainless steel baskets, each with 1/16” perforations, providing a minimum open area ratio of 4:1.
5. Bolt bases securely to floor using 316 stainless steel capsule anchors.
6. Strainer shall be as manufactured by Hayward Flow Control Systems, Eaton Filtration.

2.13 CORPORATION STOPS

A. Corporation stops shall be of bronze or brass, and shall be designed and manufactured in accordance with AWWA Standard C800, except as modified herein. Corporation stops shall have Mueller inlet threads, except that corporation stops for use with service clamps shall have IPS threads. Where corporation stops are used with plastic pipe, a brass companion flange shall be provided on the outlet of each corporation stop.

2.14 EMERGENCY SAFETY SHOWERS AND EYEWASH UNITS

A. Should other Specification sections or Drawings reference an alternate manufacturer / model or provide alternate requirements, the more stringent / costly shall be included in Contractor’s bid.

B. Furnish and install where shown on the Drawings. All assemblies shall be provided with stay-open ball valves. Provide eye wash with strainer on supply line. Units shall be complete with automatic flow control devices as required to limit emergency shower flow to 20 gpm and eye wash flow to 2.4 gpm. An emergency identification sign shall be included with each unit. Emergency safety shower and Eye Wash Assemblies shall be manufactured by

Haws, Guardian, Western, Bradley, or Speakman. All units shall be provided with a tepid water system.

C. Interior Emergency Shower/Eye Wash Unit (ESEW-A)
1. Furnish and install a combination emergency shower and eye wash unit where shown on the Drawings.
2. Units shall have a 10-in cycolac plastic shower head and eye wash bowl, stay open ball valves and hand and foot control for eye wash.
3. Units shall be complete with automatic flow control devices as required to limit emergency shower flow to 20 gpm and eye wash flow to 3 gpm.
4. Unit shall be equipped with a flow switch to provide a dry contact alarm signal when the unit is in use. The contact will be monitored by the plant SCADA system. Unit shall include strobe light and horn.
5. Unit shall be modified to include a 8-ft hand held recoil hose assembly with bracket for spray head and equal to Haws Model #8906, Guardian Model #G1716 or Bradley Model #S-19-600

D. Exterior Freeze-Proof Emergency Shower/Eye Wash Unit (ESEW-B)
1. Furnish and install where shown on the Drawings, a combination emergency shower and eye wash unit equipped with heating cable and insulation and designed to operate at temperatures as low as minus 40 degrees F.
2. Equipment shall include a ABS plastic shower head, stay-open ball valve, automatic volume control on both shower and eye wash, removable polyethylene foam insulation encased in ABS plastic jacket and a NEMA 4 enclosed thermostat. Shower flow shall be limited to 20 gpm. Eye wash shall include strainer, flow shall be 2.4 gpm.
3. Unit shall have integral purge valve that opens when water temperature falls below 45 Deg. F. The valve shall be located opposite the water supply connection and purge approximately 6 gpm to prevent freezing in case of power failure.
4. The unit shall be factory modified (special order) to include an additional 24-inch long section of heat trace wire exposed at piping inlet connection. Wrap heat trace wire around potable water supply from building. Insulate over heat trace and jacket outdoor exposed potable water piping.
5. Unit shall be equal to Haws Model #8317CTFP. Other acceptable manufacturers are Guardian and Bradley.

2.15 STAINLESS STEEL EXPANSION JOINTS

A. The expansion joints shall be OMNI-FLEX as manufactured by Victaulic, Incorporated. Unless noted otherwise all expansion joints shall be anchored with tie rods as recommended by the expansion joint Manufacturer, with no less than two rods each. Expansion joints shall be furnished for installation at the locations shown on the Drawings. Thermal expansion and contraction that will occur in the pipe resulting axial and/or lateral movement of the pipe shall be based on a maximum temperature variation of 250o degrees Fahrenheit. The expansion bellows shall be produced from fully annealed stainless steel stock rolled into a tube, seam welded and formed into corrugations. Ends of the expansion bellows shall be prepared for stainless steel plate flanges conforming to ANSI/AWWA dimensions welded directly to the integral ends of the stainless steel bellows.

2.16 RUBBER EXPANSION JOINTS

A. Expansion joints shall be single arch-type of butyl rubber construction with UV protection coating and carcass of high-grade woven cotton or suitable synthetic fiber and individual solid steel ring reinforcement. Soft rubber fillers shall be integrally cured into the arches to provide a smooth flow path to prevent settling of materials into the arch. Joints shall be constructed to pipe size and meet working pressure and corrosive conditions. Joints shall have full-faced fabric reinforced butyl flanges integral with the body. Split-type steel or ductile iron backup rings shall be provided to insure a good joint. Rings shall be designed for mating with ANSI 150 lb. flanges. Joints shall be finish coated with Hypalon or equal paint.

B. Expansion joints shall be furnished with control (harness) units. Harness units shall consist of minimum two drilled plates, stretcher bolts, and rubber washers backed by metal washers. Stretcher bolts shall prevent over-elongation of the joint. Extra nuts shall be provided on the stretcher bolts on the inside of the plate to prevent over compression. Retaining ring, nuts, bolts, and plates shall be 316L stainless steel.

C. Expansion joints shall be Style 1101 filled arch as manufactured by General Rubber Corp. or equal.

D. In addition to locations shown on the Drawings, expansion joints shall be utilized in exposed piping within one foot of a building expansion joint, and on the discharge side of non-piston pumps, compressors, and rotating machinery.

2.17 FLEXIBLE RUBBER CONNECTIONS

A. Manufacturers: One of the following or equal:
   1. Mercer Rubber Company, Type 150 Vibraflex.
   2. Red Valve Company, Inc., Part Number P-5.

B. Provide flexible rubber connections with 3/8 inch thick EPDM rubber tube with full- faced flanged ends suitable to withstand a pressure of 150 pounds per square inchgauge.

C. Provide complete flexible rubber connections, including galvanized retaining rings and control rods.

2.18 BELLOWS TYPE EXPANSION JOINTS

A. Expansion joints for general service:
   1. Expansion joints: Flexible bellows type with equalizing rings, or as otherwise specified or indicated on the Drawings.
   2. Manufacturers:
      a. Expansion joints: One of the following:
         1) Senior Flexonics Pathway, Inc., Controlled Flexing Expansion Joint.
         2) Flex-Weld, Inc., Keflex, Series 308.
         3) Victaulic Depend-o-Lok, Omniflex stainless bellows expansion joint.
      b. Pipe alignment guides: One of the following or equal:
         1) Senior Flexonics Pathway, Inc.

2) Flex-Weld, Inc.

c. Intermediate supports: Provide with protective saddles. One of the following or equal:
1) Unistrut Corporation, Roller-type.
2) Bergen-Paterson Pipe Support Corp.

3. Design:
a. Expansion joint rating: 150 pounds per square inch gauge, at 300 degrees Fahrenheit.
b. Bellows: Multi-ply stainless steel, equipped with a self-draining liner guide.
c. Axial travel of expansion joints: Not less than 1.50 inches.
d. Ends: 150 pound ASME flanges, Victaulic Depend-o-Lok Airmaster/Fluidmaster coupled ends, or plain suitable for welding connections, as required for piping in which installed.

B. Expansion joints for steam and hot water:
1. Manufacturers: One of the following:
a. Flex-Weld, Inc., Keflex, Series 308-1215.
b. Senior Flexonics Pathway, Inc., Controlled Flexing Expansion Joint.
c. Victaulic Depend-o-Lok Omniflex Expansion Joint.
2. Design:
a. Single reinforced bellows type or Victaulic mechanical couplings.
b. Pressure and temperature ratings: 150 pounds per square inch gauge,and 500 degrees Fahrenheit service.
c. Bellows: Multi-ply Type 321 stainless steel, equipped with a Type 321 stainless steel liner.
d. Axial travel of expansion joints: 3 inches minimum.
e. Ends: 150 pound ASME flanges.

C. Copper piping expansion joints:
1. Expansion joints for copper pipe: As specified before, except externally guided, without equalizing rings, and provide for 3-1/4 inch expansion per100 feet of piping.

D. Roof drain expansion joints:
1. Neoprene bellows between roof drain fitting and drain piping.
2. Up to 12-inch static head.
3. Complete with Type 316 stainless steel clamps.
4. Manufacturer: The following or equal:
a. Watts, Model RD-900.
b. Flexicraft Industries, DWV.

E. Stainless Steel Bellows for Aeration Air Service:
1. Manufacturers: One of the following or equal:
a. Hyspan.
b. Microflex.
2. Materials:
a. Bellows: Type 316L stainless steel.
b. Flow Liner: Type 316L stainless steel.
c. Flanges: Type 304 stainless steel.
3. Construction:
a. Laminated construction with a minimum of 2 plies.

b. Flow liners shall be provided on all joints.
c. End connections: fixed flange by fixed flange.
d. Provide shipping bars on all joints.

2.19 SLIP TYPE EXPANSION JOINTS

A. Expansion joints for steam cleaned piping:
1. Manufacturers: One of the following or equal:
a. BTR, Inc./Smith-Blair, Inc., Number 612 with slip pipe and without limit rods.
b. Dresser Industries, Inc., Style 63, Type 2.
2. Line and coat slip pipe and interior of body with fusion-bonded epoxy ofminimum 0.012-inch thickness.
3. Packing: Suitable for temperatures greater than 212 degrees Fahrenheit.

B. PVC expansion joints:
1. Flexible bellows type with equalizing rings.
2. Manufacturers: One of the following or equal:
a. Flo Control, Flo-Span.
b. Chemtrol.
3. Materials: PVC with EPDM O-ring.
4. Design:
a. 150 pound per square inch pressure rating.
b. Double O-ring seal.
c. Axial travel: Not less than 1.5 inches.
d. Ends: 150 pound ASME flanges, or plain end suitable for solvent welding connections.

2.20 RUBBER EXPANSION JOINTS

A. Manufacturers: One of the following or equal:
1. Mercer Rubber Company, Style 500 or 700.
2. Red Valve Company, Inc., Type J-1.

B. Provide rubber expansion joints complete with control units and split retaining rings.

C. Design:
1. Material: Neoprene rubber, reinforced with embedded steel rings, and a strong synthetic fabric.
2. Expansion rings, suitable for pressures of at least 125 pounds per square inch gauge, except as follows:
a. Expansion joints in pump suction piping and where indicated on the Drawings suitable for minimum 90 pounds per square inch gauge pressure, and minimum 30 inches mercury vacuum.
b. Split retaining rings, galvanized.
c. Ends of expansion joints, 150 pound ASME flanges with drilling to match that of the piping.

D. Rubber expansion joints for blowers and aeration air piping: EPDM type rubber formulated for service application and for maximum temperature of 250 degrees Fahrenheit, suitable

for minimum 40 pounds per square inch gauge pressure, andminimum 15 inches mercury vacuum.

1. Minimum axial expansion: 1/2 inch.
2. Minimum axial compression: 3/4 inch.
3. Minimum lateral deflection: 1/2 inch.
4. Minimum angular deflection: 5.5 degrees.

2.21 EXPANSION JOINTS FOR CHEMICAL SERVICES:

A. Manufacturers: One of the following or equal:
   1. Red Valve Company, Inc., Type T-205, Teflon Lined.
   2. Mercer, Teflon Lined, Series 700.

B. Provide Teflon-lined Hypalon or rubber expansion joints, reinforced with embeddedsteel rings, and a strong synthetic fabric. Teflon lined rubber expansion joints shall be required to have Teflon liner extend through the entire length of the joint and cover end flanges completely. Teflon-lined Hypalon expansion joints shall be required to have the Teflon liner extend through the entire length of the joint up intothe outer edge of the raised flanged faces.

C. Expansion rings, suitable for pressures of at least 125 pounds per square inchgauge.

D. Ends of expansion joints, ANSI flanges with drilling to match that of the piping. Flanges shall be ANSI-rated components suitable for a working pressure of 250 psi.

2.22 VIBRATION CONTROL JOINTS

A. Manufacturers:
   1. Braided bronze flexible vibration joints 2 inches and less in size: One of the following or equal:
      a. Senior Flexonics Canada, Inc., Type BRC bronze connectors.
      b. Flex-Weld, Inc., Keflex, Type KFCB.
   2. Flexible vibration joints larger than 2 inches: One of the following or equal:
      a. Senior Flexonics Canada, Inc., Type TCS.
      b. Flex-Weld, Inc., Keflex, Series 151-TR-1215.
   3. Corrugated stainless steel with stainless steel braid flexible vibration joints:One of the following or equal:
      a. Senior Flexonics Canada, Inc., Type BSFS stainless steel connectors.
      b. Flex-Weld, Inc., Keflex, Type USFNSS-31.

B. Design:
   1. Flexible vibration joints 2 inches and smaller: Braided bronze, suitable forpressures of not less than 250 pounds per square inch gauge.
   2. Flexible vibration joints larger than 2 inches: Flexible bellows type, suitable for pressures of not less than 150 pounds per square inch gauge, at 70 degrees Fahrenheit, except as follows:
      a. Provide vibration joints in piping subject to test pressures higher than 150 pounds per square inch gauge, suitable for such higher pressures.
      b. Bellows: Stainless steel, equipped with a stainless steel liner.
      c. Ends: ASME Class 150 flanges.

3. Vibration joints in high-pressure air piping and in digester gas piping: Corrugated Type 316 stainless steel with stainless steel braid, suitable forpressures of not less than 150 pounds per square inch gauge.
   a. Ends: ASME Class 150 flanges.

C. Protection: Protect vibration absorbers against end loading and torsional stresses by anchoring attached piping.

2.23 TRANSITION FITTINGS

A. Manufacturers: One of the following or equal:
   1. Spears.

B. Materials:
   1. Slip socket: Schedule 80 PVC.
   2. Collar: Type 316 stainless steel.
   3. Threaded insert: Type 316 stainless steel.

2.24 PIPE SADDLES

A. Manufacturers: One of the following or equal:
   1. BTR Inc./Smith-Blair, Inc., Style 317.
   2. Romac Industries, Inc., Style 202S.

B. Materials:
   1. Pipe saddles: Ductile iron.
   2. Straps, bolts, and nuts: Type 304 stainless steel with Teflon coating on nuts.
   3. Gaskets: EPDM.

2.25 SIGHT GLASSES

A. Assembly: Body casting with ASME standard adapter flanges, borosilicate Pyrex☐ glass section, cleaning assembly with scalloped neoprene wipers, operating rod and handle, packing gland with packing and suitable adapter, and cock with solvent hand pump.

B. Suitable for a minimum pressure of 30 pounds per square inch gauge.

C. Manufacturers: One of the following or equal:
   1. EIMCO Process Machinery Division of Envirotech Corporation.
   2. Ernst, Type K2 or K3 Cleanable Sight Glass.

2.26 SPRAY NOZZLES

A. Location:
   1. N/A

B. Design:
   1. Operating pressure 10 pounds per square inch gauge, at which pressure at each nozzle discharges not less than 3.5 gallons per minute, nor more than 5.0 gallons per minute.
      a. Spray: Flat, heavy sheet, fan with uniform distribution.

b. Fan width at the water surface not less than 6.5 feet at 10 pounds per square inch gauge.
c. Spray deflection with a replaceable deflector insert free to rotate away from the orifice opening and mechanically locked in place and counterweighted.

2. Spray nozzles structurally suitable for pressure up to 200 pounds per square inch gauge.
3. Nozzles, easy flush type.
4. Nozzles for primary clarifiers shall be mounted to the underside of the clarifier covers. Coordinate installation of these nozzles with the cover manufacturer and provide access to nozzles for maintenance and/or replacement. Coordinate with the cover manufacturer to provide adequate support of the spray nozzle system.

C. Materials:
1. Spray nozzles: Leaded bronze.
2. Nozzles provided with 1/4 inch national pipe thread, and the orifice diameternot less than 1/4 inch.
3. Replaceable spray deflector: Neoprene rubber.

2.27 FLANGE-MOUNTED MAGNETIC TYPE LEVEL INDICATOR

A. Manufacturers: The following or equal:
1. Gems Sensors, Sure Site Type BP.

B. Magnetic Level Indicators:
1. CPVC housing and CPVC float.
2. 2-inch flanged side mount connections.
3. Pipe caps top and bottom.
4. Colored magnetic flag indicators.
5. Rated 40 pounds per square inch/140 degrees Fahrenheit.
6. Ferric Tank: Indicating height of 12 feet.

2.28 CHEMICAL QUICK DISCONNECT COUPLINGS

A. Manufacturers: The following:
1. PT Coupling.
2. OPW Engineered Systems, Kamlok.
3. Alsco Industrial Products, Banjo Dry-Mate.

B. Metallic Hose Coupling:
1. Material, 316 Stainless Steel.
2. Female NPT threaded coupling.
3. Dust cap with twin cam arms.
4. Minimum pressure rating, 150 psi at 150 degrees F.

C. Non-Metallic Hose Coupling:
1. Material, Polypropylene.
2. Female NPT threaded coupling.
3. Dust cap with twin cam arms.
4. Minimum pressure rating, 50 psi at 150 degrees F.

D. Zero Leakage Hose Coupling:
   1. Material, Polypropylene.
   2. Assembly to include male and female fittings.
   3. Male and female fittings to have NPT threaded end.
   4. Fittings to have twin cam arms.
   5. Minimum pressure rating, 70 psi at 150 degrees F.

PART 3 EXECUTION

3.1 INSTALLATION

A. Items shall be installed per Manufacturer's instructions in the locations shown on Drawings. Contractor to thoroughly review instructions prior to installation.

B. Damage to items shall be repaired to the satisfaction of the Owner before they are installed.

C. Install brackets, extension rods, guides, the various types of operators and appurtenances as shown on the Drawings that are in masonry floors or walls, and install concrete inserts for hangers and supports as soon as forms are erected and before concrete is poured. Before setting items, check Drawings which have a direct bearing on their location to be responsible for the proper location of these appurtenances during construction of structures.

D. Items shall be carefully inspected for defects in construction and materials; debris and foreign material cleaned out of openings, etc.; operating mechanisms operated to check their proper functioning, and nuts and bolts checked for tightness. Equipment which does not operate easily, or is otherwise defective, shall be repaired or replaced.

E. Where installation is covered by a referenced Specification, installation shall be in accordance with that Specification, except as herein modified.

F. Unless otherwise noted, joints for items shall be made up utilizing the same procedures as specified under the applicable type connecting pipe joint.

3.2 INSTALLATION OF SLEEVE (DRESSER) TYPE COUPLINGS

A. Unless otherwise required by the Manufacturer's instructions, prior to installation of sleeve-type couplings, pipe ends shall be cleaned thoroughly for a distance of at least 12 inches. Soapy water may be used as a gasket lubricant. A follower and gasket, in that order, shall be slipped over each pipe to a distance of about 6 inches from the end; the middle ring shall be placed on the already installed pipe and shall be inserted into the middle ring flair and brought to proper position in relation to the pipe already laid. The gaskets and followers shall then be pressed evenly and firmly into the middle ring flares.

B. After the bolts have been inserted and nuts have been made up finger tight, diametrically opposite nuts shall be progressively and uniformly tightened around the joint, by use of a torque wrench of the appropriate size and torque for the bolts.

C. The correct torque as indicated by a torque wrench shall not exceed 75 ft-lb for 5/8- inch bolts and 90 ft-lb for 3/4-inch bolts.

D. If a wrench other than a torque wrench is used, it should be no longer than 12 inches so that when used by the average person the above torque values shall not be exceeded.

E. To prevent sleeve-type couplings from pulling apart under pressure, a suitable harnessing or flange clamp assembly shall be provided and installed.

F. The additional locations required for sleeve couplings per Part 2 of this Section shall be provided.

3.3 FLANGED COUPLINGS ADAPTERS

A. Flanged coupling adapters shall be installed in strict accordance with the coupling Manufacturer's recommendations. After the pipe is in place and bolted tight, the proper locations of holes for the anchor studs shall be determined and the pipe shall be field-filled. Holes for anchor studs shall be drilled completely through the wall pipe. Hole diameter shall not be more than 1/8-inch larger than the diameter of the stud projection.

3.4 INSTALLATION OF WALL AND FLOOR FITTINGS

A. Wall pipes and pipe sleeves embedded in concrete walls, floors, and slabs shall be embedded as shown. Support all pipes embedded in concrete walls, floors, and slabs with form work to prevent contact with the reinforcing steel.

3.5 EXPANSION CONTROL JOINTS

A. Install bellows type expansion control joints at piping connections to mechanical equipment to prevent damaging stresses due to normal expansionand contraction with temperature changes in piping and connected equipment.

B. Install bellows type expansion joints so as to allow 2-1/4 inch expansion per100 linear feet of piping.

C. Install expansion joints adjacent to an anchor, and provide 1 concentric guideon piping within 12 pipe diameters, but not more than 5 feet, from the end of the joint opposite the anchor.
   1. Locate a similar guide approximately 30 diameters but not more than10 feet from the first.

D. For expansion joints not installed adjacent to an anchor provide 2 concentricguides similarly located at each end of the joint.

E. Provide control rods and additional guides where indicated on the Drawings,but at no greater intervals than recommended by the joint manufacturer in published instructions.

F. Space intermediate supports a minimum of 10 feet, and tack weld theprotective saddles to the pipe.

3.6 VIBRATION CONTROL JOINTS

A. Install vibration control joints at piping connections to or from mechanical equipment to prevent transmitting equipment vibration through the pipingsystem.

3.7 TRANSITION COUPLINGS

A. Application:
   1. Use transition couplings with function and design similar to flexible couplings and flanged coupling adapters for connecting piping havingdifferent outside diameters.

B. Install transition-coupling products specifically designed and manufactured for that application.

3.8 PIPE SADDLES

A. Coat threads on bolts with anti-gall coating prior to installation.

3.9 TAPPING SLEEVES

A. Verify existing pipe material and outer diameter prior to ordering materials.

B. Large diameter pipe:
   1. Verify the existence of lining material.
   2. Verify lining material type.
   3. Repair lining after hot tap operations are complete with similar lining orequal.
   4. Demonstrate ability to accomplish hot tap by staging a dry run simulationof the procedure prior to the initiation of the hot tap procedure.
      a. Walk through each step of the hot tap installation, and show the Engineer every component needed to install the hot tap, including butnot limited to, tools and materials, to ensure that all the required components are on-site and in place prior to beginning the procedure.

C. Coat threads on bolts with anti-gall coating prior to installation.

3.10 SPRAY NOZZLES

A. Install spray nozzles so that elevation of the nozzles is 18 inches above thewater surface.

END OF SECTION

SECTION 40_05_19.20

DUCTILE IRON PIPE & FITTINGS

PART 1 GENERAL

1.1 SCOPE OF WORK

A. Furnish labor, materials, equipment and incidentals necessary to install ductile iron pipe and fittings, including taps, connections, and appurtenances as required for a functional system as indicated herein. Unless otherwise noted, all above grade exposed pipe, fittings, and appurtenances shall be flanged while below grade piping, fittings and appurtenances shall be mechanical joint, or push-on restrained joint. No unrestrained push-on joint piping will be permitting.

B. At all points underground where piping exits structures and transitions to natural ground or other areas subject to ground settling or other potential introduced stresses after installation, a bell-flange wall pipe w/ seep ring and restrained mechanical joint shall be provided. Drawings may/may not reflect (and it may be drawn/called as flanged fitting in locations.)

C. Components/systems/miscellaneous items contained in this specification may or may not be specifically indicated, detailed or called out on the Drawings. Regardless, provide in accordance with this specification with shall govern Drawings unless specifically indicated. Notify Engineer prior to bid for additional clarification where needed.

D. ALL push on ductile iron pipe shall be restrained joint.

E. All iron and steel products used in this project for the construction, alteration, maintenance or repair of a public water system or water treatment plant shall be produced in the United States in accordance with the Consolidated Appropriation Act of 2014. Such products include lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete and construction materials.

1.2 RELATED WORK

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 40_05_12 Piping Specialties.

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submit in accordance with Section 01_33_01 General Submittal Requirements

1.4 REFERENCE STANDARDS

A. American Water Works Association (AWWA) Standards:
1. AWWA C104 Standard for Cement Mortar Lining for Ductile Iron Pipe and Fittings
2. AWWA C105 Standard for Polyethylene Encasement for Ductile Iron Piping
3. AWWA C110 Standard for Ductile Iron and Gray Iron Fittings
4. AWWA C111 Standard for Rubber Gasket Joints for Ductile Iron Pipe and Fittings
5. AWWA C150 Standard for Thickness Design of Ductile Iron Pipe
6. AWWA C151 Standard for Ductile Iron Pipe
7. AWWA C153 Standard for Ductile-Iron Compact Fittings for Water Service
8. AWWA C600 Standard for Installation of Ductile Iron Water Mains and Appurtenances
9. AWWA C606 Grooved and Shouldered Joints

B. Steel Structures Painting Council (SSPC) Standard: SSPC SP6, Commercial Blast Cleaning.

C. All ductile iron pipe and fittings for potable water systems shall conform to American National Standards/National Science Foundation (ANSI/NSF) Standard 61 and must be certified by an organization accredited by ANSI. Ductile iron pipe must be registered with National Sanitation Foundation (NSF) as having been certified to meet NSF/ANSI Standard 61.

1.5 QUALITY ASSURANCE

A. Factory Testing: The manufacturer shall perform all tests as required by AWWA C151 to include a hydrostatic test of 500 psi for no less than 5 seconds.

B. Experience Requirements: Pipe shall be the product of a manufacturer who has a minimum of 10 years' successful experience manufacturing pipe of the particular type specified and the total pipeline shall be the product of one pipe manufacturer. The manufacturer shall have a minimum of 10 years' successful experience in the design and manufacturing of pipe joints of similar design, working pressure, pipe diameter and wall thickness as specified.

C. Pipe Classification: Pipe manufacturer shall manufacture the pipe to meet the installation conditions, cover depth, and bedding and backfill requirements as shown on the Drawings or specified and furnish the correct class of pipe to meet these conditions. If additional requirements are required based on recommended lay condition, depth, etc, pipe manufacturer shall coordinate their requirements with the Contractor prior to bid.

D. All grooved couplings, fittings, valves, and specialties shall be the products of a single manufacturer. Grooving tools shall be of the same manufacturer as the grooved components.

1. All castings used for couplings housings, fittings, or valve and specialty bodies shall be date stamped for quality assurance and traceability.

1.6 SYSTEM DESCRIPTION/DESIGN REQUIREMENTS

A. Exposed pipe shall be flanged unless noted otherwise. Exposed fittings for use with flanged joints on ductile pipe shall be cast iron or ductile iron fittings conforming to ANSI B16.1 or AWWA C110. Flanges shall be faced and drilled in accordance with ANSI B16.1, Class 125. All fittings shall be pressure rated at 250 psig. Buried fittings shall be restrained mechanical joints unless otherwise noted.

B. All above grade pipe shall be flanged unless noted otherwise. Flanges for ductile or cast iron pipe shall be ductile or cast iron flanges screwed on threaded ends of the pipe. Flanges shall conform to ANSI B16.1, Class 125. Screwed-on flanges shall be attached to the pipe in the shop; attachment, aligning and facing shall conform to AWWA C115.

1. AWWA C606 compliant Victaulic grooved joint couplings and fittings may be used on applicable piping systems in lieu of flanged joints at the Contractor's option.

C. Mechanical joints shall only be used on buried pipe or where specifically noted on the drawings for exposed pipe. Mechanical joints for use with ductile iron pipe shall conform to AWWA C111 and shall be restrained.

D. Seal strips, where required on the Drawings shall be link seal as manufactured by Thunderline Corporation, Wayne, Michigan, or equal.

E. All buried ductile iron pipe and fittings shall be protected in accordance with ANSI/AWWA C105/A21.5 "Polyethylene encasement for gray and ductile iron pipe for water and other liquids.

F. Provide restrained joints on all buried piping.

1.7 DELIVERY, HANDLING AND STORAGE

A. Storage and Handling Requirements
1. Ductile Iron Pipe shall be stored and handled in accordance with the guidelines asstated in AWWA M41.

PART 2 PRODUCTS

2.1 MATERIALS

A. Manufacturers
1. Pipe
a. American Cast Iron Pipe Company,
b. U. S. Pipe,
c. or engineer approved equal.
2. Fittings
a. American Cast Iron Pipe Company,
b. U. S. Pipe,

c. Tyler Union
d. Star Pipe Products
e. SIGMA Corporation
f. Victaulic Company
g. or engineer approved equal.

B. Ductile Iron Pipe:

1. Ductile iron pipe shall be made of ductile iron in accordance with AWWA C151. All ductile iron pipe shall have a minimum working pressure as indicated on the Drawings. Pipe shall be rated for pressure in accordance with AWWA C151 for pressure class of pipe as indicated. Standard joint length shall be 18 to 20 feet. Flanged ductile iron pipe shall be in accordance with AWWA C115.
   a. Use thickness Class 53 for interior and flanged pipe.
   b. Use thickness Class 53 or greater for grooved AWWA C606 pipe.
   c. Use thickness Class 52 for other applications.
2. Pipe manufacturer shall manufacture the pipe to meet the installation conditions, cover depth, and bedding and backfill requirements as shown on the Drawings or specified and furnish the correct class of pipe to meet these conditions.
3. The raw material for ductile iron shall have an average minimum content consisting of 90% recycled iron and steel. Ductile iron pipe shall be manufactured in the USA in accordance with ANSI/AWWA C151/A21.51.
4. All pipe shall meet the requirements of NSF 61.
5. Pipe shall have a lay length of 18 feet or 20 feet except for special fittings orclosure pieces necessary to comply with the Drawings.
6. As a minimum the following pressures classes apply. The Drawings may specify a higher-pressure class or the pressure and deflection design criteria may also requirea higher-pressure class. Pipe supplier shall verify/certify bury depth and any/all special requirements prior to bidding and recommend higher pressure class if deemed necessary based on lay conditions and pipe standards. In no case should they be less than the following:

Diameter (inches)	Min Pressure Class (psi)
3 through 12	350
14 through 20	250
24	200
30 through 64	150

7. Pipe markings shall meet the minimum requirements of AWWA/ANSIC151/A21.51. Minimum pipe markings shall be as follows:
   a. "DI" or "Ductile" shall be clearly labeled on each pipe
   b. Weight, pressure class and nominal thickness of each pipe
   c. Year and country pipe was cast
   d. Manufacturer's mark
8. Pressure and Deflection Design:
   a. Pipe design shall be based on trench conditions and design pressure class specified in the Drawings.
   b. Pipe supplier shall verify/certify bury depth and any/all special requirements prior to bidding and recommend higher pressure class if deemed necessary based on lay conditions and pipe standards.

c. Pipe shall be designed according to the methods indicated in AWWA/ANSI C150/A21.50, AWWA/ANSI C151/A21.51, and AWWA M41 for trench construction, using the following parameters:
   1) Unit Weight of Fill (w) = 130 pcf
   2) Live Load = AASHTO HS 20
   3) Trench Depth = As indicated in Drawings
   4) Bedding Conditions = As indicated in Drawings
   5) Working Pressure, Surge Pressure, and Test Pressure shall be as shown onthe Drawings.
   6) Design Internal Pressure (P_i) = P_w + P_s or 2:1 safety factor of the actualworking pressure plus the actual surge pressure, whichever is greater.
   7) Maximum Calculated Deflection (D_x) = 3 percent
   8) Restrained Joint Safety Factor (S_f) = 1.5

d. Trench depths shall be verified after existing utilities are located.
   1) Vertical alignment changes required because of existing utility or other conflicts shall be accommodated by an appropriate change in pipe designdepth.
   2) In no case shall pipe be installed deeper than its design allows.

C. Fittings:
1. Fittings shall be ASTM A536 ductile iron or ASTM A48 cast iron in accordance with C153
2. Fittings for grooved piping systems shall be ASTM A536 ductile iron or ASTM A48 cast iron. Fittings shall conform to ANSI A21.10 / AWWA C110 for center-to-end dimensions; and AWWA C153 or ANSI A21.10 / AWWA C110 for wall thickness. Basis of Design: Victaulic Company AWWA Fittings.
3. Fittings shall be rated for a minimum working pressure of 250 psi, unless specified otherwise.
4. Factory welded outlets may be used in lieu of tee fittings for 18-inch and larger tee fittings. Factory welded outlets shall have a minimum pressure rating of 250 psi. Factory welded outlets may not be used near sources of vibration, such as pump stations or roads.
5. All fittings for potable water service shall meet the requirements of NSF 61

D. Joints for Pipe and Fittings:
1. Joints shall be in accordance with AWWA C110, AWWA C111, and AWWA C151. Standard joints for ductile iron pipe and fittings shall be push-on, restrained. Where indicated, joints shall be mechanical joint, flanged, or grooved.
2. Flanged joints shall have pressure ratings equal to or greater than adjacent pipe. Flange pattern shall match pattern of valve, fitting, or appurtenance to be attached. Flanges on ductile iron pipe shall be ductile iron.
3. Field fabricated flanges are prohibited.
   1) The retainer gland shall have the following working pressure ratings basedon size and type of pipe:
      a) Ductile Iron Pipe
         (1) 3-inch – 16-inch, 350 psi
         (2) 18-inch – 48-inch, 250 psi
      b) Ratings are for water pressure and must include a minimum safetyfactor of 2 to 1 in all sizes

2) Retainer glands shall have specific designs for Ductile Iron and PVC and itshould be easy to differentiate between the 2.
3) Gland body, wedges and wedge actuating components shall be cast fromgrade 65-45-12 ductile iron material in accordance with ASTM A536.
4) Mechanical joint restraint shall require conventional tools and installation procedures per AWWA C600, while retaining full mechanical joint deflection during assembly as well as allowing joint deflection after assembly.
5) Proper actuation of the gripping wedges shall be ensured with torquelimiting twist off nuts.

4. Grooved Joint Couplings:
   a. Joints shall be in accordance with AWWA C606.
   b. Couplings with Class 53 or higher pipe rated to:
      1) 3" through 12": 350 psig.
      2) 14" through 18": 250 psig.
      3) 20" through 36" 150 psig.
   c. Couplings consist of two or more ASTM A536 ductile iron housing segments, a FlushSeal® elastomer pressure responsive gasket, and [ASTM A449 compliant electroplated steel] [ASTM F583/F594 stainless steel] bolts and nuts.
   d. Basis of Design: Victaulic Style 31.
      1) For direct connection between IPS / steel pipe and AWWA / ductile iron pipe, Victaulic Style 307 transition coupling.

E. Provisions for Thrust
1. Thrust at bends, tees, plugs, or other fittings shall be resisted by restrained joints. If thrust cannot be accommodated using restrained joints, thrust blocking or concrete anchors to restrain thrust may be used on a case-by-case basis when approved by the Engineer. See Drawings for blocking information.
2. For the purpose of thrust restraint, design pressure shall be 1.5 times the design working pressure class indicated.
   a. No thrust restraint contribution shall be allowed for the restrained length ofpipe within the casing.
   b. For the purpose of thrust, the following shall apply:
      1) Valves shall be calculated as dead ends.
      2) Design pressure shall be the test pressure or 1.5 times the working pressure,whichever is higher.
      3) Restrained joints shall consist of mechanical restrained or push-onrestrained joints approved by the Engineer.
   c. The Pipe Manufacturer shall verify the length of pipe with restrained joints to resist thrust in accordance with the Drawings, AWWA M41, and the following:
      1) The weight of earth (W_e) shall be calculated as the weight of the projected soil prism above the pipe, for unsaturated soil conditions.
      2) Soil density = 130 pcf (maximum value to be used), for unsaturated soilconditions
      3) If indicated on the Drawings and the Geotechnical Borings that groundwater is expected, account for reduced soil density.

3. The length of pipe with restrained joints to resist thrust forces shall be determined by the design engineer in accordance with Thrust Restraint Design for Ductile Iron Pipe, Ductile Iron Pipe Research Association using the following parameters:
   a. Laying condition is dependent on design. For 14" and large pipe, consideration should be given to the use of laying conditions other than Type 1.
   b. If polyethylene encasement is used, ensure the encasement is accounted for when determining restrained joint length.
4. Where indicated and where required for thrust restraint, joints shall be restrained. Restrained joints shall be mechanically interlocking joints. Restrained joints shall be HDSS®, TR FLEX®, or HP LOK® by U.S. Pipe only or engineer approved equal. Restraining fittings using set screws, restraining gaskets, gripper type glands, and field-cuts of restrained joints shall be Mega-Lug, or approved equal. Field welding shall not be allowed. Restrained joints shall be capable of sustaining the design pressure as specified herein.
   a. Note: TR FLEX is de-rated by 100 psi in 30" – 36" meaning a CL350 provides a 250 psi rating.
   b. Field cuts require gauged full-length pieces and must be measured prior to any cut by contractor.
5. Field LOK 350 Gasket may be used in 4" – 24" in order to restrain push-on joint piping.

F. Coatings:
1. Buried Ductile Iron Pipe: Coat the exterior of the pipe and fittings with a 1 mil bituminous coating in accordance with AWWA C110 and AWWA C151, unless specified otherwise.
2. Above Ground (immersion or non-immersion): Universal moisture-cured Urethane or MC-FerroClad (NSF-61 certified coatings where NSF-61 compliance is required.) Shop coat thickness: 3.0-5.0 mils dry film thickness
   a. Typical topcoats include: Alkyds, aluminums, epoxies (amine, polyamide, polyamidoamine, water-borne, and coal tar), and urethanes. Submittal required.
3. If other specifications sections conflict with the above the more restrictive / expensive shall govern.

G. Polyethylene Encasement:
   a. All buried Ductile Iron Pipe and Fittings shall be polyethylene encased.
   b. Use only virgin polyethylene material.
   c. Encasement for buried pipe shall be 8 mil, consisting of three layers of linearlow-density polyethylene (LLDPE) polyethylene encasement, infused with anti-microbial biocide.
      1) Encasement shall conform to AWWA/ANSI C105/A21.5.
      2) Encasement shall be V-Bio or approved equal.
   d. Marking: At a minimum of every 2 feet along its length, the mark the polyethylene film with the following information:
      1) Manufacturer's name or trademark
      2) Year of manufacturer
      3) AWWA/ANSI C105/A21.5
      4) Minimum film thickness and material type
      5) Applicable range of nominal diameter sizes
      6) Warning – Corrosion Protection – Repair Any Damage

e. Minimum widths shall be according to AWWA C105.

H. Lining (Potable Water): Ductile iron pipe and fittings [except air piping] shall have a cement mortar lining in accordance with AWWA C104 and bituminous seal coat. Thickness of lining shall be as specified in AWWA C104.

I. Lining (Air Piping): Air piping shall not be lined.

J. Lining (Sewer): Ductile iron pipe and fittings shall be lined with factory installed Protecto 401 Ceramic Epoxy Lining by Induron or an approved equal. Lining primers, applications, and thicknesses shall be in accordance with manufacturer's recommendations for sanitary sewer applications but shall not be less than 40 mils.

K. Gaskets: Gaskets for air piping, fittings, valves, etc. shall be high temperature resistant type, suitable for a temperature of 300 F or higher if required by the equipment and/or service application. Supplier to coordinate with engineer and/or equipment supplier.

L. Insulated Connections: Where insulated connections are indicated, the pipe manufacturer shall furnish dielectric insulation gaskets, sleeves, and two plastic washers for each bolt. Insulating kits shall be Insulket or approved equal.

M. Bonding Wires and Welding Cartridges: Bonding wire and thermite welding cartridges shall be furnished by the pipe manufacturer. Bonding wires shall consist of two insulated No. 4 copper wires.

2.2 ACCESSORIES

A. See 40_05_12 Piping Specialties.

B. Regulatory Requirements
1. All fasteners, excluding T-Bolts, shall conform to the Fastener Quality Act (FQA) (P.L. 106-34). All fasteners shall meet the marking requirements set forth by this Act.

C. T-Bolts and Nuts
1. Standard T-bolt and Nut
a. High strength, corrosion-resistant, low-carbon weathering steel in accordancewith AWWA/ANSI C111/A21.11 and ASTM A242

D. Flange Bolts and Nuts
1. Stainless Steel Bolt and Nut
a. Meet requirements of AWWA C207
b. Bolts: ASTM A193, Grade B8M, Class 1(AISI 316 Stainless Steel, carbide solution treated)
c. Nuts and Washers: ASTM A194, Grade 8 Nuts with AISI 316 Stainless Steel Washers
1) Coat nut.

E. Threaded Rods
1. Meet requirements of AWWA/ANSI C115/A21.15

2. Rods: ASTM A193, Grade B8, Class 1(AISI 316 Stainless Steel, carbide solution treated)
3. Nuts and Washers: ASTM A194, Grade 8 Nuts with AISI 316 Stainless SteelWashers
   a. Coat nut.

~~F. Petrolatum Tape System shall be as specified in Section 33 04 10 – Cathodic Protection Systems (if included or outlined in Drawings.)~~

G. Gaskets
1. General
   a. Gaskets for Ductile Iron Piping
      1) Suitable for pressures equal to and less than 150 pounds per square inch gauge, temperatures equal to and less than 250 degrees Fahrenheit, and raw sewage service.
      2) Materials
         a) Neoprene elastomer with minimum Shore A hardness value of70.
         b) Reinforcement: Inserted 13 ounce nylon fabric cloth for pipes 20-inch or larger.
         c) Thickness: Minimum 3/32 inch thick for less than 10 inch pipe; minimum 1/8 inch thick for 10 inch and larger pipe
         d) Manufacturers: One of the following or approved equal:
            (1) Garlock,
            (2) John Crane, or approved equal
   b. Gaskets for Flanged Joints in Air Piping:
      1) Suitable for pressures equal ad less than 150 pounds per square inch gauge, temperatures equal and less than 300 degrees Fahrenheit, and compressed air service.
      2) Material: EPDM elastomer, 1/8 inch thick, 60 Shore hardness, smooth surface.
      3) Manufacturers: one of the following or equal.
         a) Garlock,
         b) John Crane, or approved equal
   c. Gaskets for Grooved Joints:
      1) Molded and produced by the coupling manufacturer.
      2) Pressure responsive FlushSeal® gasket.
      3) Elastomer grade to suit intended service:
         a) Grade "M" Halogenated Butyl.
         b) Grade "S" Nitrile.
      4) Manufacturer: Victaulic Company.

2. Push-on Gaskets
   a. Conforming to the physical and marking requirements specified in ANSI/AWWA C111/A21.11.
   b. All gaskets shall meet or exceed the latest revisions NSF 61.
   c. Gaskets shall be free from porous areas, foreign material and other defects thatmake them unfit for intended use.
   d. Gaskets shall be the size and shape required to provide an adequate compressive force against the plain end and socket after assembly to affect apositive seal under all combinations of joint and gasket tolerances.
3. Mechanical Joint Gaskets

a. Conforming to the physical and marking requirements specified in ANSI/AWWA C111/A21.11.
b. All gaskets shall meet or exceed the latest revisions NSF 61.
c. Gaskets shall be free from porous areas, foreign material and other defects thatmake them unfit for intended use.

4. Flange Gaskets
   a. Full face
   b. Virgin stock
   c. Conforming to the physical and test requirements specified in AWWA/ANSI C111/A21.11
   d. All gaskets shall meet or exceed the latest revisions NSF 61.
   e. Finished gaskets shall have holes punched by the manufacturer and shall matchthe flange pattern in every respect.
   f. Frayed cut edges are not acceptable.
   g. Field cut sheet gaskets are not acceptable.
5. Isolation Flange Gaskets
   ~~a. Provide in accordance with Section 33 04 10 – Cathodic Protection Systems.~~

PART 3 EXECUTION

3.1 HANDLING

A. Pipe, fittings and accessories shall be handled in a manner that will insure installation in sound, undamaged condition.

B. Pipe and fittings with cement mortar or glass lining shall be handled with rubber covered hooks or other type of equipment to prevent damage to the cement lining.

C. Bare forklift arms, hooks, or chains shall not be inserted into open ends.

D. Pipe and fittings in which the lining has been damaged shall be immediately removed from the job site and replaced.

3.2 STORAGE

A. All pipe and fittings shall be stored off the ground.

B. Pipe ends shall be covered to prevent foreign matter from entering the pipe during storage.

C. Pipe shall be stacked using suitable lumber between rows to prevent damage to pipe.

D. Any pipe that becomes damaged or unidentifiable due to improper storage shall be rejected and immediately removed from the job site.

3.3 CUTTING PIPE

A. Cutting of pipe shall be done in a neat manner, without damage to the pipe or the lining.

B. Cuts shall be smooth, straight, and at right angles to the pipe axis.

C. Pipe shall be cut using a portable guillotine saw, abrasive wheel "cut-off ' saw, or milling cutter only. Use of gas torches for cutting pipe will not be permitted.

D. Field cut holes for saddles shall be with mechanical cutters. Gas torch cutting will not be permitted.

E. After cutting, the end of the pipe shall be dressed with a file or power grinder to remove all roughness and sharp edges.

3.4 CLEANING

A. The interior of all pipe and fittings shall be thoroughly cleaned of all foreign matter prior to installation, and shall be kept clean until the work has been accepted.

B. Before jointing, all joint contact surfaces shall be wire brushed, wiped clean, and kept clean until jointing is completed.

C. Flange faces shall be wire brushed and cleaned to remove all oil, grease, loose primer, mill scale or any other foreign matter which could effect the proper seating of the gasket.

D. When pipe installation is stopped, precautions shall be taken to prevent foreign material from entering the pipe.

E. Prior to testing, the entire pipeline shall be flushed until the flushing water runs clear and clean.

F. Cleaning for final acceptance shall be in conformance with Contract requirements.

3.5 INSTALLATION

A. General: Install ductile iron pipe, fittings, specials, valves, and hydrants in accordance with AWWA C600 and the Specifications. Before lowering into the trench, inspect each joint of pipe. Pipe will then be accepted, rejected, or repaired.

B. Lower pipe, fittings, and special castings into trench by crane or other suitable method. Do not roll in or "dump" into the trench. Handle pipe and fittings with belts, slings, or other equipment designed to prevent damage to the pipe and coating. Remove dirt and trash that may be in the barrel of the pipe, on the spigot or in the bell while the pipe is suspended. Keep the pipe clean during the laying operation and free of sticks, dirt, and trash, and at the close of each operating day seal the open end of the pipe with a gasketed night cap.

C. For buried piping a firm, even bearing throughout the length of the pipe shall be constructed by tamping selected material at the sides of the pipe up to the springline.

D. Buried pipe shall be protected from lateral displacement by use of the specified pipe embedment and/or encasement.

E. Under no circumstance shall pipe be laid in water.

F. All pipe will be laid on native material unless otherwise indicated on the contract drawings.

G. All pipe subgrade shall be compacted to 95% of maximum density per ASTM Standards unless otherwise indicated on the contract drawings.

H. All subgrade shall have compaction tests taken and be approved by the inspector prior to pipe installation.

I. When pipe laying is interrupted, or stopped at the end of the work shift, the open ends of pipe shall be sealed with a watertight plug, or other means acceptable to the engineer, to prevent water from entering the pipe.

J. Pipe Alignment: Install pipe and fittings to the line and grade indicated. In areas where the line and grade indicated cannot be achieved using standard manufactured bends and fittings, make slight adjustments by deflecting joints. Joint deflections may not exceed the lesser of the maximum deflections stipulated in AWWA C600 or 75 percent of the manufacturer's maximum recommended deflection. Use fittings as required to maintain pipe centerline within 2 feet of called centerline. Resolve any conflicts with existing utilities and structures.

K. Joint Making:
   1. Jointing Mechanical Joint Pipe:
      a. Joint this type of pipe in accordance with the manufacturer's recommendations, with uniform torque on bolts.
      b. After carefully cleaning both spigot and bell and after slipping the follower ring and gasket over the spigot end, slip the spigot into the bell. Apply a lubricant to the spigot to assist in assembly.
      c. Carefully seat the gaskets by hand to be even in the bell at all points.
      d. After drawing up the follower ring to uniform bearing against the gasket, insert the bolts and tighten by hand in pairs using bolts opposite each other.
      e. Tighten the nuts to hold the required pressure. Extension wrenches or pipes over wrench handles shall not be permitted. Use 10-inch ratchet wrenches to tighten the nuts to a uniform torque.
      f. The finished joint shall be watertight.
      g. Bolts shall be uniformly tightened to the torque values listed in Appendix A of ANSI/AWWA C111/A21.11.
      h. Over tightening of bolts to compensate for poor installation will not be permitted.
      i. Holes in mechanical joints with tie rods shall be carefully aligned to permit installation of the tie rods.
      j. In flange and mechanical joint pieces, holes in the mechanical joint bells and the flanges shall straddle the top (or side for vertical piping) centerline. The top centerline shall be marked on each flange and mechanical joint piece at the foundry.
   2. Making Flanged Joints:
      a. Erect flanged pipe in accordance with the controlling dimension as specified.
      b. Thoroughly clean each piece of flanged pipe to remove dirt, rust, grease, and other foreign matter.
      c. Thoroughly wire brush flanged faces to ensure even bearing for gaskets and mating flanges.

d. Place full face gasket, use drift pins to align holes, and tighten flange bolts, each in turn, at a uniform torque around the joint.
e. Finished joints shall be watertight.
f. When specified or indicated on the contract drawings, flanges shall conform to ANSI Bl 6. l, B16.2, and B21.10.
g. Bolts shall be tightened gradually and at a uniform rate to facilitate uniform gasket compression.
h. Care shall be taken when connecting to pumping equipment to ensure that pipe stresses are not transmitted to the pump flanges.
i. All flanged piping connecting to pumping equipment shall be permanently supported so that accurate matching of bolt holes and uniform contact over the entire surface of abutting pump and piping flanges are obtained before the installation of any bolts in these flanges.
j. Pump connection piping shall be free to move parallel to its longitudinal centerline while the bolts are being tightened.
k. Each pump shall be leveled, aligned, and placed into position, but shall not be grouted until the initial fit-up
l. and alignment of the pipe is completed.
m. Each pump shall be grouted before final bolting of the connecting piping.

3. Making Push-On Joints:
   a. The jointing of this type of joint shall be as recommended by the manufacturer. The procedure for jointing shall be generally as follows:
      1) Thoroughly clean and dry the spigot and bell before starting the assembly of the joint. Wipe the gasket clean with a cloth and ensure gasket is kept at a temperature of at least 40 degrees F.
      2) Place the gasket into the gasket seat in the bell.
      3) Apply a thin film of lubricant to the surface of the gasket that will come in contact with the entering pipe spigot. If necessary, also apply lubricant to the spigot.
      4) Make the joint by exerting sufficient force on the entering pipe so that its plain end will move past the gasket to the seat of the bell.
      5) If restrained joints are used, orient pipe to permit ease of assembly. Place locking device after installation of spigot into bell.
4. Making Grooved Joints:
   a. Grooved joints shall be fabricated and installed per AWWA C606.
   b. Grooved ends shall be clean and free from indentations, projections and roll marks in the area from pipe end to groove.
   c. Gaskets used with grooved joints shall be verified as suitable for the intended service.
   d. Install all grooved joint products in accordance with the manufacturer's latest installation instructions.
   e. The grooved coupling manufacturer's factory trained field representative shall provide on-site training for contractor's field personnel in the proper installation of grooved piping products. The representative shall periodically visit the jobsite to ensure best practices in grooved product installation are being followed. Contractor shall remove and replace any improperly installed products.
5. Making Split-Sleeve Coupling Joints:
   a. Exterior surfaces of the pipe shall be clean, smooth and free from weld beads, seams, scars, indentations, roll marks, exterior coatings and flat spots.

b. Install split-sleeve couplings in accordance with the manufacturer's latest installation instructions.

6. Bonding: Bond all pipe joints except where insulated connections are indicated. Clean pipe ends to bare metal and file or grind to prepare surface for cadwelding copper leads. After leads are attached, repair coating or complete field coating of joint.

L. FLANGED COUPLING ADAPTERS

M. When specified or indicated on the contract drawings, flanged coupling adapters shall be installed in strict accordance with manufacturer's recommendations and instructions.

N. MECHANICAL COUPLINGS

1. When specified or indicated on the contract drawings, mechanical couplings shall be installed in accordance with the manufacturer's recommendations and instructions.
2. A space of at least 1/4", and not more than 1", shall be left between the pipe ends.
3. All assembly bolts shall be uniformly tightened so that the coupling is free from leaks and all parts of the coupling are square and symmetrical with the pipe.
4. Following installation of the coupling, damaged areas of shop coatings of the pipe and coupling shall be repaired to the satisfaction of the Inspector.

O. WALL CASTINGS

1. At all points underground where piping exits structures and transitions to natural ground or other areas subject to ground settling or other potential introduced stresses after installation, a bell-flange wall pipe w/ seep ring and restrained mechanical joint shall be provided to allow for deflection whether being shown on drawings or not.
2. Wall pipe shall be provided at all points where ductile iron pipe passes through concrete walls.
3. Where a flange and mechanical joint piece is specified to connect to a mechanical joint wall casting, the bolt holes in the bell of the wall casting shall straddle the top (or side for vertical piping) center line of the casting and shall align with the bolt holes in the flange and mechanical joint piece. The top centerline shall be marked on the wall casting at the foundry.

P. WALL SLEEVES

1. Wall sleeves are to be provided where ductile iron pipe passes through concrete floors and where otherwise specified or indicated on the contract drawings.
2. Wall sleeves are to be sealed using modular casing seals ("link seals") and approved caulking on both sides of the floor penetration.

Q. REDUCERS

1. Reducers, adjacent to flowmeters and pumps or in other locations as specified or indicated on the contract drawings, shall be eccentric pattern, installed with the straight side on top so that air traps are not formed. All other reducers shall be concentric pattern. If no specific pattern is indicated on the Drawings, coordinate with Engineer for clarification prior to bid.

R. CONNECTIONS TO EXISTING PIPING

1. Connections between new work and existing piping shall be made using fittings submitted and approved by the Engineer for each separate condition encountered.
2. Each connection to existing pipe shall be made at a time and under conditions which will least impact normal plant operations, and as authorized in writing by the Engineer.
3. The contractor is responsible for making provisions for cutting of existing pipe when necessary, using approved mechanical means. Flame cutting of pipe will not be allowed.
4. The Contractor is responsible for making provisions for dewatering existing lines and for disposal of water from the dewatering operation.
5. Prior to construction, the Contractor shall submit for review and approval detailed procedures for pressure testing and the making of final connections to existing lines.
6. When connecting to existing fresh and potable water lines, all new piping and fittings shall be cleaned and disinfected prior to making the connection.
    a. Provisions shall be made to prevent any cross-connection and contamination of existing lines.
    b. Trench water, mud, or other contaminants shall not be allowed to enter the lines.
7. The contractor is responsible for disinfection and chlorination of all fresh and potable water lines after connections are made in conformance with these specifications.

S. Polyethylene Encasement: Wrap all bituminous coated ductile iron pipe in V-Bio Enhanced Polyethylene Encasement in accordance with AWWA C105. Utilize DIPRA's Modified Method A installation procedure.
1. Preparation
    a. Remove all lumps of clay, mud, cinders, etc., on pipe surface prior to installation of polyethylene encasement.
        1) Prevent soil or embedment material from becoming trapped between pipeand polyethylene.
    b. Fit polyethylene film to contour of pipe to affect a snug, but not tight encasewith minimum space between polyethylene and pipe.
        1) Provide sufficient slack in contouring to prevent stretching polyethylene where it bridges irregular surfaces such as bell-spigot interfaces, bolted joints or fittings and to prevent damage to polyethylene due to backfillingoperations.
        2) Secure overlaps and ends with adhesive tape and hold.
    c. For installations below water table and/or in areas subject to tidal actions, sealboth ends of polyethylene tube with adhesive tape at joint overlap.
2. Tubular Type (Method A)
    a. Cut polyethylene tube to length approximately 2 feet longer than pipe section.
    b. Slip tube around pipe, centering it to provide 1-foot overlap on each adjacentpipe section and bunching it accordion-fashion lengthwise until it clears pipeends.
    c. Lower pipe into trench and make up pipe joint with preceding section of pipe.
    d. Make shallow bell hole at joints to facilitate installation of polyethylene tube.

e. After assembling pipe joint, make overlap of polyethylene tube, pull bunched polyethylene from preceding length of pipe, slip it over end of the new length of pipe and wrap until it overlaps joint at end of preceding length of pipe.
f. Secure overlap in place.
g. Take up slack width at top of pipe to make a snug, but not tight, fit along barrel of pipe, securing fold at quarter points.
h. Repair cuts, tears, punctures or other damage to polyethylene.
i. Proceed with installation of next pipe in same manner.

3. Pipe-Shaped Appurtenances
   a. Cover bends, reducers, offsets and other pipe-shaped appurtenances with polyethylene in same manner as pipe and fittings.
4. Odd-Shaped Appurtenances
   a. When it is not practical to wrap valves, tees, crosses, and other odd-shaped pieces in tube, wrap with flat sheet or split length polyethylene tube by passing sheet under appurtenances and bringing it up around body.
   b. Make seams by bringing edges together, folding over twice and taping down.
   c. Tape polyethylene securely in place at the valve stem and at any other penetrations.
5. Repairs
   a. Repair any cuts, tears, punctures or damage to polyethylene with adhesive tape or with short length of polyethylene sheet or cut open tube, wrapped around fitting to cover damaged area and secured in place.
6. Openings in Encasement
   a. Provide openings for branches, service taps, blow-offs, air valves and similar appurtenances by making an X-shaped cut in polyethylene and temporarily folding back film.
   b. After appurtenance is installed, tape slack securely to appurtenance and repair cut, as well as other damaged area in polyethylene with tape.
   c. Service taps may also be made directly through polyethylene, with any resulting damaged areas being repaired as described above.
7. Junctions between Wrapped and Unwrapped Pipe:
   a. Where polyethylene-wrapped pipe joins an adjacent pipe that is not wrapped, extend polyethylene wrap to cover adjacent pipe for distance of at least 3 feet.
   b. Secure end with circumferential turns of tape.
   c. Wrap service lines of dissimilar metals with polyethylene or suitable dielectric tape for minimum clear distance of 3 feet away from Cast or Ductile Iron Pipe.

T. Blocking
1. Install concrete blocking in accordance with specifications, for all bends, tees, crosses and plugs in the pipelines as indicated in the Detail Sheets of drawings. Restrained joint piping may be used to reduce/remove blocking. Submittal required.
2. Place the concrete blocking so as to rest against firm undisturbed trench walls, normal to the thrust.

3. The supporting area for each block shall be at least as great as that indicated on the Drawings and shall be sufficient to withstand the thrust, including water hammer, which may develop.
4. Each block shall rest on a firm, undisturbed foundation or trench bottom.
5. If the Contractor encounters soil that appears to be different than that which was used to calculate the blocking according to the Drawings, the Contractor shall notify the Engineer prior to the installation of the blocking.

3.6 PRESSURE AND LEAKAGE TESTING

A. See 40_05_00.13 Piping Testing System

3.7 MARKING TAPE

A. See Section 33_05_97.23 Underground Utility Warning Tape

3.8 DISINFECTION

A. Disinfection of ductile iron pipe shall be performed in conformance with all Oklahoma Department of Environmental Quality (ODEQ) requirements and applicable sections of these Specifications (potable water only.)

3.9 DEFLECTION

A. See 40_05_00.13 Piping Systems Testing

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 40_05_23

STAINLESS STEEL PROCESS PIPE & TUBING

PART 1 GENERAL

1.1 SUMMARY

A. Stainless Steel Process Pipe & Tubing as required by this section of the Contract Documents, unless otherwise indicated specifically on individual drawings and/or other appropriate sections of Contract Documents.

B. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents including:

1. Pipe design calculations and layouts sealed by a Licensed Engineer in the State of Oklahoma.
2. Thrust restraint calculations sealed by a Licensed Engineer in the State of Oklahoma.
3. Certification with full compliance with the specifications.
4. Complete materials specification for each part to be furnished.
5. Technical Bulletins and Brochures.
6. Statement of Warranty.
7. A guaranteed delivery date for the equipment (which shall be stated in calendar days after the releases date to the manufacturer.
8. Shipping instructions according to Section 1.06.
9. Name, address, phone number, and fax number of manufacturer's representative.

10. Tests to be run during manufacturing process

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

1.5 DELIVERY AND STORAGE

A. Packing and Storage
1. Following shop fabrication, all pipe, fittings and specials shall be pickled and passivated.
2. The pipe shall be prepared for shipment to afford maximum protection from normal hazard of transportation and allow pipe to reach project site in an undamaged condition. Pipe damaged in shipment shall not be delivered to the project site unless such damaged pipe is properly repaired.
3. Pipes shall be carefully supported during shipment and storage. Each length of pipe, fitting, or special shall be internally supported and braced with stulls to maintain a true circular shape. Internal supports shall consist of timber or steel stulls firmly wedged and secured so that the stulls remain in place during handling. Pipe shall be rotated so that one (1) of the stulls is vertical during storage, shipment and installation. Pipe, fittings, and specials shall be separated so that they do not bear against each other in transit. Ship pipe on padded bunks with tie-down straps. Store pipe on padded skids, sand or dirt berms, tires, or other suitable means to protect the pipe from damage.

B. Marking for Identification: Each joint of pipe and each fitting shall have plainly marked continuously down its whole length, the following:
1. Nominal Pipe Size (Nominal Bore)
2. Schedule (Wall Thickness)
3. Specification
4. Grade
5. Method of Manufacture (Seamless or Welded)
6. Heat Number
7. Manufacturer’s Name or Symbol

1.6 QUALITY ASSURANCE

A. Manufacturer: Finished pipe shall be the product of one (1) manufacturer. Pipe manufacturing operations (pipe and fittings) shall be performed at one (1) location.

B. Factory Testing
1. The Owner reserves the option to have an independent testing laboratory, at the Owner's expense, inspect pipe and fittings at the pipe manufacturer's plant. The Owner's testing laboratory and Engineer shall have free access to the manufacturer's plant. The pipe manufacturer shall notify the Owner, in writing, at least two (2) weeks ahead of pipe fabrication as to start of fabrication and fabricating schedule so that the Owner can advise the manufacturer as to Owner's decision regarding tests to be performed by an independent testing laboratory. In the event the Owner elects to retain an independent testing laboratory to make

material tests and weld tests, it is the intent that the tests be limited to one (1) spot testing of each category unless the tests do not show compliance with the standard. If these tests do not show compliance, the Owner reserves the right to have the laboratory make additional tests and observations.

2. The cost of all tests specified are subsidiary to the cost of the pipe and will not be paid for separately.

PART 2 PRODUCTS

2.1 MATERIALS

A. Stainless Steel: Steel shall be homogeneous. Pipe and fittings shall conform to ASTM A 778 except as otherwise specified. Fabricate pipe and fittings from stainless steel sheet conforming to ASTM A 240.

B. Flange Nuts and Bolts: Shall be stainless steel and match piping material.

C. Insulated Connections: Where insulated connections are installed, furnish and install a 1/8" thick gasket conforming to ASTM F104 (Garlock Blue Guard Style 3000 or equal). Furnish and install insulating sleeves and two insulating washers for each bolt.

D. Bushings, Couplings and Plugs: Where outlets or taps are threaded, furnish and install stainless reducing bushings in larger steel half couplings for the outlet size indicated. Threaded plugs shall be stainless steel.

2.2 MANUFACTURED PRODUCTS

A. Pipe:

1. General: Pipe, bends, and special fittings shall be designed, manufactured, and tested in accordance with the applicable requirement and the special requirements of this specification.
2. Pipe Design Criteria: Pipe dimensions and wall thickness shall conform to ANSI B36.19. Fitting dimensions shall conform to ANSI B16.9. Pipe, bends, and special fittings shall be Schedule 40 Type 316L Stainless Steel
3. Pipe shall be die-formed or rolled true to dimension and round within a tolerance of plus or minus 1/16-inch. Two edges of sheet shall be brought to line so as not to leave a shoulder on the inside of the pipe.
4. Ends of pipe shall be perpendicular to the longitudinal axis.
5. Elbows shall be the smooth flow type.
6. Provisions for Thrust:
   a. Thrusts at bends, tees, plugs, or other fittings shall be resisted by restrained joints.
   b. Restrained joints shall be used for a sufficient distance from each side of the bend, tee, plug, or other fitting to resist thrust which will be developed. Restrained joints shall consist of welded joints only. Harnessed joints will only be allowed with approval of the Engineer. Clamp typejoint restraint shall be used where indicated. In areas where restrained joints are used

for thrust restraint, the pipe shall have adequate cylinder thickness to transmit the thrust forces.

7. Inside Diameter: The inside diameter shall be a minimum of the nominal diameter of the pipe specified.
8. Wall Thickness: The minimum pipe wall thicknesses for the different pipe sizes are provided below unless otherwise specified on the drawings, for pipe and fittings with no minus tolerance.

Pipe Inside Diameter	Pipe Schedule	Nominal Wall Thickness
3″	40S	0.216″
8″	10S	0.148″
12″	10S	0.180″
24″	10S	0.250″

9. Seams:
   a. Except for mill-type pipe, the piping shall be made from steel plates or sheets rolled into cylinders or sections thereof with the longitudinal and girth seams butt welded or shall be spirally formed and butt welded.
   b. There shall be not more than two (2) longitudinal seams. Girth seams shall be butt welded and shall not be spaced closer than 6' except in specials and fittings.
   c. Longitudinal seams on pipe shall be welded by either the tungsten inert gas or metallic inert gas method.
   d. Circumferential seams on pipe and fittings shall be welded by the tungsten inert gas method.
   e. Excessive weld deposits, slag, weld spatter and projections into the interior of pipe and fittings shall be removed by grinding.
   f. Interior welds shall be smooth and even and shall not have an internal bead higher than 1/16- inch.
   g. All seams shall be shop welded. Field welding shall not be permitted.

B. Insulated Connections: Where insulated connections are indicated, furnish dielectric insulation gaskets, sleeves, and plastic washers as indicated.

C. Pipe Ends: Pipe ends shall be either butt welded, flanged joint, or flexible coupled joint. Standard pipe joint shall be rubber gasket. Pipe ends shall be welded at all locations necessary to resist thrust forces. Harnessed joints may be used in lieu of welded joints where pipe is adjacent to vaults if approved by the Engineer.

1. Fittings with Flanges: Flanged joints shall be provided where indicated. Ends to be fitted with slip- on flanges shall have the longitudinal or spiral welds ground flush to accommodate the type of flanges provided. Pipe flanges shall be of rated pressure equal to or greater than the adjacent pipe class. Flanges shall match the fittings or appurtenances which are to be attached.
2. Flexible Couplings: Flexible couplings shall be provided where specified. Ends to be joined by flexible couplings shall be of the plain end type, the welds on ends to be joined by couplings shall be ground flush to permit slipping the coupling in at least one (1) direction to clear the pipe joint. Harness bolts and lugs shall comply with the plans.

D. Flanges: Flange drilling shall be in accordance with ANSI B 16.5, unless otherwise specified. Drilling shall match class of valves, pipe, or appurtenances to be attached. Nuts and bolts shall be stainless steel. Gaskets for all flanges shall be spiral, metallic gaskets, "Flexatallic" or equal. Flanges shall be Class 150.

PART 3 EXECUTION

3.1 All stainless steel pipe and fittings shall be installed in accordance with the instructions of the manufacturer and as shown on the drawings.

3.2 Testing: All stainless steel pipe and fittings shall be pressure tested.

3.3 Finish on stainless steel pipe and fittings shall be standard AISI mill finish No. 2B.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 40_05_33

HIGH DENSITY POLYETHYLENE (HDPE) PIPE

PART 1 GENERAL

1.1 SCOPE OF WORK

A. High Density Polyethylene (HDPE) Pipe

B. The City of Shawnee has selected the following Contractors as prequalified to install the HDPE piping:
   1. Prequalified General Contractors (Self-Perform all associated work without sub contractors)
   2. McGuire Brothers Construction, Tulsa, OK
   3. Belt Construction, Texarkana, AR
   4. Krapff Reynolds, Oklahoma City, OK
   5. Orr Construction, Davenport, OK
   6. TIMCO Blasting & Coatings, Inc, Bristow, OK
   7. Marsau Enterprises, Enid, OK

1.2 RELATED WORK

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. 33_05_97.23 – Underground Utility Warning Tape

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

B. The Contractor shall submit the pipe manufacturer's certification of compliance with the applicable sections of the Specifications prior to installation. This certification shall be in the form of a written document from the manufacturer attesting to the manufacturing process meeting the standards.

C. The Contractor shall submit shop drawings showing installation method and the proposed method and specialized equipment to be used.

D. Manufacturer's recommended fusion procedures for the products.

E. Lay Schedule/drawing
1. Prior to installation the contractor shall submit a lay schedule sealed by a Professional Engineer licensed in the State of Oklahomaand must include:
   a. Pipe Dimension Ratio and rated pressure
   b. Fittings – bends, tees, services, connections, MJ adapters or flange adapters
   c. Stationing
   d. Transitions
   e. Deflection
2. Note that lay schedule does not need to indicate location of butt fusion joints, as these will be determined in the field based on available pipe lengths and field conditions.

F. Installer's qualifications

G. Data Logger Records
1. Provide electronic data logger record to the Engineer daily or on request of Engineer.
2. Fusion Reports shall report manufacturer, component, component fusion-jointing parameters, assembly operation and joint identification, per ISO 12176-4, and the following fusion-jointing operation data:
   a. Temp-Compensated Fusion Time & Actual Fusion Time
   b. Resistance before & after fusion
   c. Hi and Low output voltage & output current during fusion
   d. Total Amp-Hours applied to fitting
   e. Input voltage and frequency before fusion
   f. High and Low input voltage and frequency during fusion
   g. Input waveform
   h. GPS position and quality
   i. Ambient temperature
   j. Heating iron face temperatures
   k. Fusion pressure
   l. Graphic representation of the fusion cycle.
3. Report shall comply with ISO 12176-2 requirements for traceability databases.

1.4 REFERENCE STANDARDS

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

B. In the event of a conflict with referenced standards the most stringent requirements prevail.
1. ANSI/AWWA:

a. AWWA M55 Manual of Water Supply Practices, PE Pipe–Design and Installation
b. ANSI/AWWA C111/A21.11-12 Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings
c. AWWA C207-13 Steel Pipe Flanges for Waterworks Service, Sizes 4 In. Through 144 In. (100 mm Through 3,600 mm)
d. ANSI/AWWA C651 Standard for Disinfecting Water Mains
e. ANSI/AWWA C800 Underground Service Line Valves and Fittings
f. ANSI/AWWA C901-08 Polyethylene (PE) Pressure Pipe and Tubing, ½ In. (13mm) Through 3 In. (76 mm) for Water Service
g. ANSI/AWWA C906-15 Polyethylene (PE) Pressure Pipe and Fittings, 4 In. Through 65 In. (100 mm to 1,650 mm), for Waterworks

2. Plastics Pipe Institute (PPI):
   a. PPI Handbook of Polyethylene Pipe – 2009 (2nd Edition)
   b. PPI TR-33 Generic Butt Fusion Joining Procedure for Polyethylene Gas Pipe
   c. PPI TR-34 Disinfection of Newly Constructed Polyethylene Water Mains
   d. PPI TN-34 Installation Guidelines for Electrofusion Couplings 14-inch and Larger
   e. PPI TN-42 Recommended Minimum Training Guidelines for PE Pipe Butt Fusion Joining Operators for Municipal and Industrial Projects (2009)
   f. Municipal Advisory Board Generic Electrofusion Procedure for Field Joining of 12 Inch and Smaller Polyethylene (PE) Pipe
3. National Sanitation Foundation (NSF):
   a. NSF / ANSI 61 Drinking Water System Components–Health Effects
4. ASTM:
   a. ASTM A 240 Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications
   b. ASTM D 2239 Standard Specification for Polyethylene (PE) Plastic Pipe (SIDR- PR) Based on Controlled Inside Diameter
   c. ASTM D 2683 Standard Specification for Socket-Type Polyethylene Fittings for Outside Diameter-Controlled Polyethylene Pipe and Tubing
   d. ASTM D 2774 Standard Practice for Underground Installation of Thermoplastic Pressure Piping
   e. ASTM D 3035 Polyethylene (PE) Plastic Pipe (DR-PR) Based on Controlled Outside Diameter
   f. ASTM D 3261 Standard Specification for Butt Heat Fusion Polyethylene (PE) Plastic Fittings for Polyethylene (PE) Plastic Pipe and Tubing
   g. ASTM D 3350-08 Standard Specification for Polyethylene Plastics Pipe and Fittings Materials
   h. ASTM F 714 Standard Specification for Polyethylene (PE) Plastic Pipe (SDR) Based on Outside Diameter
   i. ASTM F 905 Standard Practice for Qualification of Polyethylene Saddle-FusedJoints
   j. ASTM F 1055 Standard Specification for Electrofusion Type Polyethylene Fittings for Outside Diameter Controlled Polyethylene Pipe and Tubing
   k. ASTM F 1290 Standard Practice for Electrofusion Joining Polyolefin Pipe andFittings
   l. ASTM F 1668 Standard Guide for Construction Procedures for Buried PlasticPipe

m. ASTM F 2164 Standard Practice for Field Leak Testing of Polyethylene (PE) Pressure Piping Systems Using Hydrostatic Pressure
n. ASTM F 2206 Standard Specification for Fabricated Fittings of Butt-Fused Polyethylene (PE) Plastic Pipe, Fittings, Sheet Stock, Plate Stock, or Block Stock
o. ASTM F 2620 Standard Practice for Heat Fusion Joining of Polyethylene Pipeand Fittings

5. International Organization for Standardization:
   a. ISO 12176-2 Plastics pipes and fittings -- Equipment for fusion jointing polyethylene systems
   b. ISO/TR 13950 Plastics pipes and fittings -- Automatic recognition systems forelectrofusion joints
6. Plastic Pipe Institute
   a. TR-41 Generic Saddle Fusion Joining Procedure for Polyethylene Gas Piping

1.5 QUALITY ASSURANCE

A. Qualifications
   1. Manufacturers
      a. Finished pipe shall be the product of one manufacturer.
         1) Materials for change orders, specials, and field changes may be provided bya different manufacturer upon Engineer approval.
      b. Submit written verification that the pipe manufacturer has been manufacturingASTM F714 pipe of similar design pressure and size to the specified pipe for no less than five (5) years.

B. Pipe manufacturing operations (pipe, lining, and coatings) shall be performed under the control of the manufacturer.

C. Pipe, fittings, and appurtenances shall meet all requirements of NSF 61.

D. Furnish affidavits of compliance with referenced standards when requested.

E. Each pipe size to be furnished on this project shall be tested by the manufacturer, in accordance with the governing product standard, latest revision. Results of these tests shall be submitted to the Engineer. Tests required shall include Load Bearing, Material, Cell Class, Acetone, Dimensional and Hydrostatic tests.

F. Large diameter pipes shall be tested in accordance with the physical, dimensional, and performance requirements of AWWA C906. It shall be listed by Underwriter's Laboratories. Each pipe will be hydrostatically proof tested using AWWA C906 before being shipped.

G. Pipe and fittings shall be clearly marked by the manufacturer with the following information in such a manner that will remain legible after inspection:

H. The pipe manufacturer shall provide certification that the pipe supplied conforms to these specifications and shall include laboratory test results that support such certification. If the Manufacturer is unable to provide the certification, an independent testing facility shall be utilized and retained at no cost to the Owner. The pipe supplied shall be permanently

marked with the Manufacturer's name, the date of manufacture, and identification with the tests performed to warrant its certification as being in conformance with this standard.

I. An inspection of the pipe after delivery to the project shall be made by a representative of the Owner. Pipe with visible defects which are indicative of poor structural condition or poor workmanship shall be rejected and replaced without cost to the OWNER. Visible defects shall include cracks of any type damage, delamination, splitting, honeycombs, or any other defects of poor workmanship. Any pipe rejected shall not be returned under any condition to the project.

1.6 DELIVERY, HANDLING AND STORAGE

A. Storage and Handling Requirements
1. Handle the pipe in accordance with the PPI Handbook of Polyethylene Pipe (2nd Edition), Chapter 2 using approved strapping and equipment rated for the loads encountered. Do not use chains, wire rope, forklifts or other methods or equipment that may gouge or damage the pipe or endanger persons or property. Field storage isto be in compliance with AWWA Manual of Practice M55 Chapter 7.
2. If any gouges, scrapes, or other damage to the pipe results in loss of 10% of the pipe wall thickness, cut out that section or do not use. Damages resulting from improper delivery, storage, or handling are the responsibility of the Contractor, andno additional payment will be made.
3. Pipe and fittings shall be delivered to the job site from the factory and stored at the job site in palletized units or bundles to prevent unnecessary deflection prior to installation. Each palletized unit shall be sized to limit the stacking of pipe to not more than 60 inches high.
4. Care shall be taken during the transporting of the pipe to ensure that the binding and tie down methods do not damage or deflect the pipe in any manner.
5. Pipe bent, deflected, discolored or otherwise damaged during shipping will be rejected.
6. Pipe stored on the job site shall be covered with canvas or other opaque material to protect it from the sun's rays. Air circulation shall be provided under the covering. Pipe shall not be removed from the pallet and/or laid out along the ditch until the bedding material is in place and ready to receive the pipe. Pipe shall not be stored in direct sun exposure for more than 30 days.
7. In addition to these specifications, all pipe and fittings shall be delivered and stored per manufacturer's recommendations and specifications.

PART 2 PRODUCTS

2.1 MATERIALS

A. Only the pipe manufacturers as listed below are allowed. Other manufacturers may be considered as equals on a project basis.
1. Performance Pipe
2. Georg Fischer
3. JM Eagle
4. Driscoplex
5. WL Plastics

6. ISCO Industries

B. Only the electrofusion fittings manufacturers as listed below are allowed. Other manufacturers may be considered as equals on a project basis.
   1. Agru America
   2. Georg Fischer Central Plastics
   3. Integrity Fusion Products
   4. IPEX, Inc.
   5. M.T. Deason Company
   6. Nupi Americas
   7. Plasson, USA
   8. Strongbridge-Tega

C. Only the butt fusion fittings manufacturers as listed below are allowed. Other manufacturers may be considered as equals on a project basis.
   1. ISCO
   2. IPEX
   3. Georg Fisher

D. Only the fusion equipment manufacturers as listed below are allowed. Other manufacturers may be considered as equals on a project basis.

E. McElroy

F. Any product that is not listed on the Standard Products List is considered a substitution and shall be submitted in accordance with Substitution Request Section of the Project Manual.

G. HDPE Pipe
   1. Pipe shall have a manufacturing standard of ASTM D3035 and meet AWWA C901. Pipe shall be DR 11 unless otherwise specified on the plans. The pipe shall contain no recycled compounds except that generated in the manufacturer's own plant from resin of the same specification from the same raw material
   2. For diameters from 1/2-inches through 3-inches, HDPE pipe and fittings shall meet the requirements of AWWA C901.
   3. For diameters from 4-inches through 32-inches, HDPE pipe and fittings shall meet the requirements of AWWA C906.
   4. The outside diameter of the pipe shall be based on the Ductile Iron Pipe Size(DIPS) sizing system (unless connecting to distribution piping that is Iron Pipe Sizing (IPS) or detailed on the Drawings.)
   5. HDPE pipe shall be rated for use at a working pressure shown on the Drawings.
   6. Polyethylene pipe shall be made from HDPE resin having a material designation code of PE4710 or higher.
   7. The material shall meet the requirements of ASTM D 3350 and shall have a minimum cell classification of PE445474C.
   8. HDPE Pressure Pipe for potable water shall meet the requirements of NSF 61.
   9. Pipe Markings
      a. Meet the minimum requirements of AWWA C906. Minimum pipe markings shall be as follows:
         1) Manufacturer’s Name or Trademark and production record

2) Nominal pipe size
3) DIPS
4) Dimension Ratio
5) AWWA C906
6) Resin type (PE4710)

b. Color identification to identify pipe service is required.
1) Stripes or colored exterior pipe product shall be blue for potable water and green for sewer.
2) Permanent identification of piping shall be provided by co-extruding multiple equally spaced color stripes into the pipe outside surface or bysolid colored pipe shell.
3) The striping material shall be the same material as the pipe material exceptfor the color.
4) Plain Black HDPE Pipe without color code markings may not be used.
5) Only smooth wall HDPE will be permitted.

10. Socket fusion is not allowed.
11. Pipe shall be manufactured by an ISO 9001 certified manufacturer. The pipe manufacturer shall have an ongoing Quality Control program for incoming and outgoing materials, and shall assure that the pipe will meet the material requirements of this specification. HDPE resins for manufacturing of pipe shall be checked for density, melt flow rate, and contamination. The facility shall have the necessary testing equipment to verify that pipe meets the AWWA and NSF standards. Pipe shall be checked for outside diameter, wall thickness, length, and surface finish on the inside and outside. The Manufacturer's production facilities shall be open for inspection by the Owner or Engineer.

H. HDPE Butt Fusion Fittings:
1. Butt Fusion Fittings shall be made of HDPE material with a minimum material designation code of PE4710 and with a minimum Cell Classification equal to the HDPE pipe.
2. Butt Fusion Fittings shall meet the requirements of ASTM D3261. Molded and fabricated fittings shall have a pressure rating equal to or greater than the pipe unless otherwise specified on the plans.
a. Pipe stock used to manufacture fabricated fittings shall meet requirements ofAWWA C906 and meet the material designation code of PE4710.
b. Fabricated Fittings typically require a lower DR rating than the pipe to meet orexceed the pipe pressure rating. Calculate the difference for a fabricated fittingbased on a published rerating percentage.
c. Fabricated bend and tee fittings shall have a minimum of 3 segments.
d. Fabricated 45 degree bend fittings shall have 2 segments and 90 degree bendsshall have 3 segments.
e. Field fabricated fittings are not allowed.
3. All fittings shall meet the requirements of AWWA C906.
4. Markings for molded fittings shall comply with the requirements of ASTM D 3261.
a. Standard Designation (ASTM D 3261)
b. Manufacturer's name or trademark
c. Material designation (PE4710)
d. Date of manufacture or manufacturing code
e. Size

f. Dimension Ratio

5. Fabricated fittings shall be marked in accordance with ASTM F 2206.
   a. Standard Designation (ASTM F 2206)
   b. Manufacturer's name or trademark
   c. Material designation (PE4710)
   d. Date of manufacture or manufacturing code
   e. Size
   f. Equivalent Dimension Ratio

I. Flanges and Mechanical Joint Adapters (MJ Adapters):
1. Flanges and Mechanical Joint Adapters shall have a material designation code of PE4710 or higher and a minimum Cell Classification equal to the HDPE pipe.
2. Flanged and Mechanical Joint Adapters can be made to ASTM D 3261 or, if machined, must meet the requirements of ASTM F 2206.
3. The outside diameter of Flanges shall be based on Ductile Iron Pipe Size (DIPS).
4. Flanges and MJ Adapters shall have a pressure rating equal to the pipe unless otherwise specified on the plans.
5. Markings for molded or machined flange adapters or MJ Adapters shall be per ASTM D 3261.
   a. Manufacturer's name or trademark
   b. Material designation (PE4710)
   c. Date of manufacture or manufacturing code
   d. Size
   e. Where recessed marking is used, take care not to reduce the wall thickness below the minimum specified.
6. Fabricated (including machined) flange adapters shall be per ASTM F 2206.
7. Metal gland for MJ Adapter may be either AWWA C110 (heavyweight) or AWWA C153 (lightweight).
8. Low alloy steel bolts shall comply with AWWA C 111.4. Bolts, rods and hex nuts shall be manufactured from 304 stainless steel as per ANSI/ AWWA C111/A21.11.
9. Van-Stone style, metallic, convoluted or flat-plate, back-up rings and bolt materials shall follow the guidelines of Plastic Pipe Institute Technical Note # 38, and shall have the bolt-holes and bolt-circles conforming to one of these standards: ASME B-16.5 Class 150, ASME B-16.47 Series A Class 150, ASME B-16.1 Class 125, or AWWA C 207 Class 150 Series B, D, or E.
10. The stainless steel back-up ring shall provide a long-term pressure rating equal to or greater than the pressure class of the pipe with which the flange adapter assembly will be used, and such pressure rating shall be marked on the back-up ring. The back-up ring, bolts, and nuts shall be Type 304 stainless steel.
11. Mechanical Joint Wedge Action Restraint are not allowed.
12. Where shown on the drawings, 4" and larger transitions to mechanical joint fittings and valves shall be accomplished using a MJ Adapter with kit. The D.I./HDPE mechanical joint adaptor shall consist of:
    a. A molded or fabricated HDPE mechanical joint transition fitting.
    b. A rubber gasket.
    c. A mechanical joint backup drive ring.
    d. Corten mechanical joint tee bolts, or approved equal.

J. Pipeline Markers:

1. Provide Tracer wire on ALL HDPE piping in accordance with Section 33_05_97.23 – Underground Utility Warning Tape

K. Stiffening Insert (Stiffener)
1. Provide Stiffeners at each MJ adapter and coupling.
2. Stiffening inserts shall be specially designed for use on the inside of HDPE pipe in conjunction with AWWA C111 mechanical joints.
3. Provide stainless steel per ASTM A 240, type 304 or 316.
4. Stiffener shall be manufactured within the pipe or MJ adapter by the factory.
5. Field installed stiffeners may be allowed upon approval of the Engineer. Wedge style stiffeners are allowed.
6. Stiffener length must be sufficient to fully encompass the area of the pipe being restrained.
7. Inserts must be designed for underground pressurized fluid service and are pressurerated to match the pipe DR pressure rating, derated as appropriate for service temperature. Maximum test pressure limited to pipe rated pressure.
8. Stiffener design shall prevent movement causing fitting to slide or rotate on the pipe.

PART 3 EXECUTION

3.1 INSTALLERS

A. Only prequalified installers will be allowed to perform work under this Specification. See Scope of Work.

B. F 2620 for butt fusion.

C. Training in accordance with ASTM F 1055 for electrofusion.

D. Fusion joints shall be made by qualified fusion technicians per PPI TN-42.

E. Qualified technician has documented prior experience in performing HDPE pipe installations, head fusion procedures, and testing methods.

3.2 INSTALLATION

A. General
1. Install pipe, fittings, specials, and appurtenances as specified herein, as specified inAWWA M55, and in accordance with the pipe manufacturer's recommendations with the intention of providing a leak-free system to the Owner.
2. Excavate and backfill trenches in accordance with the Project Manual.

B. Pipe Handling
1. At the close of each operating day, when work is stopped for more than 30 minutes,or when the trench is unsupervised:
a. Keep the pipe clean and free of debris, dirt, animals, and trash – during andafter the laying operation.
b. Effectively seal the open end of the pipe using a gasketed night cap.

C. Joining Methods
1. Butt Fusion: The pipe shall be joined by the butt fusion procedure outlined in ASTM F 2620 or PPI TR-33. All fusion joints shall be made in compliance withthe pipe or fitting manufacturer's recommendations.
2. Saddle fusion: Saddle fusion shall be done in accordance with ASTM F 2620 or PPI TR-41 or the fitting manufacturer's recommendations and PPI TR-41.
3. Electrofusion: Electrofusion joining shall be done in accordance with the manufacturers recommended procedure. Other sources of electrofusion joining information are ASTM F 1290 and PPI TN 34. The process of electrofusion requires an electric source, a transformer, commonly called an electrofusion box that has wire leads, a method to read electronically (by laser) or otherwise input thebarcode of the fitting, and a fitting that is compatible with the type of electrofusionbox used. The electrofusion processor must be capable of reading and storing the input parameters and the fusion results for later download to a record file. Qualification of the fusion technician shall be demonstrated by evidence electrofusion training within the past year on the equipment to be utilized for this project.

D. Mechanical
1. Mechanical connection of HDPE to auxiliary equipment such as valves, pumps, and fittings shall use mechanical joint adapters and other devices in conformance with this specification.
2. Unless specified by the fitting manufacturer, a restraint harness or concrete anchor is recommended with mechanical couplings to prevent pullout.
3. Mechanical coupling shall be made by qualified technicians.

E. Joint Recording
1. Butt Fusion: The butt fusion equipment must be capable of reading and storing the input parameters (including GPS location) and the fusion results for later download to a record file.
2. Electrofusion: The electrofusion equipment must be capable of reading and storing the input parameters (including GPS location) and the fusion results for later download to a record file.
3. The critical parameters of each fusion joint, as required by the manufacturer and these specifications, shall be recorded by an electronic data logging device. All fusion joint data shall be included in the Fusion Technician's joint report.

F. Installation
1. Mechanical joints shall be installed in accordance with Section 02531 - DuctileIron Pipe and Fittings.
2. Buried HDPE pipe and fittings shall be installed in accordance with ASTM D2774 for pressure systems and AWWA Manual of Practice M55 Chapter 7.
3. Lay pipe with blue stripe within 45-degrees either side of crown.
4. Pipe embedment – In accordance with drawings and applicable plan sections

G. Leakage Testing
1. Hydrostatic leakage testing is recommended and shall comply with AWWA C651, ASTM F 2164, ASTM F 1412, AWWA Manual of Practice M55 Chapter 9, and PPI Handbook of Polyethylene Pipe Chapter 2 (2nd Edition). If the test section fails

this test, the Contractor shall repair or replace all defective materials and/or workmanship at no additional cost to the Owner.

2. Prior to scheduling a test with the Engineer, preform a pre-test to confirm compliance.
3. Contractor shall perform hydrostatic and leakage tests in accordance with North Carolina state requirements.
4. Installed main shall be adequately anchored with a covering of at least 6-inches of initial backfill, if installed by an open trench method. The joints and fittings, particularly flange connections shall be left uncovered for visual leak inspection.
5. Leak tests of HDPE water system shall be conducted in accordance with ASTM F2164. The pipeline should be slowly filled with potable water and all trapped air bled off. The main should undergo a hydrostatic pressure test using pressure at the lowest elevation in the system at 150 psi. The pressure shall be maintained constant for 4-hour period by adding makeup water. After 4-hour period is completed, the pressure shall remain steady within 5% (7.5 psi) of a target 150 psi test pressure for one hour.
6. The total test time should not exceed 8 hours. If the pipeline has to be retested – the pipe must be depressurized and allowed to "relax" for at least 8 hours before the next testing sequence.
7. The pressure shall be maintained constant for 4-hour period by adding makeup water. After 4-hour period is completed, test the pressure at the lowest point.
8. Test pressure for one hour. Pressure should remain steady at 1.5 times the working pressure, but not more than the design pressure of the pipe (e.g. 200 psi for DR 11). Pressure must remain within 5% of a target test pressure for one hour.
9. In fused polyethylene water piping system no leakage shall be present. If leakage is observed at a fusion joint, complete rupture may be imminent. The Contractor shall move all personnel away from the joint and depressurize the main. Leaks, failure, or defective construction shall be promptly repaired by the Contractor at the Contractor's sole expense.
10. Payment for pressure and leakage testing shall be considered included in the price paid per linear foot for water main installation.
11. Pneumatic (compressed air) leakage testing of HDPE pressure piping is prohibited for safety reasons.

H. Data Logger Records

1. Provide electronic data logger record to the Engineer daily or on request of Engineer.
2. Fusion Reports shall report manufacturer, component, component fusion-jointing parameters, assembly operation and joint identification, per ISO 12176-4, and the following fusion-jointing operation data:
    a. Temp-Compensated Fusion Time & Actual Fusion Time
    b. Resistance before & after fusion
    c. Hi and Low output voltage & output current during fusion
    d. Total Amp-Hours applied to fitting
    e. Input voltage and frequency before fusion
    f. High and Low input voltage and frequency during fusion
    g. Input waveform
    h. GPS position and quality
    i. Ambient temperature

j. Heating iron face temperatures
k. Fusion pressure
l. Graphic representation of the fusion cycle.

3. Report shall comply with ISO 12176-2 requirements for traceability databases.

SECTION 40_05_57.24

ELECTRIC ACTUATORS FOR VALVES & GATES

PART 1 GENERAL

1.1 SUMMARY

A. This specification covers the work necessary to furnish and install the various valve & slide gate motor actuators as specified herein and as shown on the plans.

B. To obtain standardization of performance, operation, spare parts, maintenance, and Manufacturer's service, it is the intent of these specifications that all valves of like type be furnished by a single Manufacturer.

C. Spare Parts:
   1. Northside – Provide four total (4) spare shelf actuator for the following locations:
      a. SBR
      b. Headworks gate
      c. Post EQ
      d. 24" influent
   2. Southside - Provide three total (3) spare shelf actuator for the following locations:
      a. Headworks gate
      b. Pumps control valves (x2)

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 DELIVERY, STORAGE & HANDLING

A. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address. Packing list shall be provided with equipment at time of delivery.

B. Electrical equipment shall be kept thoroughly dry at all times and stored indoors. Equipment storage shall be protected and maintained in accordance with the Manufacturer's recommendations. Equipment shall not be stored directly on the ground.

C. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

PART 2 PRODUCTS

2.1 ELECTRIC MOTOR OPERATORS

A. For the electric operating plug valves shown on the plans provide non-modulating electric motor operators of the close-coupled, electric motor-driven, worm gear type, complete with motor, gearing, limit switches and auxiliary contacts, torque switches, position indicators, hand-wheel, integral controller, and all required appurtenances.

B. The operator shall be mounted in the position as shown on the plans.

C. The motor operators must meet AWWA C540 standards.

D. The valve operators provided must fully open the valve from the closed position in approximately 30 seconds and fully close it in approximately 30 seconds when the differential pressure and flow values specified for the valve and the voltage at the terminals is within 15 percent of the nominal voltage. The operator shall be designed to operate the valve through three consecutive opening and closing cycles or for a period of 15 minutes, whichever is longer, during every 60-minute period, at specified ambient temperature conditions under full differential pressure.

E. The operator shall be designed for outdoor operation and for an ambient temperature range of -20 to 140 degrees F.

F. The operator shall be designed to exert an unseating torque of at least 50 percent in excess of the required disc seating torque at the specified voltage, neglecting hammer-blow effect.

G. The power gearing shall consist of helical or spur gears and worming gear. The helical and spur gears shall be accurately fabricated of machined alloy steel. The hardened alloy steel worm gear shall have the threads ground and polished after heat treating. Worm gear may be constructed of nickel or manganese bronze. Antifriction bearings shall be

utilized throughout. The operator may be lubricated by grease pack or oil bath. The lubricants provided shall be suitable for the ambient temperatures specified.

H. A hand-wheel for manual operation shall be provided and shall have a maximum rim pull of 40 pounds. The hand-wheel shall be designed so that it does not rotate during electrical operation and the motor does not rotate during manual hand-wheel operation. The operator shall be designed so that motor or motor gearing failure does not prevent manual operation. The operator shall be automatically changed from manual operation to electrical operation when the motor is energized and to continue electric operation until the operator is reset to manual operation. A means for locking the drive in either manual or motor operation shall be provided. The hand-wheel shall be removable. An adapter key or drive nut shall be provided to permit operation by a portable operator.

I. A declutching mechanism shall be provided to disengage the motor mechanically by not electrically from motor to hand-wheel operation. If the clutch is of the external lever type, arrange it such that the lever does not move when the motor is energized.

J. An operator-mounted disc position indicator of the mechanical or indicating light type shall be provided. Unless otherwise noted, indicate the fully open, fully closed, and intermediate disc position either mechanically or by lights. For throttling service, provide continuous disc position indication between the fully open and fully closed positions. Electrical contacts shall be provided for remote indication of disc position.

K. The operator motor shall be of the high torque, ball or roller bearing, squirrel-cage type designed for continuous valve duty. The motor shall be rated for 15 minute duty cycle or three complete opening and closing valve strokes, whichever is longer, during a 60 minute period under full differential pressure at 40 degrees C ambient. The motor shall operate on 480 volts, 3-phase electrical service. The motor windings and leads shall have Class F or better insulation with built-in thermal overload protection.

L. The housing for the controls, gears, and motors shall be provided with integrally cast flanges. The flanges and mating surfaces shall be fully machined and template drilled. The joints shall be metal-to-metal or gasket or O-ring sealed as required.

M. The control and motor enclosures shall be NEMA 4 rated, except as otherwise specified. NEMA 7 enclosures shall be provided where explosion-proof construction is shown or specified. The controller shall be provided with mechanical interlocks and mounted as an integral part of the operator. For explosion-proof enclosures which are dependent upon metal-to-metal faces for weatherproofing, include explosion-proof breathers and drains with desiccant type dehumidification and with sufficient silica gel desiccant for 6 months service without requiring renewal. Instructions for desiccant renewal shall be provided. A 2-year supply of desiccant shall be provided.

N. The electrical compartments shall be provided with heaters, unless otherwise specified.

O. The electrical service power required for each operator shall be as shown and specified.

P. A NEMA rated reversing controller, or an approved special duty rated reversing controller, complete with mechanical interlocks and controls as an integral part of the operator shall be provided. Adequate overload protection in the controller or embedded in the motor windings shall be provided. An overload device shall be installed in each phase. If the

overload devices are installed in the motor windings, devices of the bimetallic automatic reset type with contact in the control circuit shall be provided. The internal wiring in the operator shall be arranged so that the opening and closing coils cannot be energized simultaneously at any time, regardless of external wiring conditions.

Q. When the operators are 7 feet or closer to the floor and in an accessible location, the OPEN-STOP-CLOSE push buttons or a selector switch shall be mounted on the operator housing, as shown. The red and green position indicator lights and where shown the amber ready light or MANUAL-AUTO mode selector switch shall be mounted on the operator housing.

R. The operator shall be provided with limit and torque switches, either direct or gear driven. The limit and torque switches shall be adjustable with auxiliary contacts that are operative in either direction of travel. The limit switches shall be "in-step" with the torque switches at all times, whether in motor or manual operation. The operator shall be equipped with limit switches to stop movement in each direction and torque switches for protection against mechanical overload and to stop movement in either direction if an obstruction is encountered. The number, function, and arrangement of the limit switches shall be provided as shown, specified, or required.

S. Additional limit switches, indicating lights, position transmitters and remote position indicators, remote operating controls and other accessories and controls shall be provided where shown, specified, or required.

T. The electric motor actuators shall be M2CP as manufactured by Emerson Process Management(EIM).

PART 3 EXECUTION

3.1 INSTALLATION

A. The Contractor shall assume full responsibility for coordination of the entire project, including verification that all structures, piping, coating systems and equipment components are compatible. The Contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal of Manufacturer's shop and installation drawings, test result certificates or other data as required and specified herein.

C. Installation of equipment shall be in full conformance with the Manufacturer's shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between Manufacturer's instruction and the contract documents, the Contractor shall follow the Engineer's decision at no additional cost to the Owner.

3.2 MANUFACTURER'S SERVICES

A. Provide the services of a Representative of the Manufacturer of the actuators to assist in adjusting and testing the equipment, to supervise initial operation, and to assist in making final adjustments and the tests specified, or which may be necessary to assure the Engineer the equipment is in satisfactory operating condition.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 40_05_58

SPECIALTY VALVES

PART 1 GENERAL

1.1 SUMMARY

A. Specialty valves and appurtenances. Not all items specified in this section are required in this Contract.

B. Items covered in this specification (may or may not be included)
1. Valve Operators
2. Valves Boxes
3. Sampling Valves
4. Pressure Regulating
5. Pressure Reducing Valves.
6. Solenoid Valves.
7. Ball Valves.
8. Hose Valves.
9. Air Release Valves.
10. Combination Vacuum Relief Air Inlet/Air Release Valve.
11. Slow Closing Air/Vacuum Valve.
12. Reduced Pressure Backflow Preventer.
13. Duckbill Check Valves.
14. Telescoping sludge valves.
15. Pinch valves.
16. Corporation stops.
17. Curb stops.
18. Pressure Relieve Valves.
19. Pressure Sustaining Valves.
20. Surge Relief Valves.
21. Yard Hydrants.

C. Valves shall be same size as pipeline in which installed, with type joints similar to those in respective pipeline unless otherwise shown; flanges faced and drilled to United States of America standard class 125 pattern; bell and spigot of mechanical joints for class 150 pipe; screwed joints for USA standard threads. Valves shall be factory tested to double working pressure. Working pressure and manufacturer's name shall be cast on the valve body.

D. Any Drawing or Specification that conflicts with this Specification section shall be brought to the attention of the Engineer prior to bid. When no clarification is provided the Contractor is to assume that the more restrictive & expensive product/system/item applies and shall be included in the Contractor’s bid.

E. All listed iron and steel products used in this project must be produced in the United States. The term “iron and steel products” means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced

precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 SUBMITTALS

A. Valve submittals in accordance with Section 01_33_01 and as follows:
   1. Submit drawing or illustration showing unit construction for each type and size valve used.
   2. Submit the following information for each valve:
      a. Specific application in plant expressed in terms of service and Contract Drawing number where shown.
      b. Description, including type of valve, type of operator, and accessories included.
      c. Size.
      d. Maximum non-shock working pressure for which valve is designed when used for water applications.
      e. Materials of construction.
      f. k or Cv value.
      g. Make and model.
   3. If catalog bulletins are used to communicate above information, mark out inapplicable information.
   4. Valves specified to be manufactured in accordance with AWWA and other standards must be submitted with an appropriate affidavit of compliance.

B. Operation and maintenance data:
   1. Furnish bound sets of installation, operation, and maintenance instructions foreach type of manual valve 4 inch in nominal size and larger, and all non- manual valves. Include information on valve operators in operation and maintenance instruction manual.

1.3 REFERENCE STANDARDS

A. American National Standards Institute (ANSI)
   1. ANSI B2.1 – Pipe Threads (except Dryseal).
   2. ANSI B16.1 – Cast Iron Pipe Flanges and Flanged Fittings."

B. American Society of Testing and Materials (ASTM)
   1. ASTM A126 "Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings."
   2. ASTM A159 "Specification for Automotive Gray Iron Castings."
   3. ASTM A216 "Specification for Steel Castings, Carbon Suitable for Fusion Welding for High-Temperature Service."
   4. ASTM B62 "Specification for Composition Bronze or Ounce Metal Castings."

C. American Water Works Association (AWWA)
   1. AWWA C507 – Ball Valves, 6-Inch through 48-Inch.
   2. AWWA C509 – Resilient-Seated Gate Valves for Water Supply Service.
   3. AWWA C511 "Backflow Prevention Devices-Reduced Pressure Principle and Double Check Valve Types."
   4. AWWA C512 – Air Release, Air Vacuum, and Combination Air Valves for Waterworks Service.

1.4 QUALITY ASSURANCE

A. Valves and equipment listed herein shall be products of Manufacturers that have a minimum of five years' experience in the manufacture of the particular equipment item to be furnished.

B. Valves and equipment of the same type shall be identical, varying only with size, and the product of one manufacturer.

1.5 MAINTENANCE/SPARE PARTS

A. Special tools and the manufacturer's standard spare parts, if required for normal operation and maintenance, shall be supplied with the equipment.

B. Manufacturer/Supplier shall submit a complete listing of spare parts for all equipment furnished under this section. Spare parts list shall include only spare parts recommended for the first year of operation and a current price list for the Owner to choose which parts will be purchased.

1.6 DESIGN REQUIREMENTS

A. Pressure rating:
   1. Suitable for service under minimum working pressures of 150 pounds persquare inch gauge.
   2. When a piping system is specified in the Piping Schedule to be tested at a pressure greater than 150 pounds per square inch gauge, provide valves forthat piping system with design working pressure which is sufficient to withstand the test pressure

B. Valve to piping connections
   1. Valves 3-inch nominal size and larger: Flanged ends.
   2. Valves less than 3-inch nominal size: Screwed ends.
   3. Plastic valves in plastic piping:
      a. Up to 2.5 inches: Provide solvent or heat welded unions.
      b. 3 inches and above: Provide solvent or heat welded flanges.

PART 2 PRODUCTS

2.1 MATERIALS

A. General
   1. All valves and appurtenances shall be the size shown on the drawings.
   2. All valves and appurtenances shall have the name of the Manufacturer, flow directional arrows, the year the valve casing was made, and working pressure, for example "200W", for which they are designed cast in raised letters upon some appropriate part of the body.
   3. Except as otherwise shown on the drawings or specified herein, all valves with operators located 6 feet or more above the operating floor shall be provided with chain wheel operators complete with chain guides and galvanized steel chain.

4. All buried valves shall open left (counter clockwise). Insofar as possible, all valves shall open counter clockwise.
5. Buried valves and operators, and those located outdoors, partially buried or within maximum of two feet above liquid, or in vaults, or where noted, shall be especially designed to completely submerge the valve and operator. Provide valve position indicator for buried valves.
6. Valves shall have a minimum working pressure of 150 psi, or be of the same working pressure as the pipes they connect to, and suitable for pressure noted where installed.
7. Joints referred to herein shall be of the same type and material as the pipe or fittings they are connected to.
8. Valves and appurtenances shall be of the same nominal diameter as the pipe or fittings they are connected to.
9. All buried valves shall have flanged joint ends, unless noted otherwise on the drawings.
10. End connections to be compatible with those specified for pipe.

B. Valve Operator General Provisions
   1. Furnish geared operators with the following features, unless otherwise specified:
      a. Weatherproof enclosure.
      b. Grease lubricated design.
      c. Closes when turned clockwise.
   2. Paint operators as specified for valves.
   3. Valve and operator nuts and bolts
      a. Fabricated of stainless steel for the following installation conditions:
         1) Submerged in sewage or water.
         2) In an enclosed space above sewage or water.
         3) In structures containing sewage or water, below top of walls.
         4) At openings in concrete or metal decks.
      b. Where dissimilar metals are being bolted, use stainless steel bolts with isolation bushings and washers.
      c. Underground bolts: Low-alloy steel in accordance with AWWA C111/A21.11.

C. Valve Operators
   1. Valve operator "Open" direction: Open counterclockwise.
   2. Provide valves located below operating level or deck with extensions for key operation or floor stands and handwheels.
   3. Provide manually operated valves located not more than 6 feet above the operating level with tee handles, wrenches, or handwheels.
      a. Make the valve operator more conveniently accessible by rolling valves, located more than 5 feet but less than 6 feet above the operating level, toward the operating side.
      b. Secure tee handles and wrenches to the valve head or stem, except where a handle or wrench so secured constitutes a hazard to personnel; in which case, stow handle or wrench immediately adjacent to the valve on or in a suitable hanger, bracket, or receptacle.
   4. Fit valves located more than 6 feet above operating level with chain operated handles or valve wheels.
      a. Chains: Sufficient length to reach approximately 4 feet above the operating level.

b. Where chains constitute a nuisance or hazard to operating personnel, provide holdbacks or other means for keeping the chains out of the way.

5. Provide an operator shaft extension from valve or valve operator to finished grade or deck level when buried valves, and other valves located below the operating deck or level, are specified or indicated on the Drawings to be key operated; provide 2-inch square AWWA operating nut, and box and cover as specified, or a cover where a box is not required.

D. Valve Boxes

1. Cast iron valve boxes extending to the finished or established ground or paved surfaces shall be provided for all buried valves. They shall have suitable base castings to fit properly over the bonnets of their respective valves and heavy top sections with stay-put covers. Minimum 3/16-inch thickness of metal at any point. Boxes shall be of the screw or sliding type having 5-1/4" shaft diameter or greater. Factory painted inside and out with good quality asphalt paint. Covers shall be removable and marked with the class of service. A concrete pad 1"6" x 4" thick slightly above ground surface shall be poured around all valve boxes with name plate as outlined in plan details.
2. Standard extension stem of dimensions required to extend valve stem to required elevation; designed to operate respective valve; complete with coupling and operating nut. Extension stems for underground valves equipped with valve boxes shall be of such length as to extend within 18 to 24 inches from top of valve box and shall be provided with washers or centering plates to facilitate use of operating wrenches.

E. Sampling Valves

1. Type 316 stainless steel wetted parts, hand operated iron crank, piston to extend to innersurface of vessel or pipe, sealed by two compressible replaceable Teflon rings, one above discharge port and other below discharge port, 3/4-inch NPT inlet and 3/4-inch NPT outlet**.**
2. Manufacturers and Products:
   a. Strahman Valves, Inc.; Piston Type Sampling Valve.
   b. Fetterolf Corporation; Rod-Seal Sampling Valve.

F. Pressure Regulating Valves

1. Pressure regulating valves shall be factory tested. Outlet pressure shall be easily field adjustable over the pressure ranges shown on the Drawings.
2. Pressure regulating valves shall meet the criteria noted on the Drawings.
3. Pressure regulating valves shall have flanged connections, or shall have unions mounted in the pipe on each side of the valve.
4. Strainers for installation upstream of pressure regulating valves are specified elsewhere in Division 15. The pressure regulating valve manufacturer shall specify the screen mesh or size of perforations that are required to protect the regulating valve.
5. Pressure Regulating Valves – 3 inch and Larger:
   a. Valves 3 inch and larger and for pressure shall be flanged with globe body, fully bronze mounted, external pilot operated, diaphragm type single seat with seat base equal to size of valve and shall be equal to the Figure 4500D pressure Reducing Valve as manufactured by GA Industries, Inc., PA; Clayton Model 90 as manufactured by Cla-Val Company, CA.

G. Pressure Regulating Valves – 2.5 inch and Smaller
   1. Pressure regulating valves 2.5 inch and smaller shall be rated at the same working pressure as the connecting pipe, with bronze and brass body; renewable stainless-steel seat, and flexible diaphragm of suitable material. Outlet pressure shall be easily field adjustable over the pressure ranges tabulated.
   2. Pressure regulating valves 2.5 inch and smaller shall be Figure No. 43D as manufactured by GA Industries, Inc., PA; Cla-Val Model 90-01/690-01 as manufactured by Cla-Val Company, CA; or approved equal.

H. Solenoid Valves
   1. Solenoid valves shall be packless piston type direct acting, 2-way or 3-way valves and shall be ASCO Valve Red Hat as manufactured by Automatic Switch Co., an equal by Atkomatic Valve Co., Inc., for air and water service.
   2. Valves on water seal lines shall be of the normally closed type, interconnected with pumping unit to shut down if no seal water flow.
   3. Valves shall have forged brass bodies, NPT end connections of the size shown on the Drawings, 300 or 400 series stainless steel internal parts, and Buna n or Ethylene Propylene valve seats. Valves shall have a same working pressure as the connecting pipe and zero minimum operating pressure differentials. Connections shall be threaded.
   4. Except as otherwise specified, valves shall have NEMA 4 solenoid enclosures.
   5. Valves shall be suitable for operation on power supply as provided in the plans and specifications, and shall be provided with a continuous duty Class F coil and a manual operator.
   6. Solenoid valves on bypass piping shall be installed whether shown or not.
   7. Note that solenoid valves may be shown on Electrical and/or Mechanical Drawings, or may only be specified or called out in the details.

I. Ball Valves
   1. Ball valves for PVC piping shall be of PVC Type 1, Grade 1, with union, socket, threaded, or flanged ends as required. PVC ball valves shall be as manufactured by Spears, Nibco, Balon, Hayward Gordon.
   2. Ball valves, except otherwise specified, shall be of ductile iron body and Type 316 stainless steel ball and stem. The valve seat and body seal shall be of TFE. Other hardware shall be of stainless-steel Type 316. Valves shall have 150 psig (minimum) working water pressure. Valves shall have flanged or screwed ends as shown on the drawings, and shall be Model 5150 as manufactured by Jamesbury, an equal by Hills-McCanna.
   3. All valves shall be mounted in such a position that valve position indicators are plainly visible when standing on the floor.

J. Hose Valves
   1. Hose valves for interior (US-1) or handrail mounting (US-2) shall be brassor bronze, Crane 17, Jenkins 112 or 113 with composite disc, or equal. Hose valves for exterior pedestal mounting (US-3) shall be Zurn A-1385, Woodford or equal non-freeze post hydrant. hose valves for exterior wall mounting (US-4) shall be Zurn Z-1310, Woodford or equal anti-siphon non-freeze wall hydrant. All hose valves for use with potable water shall be equipped with vacuum breakers.

K. Air Release Valves

1. Valves shall be installed to release any small accumulations of air, which may collect while the main pipe is in operation and under pressure.
2. The small orifice assembly (Air Release Valve) shall automatically release air accumulations from the pipe while under positive pressure. When the valve body fills with air, the small orifice float ball falls to open the small orifice and exhaust the air to atmosphere. When the air has been exhausted, the small orifice shall be buoyed up and tightly close the small orifice.
3. The small orifice assembly shall be furnished with cast iron body and cover ASTM A126-B. The float ball shall be constructed of stainless-steel ASTM A240, and attached to a stainless-steel lever mechanism. A resilient, Buna-N seat shall be attached to the lever mechanism for drop-tight closure.
4. Separate air release valves shall be Crispin, APCO, Val-Matic, GA Industries, LLC.
5. Valve body shall have a test pressure rating of 300 psi and working pressure rating of 150 psi.

L. Combination Vacuum Relief Air Inlet/Air Release Valve

1. Combination Vacuum Relief/Air Inlet/Air Release Valves shall allow large volume air to escape through the orifice when filling the pipeline and shall shut off water tight, when the water enter the valves. The Combination Air Valve shall also permit large volumes of air to enter through the orifice when the pipeline is being drained to prevent vacuum from forming and water column separation. The valve shall consist of a body, cover, baffle, float and seat. The baffle will be an integral part of the body, designed to protect the float from direct contact of the rushing air and slugs of water to prevent premature shut-off. The seat shall be Buna-N fastened onto the valve cover without distortion and be easily replaced. The float shall be stainless steel and be center guided at each end for positive seating.
2. The Air/Vacuum Valve shall have the outlet threaded or flanged.
3. The Automatic Air Release Valve shall be designed to operate under pressure to allow entrapped air inside the pipeline to escape. The shut-off prevents water from escaping. The Air Release Valve will then stay closed until more air accumulates and the opening cycle will repeat automatically. The Air Release Valve float shall be heavy stainless steel.
4. The valve internals, shall be replaceable, without removing valve from the line and the materials of construction certified, conforming to following ASTM specifications:

Valve Bodies	Cast Iron	ASTM A126 Gr. B
Exterior Primer	Universal Metal Primer	FDA Approved for Potable Water
Float	Stainless steel	ASTM A240
Seats	Buna-N	Nitrile Rubber

5. Valve to be APCO Series 1800 - Combination Vacuum Relief/Air Inlet Valve/Air Release (Flanged Type) Valve manufactured by APCO by Crispin Valve Model AL/PL or Val-Matic Valve and Manufacturing Corp.

M. Slow Closing Air/Vacuum Valves

1. The Slow Closing Air/Vacuum Valve shall be three valves furnished assembled and tested as a single unit.
2. The Air/Vacuum Valve must have a stainless steel float guided at each end with stainless stems. The stems shall be guided through stainless steel bushings inside

the body and cover. The seat must be Buna-N fastened to the cover with stainless shoulder screws without distortion to allow drop tight closure.

3. The covers shall have a male lip to fit the female body register for positive float guide direction into the seat. Cover outlets may be threaded or flanged.
4. The Surge Check Valve shall be a normally open spring-loaded valve consisting of a body, seat and plug bolted to the inlet of the Air/Vacuum Valve. The surge check shall operate on the interphase between the kinetic energy and relative velocity flows of air and water. It will allow air to pass through but water shall actually close the surge check, reducing the rate of water flow by means of throttling orifices in the plug to prevent shock closure of the Air/Vacuum Valve. The surge check orifices must be adjustable type to suit operating conditions in the field.
5. The Air Release Valve shall be side connected to the upper valve, but separated with an Isolation Shut-Off Valve. The internal mechanism shall be the compound lever type to permit the valve to open under pressure to vent pockets of entrapped air as they accumulate. The compound mechanism shall be activated by a stainless steel concave float to lift the Buna-N needle to shut off the Air Release orifice.
6. Product and Manufacturer
    a. Valve to be APCO Series 1700 – Slow Closing Air/Vacuum (Flanged Type) Valve manufactured by APCO.

N. Reduced Pressure Backflow Preventer

1. The reduced pressure backflow preventer, with two independently operated check valves, shall be designed for installation in a normal horizontal flow attitude. An independent relief valve shall be located between the two check valves. They shall be in compliance with AWWA C511 and OAC 252 Regulations.
2. Two reduced pressure backflow preventers shall be installed in parallel for redundancy and ease of maintenance.
3. The reduced pressure backflow preventer shall be designed for installation in the horizontal position.
4. The reduced pressure backflow preventer shall be a complete assembly including UL listed and FM approved OSY shutoff valves and an auxiliary line consisting of an approved backflow preventer. The assembly shall meet the requirements of AWWA C511, ASSE 1013, and CSA B64.
5. The reduced pressure backflow preventer shall be Watts, Zurn, FEBCO.
6. The backflow preventer station shall be installed with a hot box for outdoor installations.
7. The enclosure shall comply with the following criteria:
    a. Totally removable for maintenance purposes.
    b. Structurally lined with a unicellular, non-wicking insulation consisting of a sandwich laminate or applied by spray.
    c. Thermostatically controlled heat source mounted to the interior wall or on the backflow preventer to provide protection to -30^{o}F. Unit shall be 120V, single phase.
    d. No wood or "particle board" shall be allowed in assembly.
    e. No insulation will be mounted with glue.
    f. Power source will be protected with a ground fault circuit interrupting receptacle, UL Standard 943, NEMA 3R inside the box.
    g. Drain openings sized to accommodate the maximum discharge of the reduced pressure zone assembly. Drain openings shall open to discharge under the most severe conditions. These openings are protected against intrusion of either wind, debris, or animal.

h. Provide with means of permanent anchor and "lockable" access doors and/or LID to prohibit theft or vandalism.
i. All "wet" portions of the backflow prevention assembly shall be protected within the enclosure.
j. OSY indicating valve handles shall be maintained outside the enclosure.
k. Factory assembled and delivered to the site ready to install with no drilling, screwing, or riveting of enclosure required on site.
l. The contractor shall be responsible for coordinating the size of the enclosure to accommodate the backflow preventer assembly.
m. Hubbell, Watts or equal.
n. Contractor shall coordinate the size of slab with the enclosure. The slab shall extend beyond the enclosure no less than 4".

8. The enclosure and the backflow preventer shall be covered by a single warranty policy.
9. Pipe outdoors, above grade, and not inside hot box shall be insulated and heat traced.

O. Duckbill Check Valve
1. Check Valves are to be all rubber and the flow operated check type with a flanged end connection. The port area shall contour down to a duckbill which shall allow passage of flow in one direction while preventing reverse flow. The flange and flexible duckbill sleeve shall be one piece rubber construction with nylon reinforcement. The bill portion shall be thinner and more flexible than the valve body, and formed into a curve of 180°.
2. The flange drilling shall conform to ANSI B16.1 Class 125/ANSI B16.5, Class 150 standards. The valve shall be furnished with steel back-up rings for installation.
3. Manufacturer must have available flow test data from an accredited hydraulics laboratory to confirm pressure drop data. Company name, plant location, valve size and serial number shall be bonded to the check valve. Valves shall be manufactured in the USA.
4. When line pressure inside the valve exceeds the backpressure outside the valve by a certain amount, the line pressure forces the bills of the valve open, allow to pass. When backpressure exceeds the line pressure by at the same amount, the bills of the valve are forced closed.
5. Acceptable Manufacturers
a. Tideflex Technologies Inc.
b. EVR

P. Telescoping Sludge Valves
1. Manufacturers: One of the following or equal:
a. Rex Chain Belt.
b. Siemens/Envirex, Telescopic Sludge Valve.
2. Design:
a. Valve assembly including the following:
1) Offset type valve stand.
2) Operating crank or handwheel.
3) Rack and pinion or handwheel shaft and lifting stem.
4) Bearings and bearing guides.
5) Connecting rods.
6) Telescoping tube with removable adapter.
7) Pipe flange.

8) O-ring seal.

b. Rising racks:

1) Equip with covers and indicators to show position of telescoping tube.

2) Valves shall be adjustable in 1/4-inch nominal increments.

c. Telescoping tubes: Provide with a 2-U notch at the top of the tube, with stemrods adequately fixed for travel in a true, vertical line.

d. Provide stops in the valves to prevent lifting the telescoping tube to the base ofthe valve stand, and design to prevent damage to equipment by forcing the handwheel.

3. Materials:

a. Valve stand: Cast-iron or fabricated steel.

b. Rack and pinion or handwheel shaft and stem: Steel.

c. Tube and adapter: Schedule 40, Type 316 stainless steel.

d. Pipe flange: Cast iron.

e. Gaskets: Neoprene.

Q. Pinch Valves

1. Manufacturers:

a. Red Valve Company, Series 80 with Type DW sleeves.

b. RKL Controls, Inc., Series KEFR.

c. Onyx Valve, equivalent product.

2. Design: Open frame handwheel type.

3. Materials:

a. Sleeve material: Suitable for operation requiring continuous opening and closing of the valve.

b. Sleeves: Teflon reinforced with butyl nylon or other equivalent reinforcing material.

R. Corporation Stops

1. Type: In accordance with AWWA C800.

a. Manufacturers: One of the following or equal:

1) Ford.

2) Mueller Company.

S. Curb Stops

1. Manufacturers: One of the following or equal:

a. Ford.

b. Mueller Company.

2. Description: Round way solid tee head stops.

T. Pressure Relief Valves

1. Pressure relief valves shall meet the criteria noted on the Drawings.

2. Pressure relief valves shall be designed to relieve excess pressure that may occur in the line or system even with back pressure or head pressure on the downstream side.

3. Pressure Relief Valves – 4 inches or smaller:

a. Valves 4 inch and smaller shall be PVC body threaded in-line 3-port valves with PTFE/EPDM diaphragm and have an adjustable screw to obtain the

selected line or tank relief pressure and shall be equal to G-Series Pressure Relief Valve as manufactured by Griffco Valves Inc., or equal.

b. The valve starts to open as line pressure approaches the set pressure until fully open. The valve shall be capable of relieving pressure between 0-250 psi.

c. There shall be no metal in contact with the fluid.

d. Contractor shall route piping from relief side of third port to containment area and terminate 2" above finished floor, whether shown in the Contract Drawings or not.

U. Pressure Sustaining Valves

1. Pressure sustaining valves shall be factory tested. Outlet pressure shall be easily field adjustable over the pressure ranges tabulated below.
2. Pressure sustaining valves shall meet the criteria noted on the Drawings.
3. Pressure sustaining valves shall have flanged connections, or shall have unions mounted in the pipe on each side of the valve.
4. Pressure Sustaining Valves – 3 inch and Larger:
   a. Valves 3 inch and larger and for pressure shall be flanged with globe body, fully bronze mounted, external pilot operated, diaphragm type single seat with seat base equal to size of valve and shall be equal to the Figure 4700D pressure Reducing Valve as manufactured by GA Industries, Inc., PA; Clayton Model 50 as manufactured by Cla-Val Company, CA.
   b. The valve shall be packed with leather or some other material acceptable to the Owner's Representative to insure tight closure and prevent metal to metal friction and sticking. The valve shall be furnished with indicator rod, to show position of opening of the piston, and pet cocks for attachment to valve body for receiving gauges for testing purposes.
   c. Pilot valve, controlling operation of main valve, shall be easily accessible and so arranged to allow for its removal from the main valve, while the main valve is under pressure. The pilot valve shall be easily adjustable without removal of the springs, weights or use of special tools. Control piping on the valves shall have strainers to prevent plugging of control mechanisms.
   d. Design shall be such that repairs or dismantling internally of main valve may be made without its removal from the line.
   e. The flanges shall have the same pressure rating as the connecting pipe. The valve body shall be constructed of cast iron.
   f. The valve shall maintain pre-adjusted upstream pressure for varying rates of flow through the positioning of the piston by the pilot without causing water hammer and without causing waste of water, and without cavitation.

V. Surge Relief Valves

1. The valve manufacturer shall submit to the Owner's Representative calculations confirming that unit's size is proper for the system to be installed.
2. Surge relief valves shall function to open when the system pressure exceeds the pressure for which the field adjustable pilot valve is set. Valves shall open rapidly and close slowly at a predetermined rate of speed. Provision shall be made to regulate the closing speed of the valves. The valves shall be completely piped ready for installation.

3. The main valve shall operate on the differential piston principle such that the area on the underside of the piston is no less than the pipe area and the area on the upper surface of the piston is of a greater area than the underside of the piston. No diaphragm will be permitted within the main valve body.
4. The valve piston shall be guided on its outside diameter by long stroke stationary Vee ports which shall be downstream of the seating surface to minimize the consequences of throttling. Throttling shall be accomplished by the valve Vee ports and not the valve seating surfaces.
5. The valve shall be capable of operating in any position and shall incorporate only one flanged cover at the valve top from which all internal parts shall be accessible. There shall be no stems, stem guides, or spokes within the waterway. There shall be no springs to assist the valve operation.
6. The valve body shall be of cast iron ASTM A126 with flanges and pressure rating as noted. The valve shall be extra heavy construction throughout. The valve interior trim shall be bronze, ASTM B62, as well as the main valve operation. The valve seals shall be easily renewable. All controls and piping shall be of non-corrosive construction. A visual valve piston position indicator shall be provided.
7. Valve shall be Figure 6700-DL (Globe Type) by GA Industries; or Series 3000 (angle-pattern) or Model 50RWR by Ross Valve.

W. Yard Hydrants

1. Yard hydrants shall be 2 inches, non-freezing and self-draining. Hydrants shall have a 2-inch NST nozzle outlet.
2. Hydrant shall be operated by turning a top-mounted operating nut counterclockwise to open, clockwise to close. Hydrants must seal the drain outlet in all positions from ¼-open to fully-open.
3. An anti-vandal locking mechanism shall be provided, which shall also serve as an operating wrench. Six operating wrenches of suitable size shall be furnished to operate all yard hydrants.
4. All internal working parts, the inlet, and the outlet shall be brass or aluminum. All working parts shall be serviceable from above ground with no digging required. All wear parts (o-rings and valve seat) shall be of commonly-available dimensions and materials, none may be of vendor-unique design.
5. Hydrant shall be designed to break away at grade level in event of significant impact. Outlet nozzle shall be able to point in any of 8 redial directions. Hydrants shall be designed to accept field-installed grade-change modifications.
6. Yard hydrants shall be set at the locations as shown in the Drawings and shall have a depth of bury that will meet the elevations given in the Drawings.
7. Yard hydrants shall be painted to match the water system it is attached to.
8. Caution sign shall be provided on each yard hydrant connected to the plant water system. Signs shall be of the plastic laminate type, suitable for outdoor application. The signs shall be a minimum of 1/8-inch thickness. Laminate shall be red in white. Signs shall be mounted to the yard hydrants using stainless steel no. 16 single jack chain. Signs shall be square cornered, approximately 3-inch by 8- inch with the following engraved text in 3/4-inch-high letters: PLANT WATER – UNFIT FOR DRINKING.
9. Yard hydrant shall be a 2” non-freezing type TF200 series by Kupferle.

2.2 SHOP PAINTING

1. A. Surface preparation and shop painting shall be as specified in Section 09900 – Painting and Coating.

PART 3 EXECUTION

3.1 INSTALLATION GENERAL

A. Prior to installation, valves shall be inspected for direction of opening, freedom of operation, rightness of pressure containing bolting, cleanliness of valve parts and especially seating surfaces, handling damages and cracks. Gate valves found to be defective shall be replaced with no additional expense to the Owner.

B. Valves shall be installed in the closed position to prevent inadvertent entry of foreign materials into the valve. Gate valves shall be set plumb and installed where shown on the Plans or as directed by the Engineer. Where feasible, valves shall be located outside the paved areas of roads and streets.

C. A valve box shall be provided for every underground valve. The valve box shall not transmit shock or stress to the valve and shall be centered over the operating nut of the valve. The box cover shall be set flush with the surface of the finished area or such other level as may be directed by the Engineer.

D. The valve assembly shall include all materials and labor required to install and complete the necessary components for a complete and operational valve installation.

E. All underground valves shall have metallic tracing wire and appurtenances installed in accordance with Underground Utility Locator System.

F. Items shall be installed per Manufacturer's instructions in the locations shown. Any damage to items shall be repaired to the satisfaction of the Owner's Representative before they are installed.

G. Install brackets, extension rods, guides, the various types of operators and appurtenances as shown on the Drawings that are in masonry floors or walls, and install concrete inserts for hangers and supports as soon as forms are erected and before concrete is poured. Before setting these items, check Drawings, which have a direct bearing on their location and be responsible for the proper location of these appurtenances during the construction of structures.

H. Items shall be carefully inspected for defects in construction and materials; debris and foreign material cleaned out of openings, etc.; operating mechanisms operated to check their proper functioning, and nuts and bolts checked for tightness. Equipment, which does not operate easily, or is otherwise defective, shall be repaired or replaced at no additional cost to the Owner.

I. Where installation is covered by a referenced Standard Specification, installation shall be in accordance with that Specification, except as herein modified.

J. Unless otherwise noted, joints for items shall be made up utilizing the same procedures as specified under the applicable type connecting pipe joint.

K. The installation of reduced pressure backflow preventers shall meet Oklahoma Department of Environmental Quality standards.

1. Reduced pressure backflow preventers shall be installed above grade. An enclosure shall be provided to protect the device from freezing for outdoor installations.
2. Two reduced pressure backflow preventers shall be installed in parallel for redundancy and ease of maintenance.

L. Provide incidental work and materials necessary for installation of valves includingflange gaskets, flange bolts and nuts, valve boxes and covers, concrete bases, blocking, and protective coating.

M. Where needed, furnish and install additional valves for proper operation and maintenance of equipment and plant facilities under the following circumstances:
1. Where such additional valves are required for operation and maintenance ofthe particular equipment furnished by Contractor.
2. Where such additional valves are required as a result of a substitution orchange initiated by Contractor.

N. Install valves with their stems in vertical position above the pipe, except as follows:
1. Butterfly valves, gate valves aboveground, globe valves, ball valves, and angle valves may be installed with their stems in the horizontal position.
2. Install buried plug valves with geared operators with their stems in a horizontal position.

O. Install valves so that handles clear obstructions when the valves are operated fromfully open to fully closed.

P. Place top of valve boxes flush with finished grade or as otherwise indicated on theDrawings.

Q. Valves with threaded connections:
1. Install valves by applying wrench on end of valve nearest the joint to prevent distortion of the valve body.
2. Apply pipe joint compound or Teflon tape on external (male) threads to prevent forcing compound into valve seat area.

R. Valves with flanged connections:
1. Align flanges and gasket carefully before tightening flange bolts.
2. When flanges are aligned, install bolts and hand tighten.
3. Tighten nuts opposite each other with equal tension before moving to next pairof nuts.

S. Backflow preventers:
1. Install with a minimum clearance of 12 inches and with maximum clearance of30 inches between the relief port and the floor or finished grade.
2. Install with sufficient side clearance for access for testing and maintenance.
3. Recertify all new backflow preventers after installation, start-up, and testing.

T. Plastic body diaphragm valves for sodium hypochlorite service:
1. When valves are installed horizontally, install valves with valve stem position rotated as necessary such that no internal valve obstruction prevents the passage of vapors traveling along the top of adjacent piping from traveling through the valve.

U. Flow control valves:
1. Install orifice in accordance with manufacturer's requirements.

3.2 STORAGE AND HANDLING

A. All valves should be unloaded carefully. The valve should be carefully lowered from the truck to the ground, not dropped. In the case of larger valves, fork trucks or slings around the body of the valve or under the skids should be used for unloading. Only hoists and slings with adequate load capacity to handle the weight of the valve or valves should be used. Do not hook hoists into or fasten chains around bypasses, yokes, gearing, motors, cylinders, or hand wheels.

B. Valves should be inspected at the time of receipt for damage in shipment. The initial inspection should verify compliance with specifications, direction of opening, size and shape of operating nut, number or turns, and type of end connections. A visual inspection of gate rings and body rings should be performed to detect any damage in shipment or scoring of the seating surfaces. Inspection personnel should look for bent stems, broken hand wheels, cracked parts, missing parts and accessories, and any other evidence of mishandling during shipment. The valve should be cycled through one complete opening and-closing cycle. All valves sixteen (16") inches and larger should be operated through one full operating cycle in the position in which they are to be installed.

C. Valves should be stored in the fully closed position to prevent entry of foreign material that could cause damage to the seating surfaces. Whenever practical, valves should be stored indoors. If outside storage is required, means should be provided to protect the operating mechanisms, such as gears, motor operators, and cylinders, from the weather and foreign materials. If valves may be subject to freezing temperatures, remove water from the valve interior and close the gates tightly before storage. Valves in outside storage in cold climates should be stored with the discs in a vertical position; if the discs are in a horizontal flat position, rain water can accumulate on top of the top disc, seep into the valve body cavity, freeze, and crack the casting. Any valves damaged by weather will not be installed.

3.3 FIELD TESTING

A. After installation, all valves and appurtenances shall be tested at the same duration and pressure as the piping system they are in.

B. During the field testing any defective valve or appurtenance shall be adjusted, removed and replaced, or otherwise made acceptable to the Owner's Representative and Owner by the Contractor.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 40_05_59.23

STAINLESS STEEL GATES

PART 1 GENERAL

1.1 SUMMARY

A. Stainless steel sluice, channel, and downward opening weir gates, and appurtenances as shown on the Contract Drawings and as specified herein.

B. The gates and appurtenances shall be supplied in accordance with the latest edition of AWWA C561 Standard for Fabricated Stainless Steel Slide Gates as modified herein. The allowable leakage rate for the stainless steel gates in this specification shall be 1/2 the allowable leakage listed in the latest revision of AWWA C561.

C. Any Drawing or Specification that conflicts with this Specification section shall be brought to the attention of the Engineer prior to bid. When no clarification is provided the Contractor is to assume that the more restrictive & expensive product/system/item applies and shall be included in the Contractor's bid.

D. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

B. Provide the following information to confirm compliance with the specification in addition to the submittal requirements.

1. Complete description of all materials including the material thickness of all structural components of the frame and slide.
2. Installation drawings showing all details of construction, details required for installation, dimensions and anchor bolt locations.
3. Maximum bending stress and deflection of the slide under the maximum design head.
4. The location of the company headquarters and the location of the principle manufacturing facility. Provide the name of the company that manufactures the equipment if the supplier utilizes an outside source.

1.4 DELIVERY, STORAGE AND HANDLINGS

A. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address. Packing list shall be provided with equipment at time of delivery.

B. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment. Any damage to surface incurred during shipment and /or installation shall be repaired to the satisfaction of the Engineer prior to installation.

C. Pumps, cables, and electrical equipment shall be kept thoroughly dry at all times, shall be stored indoors, and protected from freezing conditions. Equipment shall not be stored directly on the ground. Equipment storage shall be protected and maintained in accordance with the manufacturer's recommendations. Equipment is in storage when:
   1. It has been delivered to the jobsite and is awaiting installation.
   2. It has been installed, but operation is delayed pending completion of the project.
   3. There has been long period between operation cycles (30 days or more).

D. Improper storage could result in product failure or restoration not covered by warranty. Contractor shall be solely responsible for any damage to equipment during storage as described above. If Contractor fails to store as required by manufacturer and supplier, and the warranty is voided due to such failure, equipment is automatically rejected by Owner/Engineer. Payment made to the Contractor under Stored Materials will be deducted from next monthly payment to the Contractor. New equipment shall be ordered and paid for by the Contractor for the project and at no cost to the Owner.

1.5 QUALITY ASSURANCE

A. Qualifications
   1. All of the equipment specified under this Section shall be furnished by a single manufacturer with a minimum of 20 years experience designing and manufacturing water control gates. The manufacturer shall have manufactured water control gates for a minimum of 100 projects.
   2. The specification is based on the 900 Series Stainless Steel Gates as manufactured by Whipps, Inc. of Athol, Massachusetts, or, equal.

3. The sizes and types of gates, as well as the type of actuator, shall be as shown on the gate schedule.

B. The fully assembled gates shall be shop inspected and tested for operation before shipping.

C. The manufacturer shall be ISO 9001 certified.

1.6 WORKMANSHIP

A. The Contractor shall install equipment and materials in a workmanlike manner utilizing craftsmen skilled in the particular trade. The finished installation shall portrait a neat and plumb appearance.

B. Before installation, carefully clean equipment of all foreign material, adjust stuffing boxes, and inspect equipment. Install equipment in accordance with the applicable portions of the Specifications. Installation practices shall conform to Manufacturer's recommendations.

C. Any evidence of improper installation shall be corrected by the Contractor. Care during storage, installation and startup shall be in strict accordance with manufacturer's recommendations.

1.7 COORDINATION

A. General Contractor shall provide skilled supervision and coordination between all personnel (sub-contractors and employees) to make sure that installed equipment is easy to operate and maintain.

B. Contractor is responsible for coordination between trades.

C. The Contractor shall assume full responsibility for coordination of the entire project, including verification that all structures, piping, anchor bolts, coating systems and equipment components are compatible. The Contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

D. Electrical connections, power supply, conduit runs, and anchor bolt installation shall be coordinated and supervised by Prime Contractor and checked for proper installation per manufacturer's recommendations.

1.8 WARRANTY

A. The Manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon Final Acceptance of the entire project by the Owner.

B. B. The equipment, apparatus, and parts furnished shall be warranted for a period of one (1) year, excepting only those items that are normally consumed in service. The Manufacturer and the Contractor shall be solely responsible for the warranty of the equipment and all non-consumable components.

C. Components failing to perform as specified by the Engineer, or as represented by the Manufacturer, or proven to be defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the Manufacturer without any additional costs to the Owner.

PART 2 EQUIPMENT

2.1 GENERAL

A. Gates shall be as specified herein and have the characteristics and dimensions shown on the Contract Drawings.

B. Leakage shall not exceed 0.05 US gpm/ft of wetted seal perimeter in seating head and unseating head conditions.

C. The gate shall utilize self-adjusting seals. Due to the difficulty of accessing gates when they are in service, gates that utilize adjustable wedges, wedging devices or pressure pads are not acceptable.

D. The gate's sealing system should have been tested through a cycle test in an abrasive environment and should show that the leakage requirements are still maintained after 25,000 cycles with a minimum deterioration.

E. All structural components of the frame and slide shall be fabricated of stainless steel having a minimum thickness of 1/4-inch and shall have adequate strength to prevent distortion during normal handling, during installation and while in service.

F. All welds shall be performed by welders with AWS certification.

G. Finish: Mill finish on stainless steel. Welds shall be sandblasted to remove weld burn and scale. All iron and steel components shall be properly prepared and shop coated with a primer.

H. Materials:

Component	Materials
Frame Assembly & Retainers	Stainless Steel, Type 316 L, ASTM A240
Slides & Stiffeners	Stainless Steel, Type 316 L, ASTM A240
Stem	Stainless Steel, Type 316 L, ASTM A276
Fasteners, Nuts & Bolts	Stainless Steel, Type 316 L, ASTM A276
Invert Seal (Upward Gates)	Neoprene ASTM D-2000 or EPDM
Seats/Seals & Facing	Ultra-High Molecular Weight Polyethylene ASTM D4020
Lift Nuts	Bronze ASTM B584
Pedestals & Brackets	Stainless Steel, Type 316 L, ASTM A276
Operator Housing	Cast aluminum or ductile iron

2.2 FRAME

A. The frame assembly, including the guide members, invert member and yoke members, shall be constructed of formed stainless steel plate with a minimum thickness of 1/4-inch.

1. Frame design shall allow for mounting directly to a wall with stainless steel anchor bolts and grout or mounting to a wall thimble with stainless steel mounting studs and a mastic gasket material. Mounting style shall be as shown on the Contract Drawings.
2. All wall mounted or wall thimble mounted gates shall have a flange frame. Flat frame gates are not acceptable.
3. The structural portion of the frame that incorporates the seat/seals shall be formed into a one-piece shape for rigidity. Guide members that consist of two or more bolted structural members are not acceptable. Guide member designs where water loads are transferred through the assembly bolts are specifically not acceptable.
4. Gussets shall be provided as necessary to support the guide members in an unseating head condition. The gussets shall extend to support the outer portion of the guide assembly and shall be positioned to ensure that the load is transferred to the anchor bolts or the wall thimble studs.
5. The frame shall extend to accommodate the entire height of the slide when the slide is in the fully closed or fully opened position.
6. On self-contained gates, a yoke shall be provided across the top of the frame. The yoke shall be formed by two structural members affixed to the top of the side frame members to provide a one- piece rigid assembly. The yoke shall be designed to allow removal of the slide.
7. A rigid stainless steel invert member shall be provided across the bottom of the opening. The invert member shall be of the flush bottom type.
8. A rigid stainless steel top seal member shall be provided across the top of the opening.

2.3 SLIDE

A. The slide and reinforcing stiffeners shall be constructed of stainless steel plate. All structural components shall have a minimum thickness of 1/4-inch.
   1. The slide shall not deflect more than 1/360 of the span or 1/16 inch, whichever is smaller, under the maximum design head.
   2. When the width of the gate opening multiplied by the maximum design head is 80 square feet or greater, the portion of the slide that engages the guide members shall be of a "thick edge" design. The thick edge portion of the slide that engages the guide shall have a minimum thickness of 3 inches.
   3. Reinforcing stiffeners shall be welded to the slide and mounted horizontally. Two vertical stiffeners shall be welded on the outside of the horizontal stiffeners for additional reinforcement.
   4. The stem connector shall be constructed of two angles or plates. The stem connector shall be welded to the slide. A minimum of two bolts shall connect the stem to the stem connector.

2.4 SEALS

A. All gates shall be provided with a self-adjusting seal system to restrict leakage in accordance with the requirements listed in this specification.
   1. All gates shall be equipped with UHMW polyethylene seat/seals to restrict leakage and to prevent metal to metal contact between the frame and slide.
   2. The seat/seals shall extend to accommodate the 1-1/2 x the height of the slide when the slide is in the fully closed or fully opened position.

3. All sluice gates shall be provided with a resilient seal to seal the bottom portion of the gate. The seal shall be attached to the invert member of the frame or the bottom of the slide and it shall be held in place with stainless steel attachment hardware.
4. The seal system shall be durable and shall be designed to accommodate high velocities and frequent cycling without loosening or suffering damage.
5. All seals must be bolted or otherwise mechanically fastened to the frame or slide. Arrangement with seals that are force fit and/or held in place with adhesives are unacceptable.
6. The seals shall be mounted so as not to obstruct the water way opening.
7. Gates that utilize rubber "J" seals or "P" seals are not acceptable.
8. The seal system shall have been factory tested to confirm negligible wear (less than 0.0 l") and proper sealing. The factory testing shall consist of an accelerated wear test comprised of a minimum of 25,000 open-close cycles using a well-agitated sand/water mixture to simulate fluidized grit.

2.5 STEM

A. A threaded operating stem shall be utilized to connect the operating mechanism to the slide. On rising stem gates, the threaded portion shall engage the operating nut in the manual operator or motor actuator. On non- rising stem gates, the threaded portion shall engage the nut on the slide.
1. The threaded portion of the stem shall have a minimum outside diameter of 1-1/2 inches. Stem extension pipes are not acceptable.
2. The stem shall be constructed of solid stainless steel bar for the entire length, the metal having a tensile strength of not less than 90,000 psi for stems that are 3 inches or less in diameter. Stems that are in excess of 3 inches in diameter shall have a tensile strength of 85,000 psi.
3. The stem shall be threaded to allow full travel of the slide unless the travel distance is otherwise shown on the Contract Drawings.
4. Maximum L/R ratio for the unsupported part of the stem shall not exceed 200.
5. In compression, the stem shall be designed for a critical buckling load caused by a 40 lb effort on the crank or handwheel with a safety factor of 2, using the Euler column formula.
6. The stem shall be designed to withstand the tension load caused by the application of a 40 lb effort on the crank or handwheel without exceeding 1/5 of the ultimate tensile strength of the stem material.
7. The threaded portion of the stem shall have machine rolled threads of the full Acme type with a 16-microinch finish or better. Stub threads are not acceptable.
8. Stems of more than one section shall be joined by stainless steel or bronze couplings. The coupling shall be bolted to the stems.
9. Stems, on manually operated gates, shall be provided with adjustable stop collars to prevent over closing of the slide.

2.6 STEM GUIDES

A. Stem guide shall be provided when necessary to ensure that the maximum L/R ratio for the unsupported part of the stem is 200 or less.
1. Stem guide brackets shall be fabricated of stainless steel and shall be outfitted with UHMW or bronze bushings.
2. Adjustable in two directions.

2.7 WALL THIMBLES

A. Wall thimbles shall be provided when shown on the Contract Drawings.
   1. The wall thimble depth shall be equal to the thickness of the concrete wall in which the thimble is to be mounted.
   2. Wall thimbles shall be fabricated stainless steel construction of adequate section to withstand all operational and reasonable installation stresses.
   3. Wall thimbles shall be constructed of 1/4-inch minimum thickness stainless steel and the front face shall also have a minimum thickness of 1/4-inch.
   4. The fabrication process shall ensure that the wall thimble is square and plumb and the front face is sufficiently flat to provide a proper mounting surface for the gate frame.
   5. The face of the wall thimble shall only be machined if recommended by the gate manufacturer. If the wall thimble is to be machined, the front face shall have a minimum thickness of 1/4-inch after machining.
   6. A water stop shall be welded around the periphery of the thimble. Wall thimbles shall be designed to allow thorough and uniform concrete placement during installation.
   7. Studs and nuts shall be stainless steel.
   8. A suitable gasket or mastic shall be provided to seal between the gate frame and the wall thimble.

2.8 MANUAL OPERATORS

A. Gates shall be operated by a manual handwheel or a manual crank-operated gearbox (see schedule). The operator shall be mounted on the yoke of self-contained gates or on the pedestal of non-self-contained gates.
   1. The gate manufacturer shall select the proper gear ratio to ensure that the gate can be operated with no more than a 40 lb effort when the gate is in the closed position and experiencing the maximum operating head.
   2. An arrow with the word "OPEN" shall be permanently attached or cast onto the operator to indicate the direction or rotation to open the gate.
   3. Handwheel operators shall be fully enclosed and shall have a cast aluminum housing.
      a. Handwheel operators shall be provided with a threaded cast bronze lift nut to engage the operating stem.
      b. Handwheel operators shall be equipped with roller bearings above and below the operating nut.
      c. Positive mechanical seals shall be provided above and below the operating nut to exclude moisture and dirt and prevent leakage of lubricant out of the hoist.
      d. The handwheel shall be removable and shall have a minimum diameter of 15 inches.
   4. Crank-operated gearboxes shall be fully enclosed and shall have a cast aluminum or ductile iron housing,
      a. Gearboxes shall have either single or double gear reduction depending upon the lifting capacity required.
      b. Gearboxes shall be provided with a threaded cast bronze lift nut to engage the operating stem.
      c. Bearings shall be provided above and below the flange on the operating nut to support both opening and closing thrusts.

d. Gears shall be steel with machined cut teeth designed for smooth operation.
e. The pinion shaft shall be stainless steel and shall be supported on ball or tapered roller bearings.
f. Positive mechanical seals shall be provided on the operating nut and the pinion shafts to exclude moisture and dirt and prevent leakage of lubricant out of the hoist.
g. The crank shall be cast aluminum or cast iron with a revolving nylon grip.
h. The crank shall be removable.

5. An extended operator system utilizing chain and sprockets shall be furnished by the manufacturer when the centerline of the crank or handwheel, on a non-geared operator, is located over 48-in above the operating floor. Chain wheels are not acceptable.
   a. A removable stainless steel or aluminum cover shall be provided to enclose chain and sprockets.
   b. The extended operator system shall lower the centerline of the pinion shaft to 36-in above the operating floor.
   c. A handwheel may be utilized in conjunction with a gearbox in lieu of the extended operator system if the centerline of the pinion shaft is 60-in or less above the operating floor.
6. Pedestals shall be constructed of stainless steel. Aluminum pedestals are not acceptable.
   a. The pedestal height shall be such that the handwheel or pinion shaft on the crank-operated gearbox is located approximately 36-in above the operating floor.
   b. Wall brackets shall be used to support floor stands where shown on the Drawings and shall be constructed of stainless steel.
   c. Wall brackets shall be reinforced to withstand in compression at least two times the rated output of the operator with a 40 lb effort on the crank or handwheel.
   d. The design and detail of the brackets and anchor bolts shall be provided by the gate manufacturer and shall be approved by the ENGINEER. The gate manufacturer shall supply the bracket, anchor bolts and accessories as part of the gate assembly.
7. Operators shall be equipped with fracture-resistant clear butyrate or lexan plastic stem covers.
   a. The top of the stem cover shall be closed.
   b. The bottom end of the stem cover shall be mounted in a housing or adapter for easy field mounting.
   c. Stem covers shall be complete with indicator markings to indicate gate position.
8. When shown on the Contract Drawings, provide 2 inch square nut, mounted in a floor box, with a non-rising stem.
   a. The square nut shall be constructed of bronze.
   b. The floor box shall be constructed of stainless steel or cast iron and shall be set in the concrete floor above the gate as shown.
   c. Provide one aluminum or stainless steel T-handle wrench for operation.

2.9 ELECTRIC MOTOR ACTUATORS

A. General: The electric actuator shall be of the top mounted configuration and shall include (as one integral unit) but not limited to, the electric motor, reduction gearing, drive bushing or top entry stem nut, torque switches, position limit switches, gear case and auxiliary handwheel. The electric actuator shall be Factory Mutual approved for hazardous locations. The actuator shall be EIM Series 2000.

1. Gears: Reduction shall be accomplished by means of a two stage gear train consisting of first stage spur of helical and second stage of self-locking worm and worm gear. Gear housing shall be ductile iron. Spur gears and worms shall be steel. Worm gear shall be bronze. Non-metallic gears in power train are not acceptable.
2. Hammer Blow: When required by the unseating application, a lost motion device (independent of gear backlash) shall be supplied integral in the actuator gear train. This device shall allow the motor to attain full speed before the load is encountered.
3. Bearings: All gears and shafting shall be supported on unit-friction bearings. Where thrust is a consideration, tapered roller bearings (to accept thrust) shall be provided.
4. Lubrication: All gearing and bearings shall be grease or oil lubricated. Seals shall be provided at all exit points of the gear case to prevent leakage of lubricant. Critical area subject to high wear shall be double sealed. Lubricants shall be suitable for year-round service based on ambient temperature conditions. Special attention should be paid to environments with temperatures below 0 F.
5. Handwheel: The actuator shall be equipped with a handwheel for manual operation, so connected that operation by the motor shall not cause the handwheel to rotate. Should power be returned to the motor while the handwheel is in use, the design of the unit shall prevent transmission of the motor torque to the handwheel. Use of the handwheel shall not negate the hammer-blow feature. The handwheel shall require an effort of no more than 80 pounds on the rim for seating or unseating load, or 60 pounds for running load. The handwheel shall have an arrow and the word "Open" indicating required rotation. The handwheel shall operate in the clockwise direction to close. External declutch lever will be padlockable in either the manual (handwheel) or motor mode.
6. Motor: Electric motors shall be specially designed for valve actuator service, and shall be totally enclosed nonventilated. As a minimum, the electric motor enclosure shall meet NEMA 4 weatherproof construction. When specified, motor enclosure(s) shall be available to meet submersible NEMA 6 or NEMA 7 explosion proof Class 1, Group D, Div. 1 or 2 requirements. Motors shall be capable of operating through one complete cycle, open-close-open or under the maximum specified operating conditions when voltage to the motor is + or - 10 percent of the specified voltage. Motors shall have a Class F insulation with Class B temperature rise. Overload protection shall be by means of inherent motor thermal sensors embedded in the windings.
7. Limit Switches: Open and close limit switches shall be geared to the drive mechanism and in step at all times, whether the unit is operated electrically or manually. The switches shall be of the rotary drum wiping action contact type, field adjustable, and capable of being set either fully open, fully closed, or at any intermediate point. Limit switch contacts shall be solid silver and have a minimum rating of 10 amps (break) inductive at 120 VA-c. Limit switch gearing shall be grease lubricated. The drive mechanism shall be totally enclosed to prevent

entrance of foreign matter. Gears shall be steel. Use of cams or set screws in securing switches or the drive system is unacceptable.

8. Torque Switches: The actuator shall include an adjustable torque (and thrust where applicable) limiting switch arrangement to break the control power circuit when:
9. The valve has reached the stops in the open or close position.
10. An obstruction has been encountered in either direction of travel. Open and close torque switches shall be adjustable by means of individually calibrated dials (marked open and close).
11. Electrical Controls Enclosures (Switch Compartment): Terminal strips, space heater, limit and torque switches, as well as optional electrical accessories, shall be prewired and supplied in a modular form (modular control package-MCP), housed in a single switch compartment meeting NEMA 4 weatherproof construction. Enclosures shall be flange to flange with 0-ring seal and hinged. Cover bolting shall be stainless steel and captive.
12. Stem Coupling: For applications which require coupling to a shaft and key, a steel drive bushing properly bored and keyed shall be supplied. Stem coupling for threaded stem applications shall be accomplished by means of a high tensile, bronze alloy stem nut. The nut shall of the top entry 2-piece design, permitting installation and removal without disassembly of the actuator or disconnecting the electrical wiring conduit.
13. Position Indication: Position indication shall be accomplished by means of an indicator dial in full step at all times with valve travel, whether in power or manual operation. The indicator dial shall be graduated in 25 percent increments as a minimum; closed, quarter open, half open, three-quarter open, and open.
14. Stem Protectors: Stem protectors for rising threaded stem applications shall be supplied by the gate manufacturer or contractor in suitable length and diameter to allow for full extension of the stem. Stem covers shall couple to the top of the actuator by means of a national pipe thread NPT and shall be capped to prevent the entrance of foreign matter and precipitation.
15. Electrical Controls: Electrical controls, shall be pre-mounted and wired as part of the Modular Control Package (MCP), and shall include but not be limited to reversing contactor, control power transformer, open-stop-close push buttons, and position indication light(s) (for open-close and throttling service), control power transformer, open-stop-close push buttons, indicating light(s), feedback potentiometer, and local-off-remote selector switch:
    a. Reversing Contactor: Control voltage shall be 120 volts, single phase, 60 Hz. Seal-in latching contacts shall be supplied for use in the push button circuits. When specified, additional auxiliary contacts (1 N.O. and 1 N.C.) shall be supplied. Starter shall be both electrically and mechanically interlocked.
    b. Control Power Transformer. Transformer shall be designed to transform 230 or 460 volts, three phase, 60Hz power to 120 volts, single phase. The transformer shall be complete with a grounded and fused secondary.
    c. Push Buttons: Each actuator shall be supplied complete with open-stop-close push buttons. Push buttons shall be furnished integral. As a minimum , the remote enclosure shall meet NEMA 4 weatherproof construction. When specified, the remote enclosures shall be available to meet submersible or NEMA 7 explosion-proof requirements.
    d. Indication Light(s): Each actuator shall be furnished complete with open-close light indication for valve position. Lenses shall be red for open and

green for close. Both lamps shall be lit during intermediate travel. Light(s) shall be mounted integral or in the separate remote push button enclosure when specified.

e. Reversing Contactor: Seal-in latching contacts shall not be supplied for the selector switch remote position.

f. Feedback Potentiometer: Feedback potentiometer shall be specifically selected for compatibility with the position comparator circuit supplied. The potentiometer shall be mechanically connected to the valve stem and in step at all times whether the unit is being operated electrically or by handwheel.

g. Selector Switch: A local-off-remote selector switch ftmction shall be supplied to isolate the incoming process signal control ftmction from the manual push button controls. The selector switch shall be padlockable in all three positions.

h. Position Comparator Circuit: The position comparator circuit shall be of solid state printed circuit board design and shall include (but not limited to) a zero, span and deadband adjustment. LED lamps shall be furnished for indication of control status. Positioning of the valve should be accomplished by comparing the input from the feedback potentiometer with an incoming process control signal. Process control signal shall be 4-20 MA or as specified by the purchaser.

i. All integral electrical components shall be shop-wired to a terminal strip(s) to facilitate a minimum of field wiring at the time of installation.

j. Position Transmitter: A position potentiometer (independent of feedback potentiometer in the case of modulating service) shall be supplied when continuous valve position signal is required. It shall be mechanically connected to the valve stem and in step at all times whether the unit is being electrically or handwheel operated.

2.10 ANCHOR BOLTS

A. Anchor bolts shall be provided by the gate manufacturer for mounting the gates and appurtenances.
   1. Quantity and location shall be determined by the gate manufacturer.
   2. If epoxy type anchor bolts are provided, the gate manufacturer shall provide the studs and nuts.
   3. Anchor bolts shall have a minimum diameter of 1/2-inch.

B. Anchor bolt installation shall be coordinated and supervised by Prime Contractor and checked for proper installation per manufacturer's recommendations.

2.11 GATE SCHEDULES

A. See Drawings for Gate Schedules.

PART 3 EXECUTION

3.1 INSTALLATION

A. Installation of the sluice gates and appurtenances shall be done in a workmanlike manner. It shall be the responsibility of the Contractor to handle, store and install the equipment specified in this Section in strict accordance with the manufacturer's recommendations.

B. The Contractor shall review the installation drawings and installation instruction prior to installing the gates.

C. The sluice gate assemblies shall be installed in a true vertical plane, square and plumb.

D. The Contractor shall fill the void in between the gate frame and the wall with non-shrink grout as shown on the installation drawing and in accordance with the manufacturer's recommendations.

E. The Contractor shall add a mastic gasket between the gate frame and wall thimble (when applicable) in accordance with the manufacturer's recommendations.

3.2 FIELD TESTING

A. After installation, all gates shall be field tested in the presence of the Engineer and Owner to ensure that all items of equipment are in full compliance with this Section. Each gate shall be operated through at least two complete open/close/open cycles to confirm that they operate without binding, scraping, or distorting. The effort to open and close manual operators shall be measured, and shall not exceed the maximum operating effort specified above. Electric motor actuators shall function smoothly and without interruption. Each gate shall be water tested by the Contractor, at the discretion of the Engineer and Owner, to confirm that leakage does not exceed the specified allowable leakage. This service shall take place after all mechanical equipment associated with the control system is installed and mechanically operable.

3.3 SITE VISIT, TRAINING, AND O&M MANUALS

A. Manufacturer's qualified representative shall make visits to the site at designed periods of time to ascertain the correct installation of the gates.

B. After equipment is fully operational, and before Owner will assume responsibility for the operation of the gate, the gate manufacturer's representative shall instruct the Owner's operating personnel in the care, maintenance and proper operation of the gate at no additional cost to the Owner.

C. Six sets of O & M Manuals shall be provided.

END OF SECTION

SECTION 40_05_61

KNIFE GATE VALVES

PART 1 GENERAL

1.1 SUMMARY

A. This specification covers the work necessary to furnish and install the various knife gate valves as specified herein and as shown on the plans

B. To obtain standardization of performance, operation, spare parts, maintenance, and Manufacturer's service, it is the intent of these specifications that all valves of like type and be furnished by a single Manufacturer, DeZurik Series "L" Knife Gates, or equal.

C. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 DELIVERY, STORAGE & HANDLING

A. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address. Packing list shall be provided with equipment at time of delivery.

B. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

C. Any pumps, cables, or electrical equipment shall be kept thoroughly dry at all times, shall be stored indoors, and protected from freezing conditions. Equipment shall not be stored directly on the ground. Equipment storage shall be protected and maintained in accordance with the manufacturer's recommendations. Equipment is in storage when:
1. It has been delivered to the jobsite and is awaiting installation.
2. It has been installed, but operation is delayed pending completion of the project.
3. There has been long period between operation cycles (30 days or more).

D. Improper storage could result in product failure or restoration not covered by warranty. Contractor shall be solely responsible for any damage to equipment during storage as described above. If Contractor fails to store as required by manufacturer and supplier, and the warranty is voided due to such failure, equipment is automatically rejected by Owner/Engineer. Payment made to the Contractor under Stored Materials will be deducted from next monthly payment to the Contractor. New equipment shall be ordered and paid for by the Contractor for the project and at no cost to the Owner.

1.5 QUALITY ASSURANCE

A. The valves furnished under this contract shall be as manufactured by DeZurik or equal.

B. Manufacturers regularly engaged in the manufacture of the type of equipment specified and can demonstrate equipment of their manufacture in actual service for a period of not less than 15 years will be considered as acceptable Manufacturer if able to comply with the specifications.

C. The valve Manufacturer shall submit to the Contractor certified copies of factory test results for each system valve size. Test results shall be submitted prior to shipment upon Engineer's request and shall show compliance with specified performance requirements.

PART 2 PRODUCTS

2.1 MATERIALS

A. Valves shall be of the bonnetless knife gate type with wafer face-to-face flanged connections. Raised face flange shall be drilled to ANSI 125/150 pound standard. C.W.P. valve rating shall be 150 psi in sizes 2"-24" and 125 psi in sizes 30" and 36".

B. Valves shall be resilient seated.

C. Valve bodies shall be furnished with all wetted parts of Type 316 stainless steel. Valve body style shall be wafer, and end style code ANSI.

D. Valve packing shall be multiple layers of square, braided flax.

E. All sides of the gate shall be finish ground.

F. The stem shall be Type 316 stainless steel.

G. The valve superstructure shall be fabricated carbon steel.

H. The yoke sleeve shall be bronze. The valve body shall incorporate guides (on sizes 6" and larger) and jams to assist the seating. Valves shall have a raised face seat with a relieved area around the seat to prevent jamming.

I. Resilient seated valves shall have a seat ring with a molded resilient insert to the body and gate sides for installations where drip-tight shutoff is required. Resilient seat material shall be RS66.

J. Valves 14" and larger shall be equipped with bevel gear actuators.

PART 3 EXECUTION

3.1 INSTALLATION

A. The Contractor shall assume full responsibility for coordination of the entire project, including verification that all structures, piping, coating systems and equipment components are compatible. The Contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal of Manufacturer's shop and installation drawings, test result certificates or other data as required and specified herein.

C. Installation of equipment shall be in full conformance with the Manufacturer's shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between Manufacturer's instruction and the contract documents, the Contractor shall follow the Engineer's decision at no additional cost to the Owner.

3.2 WORKMANSHIP

A. The Contractor shall install equipment and materials in a workmanlike manner utilizing craftsmen skilled in the particular trade. The finished installation shall portrait a neat and plumb appearance.

B. Before installation, carefully clean valves of all foreign material, adjust stuffing boxes, and inspect valves in the OPEN and CLOSED positions. Install valves in accordance with the applicable portions of the Specifications. Unless otherwise indicated, install valves with the shaft vertical. Valves provided with chainwheel manual operators are to be installed with the shaft vertical, and the manual operator located below the piping. This should provide the operator with a clear view of the visual position indicator. Mount horizontal valves in such a manner that adequate clearance is provided for operation. Installation practices shall conform to Manufacturer's recommendations.

C. Prior to installing valves, the mating flange faces shall be thoroughly cleaned. After cleaning, insert the flange seals and valves and tighten the flange bolting progressively and in a uniform manner. Flanges should be pulled down tight against the valve I flange seals evenly. If flanges leak under pressure, loosen the bolting, reseat or replace the flange seals, re-tighten the bolting, and retest the connection. Flanged joints must be watertight at test pressures before acceptance.

3.3 MANUFACTURER'S SERVICES

A. Provide the services of a Representative of the Manufacturer of the valves to assist in adjusting and testing the equipment, to supervise initial operation, and to assist in making final adjustments and the tests specified, or which may be necessary to assure the Engineer the equipment is in satisfactory operating condition, and shall be done at no additional cost to the Owner.

END OF SECTION

SECTION 40_05_62.64

BUTTERFLY & PLUG VALVES

PART 1 GENERAL

1.1 SUMMARY

A. This specification covers the work necessary to furnish and install butterfly and eccentric plug valves as specified herein and as shown on the plans.

B. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 DELIVERY, STORAGE & HANDLING

A. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address. Packing list shall be provided with equipment at time of delivery.

B. Electrical equipment shall be kept thoroughly dry at all times and stored indoors. Equipment storage shall be protected and maintained in accordance with the Manufacturer's recommendations. Equipment shall not be stored directly on the ground.

C. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

1.5 QUALITY ASSURANCE

A. The valves furnished under this contract shall be as manufactured by DeZurik or approved equal.

B. Manufacturers regularly engaged in the manufacture of the type of equipment specified and can demonstrate equipment of their manufacture in actual service for a period of not less than 15 years will be considered as acceptable Manufacturer if able to comply with the specifications.

C. The valve manufacturer shall submit to the Contractor certified copies of factory test results for each system valve size. Test results shall be submitted prior to shipment and shall show compliance with specified performance requirements.

D. Unless otherwise specified, exterior and interior metallic surfaces of each valve shall be shop painted per the latest revision of industry standard AWWA C504.

PART 2 PRODUCTS

2.1 MATERIALS – BUTTERFLY VALVES

A. Body – Cast iron

B. Packing: Acrylonitrile-Butadiene or PTFE

C. Seat: Acrylonitrile-Butadiene or Ethylene Propylene Diene Monomer (EPDM)

D. Disc: Cast Iron with 316 Stainless Steel edge

E. Bearings: Non-metallic, self-lubricating

F. Shaft: 304 Stainless Steel

2.2 COMPONENTS – BUTTERFLY VALVES

A. Valves shall be flanged style or mechanical joint with manual or electric operators. Valves installed in overhead piping shall utilize chain-wheel manual operators and be provided with a sufficient amount of chain to reach within four (4) feet of the floor. Valves shall have materials of construction as outlined above.

B. The disc shall be securely attached to the shaft with a 304 Stainless Steel torque screw or tangential pin locked in place with a set screw.

C. Shaft seals shall be self-compensating V-type packing with a minimum of four (4) sealing rings. One-piece molded shaft seals and O-ring shaft seals are not acceptable.

D. The valve seat shall be of Acrylonitrile-Butadiene for water service and EPDM for high-temperature air service. Seat shall be molded in and vulcanized to the valve body. The seat shall contain an integral shaft seal protecting the valve bearings and packing from any pipe line debris. Seats vulcanized to cartridge inserts or seats on the valve disc edge are not acceptable.

2.3 MANUAL OPERATORS

A. Manual operators shall be of a traveling nut style designed and tested per the requirements of AWWA C504. Housings shall be cast iron and shall be available in both weatherproof and buried constructions. All units shall have adjustable OPEN and CLOSED position stops. Manual operator input device (hand-wheel, chain-wheel, 2" AWWA square nut) shall be provided as noted on the plans or as dictated by industry standard practices.

2.4 COMPONENTS – PLUG VALVES

A. The plug valve shall be furnished with end connections as shown on the plans. Flanged ends shall be faced and drilled to the ANSI 125/150 lb. standard. Mechanical joint ends shall be to the AWWA standard C111-64.

B. Valve bodies shall be of ASTM A126 Class B cast iron in compliance with AWWA C504, Section 2.2. Bodies in 4" and larger plug valves shall be furnished with a raised welded-in overlay, cylindrical shaped seat of not less than 90% pure nickel in accordance with AWWA C507, Section 7.2. Seat area shall be raised, with raised surface completely covered with weld to insure that the plug face contacts only nickel. Valves utilizing resilient seat attached to the body shall be not acceptable. As per AWWA C504-80, Section 3.5.2 and AWWA C507-73, Section 7.2, sprayed or plated seats are not acceptable nor shall screwed-in seats be acceptable.

C. The plugs shall be of ASTM A126 Class B cast iron in compliance with AWWA C504, Section 2.2. The plug shall be of one piece construction and shall be capable of withstanding the full pressure rating of the valve without the use of additional structural reinforcing ribs that extend beyond the profile of the plug itself. Plugs with cast inlays shall not be acceptable.

D. Upper and lower journal bearings shall be sleeve type metal bearings conforming to AWWA C504-80, Section 316 and AWWA C507-73, Section 8. Journal bearing shall be of sundered, oil impregnated and permanently lubricated Type 316 ASTM A743 Grade CF-8M or AISI Type 317L stainless steel in ½" -36" plug valve sizes. In plug valves larger than 36", the upper and lower plug journals shall be fitted with ASTM A240 Type 316 stainless steel sleeves with bearings of ASTM B30, Alloy C95400 aluminum bronze. Thrust bearing shall be of Teflon. Non-metallic journal bearings shall not be acceptable.

E. Plug valve shaft seals shall be of the multiple V-ring type and shall be externally adjustable, re-packable without removing the bonnet or actuator from the valve, and re-packable under pressure. Shaft seals shall be Buna-V. Shaft seals shall conform with AWWA C504-80, Section 3.7 and AWWA C507-73, Section 10.2. Valves utilizing O-ring seals or non-adjustable packing shall not be acceptable. All exposed nuts, bolts, springs, washers, etc., shall be stainless steel for buried or submerged valves and zinc plated for all others.

F. Valve pressure ratings shall be 175 psi for ½" through 12" and 150 psi for 14" through 72".

G. Manual valves shall have lever or worm gear actuators with hand-wheels, chain-wheels, tee wrenches, extension stems, floor-stands, etc., as shown on the plans or as called for in the valve schedule. Worm gear actuators shall be furnished for all valves 4" or larger where the maximum reverse shutoff pressure is greater than 25 psi as indicated on the plans or in a valve schedule. Worm gear actuators shall be sized for pressure as indicated on the plans. All gearing shall be enclosed in a semi-steel housing and be suitable for running in a lubricant with seals provided on all shafts to prevent entry of dirt and water into the actuator. The actuator shaft and the quadrant shall be supported on permanently lubricated bronze bearings. Actuators shall clearly indicate valve position and an adjustable stop shall be provided to set closing torque. This adjustable stop shall be the only adjustment necessary to set the clearance between the valve plug and the seat while the valve is in line and under pressure. Hand-wheel and chain-wheel sizes for worm gear actuators shall be no smaller than 6" in diameter and no larger than twice the diameter of the actuator's gear sector. All exposed nuts, bolts, and washers shall be zinc plated.

H. Valves and gear actuators for buried or submerged service shall have seals on all shafts and gaskets on the valve and actuator covers to prevent the entry of water. Actuator mounting brackets for buried or submerged service shall be totally enclosed and shall have gasket seals. All exposed nuts, bolts, springs, and washers shall be stainless steel. Furnish adjustable valve boxes, and extension stems to within 12 inches of ground surface.

PART 3 EXECUTION

3.1 INSTALLATION

A. The Contractor shall assume full responsibility for coordination of the entire project, including verification that all structures, piping, coating systems and equipment components are compatible. The Contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal of Manufacturer's shop and installation drawings, test result certificates or other data as required and specified herein.

C. Installation of equipment shall be in full conformance with the Manufacturer's shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between Manufacturer's instruction and the contract documents, the Contractor shall follow the Engineer's decision at no additional cost to the Owner.

3.2 WORKMANSHIP

A. The Contractor shall install equipment and materials in a workmanlike manner utilizing craftsmen skilled in the particular trade. The finished installation shall portrait a neat and plumb appearance.

B. Before installation, carefully clean valves of all foreign material, adjust stuffing boxes, and inspect valves in the OPEN and CLOSED positions. Install valves in accordance with the applicable portions of the Specifications. Unless otherwise indicated, install valves with the

shaft vertical. Valves provided with chain-wheel manual operators are to be installed with the shaft vertical, and the manual operator located below the piping. This should provide the operator with a clear view of the visual position indicator. Mount horizontal valves in such a manner that adequate clearance is provided for operation. Installation practices shall conform to Manufacturer's recommendations.

C. Prior to installing valves, the mating flange faces shall be thoroughly cleaned. After cleaning, insert the flange seals and valves and tighten the flange bolting progressively and in a uniform manner. Flanges should be pulled down tight against the valve / flange seals evenly. If flanges leak under pressure, loosen the bolting, reseat or replace the flange seals, re-tighten the bolting, and retest the connection. Flanged joints must be watertight at test pressures before acceptance.

3.3 MANUFACTURER'S SERVICES

A. Provide the services of a Representative of the Manufacturer of the valves to assist in adjusting and testing the equipment, to supervise initial operation, and to assist in making final adjustments and the tests specified, or which may be necessary to assure the Engineer the equipment is in satisfactory operating condition.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 40_05_65.23

SWING CHECK VALVES

PART 1 GENERAL

1.1 SUMMARY

A. This specification section covers the work necessary to furnish all labor, materials equipment and incidentals required to provide valves complete and operational with all appurtenances as specified herein and/or as shown on the plans. The equipment to be provided shall include, but not be limited to the following items: swing check valves with lever & weight/spring or air-cushion cylinders.

B. A single coordinating supplier will be responsible for furnishing the valves. The coordinating supplier shall be a manufacturer or supplier who is regularly engaged in the business. The coordinating supplier will prepare data required for complete description. The manufacturer will verify each valve is compatible with other components and all pipe materials and sizes are appropriate and all devices necessary for a proper functioning system have been provided. System supplier will furnish all equipment as a complete, integrated package, with a single responsibility for proper function.

C. The single supplier shall provide spare parts, maintenance and manufacturer's service a specified herein.

D. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 DELIVERY, STORAGE AND HANDLING

A. Individual components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address. Packing list shall be provided with equipment at time of delivery.

B. Electrical equipment and equipment to be installed inside shall be kept thoroughly dry at all times and shall be stored indoors and protected from freezing conditions. Equipment storage shall be protected and maintained in accordance with the manufacturer's recommendations. Equipment shall not be stored directly on the ground.

C. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transportation, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

1.5 QUALITY ASSURANCE

A. The valves shall comply with applicable provisions and recommendations for recognized standards, except as otherwise shown or specified.

B. Valves shall be Series 250 swing check with ANSI 125/150# class flanges, as manufactured by DeZURIK.

C. All valves shall be hydrostatically tested and seat tested to demonstrate zero leakage. When requested, the Manufacturer shall provide test certification and required documentation. The valve coating system shall be NSF61 approved.

1.6 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.
   1. ASTM A126 Standard Specification for Gray Iron Castings for Valves, Flanges,
   2. and Pipe Fittings
   3. ASTM A536 Standard Specification for Ductile Iron Castings
   4. ASTM A276 Standard Specifications for Stainless Steel Bars
   5. ASTM A582 T303 Standard Specification for Free-Machining Stainless Steel Bars
   6. AWWA 508 Swing-Check Valves for Waterworks Service, 2- through 24-inch NPS

PART 2 PRODUCTS

2.1 COMPONENTS

A. Swing check valves shall be constructed of heavy duty ductile iron body with a stainless steel body seat ring and single continuous stainless steel shaft for attachment of outside weight and lever or a totally enclosed air cushion cylinder.

B. The valve shall prevent the return of water or sewage back through the valve on pump shut off or power failure and be tight seating. The seat ring must be renewable and securely held in place by stainless steel screws.

C. If utilized, the cushion cylinder assembly shall be externally attached to the side of the valve body. The cylinder piston rod is connected to the external lever arm in a manner to lift the piston upwards when flow starts, and downwards when the flow stops to compress the entrapped air in the cylinder for cushion closing. The cushion cylinder shall be fitted with an adjustable control valve to increase or decrease air compression in the cylinder.

D. The valve disc shall be ductile iron suspended from a stainless steel shaft which shall pass through a stuffing box and be connected to the cushion cylinder on the outside of the valve.

E. The valve shall be guaranteed for a period of one year against failure to operate due to faulty workmanship or defective material, and shall meet or exceed AWWA C-508.

F. Valves materials of construction:

Body:	Ductile iron ASTM A536 GR.65-45-12
Cover:	Ductile iron ASTM A536 GR.65-45-12
Pivot Shaft:	Stainless steel T303
Disc Arm:	Ductile iron ASTM A536 GR.65-45-12
Disc:	Ductile iron ASTM A536 GR.65-45-12
Disc Seat:	Buna-N
Pivot Shaft Bushing:	Stainless steel T304
Body Seat Ring:	Stainless steel T304
Air Cylinder:	Aluminum alloy
Disc Nut:	Stainless steel T304
Counter Weight Arm:	Ductile iron ASTM A536 GR.65-45-12
Counter Weight:	Ductile iron ASTM A536 GR.65-45-12

PART 3 EXECUTION

3.1 GENERAL

A. The General Contractor shall assume full responsibility for coordination of the entire project, including verification all structures, piping, coating systems and equipment components are compatible. The General Contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal or manufacturer's shop and installation drawings, test results or other data as specified herein.

C. Installation of equipment shall be in full conformance with the manufacturer's shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between manufacturer's instructions and the contract documents, the contractor shall follow the Engineer's decision at no additional cost to the Owner.

3.2 WORKMANSHIP

A. Handle carefully and protect the equipment and appurtenances to avoid damage.

B. The equipment shall be safely installed in accordance with the manufacturer's instructions. All plumbing and electrical shall be in accordance with state and federal codes to ensure proper operation.

C. Any evidence of improper installation shall be corrected by the Contractor. Care during storage, installation and start-up shall be in strict accordance with manufacturer's recommendations.

3.3 MANUFACTURER'S SERVICES

A. The Contractor shall require the manufacturer to furnish the services of a qualified field Engineer to perform the following functions in the designed periods of time. These services are to be performed at the jobsite.
   1. Check-out of installation, start-up of equipment and initial operator instruction. This service shall take place after all mechanical equipment associated with the chemical storage and feed system is installed and mechanically operable. After equipment is fully operational, and before Owner will assume responsibility for the operation of the equipment, the equipment manufacturer's operation specialists shall instruct the Owner's operating personnel in the care, maintenance and proper operation of the equipment.

B. Instructions for installation of the equipment system and related appurtenances shall be written and furnished by the manufacturer.

C. Operation and Maintenance
   1. The manufacturer shall be responsible for supplying written instruction, which shall be sufficiently comprehensive to enable the operator to operate and maintain all valves supplied by the manufacturer. Instructions shall assume the operator is familiar with furnished equipment, but he/she has not previously operated and/or maintained the exact equipment supplied.
   2. The instruction shall be prepared as a manual applicable solely to the equipment supplied by the manufacturer, and shall include those devices and equipment supplied by him.
   3. Operation and maintenance instruction shall be specific to the equipment supplied in accordance with these Specifications.

D. Manufacturer's Cost

1. All costs for the above manufacturer's functions including travel, lodging, meals and incidentals shall be considered to have been included in the contract bid price.

3.4 INSTALLATION

A. Install per valve manufacture’s recommendations.

B. Carefully handle and lower the valves into position so to prevent damage to any part of the valves.

3.5 ADJUST

A. Adjust weight position and air cushion operation in accordance with manufacturer recommendations.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 40_05_66.23

SURGE RELIEF ANGLE VALVES

PART 1 GENERAL

1.1 SUMMARY

A. This specification covers the work necessary to furnish and install surge relief angle valves as specified herein and as shown on the plans.

B. All valves shall be APCO model SRA-3000A Surge Relief Angle Valves as manufactured by DeZurik.

C. A single coordinating supplier will be responsible for furnishing the valves. The coordinating supplier shall be a manufacturer or supplier who is regularly engaged in the business. The coordinating supplier will prepare data required for complete description. The manufacturer will verify each valve is compatible with other components and all pipe materials and sizes are appropriate and all devices necessary for a proper functioning system have been provided. System supplier will furnish all equipment as a complete, integrated package, with a single responsibility for proper function.

D. The single supplier shall provide spare parts, maintenance and manufacturer's service a specified herein.

E. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 DELIVERY, STORAGE & HANDLING

A. Individual components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address. Packing list shall be provided with equipment at time of delivery.

B. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transportation, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

1.5 QUALITY ASSURANCE

PART 2 PRODUCTS

A. Surge Relief Angle Valves shall be normally closed against the system pressure by external spring(s) in compression and shall open quickly to relieve pressure when the system pressure exceeds the pressure relief setting. The pressure relief setting shall be factory set and field adjustable by adjusting the spring compression. The valve will begin to close when the system pressure subsides below the pressure relief setting.

B. The closing speed shall be adjustable to suit the application by means of infinitely adjustable, lockable flow control valve.

C. Body shall be a 90 degree elbow design conforming to the center-to-face dimension for long-radius elbows per ASME 816.1 and ASME 816.42. Valve shall be a compact design to fit in tight installation spaces.

D. Body and cover shall be constructed of ASTM A536 Grade 65-45-12 ductile iron. Body Seat shall be 316 stainless steel. Flanges shall be flat faced and conform to ASME 816.42 Class 150. Valve shall be proof-of-design tested to 5,000 cycles.

E. A self-contained, sealed hydraulic system shall provide closing speed control. The valve cover shall provide an air gap between the line fluid and the hydraulic oil that will indicate seal wear and prevent contamination of line fluid or hydraulic oil. The valve shall be capable of being mounted in any position without modification or customization of the hydraulic system components. A mechanical stroke counter with manual reset shall provide local indication of total valve cycles.

F. External sprinq(s) located on the valve cover in a protective steel enclosure shall provide closing force. Springs shall be sized to optimally match customer-specified relief pressure

setting to minimize pressure rise above the set-point in order to fully open valve. A single adjustment screw shall be provided for field adjustment of relief pressure setting.

G. Valve Disc shall have a replaceable seat ring of Acrylonitrile-Butadiene (NBR); Terpolymer of Ethylene, Propylene and A Diene (EPDM) or Fluoro Rubber (FKM) for tight shutoff.

PART 3 EXECUTION

3.1 GENERAL

A. The General Contractor shall assume full responsibility for coordination of the entire project, including verification all structures, piping, coating systems and equipment components are compatible. The General Contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal or manufacturer's shop and installation drawings, test results or other data as specified herein.

C. Installation of equipment shall be in full conformance with the manufacturer's shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between manufacturer's instructions and the contract documents, the contractor shall follow the Engineer's decision at no additional cost to the Owner.

3.2 INSTALLATION

A. The Contractor shall assume full responsibility for coordination of the entire project, including verification that all structures, piping, coating systems and equipment components are compatible. The Contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal of Manufacturer's shop and installation drawings, test result certificates or other data as required and specified herein.

C. Installation of equipment shall be in full conformance with the Manufacturer's shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between Manufacturer's instruction and the contract documents, the Contractor shall follow the Engineer's decision at no additional cost to the Owner.

3.3 WORKMANSHIP

A. Handle carefully and protect the equipment and appurtenances to avoid damage.

B. The equipment shall be safely installed in accordance with the manufacturer's instructions. All plumbing and electrical shall be in accordance with state and federal codes to ensure proper operation.

C. Any evidence of improper installation shall be corrected by the Contractor. Care during storage, installation and start-up shall be in strict accordance with manufacturer's recommendations.

D. The Contractor shall install equipment and materials in a workmanlike manner utilizing craftsmen skilled in the particular trade. The finished installation shall portrait a neat and plumb appearance.

E. Before installation, carefully clean valves of all foreign material, adjust stuffing boxes, and inspect valves in the OPEN and CLOSED positions. Install valves in accordance with the applicable portions of the Specifications. Unless otherwise indicated, install valves with the shaft vertical. Valves provided with chain-wheel manual operators are to be installed with the shaft vertical, and the manual operator located below the piping. This should provide the operator with a clear view of the visual position indicator. Mount horizontal valves in such a manner that adequate clearance is provided for operation. Installation practices shall conform to Manufacturer's recommendations.

F. Prior to installing valves, the mating flange faces shall be thoroughly cleaned. After cleaning, insert the flange seals and valves and tighten the flange bolting progressively and in a uniform manner. Flanges should be pulled down tight against the valve / flange seals evenly. If flanges leak under pressure, loosen the bolting, reseat or replace the flange seals, re-tighten the bolting, and retest the connection. Flanged joints must be watertight at test pressures before acceptance.

3.4 MANUFACTURER'S SERVICES

A. The Contractor shall require the manufacturer to furnish the services of a qualified field Engineer to perform the following functions in the designed periods of time. These services are to be performed at the jobsite.
   1. Check-out of installation, start-up of equipment and initial operator instruction. This service shall take place after all mechanical equipment associated with the chemical storage and feed system is installed and mechanically operable. After equipment is fully operational, and before Owner will assume responsibility for the operation of the equipment, the equipment manufacturer's operation specialists shall instruct the Owner's operating personnel in the care, maintenance and proper operation of the equipment.

B. Instructions for installation of the equipment system and related appurtenances shall be written and furnished by the manufacturer.

C. Operation and Maintenance
   1. The manufacturer shall be responsible for supplying written instruction, which shall be sufficiently comprehensive to enable the operator to operate and maintain all valves supplied by the manufacturer. Instructions shall assume the operator is familiar with furnished equipment, but he/she has not previously operated and/or maintained the exact equipment supplied.

2. The instruction shall be prepared as a manual applicable solely to the equipment supplied by the manufacturer, and shall include those devices and equipment supplied by him.
3. Operation and maintenance instruction shall be specific to the equipment supplied in accordance with these Specifications.

D. Manufacturer's Services
1. Provide the services of a Representative of the Manufacturer of the valves to assist in adjusting and testing the equipment, to supervise initial operation, and to assist in making final adjustments and the tests specified, or which may be necessary to assure the Engineer the equipment is in satisfactory operating condition.
2. All costs for the above manufacturer's functions including travel, lodging, meals and incidentals shall be considered to have been included in the contract bid price.

END OF SECTION

SECTION 40_05_67

GATE VALVES

PART 1 GENERAL

1.1 SUMMARY

A. This specification covers the work necessary to furnish and install gate valves and appurtenances at locations shown on the plans or directed by the Engineer

B. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 DELIVERY, STORAGE & HANDLING

A. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address. Packing list shaJl be provided with equipment at time of delivery.

B. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting , storing and supporting the equipment during installation. Caution shall be

employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

C. Any pumps, cables, or electrical equipment shall be kept thoroughly dry at all times, shall be stored indoors, and protected from freezing conditions. Equipment shaJl not be stored directly on the ground. Equipment storage shaJl be protected and maintained in accordance with the manufacturer's recommendations. Equipment is in storage when:
1. It has been delivered to the jobsite and is awaiting installation.
2. It has been installed, but operation is delayed pending completion of the project.
3. There has been long period between operation cycles (30 days or more).

D. Improper storage could result in product failure or restoration not covered by warranty. Contractor shall be solely responsible for any damage to equipment during storage as described above in Paragraph 1.02, C. a. b. & c. If Contractor fails to store as required by manufacturer and supplier, and the warranty is voided due to such failure, equipment is automatically rejected by Owner/Engineer. Payment made to the Contractor under Stored Materials will be deducted from next monthly payment to the Contractor. New equipment shall be ordered and paid for by the Contractor for the project and at no cost to the Owner.

PART 2 PRODUCTS

2.1 GENERALS

A. Valves and appurtenances shall be manufactured by Muel1er, American Flow Control, Clow, DeZurik, or approved equal.

B. Valves for vault or building service shall be complete with all necessary operating handwheels, chain wheels, extension stems, floor stands, worm and gear operators, operating nuts, chains, and wrenches which are required for proper completion of the valve installation.

C. Valves for buried service shall be complete with gravel or concrete support pad, and two-piece valve box set in a 16- inch x 16-inch x 6-inch thick concrete pad. Concrete shall be 4000 psi at 28 days.

D. Vault or Building Service: The valve shall be iron body, bronze mounted with flanged ends, double-disc gate, rising bronze stem and confonning to AWWA C500. Design working pressure shall be 200 psi. The valve shall open counterclockwise and be operated by handwheel, unless otherwise noted.

E. Buried Service: The valve shall be iron body, non-rising stem, double-disc gate, o-ring sealed stuffing box, with mechanical joint ends. The valve shall open counterclockwise and have a 2-inch square operating nut.

F. I-Handle Operating Wrenches: Operating wrenches shall be 4-feet total length

G. Valve Boxes: The box shall be of sufficient length to reach from the pipe to at least one-inch above the final ground surface elevation. The box shall be two-piece sliding type, cast iron, with 5-inch shaft. Extension pieces, ifrequired, shall be the manufacturer's standard

type. The word WATER or "W" or SEWER or "S" shall be cast into the top of the lid, as appropriate for the service. Units shall be Mueller, Clow, or approved equal.

H. Valve Operators
1. All valve operators shall open by turning counterclockwise.
2. Valve operators shall be self-locking type to prevent creeping.

I. Extension Stems for Valve Operators (Buried Service): Where the depth of the valve is such that its centerline is more than 4 feet below grade, operating extension stems shall be provided to bring the operating nut to a point 6- inches below the surface of the ground and/or box cover. Extension stems shall be constructed of steel and shall be complete with 2-inch square operating nut.

J. Extension Bonnets for Valve Operators: Bonnet and stem shall be constructed of steel and given manufacturer's standard paint system. Bonnets shall be as supplied by Pratt, Allis Chalmers, or approved equal.

K. Valve Support Pad: All buried valves shall be supported by a concrete or gravel pad. The pad shall be at least 6- inches thick measured from the bottom of the valve. The horizontal dimensions of the pad shall be 6-inches greater than the largest centerline. Concrete shall be at least 4000 psi at 28 days. Gravel shall be clean, durable, and well- graded from 1/4-inch to one-inch.

PART 3 EXECUTION

3.1 COORDINATION

A. General Contractor shall provide skilled supervision and coordination between all personnel (sub-contractors and employees) to make sure that installed equipment is easy to operate and maintain.

B. Contractor is responsible for coordination between trades.

C. The Contractor shall assume full responsibility for coordination of the entire pro ject, including verification that all structures, piping, coating systems and equipment components are compatible. The Contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

D. Electrical connections, power supply, conduit runs, and anchor bolt installation shall be coordinated and supervised by Prime Contractor and checked for proper installation per manufacturer's recommendations.

3.2 BURIED VALVES

A. Install valves in the line at locations indicated on the plans, unless otherwise directed, and set plumb on concrete or gravel pad. All foreign matter shall be removed from the valve interior prior to installation.

3.3 VALVES IN VAULTS

A. Install in the lines as indicated on the drawings, unless otherwise directed. The valve shall be oriented to provide easy access. All foreign matter shall be removed from the interior prior to installation.

3.4 PRESSURE TEST

A. Gate valve test shall be a part of the test on the companion water line(s).

3.5 DISINFECTION

A. Gate valve disinfection shall be with the part of the disinfection of the companion water line(s).

END OF SECTION

SECTION 40_05_71.23

MUD VALVES

PART 1 GENERAL

1.1 SUMMARY

A. This specification covers the work necessary to furnish and install mud valves as specified herein and as shown on the plans.

B. To obtain standardization of performance, operation, spare parts, maintenance, and Manufacturer's service, it is the intent of these specifications that all valves of like type be furnished by a single Manufacturer.

C. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

1.5 DELIVERY, STORAGE & HANDLING

A. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address. Packing list shall be provided with equipment at time of delivery.

B. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

1.6 QUALITY ASSURANCE

A. The valves furnished under this contract shall be as manufactured by Trumbull, or approved equal.

B. Manufacturers regularly engaged in the manufacture of the type of equipment specified and can demonstrate equipment of their manufacture in actual service for a period of not less than 15 years will be considered as acceptable Manufacturer if able to comply with the specifications.

PART 2 PRODUCTS

2.1 GENERAL

A. Mud valves shall be stainless steel with resilient seats as described herein. Valves shall be the non-rising stem type and be a heavy duty design.

B. The body flange, yoke, guides and gate shall be cast of type 316 stainless steel. After machining, all castings shall be passivated in accordance with ASTM A-380. Valves including components welded from stainless steel are not acceptable. The resilient seat shall be of SBR rubber and mechanically retained. Fasteners shall be stainless steel.

C. The valve stem shall be one piece with an integral thrust collar and be cast or machined from type 316 stainless steel. The valve stem shall have the minimum diameters as shown below:

Valve Size	Minimum Stem Diameter
4″	1-3/16″
6″	1-3/16″
8″	1-7/16″
10″	1-7/16″
12″	1-7/16″
16″	1-1/2″

D. The valve shall be capable of withstanding a minimum input torque of 490 foot pounds, without damage to the valve. The valve shall not leak more than one quart per hour, when the valve is closed to a stem torque of 35 foot pounds. The manufacturer shall support leakage and torque testing with a report from an independent test laboratory.

E. The stem shall be coupled to the extension stem with a stainless steel machined coupling or a cast stainless 2" square operating nut and retained with a 1/4" stainless steel spring pin. No welded components of stainless are permitted for this connection or to the valve stem. Stems shall be retained with stainless fasteners assembled through holes drilled in the valve guide and yoke and retained with stainless hex nuts. Valve designs which retain the valve stem by threading stainless screws into tapped holes are not acceptable.

F. The stem shall have a permanently bonded coating to prevent galling with other stainless components. The coating shall be safe for potable water use and capable of enduring a minimum of 15,000 open-close cycles without galling or excessive wear. The manufacturer shall support cycle testing with a report from an independent test laboratory.

G. The base flange shall be drilled per ANSI 125# standard and have a minimum thickness of ¾". The base flange shall be machined to provide a smooth seating surface.

H. The extension stem shall be type 316 stainless steel of schedule 40 pipe or solid round bar. The top nut and bottom couplings of the extension stem shall be either cast or machined from type 316 stainless steel, but not include any welded components.

I. The position of the mud valves, from fully open to fully closed shall be visible by means of a cast stainless steel indicating-type floor stand. Where a floor is not directly over the valve and extension stem, the floors tands shall be supported by a cast stainless wall bracket mounted to the side wall. Wall brackets shall contain a plate designed to support the floor stand. The pedestal shall be cast of type 316 stainless steel and have a vertical indicating slot. A bronze indicator travels on a threaded stem to indicate the position of the valve. The floor stand shall be operated by a 12" diameter hand wheel of type 316 stainless. The word "OPEN" shall be cast in the pedestal at the top of the indicating slot. A "CLOSED" tag will be field mounted to the pedestal, to indicate the closed position of the valve. Floor stands fabricated by welding flanges to pipe shall not be accepted. The coupling used to connect the floor stand stem to the extension stem shall be stainless steel, type 316.

J. Stem Guides shall be constructed of cast stainless steel, type 316. Stem guides fabricated by welding stainless steel shall not be permitted. Stem guides shall include a bronze bushing with an inside diameter 1/16" larger than the outside diameter of the extension stem and shall be retained with two stainless steel screws.

K. The stem guide shall be of the adjustable design for plumb alignment. The adjusting bolt and washer shall be type 316 stainless. Stem guides shall be spaced so that the unsupported length between extension stems shall not exceed 7 feet. Mud valves shall be operated with extension stems, stem guides and either position indicators or indicating floor stands, as shown on the valve schedule or drawings. Mud valves shall be manufactured by Trumbull Industries, Youngstown, Ohio or Engineer approved equal.

PART 3 EXECUTION

3.1 INSTALLATION

A. The Contractor shall assume full responsibility for coordination of the entire project, including verification that all structures, piping, coating systems and equipment components are compatible. The Contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal of Manufacturer's shop and installation drawings, test result certificates or other data as required and specified herein.

C. Installation of equipment shall be in full conformance with the Manufacturer's shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between Manufacturer's instruction and the contract documents, the Contractor shall follow the Engineer's decision at no additional cost to the Owner.

3.2 WORKMANSHIP

A. The Contractor shall install equipment and materials in a workmanlike manner utilizing craftsmen skilled in the particular trade. The finished installation shall portrait a neat and plumb appearance.

B. Before installation, carefully clean valves of all foreign material, adjust stuffing boxes, and inspect valves in the OPEN and CLOSED positions. Install valves in accordance with the applicable portions of the Specifications. Unless otherwise indicated, install valves with the shaft vertical. This should provide the operator with a clear view of the visual position indicator. Installation practices shall conform to Manufacturer's recommendations.

3.3 MANUFACTURER'S SERVICES

A. Provide the services of a Representative of the Manufacturer of the valves to assist in adjusting and testing the equipment, to supervise initial operation, and to assist in making final adjustments and the tests specified, or which may be necessary to assure the Engineer the equipment is in satisfactory operating condition. Installation shall be inspected and certified by the manufacturer that the valve has been installed in accordance with manufacturer's instructions.

END OF SECTION

SECTION 40_41_13.01

INSULATION & HEAT TRACING

PART 1 GENERAL

1.1 SUMMARY

A. Furnishing and installing insulation and heat tape on piping and equipment as required by this section of the Contract Documents, unless otherwise indicated specifically on individual plans and appropriate sections of Contract Documents.

B. **ALL** equipment and **ALL** piping less than 12" exposed to non-heated indoor spaces and located outside shall be provided with heat trace and insulation to prevent freezing

C. Any Drawing or Specification that conflicts with this Specification section shall be brought to the attention of the Engineer prior to bid. When no clarification is provided the Contractor is to assume that the more restrictive & expensive product/system/item applies and shall be included in the Contractor's bid.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections if included.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

B. American National Standards Institute (ANSI)

C. Institute of Electrical and Electronics Engineers (IEEE)

D. American Society for Testing and Materials (ASTM)
   1. ASTM B193 - Standard Test Method for Resistivity of Electrical Conductor Materials.
   2. ASTM D2633 - Standard Test Methods for Thermoplastic Insulations and Jackets for Wire and Cable.
   3. ASTM C547 - Standard Specification for Mineral Fiber Pipe Insulation
   4. ASTM C553 Standard Specification for Mineral Fiber Blanket Thermal Insulation for Commercial and Industrial Applications.
   5. ASTM C578 - Standard Specification for Rigid, Cellular Polystyrene Thermal Insulation.
   6. ASTM C585 - Standard Practice for Inner and Outer Diameters of Thermal Insulation for Nominal Sizes of Pipe and Tubing.

E. National Fire Protection Association (NFPA)

F. National Electric Code (NEC)

G. Factory Mutual (FM)

H. FM Approval Guide

I. Underwriters Laboratories (UL)

J. National Electrical Manufacturers Association (NEMA)

K. NEMA 250 - Enclosures for Electrical Equipment (1000 Volts Maximum)

L. Occupational Safety and Health Administration (OSHA)

1.5 QUALITY ASSURANCE

A. Manufacturer's Qualifications
   1. The electrical heat trace system manufacturer shall be required to demonstrate a minimum of 5 years' experience in the design and manufacture of industrial electrical heat trace systems similar to those described in this Section and/or shown on the drawings.

B. Acceptable Manufacturers (or approved equivalent):
   1. Heat Tracing
      a. Raychem (Chemelex)
      b. Nelson Electronic
      c. Chromalox
      d. Thermon Manufacturing Company.
   2. Insulation
      a. Armstrong Co.
      b. CertainTeed
      c. Owens-Corning Fiberglass
      d. Pittsburg Plate Glass Co.
      e. Pittsburg – Corning

C. The insulation specified herein shall be furnished and installed by qualified insulation personnel whose principal business is the application and installation of thermal materials

on piping systems. All material shall be manufactured by one of the listed approved Manufacturer's instructions, except where these instructions conflict with the Contract Documents hereinafter stated, in which case the Contract Documents shall govern.

1.6 DESCRIPTION/DESIGN REQUIREMENTS

A. Provide a heat tracing system capable of maintaining the specified temperature during the extremes of ambient temperature.

B. Design Parameters
1. Voltage Available..... 277 Volts 1 Phase
2. Explosion Classification ..... Class I, Div.
3. Wind Velocity..... 160 mph
4. Low Ambient Temperature..... -20°F
5. Maintain Temperature ..... 65F degrees
6. Piping and equipment less than 12" exposed to non-heated indoor spaces and located outside shall be provided with heat trace and insulation to prevent freezing

1.7 WARRANTY

A. All electrical heat trace cables shall be warranted against manufacturing defects for a period of 5 years from energizing. Cables failing due to manufacturer defect prior to the expiration of the warranty shall be replaced by contractor at no additional cost to the owner.

PART 2 PRODUCTS

2.1 MATERIALS

A. General
1. Engage the services of qualified insulation personnel to furnish and install all the insulation required for the piping specified hereinafter. Heat tracing shall be of constant wattage.
2. All surfaces to be insulated shall be clean and dry before applying the insulation. All sections of molded pipe covering shall be firmly butted together. Where coverings are used, they shall lap the adjoining section of insulation by at least 3 inches. Where insulation terminates, it shall be neatly beveled and finished. No insulation shall be applied until the pipe has been pressure tested and found tight. Piping flexible connections, flanges and unions shall not be covered. All materials used shall be fire retardant or nonflammable.
3. Where vapor barriers are required, the vapor barrier shall be on the outside. Extreme care shall be taken that the vapor barrier is unbroken. Joints, etc., shall all be sealed. Where insulation with a vapor barrier terminates, it shall be sealed off with the vapor barrier being continuous to the surface being insulated. Ends shall not be left raw.
4. Aluminum bands shall be applied on the piping insulation. The bands shall be applied three to a section of pipe insulation. Fittings, valves, etc., shall have bands on each side. Apply bands at each end of pipe support.
5. Where supports are on the outside of the insulation, use a section of Foam glass or rigid cork insulation at support locations and provide No. 14 gage galvanized

steel sleeves, 12 inches long on pipe sizes up to 12 inches and 18 inches long on larger pipe sizes to protect the insulation. The sleeves shall be half cylinders with the edges hemmed to prevent cutting the insulation.

6. All materials used shall have a flame spread rating of not more than 25 without evidence of continued progressive combustion, and with a smoke developed rating not higher than 50. Shop drawing submittals shall show this information.
7. Weather exposed insulation shall be protected jacket (see below)

B. Jacket
   1. Material: Aluminum, Alloy 5005; 0.016-inch (26 gauge) minimum thickness.
   2. Overlap: Overlap circumferential joints 4 inches minimum; overlap longitudinal joints 1-inch minimum; longitudinal joints oriented to minimize water entry.
   3. Bands: 0.5 inch wide, 0.0508 inch (16 gauge) thick aluminum, same alloy as jacket or 0.0179 inch thick Type 304 stainless steel; install on 18 inch centers,uniformly spaced and at all fitting joints.
   4. Joint seal: Apply waterproof adhesive at joints and overlaps.
   5. Fittings: Custom fit of same materials.
   6. Manufacturers: One of the following or equal:
      a. Childers Products.
      b. Premetco International.

C. Freeze Protection
   1. Insulation
      a. Unless otherwise indicated in the specific requirements and/or on the plans, all piping, fittings, valves and related items smaller than 12 inches exposed to non-heated indoor spaces and located outside in yard in an unheated space subject to freezing shall be heat trace and insulated.
      b. Buried yard piping need not be insulated.
      c. Piping capable of draining automatically need not be insulated.
      d. All insulation of pipes shall run to a point 12 inches below ground surface.
   2. Heat Tracing: Electric heat tapes shall be provided inside the insulation for freeze protection on all piping receiving insulation subject to freezing. The rate and quantity of insulation shall be specified hereinafter.
   3. Schedule: Unless otherwise specified or shown elsewhere in the contract documents, the following schedule of insulation and heat tape application shall be used:

Insulation Schedule for Piping Subject to Freezing.

Nominal Pipe Size (in)**	Insulation Thickness (in)	Insulation "K"*	Heat Tape Application Rate (Minimum) Watts/Linear Feet
½	2	0.3	1.0
3/4	2	0.3	1.2
1	2	0.3	1.2
1-1/2	2	0.3	1.5
2	2	0.3	1.8
2-1/2	2	0.3	1.9
3	2	0.3	1.9
4	2	0.3	2.7
6	2	0.3	2.7
8	2	0.3	2.7
10	2	0.3	2.7
12	2	0.3	2.7

* "K" - Thermal conductivity of insulation in BTUH per square foot per degree Fahrenheit, per inch.

** Insulation and heat tape required for a pipe size not shown on the schedule shall be the same as the next larger pipe size shown on this schedule.

D. Insulation for Hot Piping

1. Insulation Material – Molded rigid fiberglass sectional pipe insulation rated to 500 degrees F. The insulation shall have a minimum density of 3.5 lbs/cu ft and a maximum thermal conductivity "K" factor of 0.29 BTU-in/(hr-sq.ft.-deg.F) at 200

degrees F mean temperature. Provide insulation with kraft paper bonded to aluminum foil reinforced with fiberglass yarn and self-sealing lap.

PART 3 EXECUTION

3.1 INSTALLATION

A. Heat Tracing

1. Pipelines or equipment subject to freezing shall be heat traced as indicated on "Insulation Schedule," paragraph 2.01 C. 3. Furnish and install on such pipeline or equipment an electric heat tracing system consisting of a flat, flexible, low heat-density electrical heating strip of self-limiting parallel-circuit construction consisting of an inner core of conductive material between two parallel copper bus strips with a polyolefin outer jacket. The strip shall be cut-to-length in field and installed on pipelines and equipment as required. The electrical insulation of the heater strip shall be rated at 185 F minimum temperature exposure and shall be suitable for 115, 208 volts as indicated on plans or as available. The heat tracing system shall be complete with all necessary power connections, end seals, adjustable thermostats and electric traced signed per Manufacturer's installation instructions.

B. Insulation

1. All work shall be performed in a neat workmanlike manner and all adhesives, bands and other fastening materials and devices shall be supplied as required to properly install the insulation materials being furnished.

END OF SECTION

SECTION 40_71_84

PARSHALL FLUMES

PART 1 GENERAL

1.1 SUMMARY

A. This specification covers the work necessary to furnish and install Parshall flumes as specified herein and as shown on the plans

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

1.5 DELIVERY, STORAGE & HANDLING

A. Equipment shall be delivered to the jobsite completely factory assembled. Individual equipment components shall be crated in adequate packing containers to prevent damage, facilitate ease of handling and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address. Packing list shall be provided with equipment at time of delivery.

B. Electrical equipment shall be kept thoroughly dry at all times and shall be stored indoors. Equipment shall be stored directly on the ground.

1.6 QUALITY ASSURANCE

A. The FRP flumes furnished under this contract shall be as manufactured by Engineered Fiberglass Composites or equal.

B. Only manufacturers regularly engaged in the manufacture of the type of equipment specified and that can demonstrate equipment of their manufacture in actual service for a period of not less than 5 years will be considered.

PART 2 PRODUCTS

2.1 GENERAL

A. The parshall flume shall be installed as shown on the plans in accordance with the manufacturer's recommendation. The FRP flumes shall be of single piece reinforced polyester construction with end flanges and reinforcing ribs providing secure and permanent anchorage. The flumes should be located in a straight reach of channel without bends or changes in alignment directly upstream and should have a well distributed velocity profile. A staff gauge with 1/4" minor divisions in inches shall be provided on each flume. Extreme care should be exercised by the installing Contractor to make sure that there is no distortion of the liner either in the sides or bottom during the "pouring" of concrete or grout when setting the flumes.

B. FRP flumes shall be of fiberglass reinforced polyester construction having smooth white isophthalic gelcoat finish on the interior surface. Flumes shall be molded one-piece units consisting of the converging, throat and diverging sections. Integral fiberglass anchor clips shall be provided to help secure unit in place during installation.

PART 3 EXECUTION

3.1 INSTALLATION

A. The Contractor shall assume full responsibility for coordination of the entire project, including verification that all electronic systems and equipment components are compatible.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal of manufacturer's shop and installation drawings, test results or other data as required and as specified herein.

C. Installation of equipment shall be in full conformance with the manufacturer shop drawings and requirements.

3.2 WARRANTY

A. The manufacturer and Contractor shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon final acceptance of the whole project by the Owner.

B. The equipment, apparatus, and parts furnished shall be warranted for a period of one (1) year form the date of final acceptance of the project by the Owner.

C. Components failing to perform as specified, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer and Contractor without cost to the Owner.

3.3 FUNCTION OF THE MANUFACTURER

A. Provide the services of a representative of the flume/flowmeter manufacturer to assist in adjusting and testing the equipment, to supervise initial operation, and to assist in making final adjustments and the tests specified, or which may be necessary to assure the Engineer that the equipment is in satisfactory operating conditions.

B. Operation and Maintenance Materials
   1. The manufacturer shall be responsible for supplying written instruction, which shall be sufficiently comprehensive to enable the operator to service, program, and operate the meter and all equipment supplied by the manufacturer.
   2. Operation and maintenance instruction shall be specific to the equipment supplied in accordance with these specifications. Instruction manuals applicable to many different configurations and meters, and which require the operator to selectively read portions of the instructions shall not be acceptable.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 40_75_43

DISSOLVED OXYGEN SENSORS

PART 1 GENERAL

1.1 SUMMARY

A. This specification covers the work necessary to furnish and install Luminescent Dissolved Oxygen Analyzer for monitoring dissolved oxygen in wastewater.
   1. Locations
      a. 1 for each SBR (3)
      b. 1 for each Digestor (2)

B. The method of measuring dissolved oxygen will be a probe using luminescent sensor technology.

C. Other methods of dissolved oxygen measurement such as probes that use a selective membrane or those that use electrolytes are not acceptable.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

1.5 DELIVERY, STORAGE & HANDLING

A. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address and weight. Packing list shall be provided with equipment at time of delivery.

B. Any electrical equipment shall be kept thoroughly dry at all times and stored indoors. Equipment storage shall be protected and maintained in accordance with the Manufacturer's recommendations. Equipment shall not be stored directly on the ground.

C. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

1.6 QUALITY ASSURANCE

A. System Description
   1. Performance Requirements
      a. Measurement range: 0.01 to 20.00 mg/L
      b. Resolution: 0.01 mg/L
      c. Accuracy: ± 0.2 percent of span
      d. Repeatability: ± 0.5 percent of span
      e. Sensitivity: 0.05 percent of span
      f. Response Time: 90 percent in less than 30 seconds and 95 percent in less than 90 seconds at 20°C

B. Certifications
   1. General Purpose CSA/CSANRTL and FM (UL Pending) when used with an approved controller.
   2. Class 1, Div 2 Groups A thru D CSA/CSANTRL and FM (UL Pending) when used with an approved controller.

C. Environmental Requirements
   1. Operating temperature: 0 to 50 °C
      a. Probe 0 to 50° C
      b. Controller: 20 to 60 °C
   2. Relative humidity: 95%, non-condensing
   3. Immersion depth: 107 meters, maximum
   4. Immersion pressure: 1050 kPa, maximum
   5. Distance, analyzer to sensor: 300 meters, maximum

1.7 WARRANTY

A. The Manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The probe body shall be warranted for a period of three years, the sensor cap is warranted for a period of one year. All warranties shall become effective upon final acceptance of the entire project by the Owner.

B. The manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

C. The Manufacturer and the Contractor shall be solely responsible for the warranty of the equipment and all non-consumable components. Components failing to perform as specified by the Engineer, or as represented by the Manufacturer, or proven to be defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the Manufacturer without any additional costs to the Owner.

1.8 MAINTENANCE SERVICE

A. Scheduled Maintenance
1. Sensor cleaning: 90 days or depending on conditions.
2. Sensor and sensor cap inspection: 90 days
3. Sensor cap replacement: annually
4. Calibration: per regulatory agency schedule

B. Unscheduled maintenance
1. Replace fuse
2. Clean instrument enclosure

PART 2 PRODUCTS

2.1 MANUFACTURER

A. Model HachLDOTM Probe, or preapproved equal - Hach Company, Loveland, CO

2.2 MANUFACTURED UNIT

A. The Probe consists of continuous-reading probe, replaceable sensor cap, and 10-meter integral cable.

B. The Probe shall connect to a dual port controller capable of accepting other parameter probes including TSS, pH, ORP, Nitrate, Ammonia, UVAS, Sludge Level, & Turbidity.

2.3 EQUIPMENT

A. The Sensor is made of polybutyl methacrolate.

B. The Probe is made of foamed Noryl® and 316 stainless steel.

C. The Probe is entirely corrosion-resistant and fully immersible.

D. The Probe does not require sample conditioning or electrolyte solutions.

E. The Probe interface to the controller is MODBUS®.

F. F. The operation of the Probe is not affected by H2S, pH, K+1, Na+1, Mg+2, Ca+2, NH4+1, Al+3, Pb+2, Cd+2, Zn+2, Cr (total), Fe+2, Fe+3, Mn+2, Cu+2, Mi+2, Co+2, CN-1, NO3-1, SO4-2, S-2, PO4+3, Cl-1, anion active tensides, crude oils, or Cl2-1.

G. G. Calibration methods:
1. Sample calibration: Sample is compared to a standard instrument or the Winkler Titration method.
2. Air calibration: One point, 100 percent water-saturated air.

2.4 COMPONENTS

A. Standard Equipment:
1. Probe with replaceable cap
2. Integral cable
3. Manual

B. Dimensions
1. Diameter: 60 mm (2.4 in.)
2. Length: 290mm (11.5in.)

C. Weight
1. Probe: 3 pounds, 2 ounces (1.4 kg)

D. Sensor cable: 30 foot, integral

2.5 ACCESSORIES

A. Hand Rail mount kit – one per probe – 1-1/2" PVC extensions purchased locally may be needed.

PART 3 EXECUTION

3.1 PREPARATION

A. Mounting
1. Probe: Pole (handrail mount)
2. Controller: Surface, pole or pipe

3.2 INSTALLATION

A. Coordinate installation with structure and confirm instrument location.

B. Contractor will install the instruments in strict accordance with the manufacturer's instructions and recommendation.

C. Coordinate with SCADA system, install complete cabling and confirm data signal communications.

D. Manufacturer's representative will include a day of start-up service by a factory-trained technician. Contractor will schedule a date and time for start-up.

E. Contractor will require the following people to be present during the start-up procedure.
   1. General contractor
   2. Electrical contractor
   3. Factory trained representative
   4. Owner's personnel
   5. Engineer's Representative

SECTION 41_21_23.15

BELT CONVEYOR SYSTEM

PART 1 GENERAL

1.1 SUMMARY

A. This specification section covers the labor and materials necessary to furnish and install all equipment required to provide a complete and operable system as described herein.
   1. Northside WWTP – 1 unit
      a. Serpentix Converyor Corporation.
      b. 12 tons per hour maximum feed rate
   2. Spare Parts
      a. 5 belt pans w/hardware
      b. 10 guide blocks
      c. 5 chain attachments
      d. 2 rubber scraper blades.

B. Components shall be of the same manufacturer or supplier to obtain standardization of performance, operation, spare parts, maintenance and manufacturer's services.

C. The Contractor shall furnish and install all equipment required to provide a complete and operable system as described herein.

D. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents and include:
   1. Detailed specifications
   2. Equipment agreement
   3. Detailed electrical data (as applicable)
   4. Installation instructions
   5. Written warranty
   6. Equipment storage requirements
   7. Any other information relating to delivery, storage, installation, operations and maintenance of the equipment

1.4 DELIVERY, STORAGE & HANDLING

A. Equipment shall be delivered to the jobsite completely factory assembled in accordance with manufacturer's recommendations. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address and packing list shall be provided with equipment at time of delivery.

B. Equipment shall be kept thoroughly dry at all times and shall be stored indoors. Equipment storage shall be protected and maintained in accordance with the manufacturer's recommendations. Equipment shall not be stored directly on the ground.

C. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment. The Contractor shall be responsible for equipment damaged during unloading transportation and storing at no additional cost to the Owner.

1.5 ACCEPTABLE MANUFACTURERS/SUPPLIERS

A. Manufacturers regularly engaged in the manufacture of the type of equipment specified and can demonstrate equipment of their manufacturer in actual service will be considered as an acceptable manufacturer. Manufacturers named in the specifications will not be required to presubmit detailed equipment information prior to the bid date per Section 01_33_02.

1.6 QUALITY ASSURANCE

A. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, Engineering data, instruction, and recommendations of the equipment manufacturer unless exceptions are noted by the Engineer. The equipment manufacturer must have at least five (5) of similar size installed and operating in the State of Oklahoma for a minimum of five (5) years. Equipment and associated appurtenances shall be provided by the same supplier.

1.7 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner or Owner's authorized agent.

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year from the final acceptance date of the WWTP, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

E. It is not intended the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacture, delays in delivery, replacement, or otherwise.

PART 2 PRODUCTS

2.1 CONVEYOR EQUIPMENT

A. The conveyor equipment consist of conveyor belt pans, tracks and supports, take up and drive stations. The centerline length of the conveyor(s) shall be approximately 51'-9", with 26 inch wide belt pans and shall travel at 30 FPM. Verify actual dimensions on Drawings. Loading onto the conveyor(s) shall be distributed evenly and shall not exceed a design capacity rated at 12 tons per hour maximum feed rate. The conveyor(s) shall have a watertight modular conveying surface with a 20 degree troughed cross section at the outside of the belt width. Each modular conveying section shall have a convolution that permits the assembled belt to make continuous vertical, horizontal and helical turns that will flatten out as it goes over the drive station, and allows for continuous belt cleaning with a pre-tensioned scraper bar. The modular belt pan section shall be reinforced with non-metallic stiffeners molded into each modular belt section to achieve troughing. The conveyor(s) will be designed in such a way that all moving parts of the system, except for the drive and tension station components, will pass a single designated point along the conveying path which may be used for maintenance and/or service of the conveyor.

2.2 CONVEYOR BELT AND CHAIN

A. The conveying surface will consist of individually replaceable modular belt pan sections molded of moldable plastic rubber (MPR). The belt pans shall be fastened every eight (8) inches and supported by a nylon attachment and two (2) durable enhanced, plastic guide

(and wear) blocks bolted to a case hardened alloy steel chain. The chain shall have a minimum breaking strength of 35,000 pounds. Each modular belt pan section will have a cleat like convolution at least 1 1/2 inches high, permanently molded into the rubber. The closed link alloy steel chain, with alternating horizontal and vertical links will allow for movement in two or more directions. The 4" pitch chain will be guided by the guide blocks bolted bilaterally to each vertical chain link. The belt pan attachments and guide blocks shall be shipped assembled on the chain. The chain and guide blocks will operate in a UHMWPE track consisting of a base, two sides and two top containment angles.

2.3 TRACKS AND SUPPORTS

A. The fabricated I beam shall be the structural frame of the conveyor system. The top and bottom flanges of the I beam will have the UHMWPE track, with bilaterally positioned angles to contain the guide blocks as they are pulled through the track system by the steel chain. The structural I beam will be fabricated from 1/8-inch thick, A36 structural steel. The containment angles will be UHMWPE. The guide blocks will stabilize the belt pan surface in the event of unbalanced material loading. Track sections of required length shall be factory fabricated and ready for job site assembly by splice bolting where indicated. The conveyor frame and the conveyor supports shall be structural steel conforming to ASTM A36. All shop welding shall conform to the latest standards of the American Welding Society.

B. Manufacturer to coordinate with structural drawings and metal building supplier for requirements of mounting discharge end of conveyor to the structural members. No support will be allowed to extend down to the floor of the loading area. If structural modifications are required they shall be the responsibility of the manufacturer and shall be submitted with structural calculations stamped by an Oklahoma Registered Structural Engineer (SE) at no additional cost.

2.4 DRIVE UNIT

A. The fully assembled drive station shall consist of a 3 horsepower, 230/460V, 3 Ph, 60 Hz, TEFC energy efficient motor, a durable corrosion resistant UHMW polyethylene sprocket, gear reducer, V belt, sheaves, and steel sprockets which in combination give the proper belt speed for the load indicated. A single chain drive between the reducer and the steel sprocket shaft is to be provided for further power and speed reduction. The belt drive sheaves shall be interchangeable in order to provide a different speed by means of other size sheaves. Directly coupled drive motor gear reducer combinations shall not be acceptable. A mechanical ratcheting clutch shall be incorporated into the drive design to prevent or mitigate damage to any of the drive components/drive structure. Any type of over-torque condition created by product overloading or jamming conditions will cause the ratcheting clutch to release, isolating the power from the electric motor to the gearbox and other power transmission components. The torque setting is adjustable and shall be properly set at the factory for each conveyor application.

2.5 CHAIN TENSIONING STATION

A. The fully assembled tension station shall consist of a durable corrosion resistant UHMW polyethylene chain sprocket, a constant pressure spring loaded chain tensioner adjustable by a single ratchet, and track all fabricated and assembled in a structural frame ready for installation.

2.6 FLEX-END DISCHARGE

A. Not used.

2.7 SKIRT BOARDS

A. Conveyor skirt boards shall be provided at each loading area per dimensions shown on the drawings. Skirts shall be 3/8" thick HDPE and shall be supported by brackets from the conveyor frame. Brackets shall be A-36 steel, hot dipped galvanized.

2.8 DRIP PANS

A. 16 gauge, galvanized steel sheet drip pans, with A36 steel support brackets, shall be provided below the conveyor and shall be sloped to drain as indicated on the drawings.

2.9 HARDWARE

A. All nuts, bolts and washers shall be type 316 stainless steel.

2.10 SAFETY STOP SWITCH

A. Flag arm safety pull cord switches on each side of the conveyor with orange protective coated cable running the entire length of the conveyor. Nema 7 (Explosion Proof), 20 amps, 125, 250 or 480 VAC, single pole, double throw circuit.

2.11 BELT SCRAPER

A. A pre-tensioned scraping mechanism, with a replaceable rubber blade and UHMWPE backing plate to continuously remove most material from the conveying surface shall be provided at the conveyor discharge.

2.12 FACTORY FINISH

A. Shall be hot dipped galvanized to ASTM 123/A 123M-02 specifications.

B. All OEM supplied equipment will be furnished with their factory-applied finish.

2.13 SPARE PARTS

A. One set of spare parts, consisting of 5 belt pans w/hardware, 10 guide blocks, 5 chain attachments, and 2 rubber scraper blades.

PART 3 EXECUTION

3.1 GENERAL

A. The General Contractor shall assume full responsibility for coordination of the entire project, including verification of all structures, piping, coating systems and equipment components are compatible. The general contractor shall initially operate each equipment

system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal or manufacturer's shop and installation drawings, test results or other data as specified herein. Installation of equipment shall be in full conformance with the manufacturer shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between manufacturer's instructions and the contract documents, the contractor shall follow the Engineer's decision at no additional cost to the Owner.

C. Installation of equipment shall be in full conformance with the manufacturer's shop drawings and requirements.

3.2 WORKMANSHIP

A. Handle carefully and protect the equipment and appurtenances to avoid damage.

B. The equipment shall be safely secured to the wall and floor in accordance with the Engineer's design drawings. All plumbing and electrical shall be in accordance with state and federal codes. All piping and tubing shall be sealed for leaks.

C. Any evidence of improper installation shall be corrected by the Contractor. Care during storage, installation and startup shall be in strict accordance with manufacturer's recommendations.

3.3 MANUFACTURER'S SERVICES

A. The Contractor shall require the manufacturer to furnish the services of a qualified field Engineer to perform the following functions in the designed periods of time. These services are to be performed at the jobsite. A minimum of two (2) visits to the job site shall be required.
   1. Check-out of installation, start-up of equipment and initial operator instruction. This service shall take place after all mechanical equipment associated with the control system is installed and mechanically operable. One (1) 8-hour man day, minimum.
   2. After equipment is fully operational, and before Owner will assume responsibility for the operation of the equipment, the equipment manufacturer's operation specialists shall instruct the Owner's operating personnel in the care, maintenance and proper operation of the equipment.
   3. All costs for the above manufacturer functions including travel, lodging, meals, and incidentals shall be considered to have been included in the contractor's lump sum bid price.
   4. Prior to plant startup, all equipment described herein shall be inspected for proper alignment, quiet operation, proper connections, and satisfactory performance by means of a functional test.
   5. During plant start-up all equipment described herein shall be inspected for proper connections and satisfactory performance by means of a function test.
   6. The equipment system and associated accessories shall be field tested to verify adequate performance.

7. Units apparently failing to meet the Specifications must be corrected to provide proper service. Should the problem persist due to a flaw in material and/or in the design of the equipment, new equipment must be provided by the Contractor to meet the specifications.

B. Operation and Maintenance
   1. The equipment manufacturer shall be responsible for supplying written instruction, which shall be sufficiently comprehensive to enable the operator to operate and maintain and all equipment supplied by the manufacturer. Instructions shall assume that the operator is familiar with related equipment and controls, but that he has not previously operated and/or maintained the exact equipment supplied.
   2. The instruction shall be prepared as a system manual applicable solely to the equipment supplied by the manufacturer to these specifications, and shall include those devices and equipment supplied by him.
   3. Operation and maintenance instruction shall be specific to the equipment supplied in accordance with these specifications.

C. Manufacturer's Costs:
   1. All costs for the above manufacturer functions including travel, lodging, meals, and incidental shall be considered to have been included in the Contractor's lump sum bid price.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 41_22_00

CRANES & HOISTS

PART 1 GENERAL

1.1 SUMMARY

A. Provide and install jib cranes, trolleys, and hoists per Drawings and Specifications with electrical connection and any/all other components necessary to provide a complete and working system. It is the intent that all Cranes and Hoists for complete project come from a single supplier.

B. Contractor shall first have pump & equipment submittals that are to be lifted approved to ascertain that the trolley and hoists supplied shall be adequate to lift specified items (clearances and weights.)

C. Electrical connections, power supply, conduit runs, and anchor bolt installation shall be coordinated and checked for proper installation per manufacturer's recommendations.

D. All components of cranes and hoists to be corrosion resistant by supplier or shall be field painted per Specifications.

E. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

B. Submittals shall include actual dimensions required for the correct operation of the complete Jib Cranes and Hoist systems for its intended purpose including, but not limited to raising the screens, lifting the pump out of the influent / effluent pump station / SBR basin, and lifting a dumpster from the headworks floor. It is the contractor's responsibility to verify in the field and check the Drawings to guarantee that the selected lifting and conveying units will perform its intended purpose.

C. Motorized Bridge Crane submittal to be stamped by an Oklahoma registered Structural Engineer (SE.)

D. Shop drawings and equipment data
   1. Manufacturer's catalog data for hoist.
   2. Dimensional drawings and details for complete system.
   3. Wiring schematics. - ship with hoists

E. Operations and Maintenance Manuals
   1. Equipment function, normal operating characteristics, and limiting conditions.
   2. Assembly, installation, alignment, and maintenance instructions.
   3. Lubrication and maintenance instructions.
   4. Guide to "troubleshooting".
   5. Parts list.
   6. Test results.

1.4 DELIVERY, STORAGE & HANDLING

A. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address. Packing list shall be provided with equipment at time of delivery.

B. Any pumps, cables, or electrical equipment shall be kept thoroughly dry at all times, shall be stored indoors, and protected from freezing conditions. Equipment shall not be stored directly on the ground. Equipment storage shall be protected and maintained in accordance with the manufacturer's recommendations. Equipment is in storage when:
   1. It has been delivered to the jobsite and is awaiting installation.
   2. It has been installed, but operation is delayed pending completion of the project.
   3. There has been long period between operation cycles (30 days or more).

C. Improper storage could result in product failure or restoration not covered by warranty. Contractor shall be solely responsible for any damage to equipment during storage as described above. If Contractor fails to store as required by manufacturer and supplier, and the warranty is voided due to such failure, equipment is automatically rejected by Owner/Engineer. Payment made to the Contractor under Stored Materials will be deducted from next monthly payment to the Contractor. New equipment shall be ordered and paid for by the Contractor for the project and at no cost to the Owner.

D. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation. Caution shall be

employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

1.5 QUALITY ASSURANCE

A. All equipment furnished under this section shall comply with OSHA requirements, Crane Manufacturer's Association of America (CMAA), and the Hoist Manufacturer's Institute (HMI).

B. Manufacturers regularly engaged in the manufacture of the type of equipment specified and who can demonstrate equipment of their manufacture in actual service for a period of not less than 15 years will be considered as an acceptable manufacturer. Manufacturers not named in the specification meeting the minimum experience time requirement must submit to the Engineer 15 working days prior to the bid date detailed information describing the equipment proposed to finish. The detailed information shall include but not be limited to dimensional data, materials of construction and an installation list with address, telephone number, and an individual's name directly employed by the owner of the equipment. Plan holders will be notified of approved manufacturers by addendum five (5) working days prior to bid date.

1.6 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon final acceptance by the Owner.

B. Equipment Warranty
1. The equipment, apparatus, and parts furnished shall be warranted for a period of one (1) year from final acceptance date by Owner, excepting only those items that are normally consumed in service, such as light bulbs, oil, grease, packing, gaskets, o-rings, etc.
2. Components failing to perform as specified by the engineers, or as represented by the manufacturer, or as proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of parts or labor to the owner.
3. It is not intended that the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacturer, delays in delivery, replacement, or otherwise.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the Manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of parts or labor to the Owner.

E. Components failing to perform as specified by the Engineer, or as represented by the Manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of parts or labor to the Owner.

PART 2 PRODUCTS

2.1 DESCRIPTION

A. Jib Cranes and Hoists on the project shall be supplied by a single supplier such as Bridge Crane Specialists, Ace/Gaffey and Four Star Material Management Systems who can not only supply but also service the supplied equipment expeditiously.

B. All component subject to contact with wastewater shall be 316 stainless steel or equivalent corrosion resistant material.

C. Bridge Crane for Northside Headworks shall be designed, built and installed by supplier and shall be stamped by an Oklahoma Registered Structural Engineer (SE.)

D. Contractor shall be responsible to provide a complete working system when installed. Contractor shall ascertain that all necessary structural, mechanical, and electrical equipment parts have been ordered from supplier and assembled to operate the jib crane, electric chain hoist, motorized trolley hoist and bridge crane as intended for the project and it shall be a complete working system.

E. Contractor to coordinate with Drawings / submittals for adjacent equipment & structural elements to verify clearances.

F. Contractor shall provide a boom lock or tie off for the jib boom that meets manufacturer's requirements. Jib boom shall not be allowed to swing freely.

G. Furnish electrical equipment including motors, motor starters, pendant control, control systems, wire, and conduit in accordance with NFPA 70, NEC Article 610. Provide motor suited for harsh environment, including cast aluminum conduit box, epoxy paint, stainless steel nameplate, internal rust inhibitor, and treated and sealed shafts for the motors.

H. Monorail conductor voltage drops from monorail track supply taps shall permit the hoist and trolley motors to operate within voltage tolerances of plus or minus 10 percent, when building supply voltage is at plus or minus 5 percent of design voltage.

I. Festooned Flat Cable Conductors: Flexible cable, carried by heavy-duty roller, permanently lubricated roller bearings, with monorail support system that will dispense and retrieve flexible cable without twisting or tangling, and 20 percent spare conductor in each cable assembly.

J. Grounding: External in accordance with NFPA 70, NEC Article 250. Provide fourth conductor for grounding of system, in accordance with NEC.

K. Jib Cranes
   1. Free standing, base plate mounted with 360° rotation

2. Manufacturer / Model
    1) Spanco, Inc., Series 100, or approved equal
3. Suppliers
    1) Ace/Gaffey
    2) Four Star Material Management Systems
    3) Bridge Crane Specialists
4. Furnish with:
    a. Corrosion resistant coating or primed for field painting
    b. Mounting components
    c. Boom lock (ground accessible) or cast in place tie off
5. Location / Specifications
    a. Northside SBR Basin Motive Pumps
        1) Quantity: 2
        2) Capacity: 5 ton
        3) Span: 18'
        4) Hub: 15'
        5) Furnish With: Motorized rotation arm
    b. Northside FEB Return Lift Station Pumps
        1) Quantity: 1
        2) Capacity: 3 ton
        3) Span: 16'
        4) Hub: 12'
    c. Southside FEB Return Lift Station Pumps
        1) Quantity: 1
        2) Capacity: 3 ton
        3) Span: 15'
        4) Hub: 12'
        5) Furnish With: Motorized rotation arm

L. Motorized Electric Trolley Hoists
1. Coordinate mounting requirements with structural drawings and crane supplier.
2. Voltage and electrical details shall be as indicated on electrical drawings
3. Coordinate with Drawings for lift, pendant and power supply lengths.
4. Manufacturers
    a. Shaw-Box, Harrington, or equal supplied by:
        1) Ace/Gaffey
        2) Four Star Material Management Systems
        3) Bridge Crane Specialists
    b. Shall be supplied as a complete system from a single supplier.
5. Furnish with:
    a. Corrosion resistant coating or primed for field painting
    b. Radio remote controls (if available) in addition to standard controls
    c. Explosion proof components with spark resistant features
    d. Molded composite, resilient bumper installed in the tracks to prevent hoist trolley, and festoon carriers
    e. Additional items deemed necessary for a complete, functional, and safe operating system based on project requirements, conditions and Drawings.
6. Speed
    a. Hoist: 11fpm, minimum, 2 speed
    b. Trolley: 40fpm, minimum, 2 speed

7. Location / Specifications
    a. Northside SBR Basin Motive Pumps
        1) Quantity: 2
        2) Capacity: 5 ton
        3) Type: Wire rope hoist with 316 SS cable
    b. Northside FEB Return Lift Station Pumps
        1) Quantity: 1
        2) Capacity: 3 ton
        3) Type: Chain hoist
    c. Northside Pre-Equalization Basin Pumps
        1) Quantity: 1
        2) Capacity: 3 ton
        3) Type: Chain hoist
    d. Northside Effluent Lift Station Pumps
        1) Quantity: 1
        2) Capacity: 3 ton
        3) Type: Chain hoist
    e. Southside FEB Return Lift Station Pumps
        1) Quantity: 1
        2) Capacity: 3 ton
        3) Type: Chain hoist
    f. Southside Headworks Screens
        1) Quantity: 1
        2) Capacity: 2 ton
        3) Type: Chain hoist
    g. Southside Influent Lift Station Pumps
        1) Quantity: 1
        2) Capacity: 5 ton
        3) Type: Chain hoist

M. Motorized Bridge Crane
    1. Top running single girder crane with dual hoists for lifting dumpster from 2 points
    2. Coordinate mounting requirements with structural drawings
    3. Coordinate with Drawings for lift, pendant and power supply lengths / requirements.
    4. Supplied by:
        a. Ace/Gaffey
        b. Four Star Material Management Systems
        c. Bridge Crane Specialists
    5. Shall be supplied as a complete system by a single supplier.
    6. Furnish with:
        a. VFD for multiple speed travel for Trolley, Bridge & Hoist
        b. Hoist: 11 fpm, minimum
        c. Trolley: 40fpm, minimum
        d. Corrosion resistant coating or primed for field painting
        e. Radio remote controls (if available) in addition to standard controls
        f. Explosion proof components with spark resistant features
        g. Molded composite, resilient bumper installed in the tracks to prevent hoist trolley, and festoon carriers

h. Additional items deemed necessary for a complete, functional, and safe operating system based on project requirements, conditions and Drawings.

7. Supplied as a complete system designed and stamped by an Oklahoma Registered Structural Engineer (SE.)
8. Voltage and electrical details shall be as indicated on electrical drawings
9. Location/Specifications
   a. Northside Headworks Pumps, Dumpsters & Misc Equipment
      1) See drawings for span requirements and structural details
      2) 5 ton (each hoist); Chain
      3) Reach shall be sufficient to extend to bottom of headworks channel.

N. Load Tests
1. The Contractor shall provide all load tests required for the Jib Crane and Trolley Hoist system at 125 percent of rated load (per OSHA standards) and submit results of the test to the Engineer. As a minimum, testing shall be operating the equipment through a complete lift and lowering cycle to determine that the equipment performs smoothly and safely without failure. Such tests shall be carried out with the hoisting equipment loaded as near to the specified capacity as possible. Any defects shall be corrected or replaced immediately by the Contractor and at no expense to the Owner. All testing and the costs of all required certification shall be at the Contractor's expense.

O. Use by Contractor
1. Any hoist used by Contractor during construction shall be repaired, repainted, and otherwise refurbished to like-new condition prior to its acceptance. The Contractor assumes all responsibility for operation and maintenance until the hoist has been accepted by Owner.

PART 3 EXECUTION

3.1 INSTALLATION

A. Installation of equipment shall be in full conformance with the manufacturer's shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between manufacturer's instructions and the contract documents, the contractor shall follow the Engineer's decision at no additional cost to the Owner.

B. Provide all electrical power wiring to a single point connection on the structure for service power. The single point connection shall be a NEMA 4X junction box in a fixed location.

3.2 WORKMANSHIP

A. Handle carefully and protect the equipment and appurtenances to avoid damage.

B. The equipment shall be safely secured to the wall and floor in accordance with the Engineer's design drawings.

C. Any evidence of improper installation shall be corrected by the Contractor. Care during storage, installation and startup shall be in strict accordance with manufacturer's recommendations.

D. Electrical connections, power supply, conduit runs, and anchor bolt installation shall be coordinated and supervised by Prime Contractor and checked for proper installation per manufacturer's recommendations.

E. End stops: Molded composite, resilient bumper installed in the tracks to prevent hoist trolley, and festoon carriers from rolling out of track. Bolt stops without energy absorbing bumper are not acceptable.

3.3 MANUFACTURER'S SERVICES

A. The Contractor shall require the manufacturer to furnish the services of a qualified field engineer to perform the following functions in the designated period of time. These services are to be performed at the jobsite as required by the Engineer/Owner.
   1. Check-out of installation, start-up of equipment and initial operator instruction. This service shall take place after all mechanical equipment associated is installed and mechanically operable.
   2. After equipment is fully operational, and before Owner will assume responsibility for the operation of the equipment, the equipment manufacturer's operation specialists shall instruct the Owner's operating personnel in the care, maintenance and proper operation of the equipment.

B. Drawings and Data
   1. Complete drawings, construction details, and specifications covering the trolley hoists, cranes, and appurtenances shall be submitted in accordance with submittal section.

C. Operation and Maintenance
   1. The equipment system manufacturer shall be responsible for supplying written instruction, which shall be sufficiently comprehensive to enable the operator to operate and maintain all equipment supplied by the manufacturer. Instructions shall assume the operator is familiar with such lifting equipment, but he/she has not previously operated and/or maintained the exact equipment supplied.
   2. Operation and maintenance instruction shall be specific to the equipment supplied in accordance with these specifications.
   3. All costs for the above manufacturer's functions including travel, lodging, meals and incidentals shall be considered to have been included in the contract bid price.

END OF SECTION

SECTION 43_11_16

HIGH EFFICIENCY BLOWER PACKAGES

PART 1 GENERAL

1.1 SUMMARY

A. This specification covers the work necessary to furnish and install high efficiency screw blower system as specified herein and as shown on the plans
   1. Northside WWTP - Universal Blower Pac
      a. Four (4) Blowers @ 150HP
      b. Two (2) Blowers @ 200HP
   2. Spare Parts
      a. One spare filter element for each blower (six total)
      b. Lubricants for 6 months for each blower

B. All components shall be furnished by a single manufacturer who shall be responsible for the performance and compatibility of the system.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

B. The submittals shall consist of a bill of material listing all components the blower system manufacturer will deliver; component Manufacturer's catalog cut sheets listing materials of construction, performance curves/charts, standards of design, warranty statement; prime/paint coating system plus the following information:
   1. Blower
      a. BHP at: normal system operating conditions
      b. Discharge temperature at ambient temperature and normal system operating conditions.

c. L10 bearing life calculations for each bearing.

2. Motor
   a. 1/2, 3/4, full load efficiencies and power factors
   b. L10 bearing life calculations for each bearing.
3. Silencers
   a. An attenuation performance curve for each type of silencer.
4. Pressure Relief Valve
   a. Set pressure
5. Shop drawings of assembled system stating what items will be shipped to the job site assembled and those shipped loose for field assembly.
6. Coupling drive calculations.
7. A list of all exceptions and an explanation of each non-compliance with the specifications.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

1. American National Standards Institute (ANSI) B16.1, B40.1
2. American Society of Mechanical Engineers (ASME) PTC 9
3. American Gear Manufacturers Association (AGMA)
4. American Society of Testing and Materials (ASTM)
5. Anti-Friction Bearing Manufacturers' Association (AFBMA) 9, 11
6. American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)
7. Institute of Electrical and Electronics Engineers (IEEE)
8. Mechanical Power Transmission Association
9. National Electrical Code (NEC)
10. National Electrical Manufacturers Association (NEMA) MG 1, ICS 6
11. National Fire Protection Association (NFPA) 70
12. Occupational Safety and Health Administration (OSHA)
13. Rubber Manufacturers Association (RMA)
14. Steel Structures Painting Council (SSPC)
15. Underwriters Laboratories (UL)

1.5 DELIVERY, STORAGE & HANDLING

A. Care must be taken during unloading and handling of equipment to ensure against undue strain to the blower and motor. DO NOT use lifting straps or chains under the blower or motor. Lift from under the main frame, base or use base mounted lifting lugs (if provided).

B. In storage blowers must be kept clean, free of moisture and rotated a minimum of 20 revolutions each week to maintain warranty. For storage in excess of four months, or in a damp or corrosive environment see the manufacturer's operation and maintenance manual.

C. Equipment shall be delivered to the jobsite completely factory assembled in accordance with manufacturer’s recommendations. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended storage at

the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address and packing list shall be provided with equipment at time of delivery.

D. Equipment shall be kept thoroughly dry at all times and shall be stored indoors. Equipment storage shall be protected and maintained in accordance with the manufacturer's recommendations. Equipment shall not be stored directly on the ground.

E. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment. The Contractor shall be responsible for equipment damaged during unloading transportation and storing at no additional cost to the Owner.

1.6 QUALITY ASSURANCE

A. The blower system(s) will be built by a blower system supplier who has units at 50 or more waste water treatment plants, the same size or larger than those specified below, that have been in successful operation for fifteen or more years.

B. All components shall be furnished by a single supplier who shall be responsible for the performance and compatibility of the system.

C. The blower system manufacturer shall be an authorized warranty service center for the bare blower provided.

D. Unnamed manufacturers shall provide a complete technical submittal to the engineer for review at least 15 days prior to the published bid date noting all project specific system performances, curves, drawings, maintenance requirements, and any non-compliances with the specification to qualify for use on the project.

E. Blowers, motors, and all primary components shall be manufactured in the United States with replacements and parts available from multiple sources within the United States.

1.7 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner and final inspection.

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

E. It is not intended the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacture, delays in delivery, replacement, or otherwise.

1.8 CONDITIONS OF SERVICE

APPLICATION:	SBR / Standby	Digester
NUMBER OF BLOWERS:	4	2
SITE ELEVATION, FASL:	1060	1060
DESIGN INLET TEMPERATURE, ºF:	100	100
DESIGN RELATIVE HUMIDITY, %:	36	36
SCFM ± 4 %:	788 - 2625	842 - 2806
ICFM ± 4 %:	902 - 3008	965 - 3216
DIFFERENTIAL PRESSURE, PSIG:	9.46	10.36
MAX BHP REQUIRED:	128.8	149.2
RPM LIMIT AT ABOVE SCFM:	2300	2450
MOTOR SIZE, HP:	150	200
SOUND LIMIT REQ. @ 1 METER IN FREE FIELD, dBA:	74	75

PART 2 PRODUCTS

2.1 MANUFACTURES

A. The blower system(s) shall be manufactured by Universal Blower Pac, Inc., Noblesville, Indiana. No substitutions or equals.

2.2 BLOWERS

A. Impellers
1. Hybrid screw design with internal compression, Teflon coated ductile iron; static and dynamically balanced; operate without rubbing, liquid seals or lubrication. Straight lobed impellers and hybrid lobe impellers that do not feature internal compression shall not be acceptable

B. Shafts
1. Cast integrally w/ impellers

C. Timing gears
1. Helical

D. Lubrication
   1. Oil Splash

E. Seals
   1. Labyrinth

F. Attenuation
   1. It is the intention of this section of the contract documents to procure an acoustical enclosure for the specified blower system. The Enclosures shall be designed, assembled and inspected by Universal Blower Pac, Inc. at the manufacturing site with documentation provided to verify the noise reduction demanded in these documents. Noise attenuation shall be provided as necessary to reach the specified sound limit requirement at a distance of 1 meter from the operating equipment in a free field environment. All readings shall be taken by personnel experienced in the field of sound attenuation.
   2. The enclosure herein specified shall be designed and manufactured by the blower system manufacturer specifically for the equipment supplied. Units shall be designed to be picked up by a fork truck. Each acoustical enclosure shall be shipped completely assembled. Each enclosure shall ship installed on the blower system when feasible. No field assembly shall be permitted
   3. Absorption of sound waves shall be the basis of design for the enclosure. Where feasible, only the blower shall be enclosed to meet the demanded sound level. Where necessary, the complete blower system will be enclosed to meet the level specified. With absorption considered, perforated metal inner skin retaining devices shall not be considered acceptable.
   4. Outer skin shall be a minimum 14 gauge powder coated galvannealed steel. Lesser gauges shall not be acceptable.
   5. Absorption media shall be a nominal 2-inch thick resilient material capable of returning to its original form after compression. Media shall have an overall weight of not less than 1.6 pounds per cubic foot. Media sheets shall have an upper oil resistant layer a minimum of three mils in thickness to protect the integrity of the media. Absorption media shall be interior and be fitted to each exterior facet and show contact at all points. Media shall be snug fit, be complete with pressure sensitive adhesive and held in place with washers, studs and cap nuts manufactured from corrosive resistant materials. All adhesives used in anchoring studs or other items in structure shall be high temperature industrial material rated for the application.
   6. Any access plates installed on enclosure for venting or screening shall be installed with self-starting, self-locking zinc plated screws to promote tightness. Rivets or loose fitting panels which can loosen during operation will not be accepted. Slide-in panels showing a loose fit shall provide grounds for rejection. Panels shall be constructed as to compress media on installation providing tightness and maximum sound absorption.
   7. Each enclosure will have service doors, covering at least 80 percent of each side. Hinges for the doors shall be full length and designed for the weight of the door provided. Door shall have a minimum 180 degree swing. All surfaces and edges shall be free of burs and sharp edges. The doors shall lock closed using ½ turn telescoping "T" handles.
   8. Each enclosure will be fitted with a weather hood covered acoustical intake vent rated for the SCFM listed in the "service" section and discharge pipe openings with sound seal.

9. Oil fills and drain extensions, and weather/sound seals will be fitted on all enclosure penetrations as needed
10. A cooling fan with acoustical vent shall be supplied installed on the enclosure. To ensure adequate cooling at all speeds the cooling fan will not be connected to the blower or motor shaft in any way.

2.3 MOTORS

A. The motor will be designed, constructed, warranted for two year operation by a constant-torque variable frequency drive for 10:1 turn down. The insulation shall meet or exceed the current NEMA MG1-31.4.4.2 and have a Class F thermostat in each phase. Motor and variable frequency drive must be capable of starting, accelerating and maintaining blower operating speed within the specified operating range on a continuous basis without overheating.

2.4 COUPLING

A. Motor shall be direct connected to the blower with a grid-flex type coupling having at least 2.0 service factor above the motor nameplate horsepower. Belt drives or gearing mechanisms shall not be acceptable.

2.5 DRIVE GUARD

A. Top, sides and bottom made of 14 gauge sheet steel with expanded metal front and back. Designed to allow ample ventilation for the drive, have an easy access cover and conform to applicable safety codes.

2.6 BASE

A. A steel angle or channel skeleton-frame base, elevated on legs, with continuous welded joints shall be supplied. Bare base weight shall equal 50% or more of the blower's weight, but not less than 100 pounds. The inlet filter, inlet silencer, blower, motor, drive, drive guard, discharge silencer, valves, interconnecting piping, supports and all other accessories shall be shipped assembled on the base to the extent allowable by trucking.

B. The blower system shall be provided with vibration mounts under each leg to separate the rotating equipment base frame from a separate steel sub-base. The sub-base shall be constructed of structural steel and provided with forklift slots to allow transport of the complete system. If an acoustical enclosure is provided it shall be shipped completely assembled and anchored to the sub-base. The two base frames shall be bonded with a grounding strap.

2.7 ACCESSORIES

A. Inlet Filter
1. Each blower shall have a filter with a paper media that removes 99.5% of 2 micron particles. The maximum pressure drop across the clean element and housing shall be less than 2-inches of water column.
2. Filter shall be shipped installed on the inlet silencer and positioned for indoor service. Filter shall be Universal Silencer CF or equal.

B. Silencers

1. 3" and smaller shall be of the premium, straight-through absorptive type. Larger silencers shall be of the multiple-chamber design. Silencers will have acoustically packed nozzle next to blowers operating above transition speed. Silencers with threaded connections shall have ports on each end and those with flanged connections will have ports on the side and end. Multi-chamber silencer attenuation performance shall be at least 18 dB at 63 hertz, 23 dB at 125 hertz, 27 dB at 250 hertz and 31 dB at 500 hertz.
2. Each blower shall have an inlet silencer with an air velocity of 4000 to 5700 feet per minute. Silencer shall be Progentex, Inc. series DS, RSI, DRSI, Universal Silencer, Inc. series U5, URB, RIS, Burgess Manning series CA, BMAI, BMSI Stoddard series L/C21, D13/L41, L61/63 or equal. Combination type inlet filter/silencers shall not be permitted.
3. Each blower shall have a discharge silencer. Based on inlet CFM air velocity shall be 5500 to 7000 feet per minute. Silencer shall be Progentex, Inc. series DS, RS, DRS, Universal Silencer, Inc. series U5, URB, SD, Burgess Manning series CA, BMA, BMSS, Stoddard series L/C21, D13, D32/33 or equal. Combination type discharge silencer/base frames shall not be permitted.

C. Flexible Joint

1. Each blower shall have an inlet and discharge flexible joint that matches the blower ports' size and type of connection. The joint's elastomer must be rated higher than the maximum expected service temperature and pressure.
2. Each blower shall have an external discharge flexible joint that matches the blower discharge silencer size. The joint's elastomer must be rated higher than the maximum expected service temperature and pressure. The flexible joint shall ship installed on the system.

2.8 VALVES

A. Pressure Relief Valve

1. Each blower shall be protected by a spring loaded pressure relief valve preset to start opening at half a PSIG above the PSIG listed in the "service" section, be full open at not more than 10% above the set pressure, and rated for the SCFM and PSIG listed in the "service" section. If the valve malfunctions it shall do so in the open condition to prevent blower damage.

B. Check Valve

1. Each blower shall have a discharge check valve with wafer connection, cast-iron body, cast-iron split discs and seal rated above the maximum anticipated discharge temperature. Valve shall be shipped installed on the system.

C. Isolation Valve

1. Each blower shall have a discharge isolation valve. Valves less than two inches in diameter will be ball valves. Valves 2-inches and larger shall be cast-iron wafer-body butterfly type with a locking handle. Valves more than eight feet above the floor shall have a chain wheel operator. The temperature rating of the seat must exceed the maximum anticipated discharge temperature. The valve shall be shipped installed on the system.

2.9 INSTRUMENTS

A. Filter Restriction Gauge
1. Each inlet filter shall have a filter restriction gauge that progressively measures vacuum in the filter element. A visual indicator, with a manual reset, shall lock at the current vacuum when the blower is shut off.

B. Pressure Guage
1. Each blower shall have a 2 1/2" diameter, stainless steel case, brass bourdon tube, liquid filled, 1/4 NPT connection pressure gauge with a 0-15 PSIG scale on systems operating up to 10 PSIG and 0-30 PSIG for higher pressures. Gauge shall have a 1/4" brass snubber and isolation valve. Gauge shall be Winters 800 or equal.

C. Thermometer / Temperature Switch
1. Each blower shall have a high discharge air temperature switch and thermometer. The thermometer shall have an easy to read 3-1/4" dual scale dial thermometer and a 3A 250VAC / 2A 250VDC SPDT relay in a 304 stainless steel housing. Color coordinated pointers display the current process temperature and set point. A front adjustment knob controls the set pointer. The internal mechanical switch movement prevents the set point pointer from sticking to the process indicating pointer. Brass wetted internal materials have 3 percent accuracy. The thermometer shall have a 10.5' stainless steel capillary with ½" NPT process connection. The electrical connections shall be finger-safe screw terminals. A u-clamp mounting bracket shall be included for mounting to the acoustical enclosure surface.

D. Pressure Switch
1. Each blower shall have a NEMA 3 high discharge pressure switch.

E. Filter Differential Vacuum Switch
1. Each filter shall have a NEMA 3 differential vacuum switch factory preset at 20" WC vacuum.

F. Replacement Parts
1. Each blower shall be furnished with the following spare parts:
a. One spare filter element (six total)
b. Lubricants for 6 months (for each of 6 blowers)

2.10 COATINGS

A. All equipment shall be cleaned to SSPC-SP 3 and receive a 2-3 mil DFT shop coat of phenolic alkyd, zinc-chromate, red iron oxide, rust inhibitive universal primer. The blower systems shall then receive a finish coat of Coronado Alkyd Enamel, 139 series, 50% gloss, high temperature paint. The coat shall be 2-3 mil DFT.

2.11 O&M MANUALS

A. Provided in accordance with these specifications.

PART 3 EXECUTION

3.1 ERECTION/INSTALLATION APPLICATION

A. The following points must be followed to ensure an adequate installation:
   1. The blower pad must be located on the equivalent of compacted soil substructure, which will allow the pad to remain flat, rigid, and free of resonant frequencies within the operating range of the equipment.
   2. The blower must be anchored using bolts intended specifically for dynamic loading.
   3. The unit must be installed and leveled per the manufacturer's instructions supplied in the O&M manual.

3.2 START-UP AND TESTING

A. The blower system supplier shall provide the services of a factory trained technician to check installation, verify proper operation and train the owner's personnel in proper maintenance procedures. Start-up services shall be a minimum of one day.

SECTION 43_23_31.35

NON-POTABLE WATER PUMPS

PART 1 GENERAL

1.1 SUMMARY

A. This specification covers the work necessary to furnish and install non-potable water pumps as specified herein and as shown on the plans
   1. Northside WWTP
      a. Three (3) (one as shelf spare)
      b. 200 gpm @ 207'
   2. Spare Parts
      a. One (1) shelf spare pump

B. Pumps and all associated components as listed above shall be of the same Manufacturer to obtain standardization of performance, operation, spare parts, maintenance and Manufacturer's services.

C. Supplier / manufacturer to review and match requirements of Belt Filter Press. Those requirements supersede any conflicting information provided herein (including pump sizing.)

D. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

1.5 DELIVERY, STORAGE & HANDLING

A. Equipment shall be delivered to the jobsite completely factory assembled. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address and packing list shall be provided with equipment at time of delivery.

B. Any electrical motors and components shall be kept thoroughly dry at all times and shall be stored indoors. Equipment storage shall be protected and maintained in accordance with the manufacturer's recommendations. Equipment shall not be stored directly on the ground.

C. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation and in accordance with manufacturers recommendation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

1.6 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

E. It is not intended the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacture, delays in delivery, replacement, or otherwise.

PART 2 PRODUCTS

2.1 DESCRIPTION

A. Quantity to be Furnished:
1. Non-Potable Supply Pumps - Three (3) (one as shelf spare)

B. Dimensional and Design Information
1. Non-Potable Water Supply Pump

a.	Liquid Pumped	- Final Effluent
b.	Design Flow Rate - gallons / minute	- 200
c.	Total Head Required - ft.(design)	- 207
d.	Motor - Horsepower (maximum)	- TBD based on flow/head
e.	Motor Service Factor	- 1.15
f.	Motor Enclosure Type	- WP1
g.	Motor Starting Method	- VFD
h.	Motor Ambient Operating Temperature	- 40 C
i.	Electrical Power Volt/Phase/Hz	- 460/3/60
j.	Pump Speed - RPM (maximum)	- 3500
k.	Discharge Size - inches (minimum)	- 6
l.	Discharge Type - ANSI Flange	- Flanged
m.	Casing Working Pressure-PSI(minimum)	- 125

C. Factory Painting
1. Pump, coupling guard and support base shall be prime painted with system compatible with finish coating system specified in Coating Section of these specifications. The motor shall be finished painted with the Manufacturer's standard enamel finish coating and furnished with adequate touch-up paint to repair field damages.

2.2 MATERIALS

A. Non-Potable Water Supply
1. Non-Potable Water Supply
2. Suction Manifold or Bell - A48 Class 30 Cast Iron
3. Bowl - A48 Class 30 Cast Iron
4. Impeller - B584 C83600 Bronze
5. Bowl Wear Ring - B505 C93200 Bronze
6. Bowl Bearings - B505 C93200 Bronze
7. Bowl Sand Collar - B505 C93200 Bronze
8. Impeller Wear Ring - B505 C93200 Bronze

9. Bowl Flange Cap Screw or Stud and Nuts- 303 stainless steel
10. Pump Shaft - A582 - 416 stainless steel
11. Column Pipe - ASTM A 53, grade A, schedule 40 steel pipe
12. Column Line Shafting - AISI 1045 steel
13. Column Coupling - A53 Grade b Steel
14. Column Top Flange Cap Screws - 303 stainless steel
15. Top Bowl Bearing - B505 C93200 Bronze
16. Intermediate Bowl Bearing - B505 C93200 Bronze
17. Suction Bearing - B505 C93200 Bronze
18. Connector Bearing - B505 C93200 Bronze
19. Column Shaft Bearing Retainer Ring - 303 stainless steel
20. Discharge Head – Carbon Steel
21. Packing Container - Class 30 Cast Iron
22. Packing Washer - Brass
23. Packing - Graphited Rope
24. Packing Gland - Cadmium plated Class 30 cast iron
25. Packing Gland T-Bolt - 316 Stainless Steel
26. Packing Gland Clamp - 302 Stainless Steel
27. Packing Gland Nut - 316 Stainless Steel
28. Packing Gland Gasket - Vellumoid
29. Packing Gland Cap Screw - Steel
30. Top Shaft – AISI 1045 Steel
31. Top Shaft Seal Ring - Neoprene
32. Top Shaft Coupling - 410 Stainless Steel
33. Sole Plate - Carbon Steel or CI
34. Sole Plate Gasket - Vellumoid
35. Sole Plate Cap Screws - Carbon Steel

2.3 COMPONENTS

A. Non-Potable Water Supply Pumps

1. The pump bowl assembly shall be of close grained cast iron having a minimum tensile strength of 30,000 pounds per square inch, free from blow holes, sand holes, and all other faults; accurately machined and fitted to close dimensions.
2. The impeller shaft shall be of stainless steel and shall be supported by bronze or neoprene bearings located on both sides of each impeller. The impeller shall be of the enclosed type and shall be of bronze, of heavy construction, accurately fitted and balanced. The impeller shall be locked securely to the impeller shaft with a tapered lock bushing. The bowls and impellers shall be designed with smooth passage to assure efficient operation. The impellers shall be adjustable by means of a top shaft adjusting nut.
3. The pump column pipe shall be furnished in interchangeable sections not over 5 feet in length, and shall be threaded.
4. The line shafting shall be of ample size to operate the pumps without distortion or vibration. The shafts shall be furnished in interchangeable sections not over 5 feet in length, and shall be coupled with extra-long threaded steel couplings machined from solid bar steel. The shaft shall be fitted with stainless steel replaceable sleeves. The column assembly shall have bronze guides fitted into the coupling and secured in place with butted pipe ends. Each guide shall contain a water lubricated rubber bearing designed for vertical turbine pump service.

5. The discharge head shall be the above ground discharge type with machined mounting surface designed for standard NEMA 1 flange motor, the discharge flange shall be furnished with 125-pound ANSI drilling the discharge head shall be fitted with a packing container designed for lubrication with the pumped liquid. A threaded connection shall be provided to allow the lubrication liquid collected in the interior ring of the discharge head to be piped to a local drain. A seal ring shall provided to prevent the lubrication liquid from leakage up onto the motor bearings. Hand hole openings large enough to provide easy access to all adjustable components shall be furnished. Lifting lugs adequately designed to support the entire weight of the pump assembly shall be integrally cast into the discharge head.
6. Sole plate with gasket and cap screws shall be furnished to provide a water tight seal between concrete base and pump and to allow for removal of pump from base without permanently damaging the water tight seal.
7. Drive Motor - The motor shall be the squirrel-cage induction alternating current inverter duty type. The motor nameplate horsepower rating shall not be exceeded at any head capacity point on the pump curve. The motor shall conform to the following:

a.	Synchronous Speed	3600 RPM or as approved
b.	Slip	3 percent maximum at full load
c.	Voltage, phase, & Frequency	460 volts, 3 phase, 60 Hz
d.	Mounting	Vertical, hollow shaft
e.	Enclosure	Weather protected, Type I
f.	Service Factor	1.15
g.	Duty Cycle	Continuous
h.	Ambient Temperature Rating	40 degrees C
i.	Starting Method	VFD
j.	Bearing Lubrication	Manufacturer's standard
k.	Bearing Bio Life	B10 Life-Ave. 25 Years, min 5 Yrs.

PART 3 EXECUTION

3.1 INSTALLATION

A. The general contractor shall assume full responsibility for coordination of the entire project, including verification that all structures, piping, coating systems and equipment components are compatible. The general contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal of manufacturer's shop and installation drawings, test results or other data as required and as specified herein.

C. Installation of equipment shall be in full conformance with the manufacturer shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between manufacturer's instructions and the contract documents, the contractor shall follow the Engineer's decision at no additional cost to the owner.

3.2 WORKMANSHIP

A. Handle carefully and protect the pump and appurtenances to avoid damage. If the pump and column are laid down, support them with blocks to prevent damage.

B. Mount pump and driver on suction barrel as shown on the Drawings. The size of the suction barrel shall be in accordance with pump manufacturer's recommendations.

C. Adjust pump assembly such that the driving unit is properly aligned, plumb, and level with the driven unit and the interconnecting shaft and coupling. Flexible coupling shall not be considered to compensate for misalignment. Install all equipment in accordance with manufactures instructions.

D. Any evidence of pump or driver misalignment, noisy operation, or other signs of improper setting shall be corrected by the Contractor. Care during storage, installation and lubrication shall be in strict accordance with the manufacturer's recommendations.

3.3 ANCHORAGE

A. Anchor bolts shall be furnished for each item of equipment. Anchor bolts, together with templates or setting drawings, shall be delivered sufficiently early to permit setting the anchor bolts when the structural concrete is placed. Two nuts shall be furnished for each bolt. Anchor bolts shall be in place prior to concrete pour.

B. Types of anchorage:
   1. All cast-in-place anchorage shall be 304 stainless steel.
   2. Drill-in anchorage shall be epoxy adhesive type and shall be used only if recommended and allowed by manufacturer.

3.4 LUBRICATION

A. Equipment shall be adequately lubricated by a system which does not require more than once-a-week operator attention, does not require attention during start-up or shutdown and does not waste lubricants.

B. The contractor shall provide lubricants of the type recommended by the equipment manufacturer in sufficient quantity to fill all lubricant reservoirs and to replace all consumption during equipment initial operation, performance testing and operation prior to acceptance of equipment by the owner.

3.5 FIELD PAINTING

A. Painting shall be in accordance with the high performance coating section of these specifications. All ferrous materials which are not non-corrosive shall be painted with epoxy paint systems. Items to be painted which will be exposed to submerged or wet conditions shall be painted with the coal-tar epoxy paint system. Paint systems in contact with water to be used for potable public water supply systems shall be approved by the FDA for this application.

B. Minor defects in the hot-dipped galvanized coating caused by shipping, handling or installation shall be repaired after equipment installation. The defects shall be thoroughly

cleaned and wire-brushed to remove all foreign substances, wiped clean with a damp rag, thoroughly dried, and coated with at least 6 mils of zinc-rich compound.

3.6 MANUFACTURER'S SERVICES

A. The Contractor shall require the manufacturer to furnish the services of a qualified field engineer to perform the following functions in the designated periods of time. These services are to be performed at the jobsite.
   1. Check-out of installation, start-up of equipment and initial operator instruction. This service shall take place after all mechanical equipment associated with the control system is installed and mechanically operable.
   2. After equipment is fully operational, and before Owner will assume responsibility for the operation of the equipment, the equipment manufacturer's operation specialists shall instruct the Owner's operating personnel in the care, maintenance and proper operation of the equipment.

B. Field Test
   1. Prior to plant startup, all equipment described herein shall be inspected for proper alignment, quiet operation, proper connections, and satisfactory performance by means of a functional test.
   2. The pump and motor assembly shall be field tested to verify vibration is not in excess of the limits stated in the latest revision of Hydraulic Institute and NEMA MG 1.
   3. The pumps, motors, and controls shall be given an operational test in accordance with the standards of the Hydraulic Institute. Recordings of the test shall substantiate the correct performance of the equipment at the design head, capacity, suction lift, speed and horsepower as herein specified.
   4. Units failing to meet the Specifications and to the satisfaction of the Owner must be more accurately tested in accordance with Hydraulic Institute Standards. If the pump fails the second test, the unit will be rejected, and the Contractor shall remove the unit that is rejected, and the Contractor shall furnish a unit that will perform as specified.

C. Instructions for installation of the pump and related appurtenances shall be written and furnished by the manufacturer. Contractor shall follow these instructions in installing the equipment.

D. Operation and maintenance materials
   1. The pump manufacturer shall be responsible for supplying written instruction, which shall be sufficiently comprehensive to enable the operator to operate and maintain the pump and all equipment supplied by the manufacturer. Instructions shall assume that the operator is familiar with pumps, motors, piping, valves, and controls, but that he has not previously operated and/or maintained the exact equipment supplied.
   2. The instruction shall be prepared as a system manual applicable solely to the pump and equipment supplied by the manufacturer to these specifications, and shall include those devices and equipment supplied by him.
   3. Operation and maintenance instruction shall be specific to the equipment supplied in accordance with these specifications. Instruction manuals applicable to many different configurations and pump stations, and which require the operator to selectively read portions of the instructions shall not be acceptable.

E. All costs for the above manufacturer functions including travel, lodging, meals, and incidental shall be considered to have been included in the Contractor's lump sum bid price.

END OF SECTION

SECTION 43_23_58.03

POSITIVE DISPLACEMENT ROTARY LOBE PUMPS

PART 1 GENERAL

1.1 SUMMARY

A. This specification covers the work necessary to furnish and install positive displacement rotary lobe pumps as specified herein and as shown on the plans.
   1. Northside WWTP – 2 units - Netzsch Tornado (140 gpm @30')
   2. Spare Parts:
      a. One rear wear plates for each pump model.
      b. One front wear plates or front hinged front cover for each model.
      c. One set of radial wear plates or two radial housing sections for each model pump (if applicable).
      d. One set of rotors for each model pump.
      e. One set of mechanical seals for each model pump.
      f. One front cover o-ring or gasket for each model pump.

B. Supplier / manufacturer to review and match requirements of Belt Filter Press. Those requirements supercede any conflicting information provided herein (including pump sizing.)

C. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

E. It is not intended the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacture, delays in delivery, replacement, or otherwise.

PART 2 PRODUCTS

2.1 MATERIALS/EQUIPMENT

A. General:
   1. Pump Type: Heavy-duty rotary lobe, horizontal pumps.
   2. Major Required Features:
      a. Pumps must be designed with a Gearbox Security System (GSS), an open gap between pump head and pump bearing housing in order to prevent the product from entering the bearing housing in the event of shaft seal failure.
      b. Pumps that do not have an open gap between the wet end and the bearing housing will not be acceptable.
   3. The equipment covered by these Specifications shall be of standard design, and of proven ability as manufactured by reputable concerns having long experience in the production of such equipment. The equipment furnished shall be designed, constructed, and installed in accordance with the best practice and methods, and shall operate satisfactorily when installed as shown on the Drawings.

4. All equipment shall be designed and built for 24-hour continuous service at any and all points within the specified range of operation, without overheating, and without excessive vibration or strain.
5. Pump design shall allow run dry for a temporarily period of time, without damage to the pump, or its internals.
6. Pumps must have design option to integrate a dry running protection in the rotor case in terms of unlikely very long period of dry running.
7. The pumping units required under this section shall be complete. All parts shall be so designed and proportioned as to have liberal strength, stability, and stiffness and to be especially adapted for the service to be performed. Ample room for inspection, repairs and adjustment shall be provided.
8. All working parts of the pumps and motors, such as bearings, wearing rings, shaft, sleeves, etc., shall be standard dimensions built to limit gauges or formed to templates, such that parts will be interchangeable between like units and such that the Owner may, at any time in the future, obtain replacement and repair parts for those furnished in the original machines.
9. Mechanical equipment, including drives and electric motors shall be supplied and installed in accordance with applicable OSHA regulations. The noise level of the pumps shall not exceed 85 dBA measured 3 meters from the unit under free field conditions.
10. All lubrication fittings shall be brought to the outside of all equipment so that they are readily accessible from the outside without the necessity of removing covers, plates, housings, or guards.
11. Performance Requirements:
    a. 140 GPM @ 30' TDH, 7.5 HP motor.
    b. There shall be no significant vibration or change in vibration and noise level over the entire listed range of operating conditions of the pumping system.
12. Maximum motor speed shall not exceed 1800 rpm.

B. Pump Construction
1. Pump Housing:
    a. The pump housing shall be constructed of cast iron GG25. Suction and discharge ports shall be 150 lb. ANSI flanged.
    b. The housing shall be of modular construction with components that make up the housing dowelled to provide and maintain repeatable relative position. In terms of wear or unlikely damages, radial housing sections or wear plates must be easily removable.
    c. The pump head flanges shall provide a smooth transition from circular port to connections at the flanges, to a full width rectangular port at the rotor chamber, with a greater cross sectional area than at the flanged port connection, to allow for unimpeded passage of solids.
    d. The front cover shall incorporate a compression fit seal for sealing between front cover and rotor case. All fasteners shall be stainless steel.
2. Radial wear plates: Pumps without replaceable radial housing sections, shall be provided with radial wear plates.
    a. The removable wear plates shall be 40 Rockwell C AISI 4140 carbon steel wear plates that will protect the wear of the rotor case.
    b. The wear plates must be easy to remove and fixed/bolted at the in- and outlet of the rotor case.

3. Rear and Front wear plates: Pumps must have rear and front wear plates. The front and rear wear plate shall be easy to remove and easily accessible.
4. Front Cover:
    a. The pumps shall be provided with a quick release front cover or hinged to open. Front covers shall incorporate replaceable wear plate in an abrasion resistant material Hardox 500.
    b. The quick release front cover must be held with only 4 screws at the housing, thus maintain the repeatable relative position.
5. Rotors:
    a. The pump shall be fitted with a pair of intermeshing rotors with a minimum of four lobes in helical low pulse design, in order to give lowest possible pulsation and thus safe operation for the complete sludge handling process. The rotors must be constructed from cast iron GG25 covered with an abrasion resistant elastomer.
    b. The elastomeric coated rotors shall be guaranteed against "bonding failure" otherwise known as delamination.
    c. The rotors shall be end-mounted on the shafts and held precisely in the radial position. This shall ensure the positive positioning of the rotors on the shaft as well as providing precise intermeshing clearances around the rotors. The rotors shall be axially locked into position.
6. Shafts:
    a. The shafts shall be constructed of carbon steel and be appropriately sized and heat treated to ensure a smooth operation and concentric positioning on the rotors.
    b. Total length of shafts must be as short as possible in order to avoid any shaft deflection. Long shaft overhang at pump head side is not acceptable
    c. The motor driven shaft shall be either the upper shaft or lower shaft as determined by the centerline height of the driver.
    d. The shafts shall be non-wetted at all points and sealed from the pumped liquid.
    e. Shafts shall be fitted with replaceable stainless steel sleeves.
    f. Shafts with sludge contact below shaft seal sleeve are not acceptable due to risk of corrosion.
7. Bearings and Timing gears: Each shaft shall be supported by heavy-duty cylindrical- and roller bearings. Synchronization of shafts shall be done by hardened and ground high precision timing gears.
    a. The bearings must be housed in the gearbox and positioned either side of the timing gears in order to give the best shaft support.
    b. The bearings and timing gears shall be well lubricated by oil contained the gearbox lubrication reservoir.
8. Pumps without oil lubricated bearings shall have bearing isolators.
    a. Bearing Isolators:
        1) The bearings shall be completely protected from water or sludge by grease packed stainless steel labyrinth bearing isolators providing full protection with the pump either operating or idle. The gearcase wall adjacent to the rotor case shall be sealed from water or sludge penetration by a pair of non-wearing stainless steel AISI 316, grease filled, labyrinth-bearing isolators.
9. Gearcase:
    a. The gear case shall be constructed of cast iron and incorporate a separate oil reservoir for the bearings of each shaft to ensure adequate lubrication

at low running speed. Sealed expansion chambers shall be used for vent caps preventing any air transfer to and from the gearbox.

b. The design shall be a gear case security system (GSS) or open gap for highest possible reliability. Pumps without open gap between gear case and rotor case are not acceptable.

10. Mechanical Seals: Each pump shall be supplied with mechanical shaft seals. Shaft seals must be of heavy duty simple and robust design in order to allow high operation safety and easy servicing. The rotating and static seal faces must be abrasive resistant silicon carbide to silicon carbide seal surfaces, elastomer in NBR quality. Each shaft seal must have flushing connections for grease, oil or water lubrication. Shaft seals must be front loading seals and internal mounted. Designs requiring the removal of the rotor case for seal replacement will not be acceptable.
11. Couplings: Furnish a flexible, forged steel coupling of an approved type for connecting the pump, reducer and motor. Provide couplings of the proper size to transmit the power required to drive the pump under all conditions of operation.
12. OSHA approved guards shall be furnished over all couplings.
13. Pump Dimensions and Arrangement: Each pump shall be arranged in an in-line, L-Shape or Piggy-back arrangements as shown on the drawings.
14. Common Steel Base: Factory mount pump and motor, coupled together, on a common groutable steel base, properly braced to form a rigid support for the entire unit. Factory align the units on the base prior to shipment (final alignment to be performed in field following base grouting and piping connections).

C. Pump Manufacturer:
1. The following pump manufacturer and model has been approved for use on this contract through a formal pre-selection process. No other pump manufacturer or model will be allowed.
a. Manufacturer: NETZSCH TORNADO®

D. Motors:
1. Motor shall be non-overloading at any performance point without using any of the service factor.

E. Grout: Comply with Specification Sections

2.2 SPECIAL TOOLS, SPARE PARTS AND MAINTENANCE MATERIALS

A. Special Tools:
1. Each pump shall be furnished with any special tools required to maintain and adjust equipment.

B. Spare Parts: Provide:
1. One rear wear plates for each pump model.
2. One front wear plates or front hinged front cover for each model.
3. One set of radial wear plates or two radial housing sections for each model pump (if applicable).
4. One set of rotors for each model pump.
5. One set of mechanical seals for each model pump.
6. One front cover o-ring or gasket for each model pump.

C. Maintenance Materials:

1. Provide lubricants (greases and/or oils) necessary to maintain each pump for the two years of operation.

2.3 PAINTING

A. Provide a manufacturers standard factory applied epoxy coating to pump, reducer, motor, base and coupling guards.

2.4 NAMEPLATE

A. Each pump shall be provided with a stainless steel nameplate suitably attached. Nameplate shall also be attached to the pump which shall contain identification of the frame and serial number, type and model number. Provide nameplates with similar information for motor and gear reducer.

2.5 SOURCE QUALITY CONTROL

A. Factory Testing:
1. Factory testing in accordance with the standards of the Hydraulic Institute shall be required for all pumps. All pumps shall be tested complete with drives at the Lobe Pump Manufacturer facility.
2. Certified pump performance curves shall be submitted, including head, capacity, and brake horsepower for each pump supplied.
3. All Lobe Pumps shall be tested at full speed and complete staging through the specified range of flow, and head/capacity/efficiency curves plotted at maximum output speed. During each test, the pump shall be run at each head condition for sufficient time to accurately determine discharge, head, power input, and efficiency.
4. If any pump tested fails to meet any specific requirement it shall be modified until it meets all specification requirements. If any pump tested fails to meet the efficiency requirements at any of the listed flow or head conditions listed and all reasonable attempts to correct the inefficiency are unsuccessful, the pump(s) shall be replaced with unit(s) which meet the specified requirements.
5. Submit Factory Test Report for each tested pump.

PART 3 EXECUTION (NOT USED)

END OF SECTION

SECTION 43_25_13.13

SUBMERSIBLE PUMP SYSTEM

PART 1 GENERAL

1.1 SUMMARY

A. Contractor shall provide a complete submersible pumping system. The supplier shall coordinate the equipment requirements with the mechanical and electrical requirements of the Contract Documents, shall integrate the equipment furnished with the requirements shown on the electrical drawings, and provide complete installation and interconnection drawings and diagrams required for installation, start-up, testing and adjustment.

B. The pumping system shall consist of submersible pumps, the electrical components, discharge check valves, plug valves, and a level control system located as shown on the Drawings and specified herein.

C. All pumps when shipped shall be provided with a stainless steel tag or other system as recommended that denotes basin name, HP & GPM minimum so that Contractor may visually verify pumps are being placed in correct location.

D. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

1.5 DELIVERY, STORAGE & HANDLING

A. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling, and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address. Packing list shall be provided with equipment at time of delivery.

B. Any electrical equipment shall be kept thoroughly dry at all times and shall be stored indoors. Equipment storage shall be protected and maintained in accordance with the manufacturer's recommendations. Equipment shall not be stored directly on the ground.

C. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

1.6 QUALITY ASSURANCE

A. The Contractor shall note that the Submersible Pumping System is an integrated system which shall be furnished, factory assembled and integrated by one manufacturer or supplier who shall provide all of the equipment and appurtenances regardless of the manufacturer of the various components.

B. The entire System shall be designed, coordinated and supplied by a company regularly engaged in the business of designing and fabricating pumping systems. The pumps and motors shall be manufactured by ISO-9001 certified companies only. All pumps shall be as manufactured by Fairbanks Morse. No substitution or equals.

1.7 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year from the date of final acceptance by Owner, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required

to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

PART 2 PRODUCTS

2.1 SUBMERSIBLE PUMPS

A. General

1. Furnish and install pull-up submersible pumping units as described below, UL Listed for explosion proof Class 1, Group C and D hazardous location in air or submersible in water and sewage. The pumps shall be clockwise rotation and constructed to automatically connect to the discharge piping when lowered into place.

B. Conditions of Operation

1. Each pump shall be capable of providing the following hydraulic conditions when pumping domestic sewage:

SS High Service Pumps:

Quantity	Three (3), One is Spare
Capacity	3,600 GPM
Total Dynamic Head	172 Ft.
Minimum Dynamic Head	148 Ft.
Minimum Pump Efficiency at Design	72 %
BHP at Design	231 HP
Motor Size Required	250 HP
Maximum Speed	1785 RPM
Minimum Shutoff Head	282 Feet
Maximum NPSHr at Design	28.35 Feet
Minimum Solid Size	3 Inches
Size Guide Rails Required	3" SCH 40 304SS Pipe
Discharge Elbow Size(Minimum)	10"
Grout Pad Height Required Under Base Elbow	6.5"
Minimum Pump Weight	5,700#

SS Stormwater Pumps:

Quantity	Two (2)
Capacity	6,000 GPM
Total Dynamic Head	36 Ft.
Minimum Dynamic Head	12 Ft.
Minimum Pump Efficiency at Design	82.5 %
BHP at Design	68 HP
Motor Size Required	75 HP
Maximum Speed	889 RPM
Minimum Shutoff Head	57 Feet
Maximum NPSHr at Design	15.9 Feet

Minimum Solid Size	3.25 Inches
Size Guide Rails Required	3" SCH 40 304SS Pipe
Discharge Elbow Size(Minimum)	14"
Grout Pad Height Required Under Base Elbow	5"
Minimum Pump Weight	4,700#

SS Stormwater Return Pumps:

Quantity	Two (2)
Capacity	3,200 GPM
Total Dynamic Head	12 Ft.
Minimum Dynamic Head	-2 Ft (Pinch Valve added)
Minimum Pump Efficiency at Design	83 %
BHP at Design	16.4 HP
Motor Size Required	20 HP
Maximum Speed	711 RPM
Minimum Shutoff Head	26.6 Feet
Maximum NPSHr at Design	10.3 Feet
Minimum Solid Size	4.5 Inches
Size Guide Rails Required	3" SCH 40 304SS Pipe
Discharge Elbow Size	12"
Grout Pad Height Required Under Base Elbow	6.5"
Minimum Pump Weight	3,400#

NS SBR Motive Pumps:

Quantity	Three (3)
Capacity	9,519 GPM
Total Dynamic Head	19 Ft.
Minimum Dynamic Head	13 Ft.
Minimum Pump Efficiency at Design	81.5 %
BHP at Design	56 HP
Motor Size Required	75 HP
Maximum Speed	507 RPM
Minimum Shutoff Head	28 Feet
Maximum NPSHr at Design	10 Feet
Minimum Solid Size	4.37 Inches
Size Guide Rails Required	3" SCH 40 304SS Pipe
Discharge Elbow Size	20"
Grout Pad Height Required Under Base Elbow	6.5"
Minimum Pump Weight	6,000#

NS Headworks:

Quantity	Four (4)
Capacity	3,500 GPM
Total Dynamic Head	59 Ft.
Minimum Dynamic Head	20 Ft.
Minimum Pump Efficiency at Design	75 %
BHP at Design	67 HP
Motor Size Required	75 HP
Maximum Speed	1185 RPM
Minimum Shutoff Head	78 Feet
Maximum NPSHr at Design	26 Feet

Minimum Solid Size	4.5 Inches
Size Guide Rails Required	3" SCH 40 304SS Pipe
Discharge Elbow Size	12"
Grout Pad Height Required Under Base Elbow	6.5"
Minimum Pump Weight	3,900#

NS Pre-Eq to SBR:

Quantity	Four (4)
Capacity	4,700 GPM
Total Dynamic Head	20 Ft.
Minimum Dynamic Head	-4 Ft. (BFV on SBR Assists)
Minimum Pump Efficiency at Design	79 %
BHP at Design	30.3 HP
Motor Size Required	40 HP
Maximum Speed	711 RPM
Minimum Shutoff Head	32 Feet
Maximum NPSHr at Design	11 Feet
Minimum Solid Size	5.25 Inches
Size Guide Rails Required	3" SCH 40 304SS Pipe
Discharge Elbow Size	14"
Grout Pad Height Required Under Base Elbow	5"
Minimum Pump Weight	4,700#

NS Stormwater Return:

Quantity	Two (2)
Capacity	3,250 GPM
Total Dynamic Head	22 Ft.
Minimum Dynamic Head	-17 Ft. (pinch valve added)
Minimum Pump Efficiency at Design	81.5 %
BHP at Design	25.7 HP
Motor Size Required	30 HP
Maximum Speed	889 RPM
Minimum Shutoff Head	40 Feet
Maximum NPSHr at Design	14.9 Feet
Minimum Solid Size	4.5 Inches
Size Guide Rails Required	3" SCH 40 304SS Pipe
Discharge Elbow Size	12"
Grout Pad Height Required Under Base Elbow	6.5"
Minimum Pump Weight	3,400#

NS Effluent:

Quantity	Three (3)
Capacity	6,000 GPM
Total Dynamic Head	30 Ft.
Minimum Dynamic Head	3 Ft.
Minimum Pump Efficiency at Design	77 %
BHP at Design	57 HP
Motor Size Required	75 HP
Maximum Speed	889 RPM
Minimum Shutoff Head	47.7 Feet
Maximum NPSHr at Design	17.7 Feet

Minimum Solid Size	5.25 Inches
Size Guide Rails Required	3" SCH 40 304SS Pipe
Discharge Elbow Size	14"
Grout Pad Height Required Under Base Elbow	5"
Minimum Pump Weight	4,700#

C. Impeller

1. The impeller shall be of one-piece, single suction, enclosed two-vane, radial flow design with well-rounded leading vane edges and thick hydrofoil shape with large openings to prevent the accumulation of solids and stringy material through the impeller. The impeller shall be made of close-grained cast iron conforming to ASTM A48 Class 30. It is to be balanced and secured to a straight fit on the shaft by means of a key and fastener. Wiper vanes are not allowed. The impeller waterways and clearance between the impeller periphery and volute cutwater shall be capable of passing a sphere as listed above and is to be matched to a constant velocity equalizing pressure volute. Impeller shall be trimmed to specifically meet the conditions of operation and be fitted with an axial (face-type), stainless steel wear ring with a minimum 300-350 Brinell hardness. The impeller shall be adjustable by use of shims to restore the wear ring clearance in the field. **Radial or non-adjustable wear rings will not be accepted.**

D. Volute & Sliding Bracket

1. The volute shall be one-piece cast with side centerline flanged discharge. The volute shall be made of close-grained cast iron conforming to ASTM A48 Class. It is to be one-piece, constant velocity equalizing pressure with smooth fluid passages large enough to pass any size solid that can pass through the impeller. Volute shall be fitted with an axial (face-type) stainless steel wear ring with a minimum 300-350 Brinell hardness. Diffusion vanes are not permitted. The sliding bracket assembly shall be a part of the pumping unit constructed so that when lowered to the discharge base/elbow, the knifing action of the vertical metal-to-metal seal provides a self-cleaning, non-clogging, UL Listed, non-sparking assembly. **Pump pull-out systems that are not UL Listed non-sparking will not be accepted.**

E. Guiderail / Bracket

1. Two stainless steel guide rails shall be provided on which the pump rides when being raised or lowered in the sump and mount on the discharge base/elbow. Single rail or cable guide systems are not acceptable. The rails shall align the pump with the discharge elbow as it is lowered into place. A stainless-steel upper guide rail bracket shall be furnished to support and align the rails at the top of the sump. For guide rail lengths greater than 20 feet, a stainless-steel intermediate rail guide bracket shall be provided every ten feet.

F. Discharge Base

1. A rigid discharge base-elbow to support the total weight of the pumping unit shall be provided. The base is to be bolted directly to the floor with the 90 Degree elbow having a 125 lb. ANSI flange discharge vertically.

G. Motor

1. Each submersible solids-handling pump shall be driven by a completely sealed, electric submersible squirrel cage induction motor, 1.15 service factor, 460 volts, 3 phase, 60 Hertz power. The motor nameplate horsepower rating shall not be exceeded by the brake horsepower requirements at any head and capacity condition on the operating curve. Motor shall be rated for VFD service.
2. The submersible motor shall be UL Listed for Class I, Division 1, Group C and D explosion-proof hazardous locations as defined by the National Electric Code. All electrical parts shall be housed in an air-filled, cast iron, water-tight enclosure which is sealed by the use of O-rings and shall have rabbet joints with an extra-large overlap.
3. The stator-winding and lead shall be insulated with moisture-resistant Class F insulation for continuous duty in 40 Degree C rise liquids. The motor shall be designed for continuous duty capable of minimum of ten (10) starts per hour. The motor shall not draw more than the nominal listed motor HP at rated voltage on point on the operating curve. Automatic reset, normally closed thermal overloads shall be imbedded in the motor winding to provide overheating protection. Motor winding thermostats shall be connected to an electrical controller per local and state codes, and the National Electric Code.
4. Motor shaft shall be 416 stainless steel. Carbon steel shafts or shaft sleeves are not acceptable. The rotor is to be dynamically balanced to meet NEMA vibration limits; all hardware to be stainless steel. Cable leads are to allow the connection of a cable to the motor, to be accomplished in the field without soldering cable. All leads are to be sealed and designed to prevent cable-wicking to conduit box located on top of the motor. The sealing system shall consist of a rubber grommet followed by epoxy that is high in adhesive qualities and has a low coefficient of expansion. Each cable wire is to have a small section of insulation removed to establish a window area of bare wire and each wire is to be untwisted and surrounded by epoxy potting material. A cable strain relief mechanism shall be an integral part of the sealing system. Cable sealing system shall be capable of withstanding an external pressure test of 1200 PSI as well as a cable assembly pull test as required of Underwriters Laboratories. Singular grommet or other similar sealing systems are not acceptable. Motor shall be supplied with 30 feet of multi-conductor type "SOW-A" or "W" power cable and control cable. Cable sizing shall conform to NEC specifications and be UL listed.
5. Power and control leads shall be terminated on a sealed terminal board. The terminal board and its bronze lugs shall be O-ring sealed.
6. Each pump shall be provided with two separate tandem-mounted mechanical seals to prevent the pumped liquid from entering the rotor/stator cavity area to ensure reliability of operation. The upper and lower seals are mounted to rotate in the same direction. The mechanical seals must be commercially available and manufactured by a major seal manufacturer such as John Crane or equal.
7. The upper seal is to be completely immersed in an oil bath and seals the oil chamber and the motor housing. The lower seal mating surfaces are to be immersed in the oil bath sealing the pump volute and the oil chamber. Each seal shall be held in contact by its own spring system and require neither maintenance nor adjustment, but shall be easily inspected and replaceable. The lower seal spring shall be protected from trash in the pumped fluid by a spring cover, which extends over the entire length of the compressed seal spring. Pressure generated by the pump assists in sealing the mating surfaces of the lower seal.
8. Seal materials for the upper and lower seals shall be stainless steel and Buna-N components. The upper seal shall have the carbon rotating face rotating against a

Ni-Resist stationary face. The lower seal shall have a silicon carbide rotating face against a tungsten carbide stationary face.

9. Two moisture detection probes shall be installed so that they will detect moisture in either the seal or stator cavity measuring resistivity between the probes. They shall be wired internally to the control cable connection at the top of the motor. Float type devices located in the rotor/stator area or single probe-to-ground moisture detectors measuring continuity are not acceptable. O-ring sealed inspection plugs shall be provided in the mechanical seal oil chamber for ease in inspection, draining, and filling of oil.
10. The pump shall rotate on a minimum of two bearings permanently lubricated but capable of being re-greased, suitable for a minimum L10 bearing life of 40,000 hours. All mating surfaces shall be machined and fitted and sealed with O-rings. Fittings shall be accomplished by metal-to-metal contact between each machine surface, resulting in controlled compression with O-rings, without requirement of a specific torque limit. No secondary sealing compound shall be used.
11. A heavy-duty stainless steel lifting bail shall be included and be of adequate strength to lift the entire pump and motor assembly.

H. Lifting Chains

1. Each pump shall be provided with 304 stainless steel chain of sufficient length and lifting capacity to allow for the installation and removal.

PART 3 EXECUTION

3.1 GENERAL

A. The general contractor shall assume full responsibility for coordination of the entire project, including verification all structures, piping, coating systems and equipment components are compatible. The general contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal or manufacturer's shop and installation drawings, test results or other data as specified herein.

C. Installation of equipment shall be in full conformance with the manufacturer's shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between manufacturer's instructions and the contract documents, the contractor shall follow the Engineer's decision at no additional cost to the Owner.

3.2 WORKMANSHIP

A. Handle carefully and protect the equipment and appurtenances to avoid damage.

B. The equipment shall be safely secured to the wall and floor in accordance with the Engineer's design drawings. All plumbing and electrical shall be in accordance with state and federal codes to ensure proper operation of the pumping system, as-well-as the safety of plant personnel. All piping and tubing shall be sealed for leaks.

C. Any evidence of improper installation shall be corrected by the Contractor. Care during storage, installation and startup shall be in strict accordance with manufacturer's recommendations.

3.3 MANUFACTURER'S SERVICES

A. The Contractor shall require the manufacturer to furnish the services of a qualified field engineer to perform the following functions in the designed periods of time. These services are to be performed at the jobsite.
   1. Check-out of installation, start-up of equipment and initial operator instruction. This service shall take place after all mechanical equipment associated with the control system is installed and mechanically operable.
   2. After equipment is fully operational, and before Owner will assume responsibility for the operation of the equipment, the equipment manufacturer's representative shall instruct the Owner's operating personnel in the care, maintenance and proper operation of the equipment.

B. Field Test
   1. Prior to equipment startup, all equipment described herein shall be inspected for quiet operation, proper connections, and satisfactory performance by means of a functional test.
   2. The pump and motor assembly shall be field tested to verify vibration is not in excess of the limits stated in the latest revision of Hydraulic Institute and NEMA MG 1.
   3. The pump, motor, and controls shall be given an operational test in accordance with the standards of the Hydraulic Institute. Recordings of the test shall substantiate the correct performance of the equipment at the design head, capacity, speed and horsepower as specified herein.
   4. Units apparently failing to meet the Specifications to the satisfaction of the Engineer must be more accurately tested in accordance with Hydraulic Institute Standards. If the pump fails the second test, the unit will be rejected, and the Contractor shall furnish a unit that will perform as specified.

C. Operation and Maintenance Materials
   1. The pump manufacturer shall be responsible for supplying written instruction, which shall be sufficiently comprehensive to enable the operator to operate and maintain the pump and all equipment supplied by the manufacturer. Instructions shall assume that the operator is familiar with pumps, motors, piping, valves, and controls, but that he has not previously operated and/or maintained the exact equipment supplied.
   2. The instruction shall be prepared as a system manual applicable solely to the pump and equipment supplied by the manufacturer to these specifications, and shall include those devices and equipment supplied by him.
   3. Operation and maintenance instruction shall be specific to the equipment supplied in accordance with these specifications. Instruction manuals applicable to many different configurations and pumps, and which require the operator to selectively read portions of the instructions shall not be acceptable.
   4. All costs for the above manufacturer functions including travel, lodging, meals, and incidentals shall be considered to have been included in the Contractor's lump sum bid price.

END OF SECTION

SECTION 46_05_09

PROCESS EQUIPMENT IDENTIFICATION

PART 1 GENERAL

1.1 SUMMARY

A. Devices used to identify process equipment including tags, nameplates, stencils, pipe markers, labels and lockout devices.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

B. Referenced Standards:
   1. American Society of Mechanical Engineers (ASME):
      a. A13.1, Scheme for the Identification of Piping Systems.
      b. Instrumentation, Systems, and Automation Society (ISA).
   2. National Electrical Manufacturers Association/American National Standards Institute (NEMA/ANSI):
      a. Z535.1, Safety Color Code.
      b. Z535.2, Environmental and Facility Safety Signs.
      c. Z535.3, Criteria for Safety Symbols.
      d. Z535.4, Product Safety Signs and Labels.
   3. National Fire Protection Association (NFPA):
      a. 70, National Electrical Code (NEC).
   4. Occupational Safety and Health Administration (OSHA):

a. 29 CFR 1910.145, Specification for Accident Prevention Signs and Tags.

1.5 QUALITY ASSURANCE

A. Piping and equipment color scheme and lettering size: comply with ASME A13.1

1.6 MAINTENANCE/SPARE PARTS

A. Extra stock materials: furnish two containers of spray-on adhesive.

B. Tools: Furnish special crimpers and other devices required for Owner to reinstall tags.

PART 2 PRODUCTS

2.1 MATERIALS

A. Subject to compliance with the Contract Documents, the following manufacturers are acceptable:
1. W.H. Brady Co.
2. Panduit.
3. Seton.
4. National Band and Tag Co.
5. Carlton Industries, Inc.

B. Type Al - Round Metal Tags:
1. Materials:
a. Aluminum or stainless steel.
b. Stainless steel shall be used in corrosive environments.
2. Size:
a. Diameter: 1-1/2 IN minimum.
b. Thickness: 0.035 IN (20 GA) minimum.
3. Fabrication:
a. 3/16 IN minimum mounting hole.
b. Legend: Stamped and filled with black coloring.
4. Color: Natural.

C. Type A2 - Rectangle Metal Tags:
1. Materials: Stainless steel.
2. Size:
a. 3-1/2 IN x 1-1/2 IN minimum.
b. Thickness: 0.036 IN (20 GA) minimum.
3. Fabrication:
a. 3/16 IN minimum mounting hole.
b. Legend: Stamped and filled with black coloring.
4. Color: Natural.

D. Type A3 - Metal Tape Tags:
1. Materials: Aluminum or stainless steel.
2. Size:

a. Width 1/2 IN minimum.
b. Length as required by text.

3. Fabrication:
   a. 3/16 IN minimum mounting hole.
   b. Legend: Embossed.
4. Color: Natural.

E. Type B1- Square Nonmetallic Tags:
1. Materials: Fiberglass reinforced plastic.
2. Size:
   a. Surface: 2 x 2 IN minimum.
   b. Thickness: l00 mils.
3. Fabrication:
   a. 3/16 IN mounting hole with metal eyelet.
   b. Legend: Preprinted and permanently embedded and fade resistant.
4. Color:
   a. Background: Manufacturer standard or as specified.
   b. Lettering: Black.

F. Type B2 - Nonmetallic Signs:
1. Materials: Fiberglass reinforced or durable plastic.
2. Size:
   a. Surface: As required by text.
   b. Thickness: 60 mils minimum.
3. Fabrication:
   a. Rounded corners.
   b. Drilled holes in corners with grommets.
   c. Legend: Preprinted, permanently embedded and fade resistant for a 10 year minimum outdoor durability.
4. Color:
   a. Background: Manufacturer standard or as specified.
   b. Lettering: Black.
5. Standards for OSHA signs: NEMA/ANSI Z535.1, NEMA/ANSI Z535.2, NEMA/ANSI Z535.3, NEMA/ANSI Z535.4, OSHA 29 CFR 1910.145.

G. Type C - Phenolic Name Plates:
1. Materials: Phenolic.
2. Size:
   a. Surface: As required by text.
   b. Thickness: 1/16 IN.
3. Fabrication:
   a. Two (2) layers laminated.
   b. Legend: Engraved through top lamination into bottom lamination.
   c. Two (2) drilled side holes, for screw mounting.
4. Color: Black top surface, white core, unless otherwise indicated.

H. Type D - Self-Adhesive Tape Tags and Signs:
1. Materials: Vinyl tape or vinyl cloth.
2. Size:
   a. Surface: As required by text.
   b. Thickness: 5 mils minimum.

3. Fabrication:
    a. Indoor/Outdoor grade.
    b. Weather and UV resistant inks.
    c. Permanent adhesive.
    d. Legend: Preprinted.
    e. Wire markers to be self-laminating.
4. Color: White with black lettering or as specified.
5. Standards for OSHA signs: NEMA/ANSI Z535.1, NEMA/ANSI Z535.2, NEMA/ANSI Z535.3, NEMA/ANSI Z535.4, OSHA 29 CFR 1910.145.

I. Type E - Heat Shrinkable Tape Tags:
1. Materials: Polyolefin.
2. Size: As required by text.
3. Fabrication:
    a. Legend: Preprinted.
    b. Color: White background, black printing.

J. Type F - Underground Warning Tape:
1. Materials: Polyethylene.
2. Size:
    a. 6 IN wide (minimum).
    b. Thickness: 4 mils.
3. Fabrication:
    a. Legend: Preprinted and permanently imbedded.
    b. Message continuous printed.
    c. Tensile strength: 1750 psi.
4. Color: As specified.

K. Type G - Stenciling System:
1. Materials:
    a. Exterior type stenciling enamel.
    b. Either brushing grade or pressurized spray can form and grade.
2. Size: As required.
3. Fabrication:
    a. Legend: As required.
4. Color: Black or white for best contrast.

L. Underground Tracer Wire:
1. Materials:
    a. Wire:
        1) 12 GA AWG.
        2) Solid.
    b. Wire nuts: Waterproof type.
    c. Split bolts: Brass.

M. Valve lockout devices
1. Materials
    a. Nylon or Plastic
    b. Furnish device to restrict access to valve operator and to accept lock shackle.

N. Accessories
1. Fasteners:
a. Bead chain: #6 brass, aluminum or stainless steel.
b. Plastic strap: Nylon, urethane or polypropylene.
c. Screws: Self-tapping, stainless steel.
d. Adhesive, solvent activated.

O. Maintenance Materials
1. Where stenciled markers are provided, clean and retain stencils after completion and include in extra stock, along with required stock of paints and applicators.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install identification devices at specified locations.

B. All identification devices to be printed by mechanical process, hand printing is not acceptable.

C. Attach tags to equipment with sufficient surface or body area with solvent activated adhesive applied to back of each tag.

D. Attach tags with 1/8" round or flat head screws to equipment without sufficient surface or body area, or porous surfaces.
1. Where attachment with screws should not or cannot penetrate substrate, attach with plastic strap.

E. Single items of equipment enclosed in a housing or compartment to be tagged on outside of housing.
1. Several items of equipment mounted in housing to be individually tagged inside the compartment.

F. Tracer Wire:
1. Attach to pipe at a maximum of 10 FT intervals with tape or tie-wraps.
2. Continuous pass from each valve box and above grade at each structure.
3. Coil enough wire at each valve box to extend wire a foot above the ground surface.
4. 1,000 FT maximum spacing between valve boxes.
5. If split bolts are used for splicing, wrap with electrical tape.
6. If wire nuts are used for splicing, knot wire at each splice point leaving 6 IN of wire for splicing.
7. Use continuous strand of wire between valve box where possible.
8. Continuous length shall be no shorter than 100 FT.

G. Schedules
1. Process Systems:
a. General:
1) Provide arrows and markers on piping.
a) At 20 FT maximum centers along continuous lines.
b) At changes in direction (route) or obstructions.

c) At valves, risers, "T" joints, machinery or equipment.
d) Where pipes pass through floors, walls, ceilings, cladding assemblies and like obstructions provide markers on both sides.

2) Position markers on both sides of pipe with arrow markers pointing in flow direction.
a) If flow is in both directions use double headed arrow markers.

3) Apply tapes and stenciling in uniform manner parallel to piping.

b. Piping: See Painting and Coatings Specifciations for process pipe color and type.

c. Trenches with piping:
1) Tag type: Type F - Underground Warning Tape
2) Location: Halfway between top of piping and finished grade.
3) Letter height: 1-1/4 IN minimum.
4) Natural gas or digester gas:
a) Color: Yellow with black letters.
b) Legend:
(1) First line: "CAUTION CAUTION CAUTION"
(2) Second line: "BURIED GAS LINE BELOW"
5) Nonpotable water piping, except 3 IN and smaller irrigation pipe:
a) Color: Green with black letters.
b) Legend:
(1) First line: "CAUTION CAUTION CAUTION"
(2) Second line: "BURIED NONPOTABLE WATER LINE BELOW"
6) Other piping (e.g., compressed air, irrigation, refrigerant, heating water, etc.):
a) Color: Yellow with black letters.
b) Legend:
(1) First line: "CAUTION CAUTION CAUTION"
(2) Second line: "BURIED PIPE LINE BELOW"

d. Yard valves, buried, with valve box and concrete pad:
1) Tag type: Type A2 - Rectangle Metal Tags as outlined in Detail Sheets.
2) Fastener: 3/l6 IN x 7/8 IN plastic screw anchor with 1 IN #6 stainless steel pan head screw.
3) Legend:
a) Letter height: 1/4 IN minimum.
b) Valve designation as indicated on the Drawings (e.g., "V-xxx").

e. Valves and slide gates:
1) Tag type:
a) Outdoor locations: Type B1 - Square Nonmetallic Tags.
b) Indoor noncorrosive:
(1) Type A1- Round Metal Tags.
(2) Type B1 - Square Nonmetallic Tags.
c) Indoor corrosive:
(1) Stainless steel Type A1 - Round Metal Tags.
(2) Type B1 - Square Nonmetallic Tags.
2) Fastener:

a) Type A1: Chain of the same material.
b) Type B1: Stainless steel chain.

3) Color: Per ASME A13.1 corresponding to the piping system.
4) Legend:
a) Letter height: 1/4 IN minimum.
b) Valve designation as indicated on the Drawings (e.g., "V-xxx").

f. Process equipment (e.g., pumps, pump motors, blowers, air compressors, bar screens, clarifier drive mechanism, etc.):
1) Tag type:
a) Type B2 - Nonmetallic Signs.
b) Type D - Self-Adhesive Tape Tags and Signs.
c) Type G - Stenciling System.
2) Fastener:
a) Self.
b) Screws.
c) Adhesive.
3) Legend:
a) Letter height: 1/2 IN minimum.
b) Equipment designation as indicated on the Drawings (e.g., "Primary Sludge Pump P-xxx").

g. Piping systems:
1) Tag type:
a) Outdoor locations: Type G - Stenciling System.
b) Indoor locations:
(1) Type D - Self-Adhesive Tape Tags and Signs.
(2) Type G - Stenciling System.
2) Fastener: Self.
3) Color: Per ASME A13.1.
4) Legend:
a) Letter height: Manufacturers standard for the pipe diameter.
b) Mark piping in accordance with ASME A13.1.
c) Use piping designation as indicated on the Drawings.
d) Arrow: Single arrow.

h. Process tanks (over 1000 GAL) and basins, (e.g., chemical storage, clarifiers, trickling filters, digesters, etc):
1) Tag type:
a) Type B2 - Nonmetallic Signs.
b) Type G - Stenciling System.
2) Fastener:
a) Screw.
b) Self.
3) Location as directed by Owner.
4) Legend:
a) Letter height: 4 IN minimum.
b) Equipment designation as indicated on the Drawings (e.g., "Clarifier CL-xxx").

i. Equipment that starts automatically:
1) Tag type:
a) Type B2 - Nonmetallic Signs.

b) Type D - Self-Adhesive Tape Tags and Signs.

2) Fastener:
   a) Type B2 - Screw or adhesive.
   b) Type D - Self.
   c) Size: 5 IN x 7 IN
3) Location: Equipment name.
4) Legend:
   a) OSHA Warning Sign.
   b) Description of Warning: "THIS MACHINE STARTS AUTOMATICALLY".

2. Instrumentation Systems:
   a. Instrumentation Equipment (e.g., flow control valves, primary elements, etc.):
      1) Tag type:
         a) Outdoor locations: Type B1 - Square Nonmetallic Tags.
         b) Indoor noncorrosive:
            (1) Type A1 - Round Metal Tags.
            (2) Type B1 - Square Nonmetallic Tags.
         c) Indoor corrosive:
            (1) Stainless steel Type A1 - Round Metal Tags.
            (2) Type B1 - Square Nonmetallic Tags.
      2) Fastener:
         a) Type A1: Chain of the same material.
         b) Type B1: Stainless steel chain.
      3) Legend:
         a) Letter height: 1/4 IN minimum.
         b) Equipment ISA designation as indicated on the Drawings (e.g., "FIT-xxx").
   b. Enclosure for instrumentation and control equipment, (e.g., PLC control panels, etc.):
      1) Tag type: Type C - Phenolic Name Plates.
      2) Fastener: Screws.
      3) Legend:
         a) Letter height: 1/2 IN minimum.
         b) Equipment name (e.g., "PLC CONTROL PANEL PCP-xxx").
   c. Components inside equipment enclosure, (e.g., PLC's, control relays, contactors, and timers):
      1) Tag type: Type D - Self-Adhesive Tape Tags.
      2) Fastener: Self.
      3) Legend:
         a) Letter height: 3/16 IN minimum.
      4) Description or function of component (e.g., "PLC-xxx" or "CR-xxx").
   d. Through enclosure door mounted components (e.g., selector switches, controller digital displays, etc.):
      1) Tag type: Type C - Phenolic Name Plates.
      2) Fastener: Screws.
      3) Legend:
         a) Letter height: 1/4 IN minimum.
         b) Component ISA tag number as indicated on the Drawings (e.g., "HS-xxx").

3. HVAC Systems:
   a. General:
      1) Provide arrows and markers on ducts.
         a) At 20 FT maximum centers along continuous lines.
         b) At changes in direction (route) or obstructions.
         c) At dampers, risers, branches, machinery or equipment.
         d) Where ducts pass through floors, walls, ceilings, cladding assemblies and like obstructions provide markers on both sides.
      2) Position markers on both sides of duct with arrow markers pointing in flow direction.
         a) If flow is in both directions use double headed arrow markers.
      3) Apply tapes and stenciling in uniform manner parallel to ducts.
   b. HVAC Equipment (e.g., unit heaters, exhaust fans, air handlers, etc.):
      1) Tag type:
         a) Type B2 - Nonmetallic Signs.
         b) Type C - Phenolic Name Plates.
      2) Fastener: Screws.
      3) Legend:
         a) Letter height: 1 IN minimum.
         b) Equipment designation as indicated on the Drawings (e.g., "EF- xxx").
   c. Ductwork:
      1) Tag type:
         a) Type D - Self-Adhesive Tape Tags and Signs.
         b) Type G - Stenciling System.
      2) Fastener: Self.
      3) Legend:
         a) Letter height: 1 IN minimum.
         b) Description of ductwork, (e.g., "AIR SUPPLY").
         c) Arrows: Single arrow.
   d. Enclosure for instrumentation and control equipment, (e.g., fan control panels, etc.):
      1) Tag type: Type C - Phenolic Name Plates.
      2) Fastener: Screws.
      3) Legend:
         a) Letter height: 1/2 IN minimum.
         b) Equipment designation as indicated on the Drawings (e.g., "FAN CONTROL PANEL FCP-xxx").
   e. Wall mounted thermostats:
      1) Tag type: Type D - Self-Adhesive Tape Tags and Signs.
      2) Fastener: Self.
      3) Legend:
         a) Letter height: 3/16 IN minimum.
         b) Description of equipment controlled (e.g., "UH-xxx" or AHU-xxx").
   f. Components inside equipment enclosure, (e.g., controller's, control relays, contactors, and timers):
      1) Tag type: Type D - Self-Adhesive Tape Tags and Signs.
      2) Fastener: Self.

3) Legend:

g. Letter height: 3/16 IN minimum.

1) Description or function of component (e.g., "CR-xxx").

2) Through enclosure door mounted equipment (e.g., selector switches, controller digital displays, etc.):

3) Tag type: Type C - Phenolic Name Plates.

a) Fastener: Screws.

b) Legend:

(1) Letter height: 1/4 IN minimum.

(2) Component tag number as indicated on the Drawings or as defined by contractor (e.g., "HS-xxx").

4. Electrical Systems:

a. Trenches with ductbanks, direct-buried conduit, or direct-buried wire and cable.

1) Tag type: Type F - Underground Warning Tape.

2) Letter height: 1-1/4 IN minimum.

3) Location:

a) Where trench is 12 IN or more below finished grade: In trench 6 IN below finished grade.

b) Where trench is less than 12 IN below finished grade: In trench 3 IN below finished grade.

4) Electrical power (e.g., low and medium voltage):

a) Color: Red with black letters.

b) Legend:

(1) First line: "CAUTION CAUTION CAUTION".

(2) Second line: "BURIED ELECTRIC LINE BELOW".

5) Communications (e.g., telephone, instrumentation, LAN, SCADA):

a) Color: Orange with black letters.

b) Legend:

(1) First line: "CAUTION CAUTION CAUTION".

(2) Second line: "BURIED COMMUNICATION LINE BELOW".

b. Switchgear, switchboards and motor control centers:

1) Tag type: Type C - Phenolic Name Plates.

2) Fastener: Screws.

3) Main equipment legend:

a) Letter height:

(1) First line: 1 IN minimum.

(2) Subsequent lines: 3/8 IN minimum.

b) First line: Equipment name (e.g., "MAIN SWITCHBOARD MSBxxx").

c) Second line:

(1) Source of power (e.g., "FED FROM MCCxxx LOCATED IN ROOM xxx").

(2) The source of power room number is only required when there are multiple electrical rooms, if the source is in another building, the building name or number shall be used.

d) Third line: System voltage and phase (e.g., "480/277 V, 3PH").

4) Main and feeder device legend:
   a) Letter height: 3/8 IN minimum.
   b) Description of load (e.g., "MAIN DISCONNECT", "PUMP Pxxx" or "PANELBOARD HPxxx").

c. Panelboards and transformers:
1) Tag type: Type C - Phenolic Name Plates.
2) Fastener: Screws.
3) Legend:
   a) Letter height:
      (1) First line: 3/8 IN minimum.
      (2) Subsequent lines: 3/16 IN minimum.
   b) First line: Equipment name (e.g., "PANELBOARD Pxxx" or "TRANSFORMER Txxx").
   c) Second line (panelboards only): System voltage and phase (e.g., "208/120V, 3PH").

d. Transfer switches:
1) Tag type: Type C - Phenolic Name Plates.
2) Fastener: Screws.
3) Legend:
   a) Letter height:
      (1) First line: 3/8 IN minimum.
      (2) Subsequent lines: 3/16 IN minimum.
   b) First line: Equipment name (e.g., "AUTOMATIC TRANSFER SWITCH ATSxxx").

e. Safety switches, separately mounted circuit breakers and motor starters, VFD's, etc.:
1) Tag type: Type C - Phenolic Name Plates.
2) Fastener: Screws.
3) Legend:
   a) Letter height: 1/4 IN minimum.
      (1) First line: Description of load equipment is connected to (e.g., "PUMP Pxxx").

f. Enclosure for instrumentation and control equipment, (e.g., lighting control panels, etc.):
1) Tag type: Type C - Phenolic Name Plates.
2) Fastener: Screws.
3) Legend:
   a) Letter height: 1/2 IN minimum.
   b) Equipment name (e.g., "LIGHTING CONTROL PANEL LCPxxx").

g. Components inside equipment enclosures (e.g., circuit breakers, fuses, control power transformers, control relays, contactors, timers, etc.):
1) Tag type: Type D - Self-Adhesive Tape Tags and Signs.
2) Fastener: Self.
3) Legend:
   a) Letter height: 3/16 IN minimum.
   b) Description or function of component (e.g., "M-xxx", "CR-xxx" or "TR-xxx").

h. Through enclosure door mounted equipment (e.g., selector switches, controller digital displays, etc.):
1) Tag type: Type C - Phenolic Name Plates.

2) Fastener: Screws.
3) Legend:
    a) Letter height: 1/4 IN minimum.
    b) Component tag number as indicated on the Drawings or as defined by contractor (e.g., "HS-xxx").

i. Conductors in control panels and in pull or junction boxes where multiple circuits exist.
1) Tag type: Type D - Self-Adhesive Tape Tags.
2) Fastener: Self.
3) Tag conductor at both ends.
4) Legend:
    a) Letter height: 1/8 IN minimum.
    b) Circuit number or wire number as scheduled on the Drawings or as furnished with the equipment.

j. Conductors in handholes and manholes.
1) Tag type: Type A3 - Metal Tape Tags.
2) Fastener: Nylon strap.
3) Tag conductor at both ends.
4) Legend:
    a) Letter height: 1/8 IN minimum.
    b) Circuit number or wire number as scheduled on the Drawings.

k. Grounding conductors associated with grounding electrode system in accordance with the following:
1) Tag type: Type D - Self-Adhesive Tape Tags.
2) Fastener: Self.
3) Legend:
    a) Letter height: 1/8 IN minimum.
    b) Function of conductor (e.g., "MAIN BONDING JUMPER", "TO GROUND RING", "TO MAIN WATER PIPE").

l. Flash protection for switchboards, panelboards, industrial control panels and motor control centers:
1) Tag type: Type D - Self-Adhesive Tape Signs.
2) Fastener: Self.
3) Legend: Per NFPA 70.

m. Entrances to electrical rooms:
1) Tag type: Type B2 - Nonmetallic Signs.
2) Fastener: Screw or adhesive.
3) Size: 5 IN x 7 IN.
4) Location: Each door to room.
5) Legend:
    a) OSHA Danger Sign.
    b) Description of Danger: "HIGH VOLTAGE, AUTHORIZED PERSONNEL ONLY".

n. Equipment where more than one (1) voltage source is present:
1) Tag type:
    a) Type B2 - Nonmetallic Signs.
    b) Type D - Self-Adhesive Tape Signs.
2) Fastener:
    a) Screw or adhesive.
    b) Self.

3) Size: 1-3/4 IN x 2-1/2 IN.
4) Location: Exterior face of enclosure or cubical.
5) Legend:
   a) OSHA Danger Sign.
   b) Description of Danger: "MULTIPLE VOLTAGE SOURCES".

SECTION 46_05_05

EQUIPMENT GENERAL PROVISIONS

PART 1 GENERAL

1.1 SUMMARY

A. General provisions pertaining to all specified equipment.

B. The requirements of this section apply to all equipment specified.

C. If a conflict exists between this section and other individual equipment sections, the more stringent section governs.

D. The Contractor shall assume full responsibility for coordination of the entire project including verification that all structures, piping, coating system, and equipment components arc compatible. The Contractor shall initially operate each equipment system and shall make all necessary adjustments so that each system is placed in proper operating condition.

E. Without exception, the Contract Price shall include all royalties, payments, technology fees arising from patents, licenses, or proprietary designs or processes associated with furnishing the equipment.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

B. Drawings showing general dimensions and conforming the size of equipment, drives and specified appurtenances, piping connections and construction details of equipment.

C. Assembly and installation drawings including shaft size, seal, coupling, bearings, anchor bolt plan, part nomenclature, part list with materials of construction by ASTM reference and grade, outline dimensions, and shipping weights.

D. Manufacturer's installation instructions.

E. Complete electrical schematic diagrams.

F. Submit operation and maintenance manual in accordance with Section 01_78_23 – Operation and Maintenance Data.

1.4 QUALITY ASSURANCE

A. Unless approved by Engineer, all equipment furnished shall have a record of at least 10 years of successful, trouble-free operation in similar applications, from the same Manufacturer. This requirement does not apply to equipment specifically named in the individual specification sections or by addendum.

B. Inspection, Startup, and Field Adjustment: The Contractor shall demonstrate that all equipment meets the specified performance requirements. Contractor shall provide the services of an experienced, competent, and authorized service representative of the Manufacturer of each item of major equipment who shall visit the site of Work to perform the following tasks:
   1. Assist the Contractor in the installation of the equipment.
   2. To inspect, check, adjust if necessary and approve the equipment installation.
   3. To start-up and field-test the equipment for proper operation, efficiency, and capacity.
   4. To perform necessary field adjustments during the test period until the equipment installation and operation are satisfactory to the Engineer.
   5. Where required by the individual equipment sections, an authorized training representative of the manufacturer shall visit the Site for the number of days indicated in those sections to instruct the Owner's personnel in the operation and maintenance of the equipment.
   6. The costs of all inspection, startup, testing, adjustment, and instruction Work performed by factory-trained representatives at the site shall be borne by the Contractor.

C. System Design & Arrangement
   1. The equipment, sizes, materials, and arrangements described are based on recommendations by equipment manufacturers and the named equipment in the individual specification sections and shall be considered minimum limits of acceptability. The equipment manufacturer shall be responsible for design, arrangements, and performance of all equipment supplied. Arrangements or equipment other than those shown on the Drawings shall be subject to the Engineer's approval.
   2. Modifications to structural design due to a change of equipment manufacturer, manufacturer's varying space requirements, foundation requirements, floor slope requirements, or dimension changes to fit manufacturer specific requirements shall be coordinated by the Contractor and included in the Bid and shall be at no additional cost to the Owner.

3. The Contractor shall be responsible for any modifications to the piping, electrical, structural, and mechanical layouts, as well as reimbursement to the Owner for additional charges by the Engineer for additional work required for the changes.

1.5 DELIVERY, HANDLING AND STORAGE

A. The equipment manufacturer shall provide unloading, storage, and handling instructions to the Contractor prior to shipment.

B. Equipment delivered onsite without an accepted submittal will not be allowed to be unloaded.

C. Equipment shall be boxed, crated, or otherwise protected from damage and moisture during shipment, handling, and storage. Equipment shall be protected from exposure to corrosive fumes and shall be kept thoroughly dry at all times. Pumps, motors, drives, electrical equipment, and other equipment with anti-friction or sleeve bearings shall be stored in weather tight storage facilities prior to installation. For extended storage periods, plastic equipment wrappers shall not be used to prevent accumulation of condensate in gears and bearings.

D. All equipment shall be delivered to the Contractor in good, sound condition, and free from damage. Equipment which has been damaged will be rejected.

E. The Contractor shall be responsible for proper unloading, handling, and storage of all equipment in accordance with the Manufacturer's instructions. Products shall be carefully stored in a manner that will prevent damage and in an area that is protected from the elements. Any equipment stored for longer than 30 days shall be inspected by the Manufacturer’s representative prior to installation. Contractor shall replace equipment that has been damaged as a result of storage not in accordance with Manufacturer’s instructions.

1.6 MAINTENANCE/SPARE PARTS

A. Tools: The Contractor shall supply one complete set of special wrenches and other special tools necessary for the assembly, adjustment, and dismantling of the equipment. The set of tools shall be neatly mounted in a labeled tool box of suitable design provided with a lockable hinged cover.

B. Spare Parts: All equipment shall be furnished with the manufacturer’s recommended spare parts as indicated in the individual equipment Sections. Spare parts subject to deterioration such as ferrous metal items and electrical components shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping. Spare parts with individual weights less than 50 pounds and dimensions less than 2 feet wide, or 18 inches high, or 3 feet in length shall be stored in a wooden box with hinged wooden cover and locking hasp. Hinge shall be strap type. The box shall be painted and identified with stenciled lettering stating the name of the equipment, equipment numbers, and word “spare parts”. A neatly typed inventory of spare parts shall be taped to the underside of the cover. All spare parts are intended for use by the Owner only, after expiration of the warranty period specified in the Contract Documents.

PART 2 PRODUCTS

2.1 LUBRICATION

A. Equipment shall be adequately lubricated by systems which require attention no more frequently than weekly during continuous operation. Lubrication systems shall not require attention during start-up or shut-down and shall not waste lubricants.

B. Lubricants of the type recommended by the equipment manufacturer shall be provided by the Supply Contractor in sufficient quantity for all consumption prior to completion of required testing and acceptance of equipment by the Owner.

C. All drives and gear reducers shall be fitted with weatherproof vent plugs, oil fill, and oil drain fittings, and oil level indicators as appropriate. Vent plugs and fittings shall be stainless steel, or other approved corrosion resistant material.

D. For all grease lubricated bearings provide grease lines and fittings routed to a safe and accessible location for ease of operator maintenance. Grease lines shall be rigidly mounted and neatly routed, and shall be copper or stainless steel. Plastic grease piping will not be allowed.

2.2 EQUIPMENT SUPPORTS AND FOUNDATIONS

A. Equipment Supports: All equipment supports, anchors, and restrainers shall be adequately designed for static, dynamic, wind, and seismic loads.
   1. Wall-mounted equipment weighing more than 250 pounds or which is within 18-inches above the floor shall be provided with fabricated steel supports. Pedestals shall be of welded steel. If the supported equipment is a panel or cabinet or is enclosed with removable sides, the pedestal shall match the supported equipment in appearance and dimensions.
   2. Seismic requirements: Freestanding and wall-hung equipment shall be anchored in place by methods that satisfy the building code. Calculations shall be performed and signed and stamped for equipment weighing more than 400 pounds. Calculations shall analyze lateral and overturning forces and meet all applicable building code requirements. Calculations shall include the distribution of forces imposed on the supporting structure and anchors, verifying that each anchor can develop the required resistance forces.
   3. Wind requirements: Exterior freestanding equipment shall be anchored in place by methods that satisfy the building code. Calculations shall be performed and signed and stamped, analyzing lateral and overturning forces and meet all applicable building code requirements. Calculations shall include the distribution of forces imposed on the supporting structure and anchors, verifying that each anchor can develop the required resistance forces.

B. Anchors: Anchor bolts shall be in accordance with Division 05 specifications and all Manufacturer's recommendations. In the event that requirements are conflicting, the more stringent requirements shall apply.

C. Equipment Foundations: Equipment foundations shall be as shown in the Drawings and in accordance with Manufacturer's written recommendations. In the event that requirements are conflicting, the more stringent requirements shall apply. All mechanical equipment,

tanks, control cabinets, etc., shall be supported as shown in the Drawings, unless otherwise specified.

2.3 COUPLINGS

A. Flexible couplings shall be provided between the driver and the driven equipment to accommodate slight angular misalignment, parallel misalignment, end float, and to cushion shock loads. Where required for vertical shafts, 3-piece spacer couplings or universal type couplings for extended shafts shall be installed. Unless otherwise indicated, or recommended by the equipment manufacturer, gear or flexible spring type coupling shall be furnished with horizontal and end suction pumps.

B. The equipment manufacturer shall recommend the size and type of coupling required to suit each specific application.

C. Taper-lock bushings may be used to provide for easy installation and removal on shafts of various diameters.

D. Where universal type couplings are shown, they shall be of the needle bearing type construction, equipped with commercial type grease fittings.

2.4 SHAFTING

A. General: All shafting shall be continuous between bearings and shall be sized to transmit the power required. Keyways shall be accurately cut in line. Shafting shall not be turned down at the ends to accommodate bearings or sprockets whose bore is less than the diameter of the shaft. Shafts shall rotate in the end bearings and shall be turned and polished, straight, and true.

B. Design Criteria: Shafts shall be designed to carry the steady state and transient loads suitable for unlimited number of load applications. Where shafts are subjected to fatigue stresses, such as frequent start and stop cycles, the mean stress shall be determined by using the modified Goodman Diagram. The maximum torsional stress shall not exceed the endurance limit of the shaft after application of the factor of safety of 2 in the endurance limit and the stress concentration factor of the fillets in the shaft and keyway. Stress concentration factor shall be in accordance with ASME Standard B17.1– Keys and Keyseats.

C. Materials: Shafting materials shall be appropriate for the type of service and torque transmitted. Environmental elements such as corrosive gases, moisture, and fluids shall be taken into consideration. Materials shall be as shown or specified unless furnished as part of an equipment assembly.
   1. Low carbon cold-rolled steel shafting shall conform to ASTM A 108, Grade 1018.
   2. Medium carbon cold-rolled shafting shall conform to ASTM A 108, Grade 1045.
   3. Corrosion-resistant shafting shall be stainless steel or Monel, whichever is most suitable for the intended service.

D. Differential Settlement: Where differential settlement between the driver and the driven equipment may occur, an extension shaft with two sets of universal type couplings shall be provided.

2.5 DRIVE GUARDS

A. Power transmission, prime movers, machines, shaft extensions, and moving machine parts shall be guarded in accordance with the OSHA Safety and Health Standards (29CFR1910.211 to 1910.219). The guards shall be constructed of minimum 10 gauge stainless steel or aluminum with smooth edges and corners and securely fastened. Where required for lubrication or maintenance, guards shall have hinged and latched access doors.

2.6 FLEXIBLE CONNECTORS

A. Flexible connectors shall be installed in all piping connections to engines, blowers, compressors, and other vibrating equipment with the requirements of the ANSI B31.1.

2.7 GASKETS AND PACKINGS

A. Packing around valve stems and reciprocating shafts shall be of compressible material, compatible with the fluid being used. Chevron-type "V" packing shall be Garlock No. 432, or John Crane "Everseal".

B. Packing around rotating shafts (other than valve stems) shall be "O"-rings, stuffing boxes, or mechanical seals, as recommended by the Manufacturer and acceptable to the Owner's Representative.

2.8 NAMEPLATES

A. Equipment nameplates of stainless steel shall be engraved or stamped and fastened to the equipment in an accessible location with No. 4 or larger oval head stainless steel screws or drive pins. Adhesives shall not be used in lieu of stainless steel screws. Nameplates shall contain the Manufacturer's name, model, serial number, size, characteristics, date of manufacture, and appropriate data describing the machine performance ratings. Manufacturer to provide equipment tag number.

2.9 SAFETY REQUIREMENTS

A. Where Work areas are located within a flammable or toxic gas environment, suitable gas detection, ventilating, and oxygen deficiency equipment shall be provided. Workers shall be equipped with approved breathing apparatus.

PART 3 EXECUTION

3.1 INSTALLATION

A. General: Equipment shall be installed in accordance with the manufacturer's written recommendations and the requirements of the individual equipment specification sections.

B. Field Assembly: Studs, cap screws, bolt and nuts used in field assembly shall be coated with Never Seize compound.

C. Insulating Connections: All insulating connections shall be installed in accordance with the Manufacturer's printed instructions.

D. Pipe Hangers, Supports, and Guides: Hangers, supports, and guides shall be spaced in accordance with Section 40_05_07.03 – Pipe Supports, as shown on the drawings and ANSI/ASME B.31.1 standard.

E. Packaged Equipment
1. When any system is furnished as pre-packaged equipment, the Contractor shall coordinate space and structural requirements, clearances, utility connections, signals, and outputs with Subcontractors to avoid later change orders.
2. If the packaged system has any additional features (as safety interlocks, etc.) other than required by the Contract Documents, the Contractor shall coordinate such features with the Owner's Representative and provide material and labor necessary for a complete installation as required by the manufacturer.

3.2 FIELD TESTS

A. Where indicated by the individual equipment sections, equipment shall be field tested after installation to demonstrate satisfactory operation without excessive noise, vibration, or overheating of bearings or motor.

B. At the very minimum, the following field testing shall be conducted:
1. Start equipment, check, and operate the equipment over its entire operating range. Vibration level shall be within the amplitude limits as indicated or as recommended by the reference applicable standards.
2. Obtain concurrent readings of motor voltage, amperage, capacity, vibration, and bearing temperatures.
3. Operate equipment indicated in Section 01650 – Testing, Adjusting, Balancing, Demonstration, and Startup of Systems.

C. The Owner's Representative will witness field-testing. The Contractor shall notify the Owner's Representative of the test schedule 3 Days in advance.

D. In the event that any equipment fails to meet the test requirements, the equipment shall be modified/replaced and retested until it satisfies the requirement.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 46_07_54

WASTE ACTIVATED SLUDGE PUMP STATION

PART 1 GENERAL

1.1 SUMMARY

A. This specification section covers the work necessary to furnish all labor, materials equipment and incidentals required to provide one (1) above ground fiberglass pump station with duplex self-priming pumps and automatic control system complete and operational with all appurtenances as specified herein and/or as shown on the plans for pumping domestic sewage. The principal items of equipment shall include two self-priming, horizontal, centrifugal, v-belt motor driven sewage pumps, valves, internal piping, motor control center with thermal magnetic circuit breakers, magnetic motor starters, automatic control system, internal wiring, fiberglass reinforced polyester resin enclosure equipped with ventilating blower, and thermostatically controlled electric heater. The pumps, fiberglass pump stations, and controls shall be manufactured by Gorman Rupp Pump Company, as provided by Haynes Equipment Company, LLC.

B. Provide the following:
   1. Northside WWTP
      a. 1 Duplex unit w/ Fiberglass Enclosure
         1) Gorman Rupp T6A3S-B SUPER T Series
         2) Self-priming centrifugal solids handling
         3) 600 gpm @ 9′ (3′ minimum)

C. A single coordinating supplier will be responsible for furnishing and coordinating the pump stations. The coordinating supplier shall be a manufacturer or supplier who is regularly engaged in the business of pumping systems. The coordinating supplier will prepare detailed drawings of equipment structure and equipment information, and other data required for complete system description. The manufacturer will verify each system component is compatible with all other components of the system, all pipe materials and sizes are appropriate and all devices necessary for a proper functioning system have been provided. System supplier will furnish all equipment as a complete, integrated package, with a single responsibility for proper function of related equipment including fiberglass enclosure, pumps, valves, and controls.

D. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 DELIVERY, STORAGE & HANDLING

A. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address. Packing list shall be provided with equipment at time of delivery.

B. Electrical equipment shall be kept thoroughly dry at all times and shall be stored indoors and protected from freezing conditions. Equipment storage shall be protected and maintained in accordance with the manufacturer's recommendations. Equipment shall not be stored directly on the ground.

C. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

D. Weight of each complete collector, these weights to be verified by the Contractor with substantiating copy to the Engineer as the material is received on the job site.

1.5 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition,

the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

E. It is not intended the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacture, delays in delivery, replacement, or otherwise.

PART 2 PRODUCTS

2.1 OPERATING CONDITIONS

A. Pumps
1. Each self-priming pump shall have the necessary characteristics and be selected to perform in accordance with, and subject to, the provisions of the paragraph hereafter titled pumps.

B. Power
1. Electrical power to be furnished to the site will be 3 phase, 60 hertz, 4 wire, 460 volts, maintained within plus or minus 10 percent. Control voltage shall not exceed 132 volts.

2.2 FRP LIFT STATION ENCLOSURE

A. Shelter Details
1. Size:
   a. Exterior Width: 8 ft
   b. Exterior Length: 14 ft
   c. Wall Height: 8 ft
2. Roof Slope: Sufficient to allow rain drainage, 12 – 17 pitch.
3. Roof Type: Roof shall be wind-resistant "hip" design sloping up from all four sides. Roof shall form a permanent weather-proof connection with a seamless exterior appearance that uses low-maintenance silicone caulk matching the shelter's exterior color.
4. Roof deck is compliant with ASTM E 108/ULC S107 (class C) with <13' Flame Spread.
5. Roof shall not overhang walls in order to maximize shelter's wind speed rating.

B. System: Design, furnish, and install complete package using manufacturer's standard components.

C. Structure Type: Fiberglass Reinforced Polymer (FRP) shelter on a formed and poured concrete pad as specified herein.

D. Submittals: Shelter vendor to provide one (1) digital version of shop drawings and manufacturer's data including the following:
   1. Dimensions, weight, materials, parts, devices, and all other information required to verify compliance with these Specifications.
   2. Manufacturer's Literature and Technical Data: Drawings and Specifications for proposed system.
   3. Drawings prepared specifically for this Project:
   4. Materials and Details: Show materials, details of components (including doors and other accessories), finishes, fastenings, methods of joining, sealants, anchor bolt details, structural members and bracing, and openings.
   5. Anchorage details of structure to foundation.

2.3 QUALITY ASSURANCE

A. Qualifications:
   1. Manufacturer:
      a. Longevity: At least 10 years' experience in work of the type required in this section.
      b. Capacity: Production throughput sufficient to provide work required for this Project without delay.
      c. Certified Test Results: The manufacturer shall have an entire fiberglass panel destructive tested by an accredited Testing Laboratory and Third Party Quality Control Agency and upon request shall furnish to the engineer the certified and stamped test results of the laboratory testing. The accredited Testing Laboratory must be accredited to ISO 17020 and 17025.
      d. Quality: The manufacturer shall maintain a quality assurance program that is reviewed and approved by a Third Party Quality Control Agency.

B. Material Properties:
   1. Fiberglass Laminate Properties:
      a. Tensile Strength (ASTM D 638) 16,000 (psi)
      b. Flexural Strength (ASTM D 790) 33,700 (psi)
      c. Flexural Modulus (ASTM D 790) 1,160,000 (psi)
      d. Tensile Modulus (ASTM D 638) 1,300,000 (psi)
      e. Barcol Hardness 45
      f. Izod Impact – Notched ((ft.-lbs)/in) 16.30
      g. Izod Impact – Unnotched ((ft.-lbs)/in) 21.79
   2. Foam shall be rigid closed cell, polyisocyanurate with a density of 1.5 – 1.9 pounds per cubic foot.
      a. Flame Spread (ASTM E 84) <75
      b. Smoke Development (ASTM E 84) <450

2.4 DELIVERY, STORAGE, AND HANDLING

A. The fiberglass shelter and the accessory items shall be carefully transported, stored, handled and set in place in a manner that will prevent distortion, misalignment or other damage to the units.

B. During storage prior to installation and following installation, but prior to placing in service, the manufacturer's recommendations regarding handling shall be followed.

2.5 SPECIAL MANUFACTURERS WARRANTY

A. Manufacturer shall provide a twenty-five (25) year warranty on the shelter materials and workmanship, according to the following specifications:
   1. The shelter will be free from manufacturing defects in workmanship and will not appreciably deteriorate under conditions of normal use and regular service and maintenance when installed properly, for a period of twenty-five (25) years from the original date of purchase.
   2. Component parts will be purchased from reputable manufacturers and carry their own warranties.
   3. Any shelter penetrations made by shelter manufacturer must be maintained by the Customer to ensure proper sealing. Suggested intervals is every (2) two years. All penetrations made by the Customer during shelter installation are the responsibility of the Customer and may void or limit the warranty if done improperly.
   4. All warranties are Null and Void if the shelter and/or its components are modified or damaged as a result of unauthorized repair, misuse, negligence, accident, or act of God. This warranty does not cover vandalism, unreasonable use, damage caused by flying or falling objects, collision with animals or vehicles, or damages caused by environmental extremes or natural disasters, such as earthquakes, floods, hail or lightning.

2.6 SHELTER MANUFACTURERS

A. Product from Shelter Works, St. Louis, MO as represented by Haynes Equipment (405-755-1357), meeting these Specifications, may be used on this Project.

B. Products from other manufacturers will be considered for substitution 14 days prior to bid. Requests for substitution will not be considered if received 13 or fewer days before bid. Requests for substitution must include the following information in order to be considered:
   1. Formal written request certifying that products to be substituted will match specified products in terms of structural properties, dimensions, physical appearance, quality level and quantities and that they will perform the same function in the same manner and will achieve the same end result.
   2. Manufacturer's and supplier's material data sheets, specifications and performance data.
   3. A list of fifty (50) projects in satisfactory service for not less than three years with shelters similar to those being proposed for substitution. For each project, include name, address and telephone number of the engineer, the contractor and the plant manager.

C. SYSTEM PERFORMANCE. Structural Loading:
   1. Shelter: Own dead load.
   2. Roof Live Load: 20 psf
   3. Wind Load: 90 mph per ASCE 7-10
   4. Seismic Load: Per local building code

2.7 COMPONENTS

A. U-BOLTS. Through-wall lifting/tie-down eyes at the top of each corner to facilitate handling.

B. WALLS. Each wall shall be one single monolithic piece with faux brick textured appearance. Panelized construction not acceptable because connections could fail and leak over time.

C. CONNECTIONS. Wall panels shall overlap to form a permanent weather-proof connection with a seamless exterior appearance that uses low-maintenance silicone caulk matching the shelter's exterior color. Internal connections shall use stainless steel hardware spaced no more than 12" on center.

D. EXTERIOR. All exterior surfaces shall have 18-20 mils of superior performance marine grade gel coat, incorporating ultra violet inhibitors. Exterior color shall be desert sand, polar white, meadow green, or storm gray.

E. INTERIOR. All interior surfaces shall be sprayed with 18-20 mils of Polycor 944 high quality isophthalic white gel coat finish offering the same characteristics as the exterior surfaces without ultra-violet inhibitors. Interior surface shall not contain any visible surface-mounted strut or other unsightly channel.

F. BASE FLANGE. Shelter shall have an FRP mounting flange around the entire interior perimeter, ¼" thick x minimum 2" wide. Pockets which reduce the wall's full insulation value shall not be accepted. ConSeal Bitumen/Butyl sealant shall be provided for a weather-proof connection below the shelter's base. Flange shall be pre-drilled with 7/16" diameter holes 24" on center.

G. ACCESS
1. Pedestrian doors shall be made of fiberglass reinforced polymer (FRP) using exclusive FiberWrap technology to eliminate the possibility of delamination during the shelter's entire lifespan.
2. Pedestrian doors shall be hung with stainless steel ball bearing type hinges equipped with tamper-resistant, non-removable pins. Hinges shall be oriented with no fasteners exposed when door is closed.
3. Pedestrian doors shall be sealed with a weather-tight EPDM gasket along the entire perimeter of the door.
4. Pedestrian doors shall have a 2.5" deep aluminum rain drip molding located above.
5. All pedestrian doors must be able to be set in 'open' position with no hands. Doors must be able to be removed from 'open' position and closed with no hands. Doors must have hydraulic closer to prevent wind damage to door.
6. (1) 6'-0" wide x 6'-8" high double door(s).
    a. Closure system is panic push bar, key-lockable.
    b. Threshold is ½" tall, low profile aluminum.

H. TERMINATION. Electrical terminations in NEMA 1 208Y/120V 3-phase load center with 200 amp main breaker. Includes two (2) spare/unused 3P 80A breakers and two (2) spare/unused 1P 20A breakers.

I. RECEPTACLES: (4) GFCI duplex each with weather-proof-when-not-in-use cover.
1.

J. WIRING
1. Schedule 40 PVC conduit installed around the interior perimeter of the shelter, along the top of the wall. All conduit and fittings shall be UL Listed.

2. Conduit and wiring shall be installed in accordance with the most recent National Electric Code (NEC).
3. Minimum 12 gauge shall be used for wiring in conduit.
4. Wiring shall not be loaded above 60º C temperature rating.

K. ILLUMINATION
1. Vapor-tight, fluorescent light fixture(s) providing at least 100 lumen/sf.
2. Interior lights to be operated by (1) 2-way switch with weatherproof cover.
3. (1) exterior 40 Watt LED flood light operated by photocell.

L. VENTILATION
1. (1) fan which shall be rated for at least 500 cubic feet per minute. Fan to be exhaust (blowing from inside out). Fan operation controlled by thermostat.
2. (1) gravity louver with insect screen and aperture size equal to or larger than the fan opening. Manual vents are not acceptable in order to avoid fan motor burnout which could occur if fan were energized when manual vents are closed.
3. Ventilation through-wall openings shall be protected from the elements with a weather-tight fiberglass hood the same color as the shelter itself.

M. HEAT. Thermostatically-controlled, 208 Volt, single--phase electric and at least 3 KW. Wall or ceiling mounted.

2.8 MATERIALS

A. Walls, roof and doors shall be seamless, one-piece panels laminated with 1/8" thick sprayed fiberglass outside surface, core material, and 1/8” thick sprayed fiberglass inside surface. Walls, roof and doors shall have continuous FiberBeam laminations (floor to ceiling and top-of-wall to ridge) every 12” to permanently bond inner FRP surface with outer FRP surface to provide structural integrity and prevent de-lamination of the fiberglass from the core material.

B. Walls and roof shall have minimum R-12 insulation with core consisting of minimum 1.5” thick foam.

C. Shelter shall comply with all requirements of the most recent International Building Code (IBC) with minimum 19/32” wood encapsulated within interior surface of all walls, roof, and doors.

2.9 PUMPS

A. Description
1. Pumps shall be horizontal, self-priming sewage pumps, specifically designed for pumping raw, unscreened, domestic sanitary sewage. The pumps shall be T6A3S-B SUPER T Series self-priming centrifugal solids handling pumps as manufactured by Gorman-Rupp Pump Company.

B. Material
1. Wall areas of the pump casing and volute which are exposed to sewage shall be constructed of cast iron of no lesser grade than class 30.

C. Internal passages

1. All openings, internal passages, and internal recirculation ports shall be large enough to permit the passage of a sphere 3" in diameter, and any trash or stringy material which may pass through the average house collection system. Screens or any internal devices that create a maintenance nuisance or interfere with priming and performance of the pump shall not be permitted.
2. Upon request from the engineer, certified dimensional drawings indicating size and locations of the priming recirculation port or ports shall be submitted to the engineer prior to shipment.

D. Pump performance
1. Each pump must have the necessary characteristics and be properly selected to perform under the following operating conditions:
   a. Capacity, in GPM — 600
   b. Total dynamic head, in feet — 9 (3' minimum)
   c. Total dynamic suction lift, in feet — Flooded
2. Consideration shall be given to the sanitary sewage service anticipated, in which occasionally debris will lodge between the pump suction check valve and seat, resulting not only in the loss of liquid in the suction leg, but also in the siphoning of liquid from the pump casing to the approximate center line of the impeller. Such occurrence shall be considered normal with proper installation of air release line free to atmosphere.
3. In consideration of such occurrence and of the unattended operation intended, each pump shall be so designed as to retain adequate liquid in the pump casing to insure unattended automatic re-priming while operating at its rated speed in a completely open system without suction check valves and with a dry suction leg.

E. Re-prime performance
1. Each pump must be capable of a re-prime lift of 25 feet at the selected speed and impeller diameter. Re-prime lift is defined as the static height of pump suction centerline above liquid that the pump will prime; and delivery within five minutes on liquid remaining in the pump casing after a delivering pump is shut down with the suction check valve removed.

F. Cover plate
1. Cover plate shall be cast iron Class 30. Design must incorporate the following maintenance features:
   a. Retained by hand nuts for complete access to pump interior. Cover plate removal must provide ample clearance for removal of stoppages, and allow service to the impeller, seal, wear-plate, or check valve without removing suction or discharge piping.
   b. A replaceable wear-plate secured to the cover plate by weld studs and nuts shall be AISI 1015 HRS.
   c. In consideration for safety, a pressure relief valve shall be supplied in the cover plate. Relief valve shall open at 75-200 psi.
   d. Two O-rings of BUNA-N material shall seal cover plate to pump casing.
   e. Pusher bolt capability to assist in removal of cover plate. Pusher bolt threaded holes shall be sized to accept same retaining cap-screws as used in rotating assembly.
   f. Easy-grip handle shall be mounted to face of cover plate.

G. Rotating assembly

1. A rotating assembly, which includes impeller, shaft, mechanical shaft seal, lip seals, bearings, seal-plate and bearing housing, must be removable as a single unit without disturbing the pump casing or piping. Design shall incorporate the following features:
   a. Seal-plate and bearing housing shall be cast iron Class 30. Separate oil filled cavities, vented to atmosphere, shall be provided for shaft seal and bearings. Cavities must be cooled by the liquid pumped. Three lip seals will prevent leakage of oil.
   b. The bearing cavity shall have an oil level sight gauge and fill plug check valve. The clear sight gauge shall provide easy monitoring of the bearing cavity oil level and condition of oil without removal of the fill plug check valve. The check valve shall vent the cavity but prevent introduction of moist air to the bearings.
   c. The seal cavity shall have an oil level sight gauge and fill/vent plug. The clear sight gauge shall provide easy monitoring of the seal cavity oil level and condition of oil without removal of the fill/vent plug.
   d. Double lip seal shall provide an atmospheric path providing positive protection of bearings, with capability for external drainage monitoring.
   e. Pusher bolt capability to assist in removal of rotating assembly. Pusher bolt threaded holes shall be sized to accept same cap-screws as used for retaining rotating assembly.

H. Suction check valve
1. Each pump shall incorporate a suction valve that can be removed or installed through the removable cover plate opening, without disturbing the suction piping. Sole function of check valve shall be to eliminate re-priming with each cycle. Pumps requiring suction check valves to prime or re-prime will not be acceptable.

I. Impeller clearance adjustment
1. Clearances shall be maintained by external shim-less cover plate adjustment, utilizing collar and adjusting screw design for incremental adjustment of clearances by hand. Requirement of realignment of belts, couplings, etc., shall not be acceptable. Cover plate shall be capable of being removed without disturbing clearance settings.
2. There shall be provisions for additional clearance adjustment in the event that adjustment tolerances have been depleted from the cover plate side of the pump. The removal of stainless steel shims from the rotating assembly side of the pump shall allow for further adjustment as described above.
3. Clearance adjustment by means of positioning the shaft only toward the wear plate, thereby reducing pressure on the seal, shall not be acceptable.

2.10 CONSTRUCTION

A. Impeller
1. The impeller shall be two-vane, semi-open, non-clog, cast in ductile iron with integral pump out vanes on the back shroud. Impeller shall thread onto the pump shaft and be secured with a lock screw.

B. Seal
1. The pump shaft shall be sealed against leakage by a mechanical seal. Both the stationary sealing member and mated rotating member shall be of tungsten

titanium carbide alloy. Each of the mated surfaces shall be lapped to a flatness of one-half light band (5.8 Millionths of an inch), as measured by an optical flat under monochromatic light. The stationary seal seat shall be double floating so that faces will not lose alignment during periods of shock loads that will cause deflection, vibration, and axial movement of the pump shaft.

2. The seal shall be lubricated with oil from a separate, oil-filled reservoir. The same oil shall not be used to lubricate both the shaft seal and the shaft bearings.

C. Shaft bearings

1. The pump shaft bearings shall be anti-friction ball or tapered roller bearings, of ample size and proper design to withstand all radial and thrust loads which can reasonably be expected during normal operation. Bearings shall be lubricated from a separate reservoir. Pump designs in which the same oil lubricates both the shaft bearings and the shaft seal shall not be acceptable.

D. Pump suction spool

1. Each pump shall be equipped with a one-piece, cast iron suction spool, flanged on each end. Each spool shall have one 1¼ inch NPT and one ¼ inch NPT tapped hole with pipe plugs for mounting of gauges or other instrumentation.

E. Impeller shaft

1. The impeller shaft shall be constructed of 17-4 pH stainless steel.

2.11 VALVES AND PIPING

A. Check valves

1. Full flow type check valves, capable of passing a 3" spherical solid, shall have cast iron body with flanged ends rated at 125 lbs. Valves shall be fitted with an external spring and lever. Valves through 6" shall have a bronze body ring threaded into the valve port. Valve clapper shall be cast iron, bronze face, and shall swing completely clear of waterway when valve is full open. Hinge pin shall be 18-8 stainless steel construction and shall be utilized with bronze bushings and "O" ring seals. Valves shall be equipped with a removable cover plate to permit entry or for complete removal of internal components without removing the valve from the line. Valve rating shall be 175 psi water working pressure, 350 psi hydrostatic test pressure. Valves mounted in such a manner that prevents the passage of a 3" spherical solid shall not be acceptable.

B. Plug valves

1. Plug valves shall be of the non-lubricated, tapered type. Valve body shall be semi-steel with flanged end connection drilled to ANSI 125 lb. Standard. Valves shall have ports designed to pass spherical solids equal to the pumps capability. Valves shall be furnished with a drip-tight shutoff plug mounted in stainless steel or teflon over phenolic bearings, and shall have a resilient facing bonded to the sealing surface.

C. Gauge kit

1. Each pump shall be equipped with a glycerin-filled compound gauge to monitor suction pressures, and a glycerin-filled pressure gauge to monitor discharge pressures. Gauges shall be a minimum of 4" in diameter, and shall be graduated in feet water column. Rated accuracy shall be 1% of full scale reading. Compound

gauges shall be graduated -30' to +30' water column minimum. Pressure gauges shall be graduated 0 to 70' water column minimum.

2. Gauges shall be mounted on a resilient panel and frame assembly which shall be firmly secured to pumps or piping. Gauge installations shall be complete with all hoses and fittings, and shall include a shutoff valve installed in each gauge inlet at the point of connection to suction and discharge pipes.

D. Flanged header pipe
1. Flanged pipe shall be centrifugally cast, ductile iron, complying with ANSI 21.6 (AWWA C101), and class 53 thickness.
2. Flanges shall be class 125 and comply with ANSI B16.1.

E. All piping
1. Pipe and flanges shall be threaded and suitable thread sealant applied before assembling flange to pipe.
2. Bolt holes shall be in angular alignment within ½-degree between flanges. Flanges shall be faced and a gasket finish applied that shall have concentric grooves a minimum of 0.010 inch deep by approximately 0.030 inch wide, with a minimum of three grooves on any given surface spaced a maximum of ¼-inch apart.
3. Flanged to flexible connection devices shall be provided for each suction and discharge connection, to relieve misalignment stresses.

F. Support and thrust blocks
1. All pipes connected to the pump station shall be supported according to good commercial practice to prevent piping loads from being transmitted to pumps. Piping exterior of pump station shall be anchored with thrust blocks where shown on the contract drawings.

2.12 DRIVE UNIT

A. Motors
1. Note: maximum horsepower is 10 hp at 460 volts.
2. The pump motors shall be horizontal, open drip proof, induction type, with normal starting torque and low starting current characteristics, suitable for the electrical power available. The motors shall not be overloaded at the design condition or at any head in the operating range as specified.
3. Each motor shall be in current NEMA design, cast iron frame, copper windings, 1.15 service factor with class F insulation.

B. Drive transmission
1. Power shall be transmitted from motors to pumps by means of v-belt drive assemblies. The drive assemblies must be selected to establish proper pump speed to meet the specified operating conditions.
2. Each drive assembly shall have a minimum of two v-belts. In no case will a single belt drive be acceptable. Each v-belt drive assembly shall be selected on the basis that adequate power will be transmitted from driver to pump.
3. Drive systems with a safety factor of less than 1.5 To 1 shall not be considered sufficient for the service intended. Computation of safety factors shall be based on performance data published by the drive manufacturer.

C. Belt guards

1. Pump drive transmissions shall be enclosed on all sides in a guard constructed of any one or combination of materials consisting of expanded, perforated, or solid sheet metal, except that maximum perforated or expanded openings shall not exceed ½ inch.
2. Guards shall be manufactured to permit complete removal from the pump unit without interference with any unit component, and shall be securely fastened to the unit base and rigidly braced to some fixed part.
3. All metal shall be free from burrs and sharp edges. Structural joints shall be continuously welded. Panels may be riveted to frames with not more than five-inch spacing. Tack welds shall not exceed a four-inch spacing.
4. The guard shall be primed with a minimum of 1.5 Mils of zinc-based synthetic primer. A finish acrylic enamel coating with a minimum 1.5 Mils shall be applied in accordance with section 3, color definitions of ANSI 253.1; 1967, Safety color code for marking physical hazards.

2.13 FINISH

A. The pumps, piping, and exposed steel framework shall have a prime coat of a zinc base synthetic primer. The finish coat shall be an automotive grade white acrylic enamel.

2.14 ELECTRICAL CONTROL COMPONENTS

A. The electrical control system for the new pumps shall be manufactured by the pump station manufacturer and shall consist of the items shown below. The new control panel will provide a complete control system for the two self-priming horizontal pumps.
   1. Panel enclosure
      a. The electrical control equipment shall be mounted within NEMA 1, enclosures fabricated of stainless steel. Enclosure doors shall be gasketed with neoprene, shall be hinged and shall be equipped with captive closing hardware. Control compartments shall incorporate a removable back panel on which control components shall be mounted. Back panel shall be secured to enclosure with collar studs. The use of an additional control enclosure is permitted for units with size 4 and larger motor starters.
   2. Mounting
      a. All control components shall be securely fastened to a removable back panel with screws and lock washers. Switches, indicators and instruments shall be mounted through the control panel door. Self-tapping screws shall not be used to mount any components. All connections from the back panel to door mounted or remote devices shall be made through terminal blocks.
      b. All operating controls and instruments shall be securely mounted and shall be clearly labeled to indicate function.

2.15 MOTOR BRANCH COMPONENTS

A. Circuit breaker and operating mechanism
   1. A properly sized thermal-magnetic air circuit breaker shall be furnished for each self-priming horizontal pump motor, and shall have a symmetrical rms interrupting rating of 15 amperes at 460 volts. All circuit breakers shall be sealed by the manufacturer after calibration to prevent tampering.

2. A padlocking operating mechanism shall be installed on each motor circuit breaker. Operator handles for the mechanism shall be located on the exterior of the control compartment door, with interlocks which permit the door to be opened only when the circuit breakers are in the "off" position.

B. Motor starters

1. An open frame, across-the-line, NEMA rated magnetic motor starter shall be furnished for each pump motor. Starters of NEMA size 1 and above shall be designed for addition of at least two auxiliary contacts. Starters rated "0", "00", or fractional size are not acceptable. Power contacts shall be double-break and made of cadmium oxide silver. All motor starters shall be equipped to provide under-voltage release and overload protection on all three phases. Motor starter contacts shall be easily replaceable without removing the motor starter from its mounted position. Overload reset pushbuttons shall be located on the exterior of the control panel in such a manner as to permit resetting the overload relays without opening the control panel.

C. Overload relays

1. Overload relays shall be of block-type, utilizing melting alloy type spindles, and shall have visual trip indication with trip-free operation. Pressing of the overload reset lever shall not actuate the control contact until such time as the overload spindle has reset. Resetting of the overload reset lever will cause a snap-action control contact to reset, thus reestablishing a control circuit. Overload relays shall be manually reset only and not convertible to automatic reset. Trip setting shall be determined by heater element only and not by adjustable overload relays.

2.16 OTHER CONTROL COMPONENTS

A. Pump run indicators

1. Control panel shall be equipped with one pilot light for each of the two pump motors. Light shall be wired in parallel with the related pump motor starter to indicate that the motor is or should be running.

B. Elapsed time meters

1. Six digit elapsed time indicators (non-reset type) shall be connected to each of the two motor starter to indicate the total running time of each pump in "hours" and "tenths of hours".

C. High pump temperature protection for horizontal pumps

1. The control shall be equipped to protect the new pumps from damage caused by excessive temperature. Each pump shall be furnished with a temperature switch wired to cause shutdown of the pump motor when the housing exceeds +63□C (+145□F). Such occurrence shall illuminate an indicator to alert the operator to the cause of shutdown. The indicator shall remain illuminated and the pump motor locked out until the pump has cooled and the circuit has been manually reset. Automatic reset of such a circuit shall not be acceptable.

D. Phase Monitor

1. The control panel shall be equipped to monitor the incoming power and shut down the pump motors when required to protect the motor(s) from damage caused by phase reversal, phase loss, voltage unbalance, and low voltage. A time delay shall

be provided to minimize nuisance trips. The motor(s) shall automatically restart when power conditions return to normal.

E. Grounding
1. The pump station manufacturer shall ground all electrical equipment inside the pump station to the enclosure back panel. The mounting surface of all ground connections shall have any paint removed before making final connections.
2. The contractor shall provide an earth driven ground connection to the lift station at the main ground lug in accordance with the National Electric Code (NEC).

F. Transient Voltage Surge Suppressor:
1. The control panel shall be equipped with a transient voltage surge suppressor to minimize damage to the pump motors and control from transient voltage surges. The suppressor shall utilize silicon-oxide varistors encapsulated in a non-conductive housing. The arrestor shall have a current rating of 60,000 Amps, and a Joule rating of 1500.
2.

PART 3 EXECUTION

3.1 GENERAL

A. The general contractor shall assume full responsibility for coordination of the entire project, including verification all structures, piping, coating systems and equipment components are compatible. The general contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal or manufacturer's shop and installation drawings, test results or other data as specified herein.

C. Installation of equipment shall be in full conformance with the manufacturer's shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between manufacturer's instructions and the contract documents, the contractor shall follow the Engineer's decision at no additional cost to the Owner.

3.2 WORKMANSHIP

A. Handle carefully and protect the equipment and appurtenances to avoid damage.

B. The equipment shall be safely secured to the wall and floor in accordance with the Engineer's design drawings. All plumbing and electrical shall be in accordance with state and federal codes to ensure proper operation of the disinfecting system, as-well-as the safety of plant personnel. All piping and tubing shall be sealed for leaks.

C. Any evidence of improper installation shall be corrected by the Contractor. Care during storage, installation and startup shall be in strict accordance with manufacturer's recommendations.

3.3 MANUFACTURER'S SERVICES

A. The Contractor shall require the manufacturer to furnish the services of a qualified field engineer to perform the following functions in the designated period of time. These services are to be performed at the jobsite. A minimum of one (1) visit to the job site shall be required.
   1. Check-out of installation, start-up of equipment and initial operator instruction. This service shall take place after all mechanical equipment associated is installed and mechanically operable.
   2. After equipment is fully operational, and before Owner will assume responsibility for the operation of the equipment, the equipment manufacturer's operation specialists shall instruct the Owner's operating personnel in the care, maintenance and proper operation of the equipment.

B. Field Test
   1. During plant start-up all equipment described herein shall be inspected for proper connections and satisfactory performance by means of a function test.
   2. The equipment system and associated accessories shall be field tested to verify adequate performance.
   3. Units apparently failing to meet the Specifications must be corrected to provide proper service. Should the problem persist due to a flaw in material and/or in the design of the equipment, new equipment must be provided by the Contractor to meet the specifications.

C. Instructions for installation of the equipment system and related appurtenances shall be written and furnished by the manufacturer.

D. Drawings and Data
   1. Complete drawings, construction details, and specifications covering the enclosure, pumps, piping, valves, controls, and appurtenances shall be submitted in accordance with the submittal section.

E. Operation and Maintenance
   1. The equipment system manufacturer shall be responsible for supplying written instruction, which shall be sufficiently comprehensive to enable the operator to operate and maintain all equipment supplied by the manufacturer. Instructions shall assume the operator is familiar with pumping equipment, but he/she has not previously operated and/or maintained the exact equipment supplied.
   2. The instruction shall be prepared as a system manual applicable solely to the equipment supplied by the manufacturer, and shall include those devices and equipment supplied by him.
   3. Operation and maintenance instruction shall be specific to the equipment supplied in accordance with these specifications.

F. Manufacturer's Cost
   1. All costs for the above manufacturer's functions including travel, lodging, meals and incidentals shall be considered to have been included in the contract bid price.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 46_21_53

PERFORATED FINE SCREEN

PART 1 GENERAL

1.1 SUMMARY

A. The manufacturer will furnish four (4) automatic self-cleaning fine screens, as detailed in these specifications. The manufacturer will also supply the control system required to monitor and control the equipment, as well as any screen appurtenances necessary for the installation. The equipment will be of the latest design and will be fabricated of the specified materials and in a fashion that will fully perform the functions described in these specifications:

1. Northside WWTP – Aqua Guard Model AG-PF-MN-A-2.5'x15'x75x1/4"
2. Southside WWTP – Aqua Guard Model AG-PF-MN-A-2.5'x19'x75x1/4"

Manufacturer to verify final sizing with Drawings prior to bid and certify screen provided will fit without modifications.

B. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

B. Complete submittal drawings and product information will be submitted to confirm the scope of supply, the fit of the equipment, and conformance to project plans and specifications. As a minimum, the following information will be submitted:
   1. A Letter of Compliance, which confirms any variances with the Contract Plans and Specifications, and provides further explanations where necessary to adequately define the scope of supply.
   2. Dimensional plan and section drawings of the equipment mounted in the structure, showing all utility connections and requirements, and anchor bolt locations. Where applicable, drawings will show connection to associated equipment provided by others.
   3. Approximate weight of each component or piece of equipment.
   4. Manufacturers' catalog information, descriptive literature, and technical specifications.
   5. Power and control wiring diagrams, including terminal layout with numbers, panel construction and panel layout drawings, and control schematics diagrams. Control diagrams will also include a description of operation.
   6. Manufacturers' performance data for all drives.
   7. Hydraulic calculations of the fine screen based on peak and average flows and the specified downstream water levels.
   8. Installation, Operation and Maintenance manuals, which will be submitted after final approval of the equipment. A spare manual will be shipped with the unit in order to allow for proper installation and operation of the equipment prior to the release of all final Installation, Operation, and Maintenance manuals.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.
   1. ABMA, American Bearing Manufacturers Association
   2. AGMA, American Gear Manufacturers Association
   3. ANSI, American National Standards Institute
   4. ASME, American Society of Mechanical Engineers
   5. ASTM, American Society of Testing and Materials
   6. AWS, American Welding Society
   7. NEC, National Electric Code

1.5 DELIVERY, STORAGE & HANDLING

1.6 QUALITY ASSURANCE

A. One manufacturer will be responsible for the supply of the equipment specified in this specification. The equipment manufacturer will have no less than ten (10) years' experience in the design and manufacturing of fine screens in North America. The equipment manufacturer will have more than 100 fine screens operating in North America, and no less than ten (10) fine screens equipped with perforated plates operating in North America.

B. The contract plans and specifications are based on Parkson's Aqua Guard® Perf Screen design. If an alternative manufacturer's design is selected, the installing contractor will be

responsible for all changes associated with that design, including the cost of the consulting engineer to review and confirm the use of the alternative design.

C. Where a manufacturer's standard equipment and/or model number is listed, the equipment will be provided as modified to conform to the performance, function, features, and materials of construction specified herein.

1.7 PERFORMANCE REQUIREMENTS

A. The automatic self cleaning fine screen will be designed to meet the following requirements:

1. The screens will be designed for an outdoor installation, in an unclassified area.
2. The screen controls will be designed for an outdoor installation, in an unclassified area.
3. The screen will be designed to present a clean filtration surface to the oncoming liquid stream in the form of a continuous screen belt loop. The screen will remove material larger than the screen belt perforations, lift the material above the operating floor, and discharge the material at an acceptable height above the operating floor.
4. The screen will be capable of continuous or intermittent operation in order to optimize screenings removal and minimize screen run time.
5. The screen belt speed will be seven (7) feet per minute.
6. Dimensional requirements. Verify with construction Drawings which shall supersede table.

a.	Channel Width:	2′ 6″
b.	Discharge Height:	19′ (Southside) 15′ (Northside)
c.	Channel Depth:	14′ (Southside) 10′ (Northside)
d.	Screenings Drop-Off Height	4′ 3″
e.	Screen Installation Angle:	75 deg
f.	Channel recess:	9″

7. Screening requirements:

a.	Screen Opening (diameter of perforations):	¼″
b.	Screen Open Area:	48%

8. Flow requirements:

a.	Influent type:	Domestic Sewage
b.	Peak flow:	6.5 MGD
c.	Downstream water level (at peak flow):	1.00 ft
d.	Max headloss (at peak flow):	15″

9. Utility requirements:

a.	Spray Wash Water (per screen)	15 GPM

10. Power Supply 460 V / 3 ph / 60 Hz

1.8 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

E. It is not intended the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacture, delays in delivery, replacement, or otherwise.

PART 2 PRODUCTS

2.1 MANUFACTURER

A. Acceptable manufacturer
   1. The automatic self-cleaning fine screen will be manufactured by Parkson Corporation, Vernon Hills, IL. Model will be an AG-PF-MN Aqua Guard® Perf Screen.
   2. No alternative manufacturers will be accepted.

2.2 QUALITY ASSURANCE

A. The screens will be fully assembled and tested in the U.S. factory for a minimum of 1/2 hour to confirm the fit and function of the screen.

B. The screen will be shipped to the site as fully assembled as possible. Some components may be removed to prevent damage during shipment.

2.3 MATERIALS AND FABRICATION

A. Materials
   1. The screen will be fabricated primarily in stainless steel. Where stainless steel is noted in these specifications as the material of construction, the type of stainless steel will be 304.
   2. Hardware will be supplied in type 18-8 stainless steel.
   3. Nameplates will be stainless steel, stamped and fastened to the screen with stainless steel rivets.
   4. Other materials of construction are as noted in these specifications.

B. Design

1. The fine screen will consist of a screen frame with screen mounting brackets, an adjustable continuous screen belt that is driven by a direct drive system,a screen belt cleaning system including a water spray header and an adjustable rotating brush, covers above the operating floor including panels for inspection access, and seals to eliminate flow and screenings by-pass.
2. A controls system will be furnished to monitor and control the screen andwash press unit.

C. Screen Frame

1. The screen frame will provide the support structure for all screen components. The screen frame will rest on the bottom of the channel and be supported and anchored at the operating floor. No mounting or fastening of the screen to the sidewalls or the bottom of the channel will be allowed.
2. The screen frame will be fabricated of 1/4 inch thick stainless steel plate. The frame will be adequately braced to accommodate the expected loads.
3. Front and rear guide rails will be mounted on the inside of the frame to guide and support the screen belt as it travels through its cycle. The guide rails will measure 1/2 inch x 1/2 inch, and be constructed of stainless steel. Plastic or ferrous metal guide rails will not be allowed.
4. Bottom guides will be provided at the base of the screen to direct the screen belt during its 180-degree turn at the bottom of the screen. Bottom guides will be 1/2 inch thick, and be constructed of stainless steel. Plastic guides or rotating guides with submerged bearings and bushings will not be allowed.
5. Screen mounting brackets will be provided on each side of the frame to allow the frame to be secured to the structure at the operating floor. Supports will be fabricated of 3/8 inch thick (minimum) stainless steel plate.

D. Screen Belt

1. The continuous screen belt will consist of a series of close fitting perforated screen panels that are mounted on and driven by a drive chain on each end of the panels.
2. Each screen panel will be fabricated from 11 ga (.120 inch) type 304L stainless steel perforated sheet, formed to provide a 2-½ inch shelf for lifting solids out of the channel. The perforations will be provided on the face and the shelf of the panels; no perforations will be allowed in the sharp bend areas of the screen panels. Support plates will be welded to the ends and in the middle of the formed perforated sheet. The end support plates will be provided with weld nuts for mounting of the screen panel onto the drive chains.
3. Each drive chain will consist of chain links assembled with pins, bushings, and rollers to provide a continuous strand. Each drive chain will have an ultimate strength of 10,000 lb.
4. Chain links will have a cross section of 1.62 inch x 3/16 inch, and have a pitch of 7.87 inches (200 mm). Links will be made of stainless steel. Inner links will be fabricated with a mounting bar to provide the means to fasten the screen panels to the chain.
5. Rollers will be made of 416 Stainless Steel, having a minimum hardness of 39 (Rockwell C). Every other roller will be flanged on one end to assist in guiding the chain through its cycle. Rollers will be machined to an OD of 1.77 inch, with the flange machined to an OD of 2.17 inch.

6. Bushings will be made of 416 Stainless Steel, having a minimum hardness of 39 (Rockwell C). Bushings will be machined to an OD of 1.24 inch.
7. Pins will be made of wrought 416 Stainless Steel, having a minimum hardness of 39 (Rockwell C). Pins will be machined to an OD of 1.00 inch. The ends of each pin will be machined with snap ring grooves to accommodate snap rings for securing the chain components.
8. Overlapping side plates will be sandwiched between the end of the screen panel and the chain, to enclose the ends of the screen belt. Side plates will be made of 16 ga (.059 inch) stainless steel.
9. The screen belt is supported by a drive shaft with two (2) sprockets. The shaft ends extend beyond the screen frame and are mounted on take-up bearing assemblies.
10. Drive shaft and sprockets will be made of 304 Stainless Steel. Sprocket teeth will have a pitch diameter of 18.15 inches.
11. Bearings will be spherical roller type, mounted in take-up housings and provided with centralized lubrication points for periodic lubrication.
12. A take-up bracket and take-up rod will be mounted on the screen frame and secured to the bearing housings to hold the position of the drive shaft and allow for adjustment of the screen belt tension. Bracket will be made of stainless steel. Take-up rods and associated hardware will be made of 304 Stainless Steel.

E. Screen Belt Drive System
1. The screen drive system provides the necessary power to drive the screen belt through its cycle under expected loading conditions.
2. The gear reducer will be shaft mounted to the screen drive shaft; reducer will be supplied with a keyless tapered bushing to facilitate installation. A torque arm is fastened to the gear reducer, and tied into the take-up assembly, which allows the drive system to move when the screen belt position is adjusted.
3. The gear reducer will be a cyclo / spiral bevel gear arrangement, which provides the required output torque at an output speed of 1.57 rpm. The gear reducer will be grease lubricated in the input section, and oil lubricated in the output section. A breather will be provided in the oil lubricated section.
4. The screen drive motor will be a 460 voltage, 3 Phase, 60 Hz, minimum 1/2 HP TEFC motor. The motor will be provided in a NEMA C-face frame and close coupled to the gear reducer.

F. Screen Belt Cleaning System
1. A dual-pattern spray header and a high speed rotating brush will provide effective cleaning of the screen belt. Screenings removed by the spray and brush will be directed into the screenings discharge chute.
2. A spray header assembly will be provided on the inside of the screen belt. The dual-pattern spray will be designed to clean the perforated surfaces (face and shelf) of each screen panel.
3. The spray header pipe will be a 1-1/4" NPT schedule 40 pipe, made of stainless steel.
4. The spray header will be machined with tapped holes to accommodate two rows of spray nozzles. One row will be Vee-Jet type nozzles, providing a straight spray pattern to clean the face of the screen panels. The other row will be Flat-Jet type nozzles, providing a deflected spray pattern to clean the shelf of the screen panels. Nozzles will be made of type 304 stainless steel. Each nozzle will have a capacity of 1 gpm at 40 psi (1.2 gpm at 60 psi).

5. Each end of the spray header will be provided with a schedule 80 PVC pipe coupling. One end will include a PVC pipe plug. Source water can be connected at either end of the header.
6. The spray header will be mounted on two (2) adjustable flanges that are fastened to the screen frame. Flanges will be made of stainless steel.
7. The rotating brush assembly will consist of a split core brush that is fastened to a drive shaft. The brush drive shaft is supported by two (2) bearings mounted on adjustable brackets. The split core design allows removal of the brush without removing the brush drive shaft and bearings.
8. The core of the brush will be made of 6063-T6 aluminum, and split into two halves. The core will be extruded with longitudinal channels that are used to secure rows of brush bristles.
9. The brush will consist of a total of sixteen (16) rows of nylon brush bristles running the width of the screen panels and equally spaced from each other. The brush will have an OD of 21 inches.
10. Aluminum flanges will be keyed and fastened to the brush drive shaft. Flanges will have a profile that matches the inside diameter of the brush core, and allows the core to be fastened to the flanges.
11. The brush drive shaft will be made of stainless steel.
12. The brush drive shaft will extend beyond the screen frame, and be supported by flanged mounted ball bearings on each end. Bearings will be provided with grease zerks for periodic lubrication. Bearings will be mounted on adjustable brackets made of minimum 1/4" thick stainless steel, which allow the drive shaft and brush to be linearly adjusted for optimum brush contact with the travelling screen belt.

G. Brush Drive System
1. The brush drive system provides the necessary power to drive the brush as it contacts and removes screenings from the face of the travelling screen belt.
2. The gear reducer will be shaft mounted to the brush drive shaft; reducer will be supplied with a keyless tapered bushing to facilitate installation. A torque arm is fastened to the gear reducer, and tied into the adjustable brush mounting bracket, which allows the drive system to move when the brush position is adjusted.
3. The gear reducer will be a cyclo / helical gear arrangement, which provides the required output torque at an output speed of 83 rpm. The gear reducer will be grease lubricated in the input section, and oil lubricated in the output section. A breather will be provided in the oil lubricated section.
4. The brush drive motor will be a 460 voltage, 3 Phase, 60 Hz, 1 HP TEFC motor. The motor will have a 1.15 service factor and be suitable for use in a severe environment. The motor will be provided in a NEMA C-face frame and close coupled to the gear reducer.

H. Covers
1. Covers will be provided to enclose the screen frame above the operating floor.
2. Covers will be made of 14 ga (.075 inch) stainless steel.
3. Covers will be bolted to the screen frame, and can be removed as required to service the screen.
4. A hinged and gasketed door will be provided above the discharge chute, to allow inspection access to the rotating brush. The hinges and door will be made of stainless steel and will be removable for unobstructed access when required to replace the brush.

5. A bolted and gasket access panel will be provided on each side of the screen frame to allow inspection access to the screen belt. Access panels will also be utilized when screen panels must be removed to service the screen. Panels will be made of stainless steel.

I. Front Seals
1. Front seals will be provided to ensure that flow is directed through the screen belt.
2. Front inner seals will consist of a neoprene seal mounted on an adjustable stainless steel bracket. The front seals will be positioned parallel to the screen panel side plates and prevent flow by-pass between the screen belt and the screen frame.
3. Front outer seals will be neoprene seals that are mounted between the front inner seal brackets and the screen frame, and extend outward to positively contact the channel walls and prevent flow by-pass between the screen frame and the channel walls.
4. A bottom seal will consist of a neoprene seal mounted between two stainless steel reinforcing plates, and fastened to the bottom plate of the screen frame. The seal extends upward to maintain contact with the travelling screen belt throughout its cycle and prevent flow by-pass under the screen belt.

J. Chute Seals
1. The chute seal will deflect spray water and screenings into the screenings discharge chute and prevent screenings from falling back into the flow downstream of the screen belt.
2. The chute seal will be made of 3/8" thick reinforced neoprene belting.
3. A stainless steel reinforcing plate will be provided to fasten the chute seal to the discharge chute.
4. The lead face of the discharge chute shall be fitted with a flexible silicone rubber wire wound heater to prevent material from freezing to the surface and creating a build up that could cause damage to the filter belt assembly as it passes. The heater shall have an integral thermostat to regulate the heating element.

K. Surface Treatment
1. All stainless steel components and sub-assemblies will be mechanically cleaned using DuPont Starblast. Additionally, an acid passivation paste will be applied in the welded and heat affected areas to locally passivate these areas. After passivation, the weldments will be thoroughly rinsed with clean water and allowed to air dry.
2. Sheet metal components, such as covers, will be furnished with a 2B mill finish.
3. Motors, gear reducers, and bearings will be provided with the manufacturers' standard finish suitable for a severe environment.
4. Plastic parts will remain unfinished.
5. tic parts will remain unfinish.

L. Electrical Devices & Controls
1. In addition to the drive motors, the following electrical devices and controls will be supplied.
2. A NEMA 4X emergency stop pushbutton station will be mounted on the side of the screen frame. E-stop will be rated for use in a 120 volt circuit and provided with a 1/2 inch conduit opening.

3. E-Stop will be wired to the control panel to cause all unit functions to cease upon pressing the E-Stop. Proper wiring from the E-Stop to the control panel will be the responsibility of the contractor.
4. When the screen is in operation, the water spray will be actuated by a normally closed solenoid valve. The solenoid valve will have a brass body with NPT pipe connections (solenoid pipe threads to match header pipe threads).
5. The solenoid valve requires 115 volt, 60 Hz, single phase power and will be provided with an 18 inch long 18/3 lead. Electrical housing will be rated NEMA 4X, and provided with a 1/2" NPT conduit connection.
6. The solenoid valve will be shipped loose to be field installed by the contractor in the respective wash water supply line. Proper wiring from the solenoid valve to the control panel will be the responsibility of the contractor.
7. A mercury type float switch of chemical resistant polypropylene construction will be provided with a 316 SST pipe mounting bracket, float mounting clamp and expansion anchors. The mounting bracket requires a suitable length of 1" nominal pipe to suspend the float in the channel, to be supplied by others. The float will have a 20-foot long integral cable.
8. The screen will be equipped with a thermostat that will actuate the screen when ambient temperatures drop below 35 degrees F. The thermostat will be rated NEMA 4X. The thermostat will be installed on the screen control panel, when the control panel is mounted in close proximity to the screen. Otherwise, the thermostat will be mounted on the screen frame. When the thermostat is mounted on the screen, field wiring to the control panel will be the responsibility of the contractor.
9. A 460 volt UL listed triple control panel will be provided in a NEMA 4X type 304 stainless steel enclosure suitable for wall mounting. It will contain the following logic devices for proper operation of one (1) screen and one (1) wash press:
    a. Main breaker switch.
    b. Motor starters.
    c. Overload protection
    d. 460 to 120 Volt Control Power Transformer.
    e. Programmable relay to monitor equipment mounted electrical devices and to perform the necessary logic functions.
    f. Run Time meters.
    g. Emergency Stop push button.
    h. Fault reset button.
    i. Control power and run indicating lights.
    j. Fault lights.
    k. Run and fault auxiliary output contacts for customer use.
10. Sequence of Operation (Overview)
    a. When the respective selector switch is in Hand mode, the screen, brush and spray will run continuously.
    b. When all of the selector switches are in Auto mode, the screen and brush drive motors and spray will be controlled per the automatic control logic:
    c. The screen will run via the liquid level sensing system. When the upstream liquid level reaches the switch point (adjustable), the screen, brush and spray water will operate continuously. Screen, brush and spray will be turned off 5 minutes (adjustable time) after the liquid level drops below the switch point.

d. An adjustable time clock override will be provided, to ensure that the screen runs for a minimum amount of time, regardless of the flow conditions.
e. The screen and brush are protected by their respective motor starter overload relay. Additionally, the screen is protected by a power monitor. In the event of an overload condition, the screen will immediately shut down, and a fault light will illuminate. When the screen shuts down due to an overload condition, the screen will not restart until the alarm condition has been cleared and the reset button is pressed.
f. Refer to project-specific Control Panel drawings for additional control logic designed specifically for this project.

2.4 CONTRACTOR RESPONSIBILITIES

A. The contractor will be responsible for reviewing the design of the equipment provided by the manufacturer, so that it fits properly in the structure and interfaces properly with associated equipment provided by others.

B. The contractor will be responsible for receiving the equipment, unloading it from the common carrier, and storing it safely until it is ready to be installed.

C. The contractor will install the manufacturer's equipment in accordance with the manufacturer's Installation, Operation and Maintenance instructions.

D. The contractor will provide all field wiring between the electrical devices on the screen (motors, switches, valves, etc.) and the control panel. Contractor will also provide all required local disconnects and junction boxes.

E. The contractor will provide all field piping, fittings, isolation valves, and components required to supply the necessary wash water to the screen spray system.

F. The contractor will be responsible for supplying and installing sixteen (16) ¾-inch stainless steel anchor bolts. Anchor bolts will be ¾ inch-10 x 10" lg. UNC threaded rods for use with the HILTI HY-200 adhesive anchoring system (provided by the contractor).

PART 3 EXECUTION

3.1 INSPECTION AND STORAGE

A. Screen will be shipped assembled and as much as possible (depending on size of unit, drives and supports may be shipped loose). The contractor will be responsible for inspecting the equipment upon receipt of goods at the jobsite, unloading, and storing the equipment in a reasonable manner and protecting the motors, gearboxes, and controls from the weather in accordance with the Installation Operation and Maintenance manual.

3.2 INSTALLATION

A. The contractor will install the fine screen in the structure, according to the Contract Documents and the approved submittals provided by the manufacturer, and following the instructions detailed in the Installation Operation and Maintenance manual.

B. Upon completion of installation by the contractor and startup of the equipment by the manufacturer's field service representative, the equipment will be operated under the supervision of the contractor for a minimum of eight (8) hours to ensure that all operating characteristics are within acceptable limits.

3.3 STARTUP AND FIELD SERVICE ASSISTANCE

A. The contractor will obtain the services of a qualified factory representative for installation inspection, startup, and training of the plant operations staff. The service representative will make one (1) trip to the site, and be on site for two (2) full days.

B. During this trip, start-up services will also be provided for the screenings washer/compactor (AWP).

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 46_21_73.13

SCREW WASHER COMPACTOR

PART 1 GENERAL

1.1 SUMMARY

A. The manufacturer will furnish four (4) model AWP8-2 Aqua Washpress units, as supplied by Parkson Corp., Vernon Hills, IL. The Aqua Washpress units will consist of a main body, screw, wash spray, flush spray, drive system, covers, inlet chute, discharge piping and controls.
   1. Northside WWTP – two (2)
   2. Southside WWTP – two (2)

B. The equipment will be of the latest design and will be fabricated of the specified materials and in a fashion that will fully perform the functions described in these specifications.

C. The contract documents and specifications are based on Parkson's Aqua Washpress Model AWP8-2 design. Any changes in layout, access platforms, piping or structural requirements for an alternative manufacturer's design will be the responsibility of the installing contractor, including the cost of the engineer to verify layout, sizing, and structural requirements.

D. The Aqua Washpress unit will be inclined at 0 degrees from horizontal. The discharge piping will be designed to direct the screenings from the unit into the designated receptacle or receiving equipment.

E. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.
   1. Complete submittal drawings, quality control and product information will be submitted. As a minimum, the following information will be submitted:
   2. A Letter of Compliance, which confirms any variances with the Contract Plans and Specifications, and provides further explanations where necessary to adequately define the scope of supply.
   3. Dimensional plan and section drawings of the equipment mounted in the structure, showing all utility connections and requirements, and anchor bolt locations. Where applicable, drawings will show connection to associated equipment provided by others.
   4. Approximate weight of each component or piece of equipment.
   5. Manufacturers' catalog information, descriptive literature, specifications, and identifications of material of construction.
   6. Power and control wiring diagrams, including terminal layout with numbers, panel construction and panel layout drawings, and control schematics diagrams. Control diagrams will also include a description of operation.
   7. Manufacturers' performance data for all drives.
   8. Installation, Operation and Maintenance manuals, which will be submitted after final approval of the equipment. A spare manual will be shipped with the unit in order to allow for proper installation and operation of the equipment prior to the release of all final Installation, Operation, and Maintenance manuals.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.
   1. AGMA, American Gear Manufacturers Association
   2. ASME, American Society of Mechanical Engineers
   3. ASTM, American Society of Testing and Materials
   4. ANSI, American National Standards Institute
   5. NEC, National Electric Code
   6. ABMA, American Bearing Manufacturers Association

1.5 DELIVERY, STORAGE & HANDLING

1.6 QUALITY ASSURANCE

A. The equipment manufacturer will have a minimum of five (5) years of design and manufacturing experience with screw wash press units, with not less than one-hundred (100) screw wash press units sold and installed in similar applications. Manufacture will include U.S. installation list with the equipment submittal.

1.7 PERFORMANCE REQUIREMENTS

A. The Aqua Washpress unit will be capable of the following performance:

1. The Aqua Washpress unit will be designed to receive and wash screenings, then reduce the volume and water content by means of a pressing action. Screenings to be washed will be gravity fed to the drainage trough and conveyed by the screw towards the washing section. Wash water is added, which back flows the screenings, while the spiral alternately stops and restarts to convey the screenings through the wash section. The wash water is then turned off and the screenings are discharged and dewatered by the backpressure generated in the discharge pipe.
2. The unit will be installed outdoors in an unclassified area.
3. The unit's controls will be installed outdoors in an unclassified area.
4. The unit will be suitable for installation and operation in the designated space.
5. The unit will have an inlet capacity of 35 cubic feet per hour, handling wet screenings with an approximate dry weight of not less than 8% solids.
6. Utilities
   a. Total Spray wash (max @ 60 psi): 15 gpm
   b. Power Supply 460 / 3/ 60

1.8 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

E. It is not intended the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacture, delays in delivery, replacement, or otherwise.

PART 2 PRODUCTS

2.1 MANUFACTURER

A. Acceptable manufacturer
   1. The Aqua Washpress unit will be manufactured by Parkson Corporation, Vernon Hills, IL.

2. No alternative manufacturers will be accepted.

2.2 QUALITY ASSURANCE

A. The equipment will include all necessary devices, such as machinery guards, emergency stops, warning labels, and similar items.

B. Threaded fitting will have a standard tapered pipe threads complying with ANSI/ASME B1.20.1.

C. Bearings will conform to the standards of ABMA.

D. Gear reducer selections will comply with AGMA standards and gear reducer's recommendations.

E. Nameplates will be engraved stainless steel and stamped and fastened to the equipment with stainless steel rivets.

F. The equipment will be factory assembled and tested for a minimum of 30 minutes at the U.S. factory prior to delivery. The Engineer and/or Owner may witness the factory test, at their own option and expense.

G. The equipment will be delivered to the site as fully assembled as possible. Some components may be removed from the unit after shop testing to prevent damage during shipment' these components must be re-assembled on the unit by the Contractor.

2.3 MATERIALS of CONSTRUCTION AND FABRICATION

A. MAIN BODY

1. The main body will consist of a drainage trough and a washer barrel, enclosed by an outer housing and a support leg at each end. The main body will be constructed of type 304L stainless steel for all welded components; to minimize corrosion in the heat affected zones, and type 304 stainless steel for all non-welded components.

a. DRAINAGE TROUGH

1) The drainage trough will be the perforated inlet area of the unit, which captures screenings and allows liquid to drain. The inlet area will measure 11" wide x 27 inches long. The drainage trough will be constructed from 12 gauge (0.11") stainless steel with 0.19 inch diameter perforations.

b. WASHER BARREL

1) The washer barrel will provide a washing zone and a dewatering zone for the incoming screenings. The washer barrel will be constructed of 0.25 inch thick stainless steel, with three distinct perforated drainage zones having 0.19 inch diameter holes chamfered to 0.38 inch diameter on the outside. The inside of the washer barrel will be provided with six (6) 0.25 inch thick by 1.50 inch wide replaceable wear bars with 400 Brinnel hardness.

c. OUTER HOUSING

1) The outer housing will enclose the sides and bottom of the drainage trough and washer barrel. The outer housing will collect

drained liquid from the drainage trough and washer barrel and direct the liquid to a 4.0 inch drain tube. Access panels will be provided on the outer housing in the washer barrel area to facilitate servicing of the washer barrel. The outer housing will be constructed from 10 gauge (0.135 inch) thick stainless steel.

d. SUPPORT LEGS

1) A support leg will be provided at each end of the main body to support the main body, provide the means to mount the drive assembly (at the drive end), and provide the means to mount discharge piping (at the discharge end). Each support leg will be designed to allow the screw to be removed from either end of the main body. Each support leg will be provided with a footpad and anchor bolt holes, to secure the unit to the structure.

B. SCREW

1. The shafted screw will be provided to convey screenings through the various stages of the unit. The screw will be constructed of carbon steel and finished with alkyd enamel paint. The spiral will be 8.00 inches OD and have minimum 0.63 inch thick flights. A replaceable 0.25 inch wide nylon brush with a stainless steel casing will be attached with bolted clips to the spiral OD throughout the inlet area to scour the perforated sheet. The brush OD will be 8.50 inches.

C. WASH SPRAYS

1. The wash zone will include a spray wash system to wash organic residue from screenings. The wash zone spray will consist of one (1) spray header, four (4) water injection points, one (1) ball valve and one (1) solenoid valve. The solenoid valve body will be of brass construction with Buna seals. The ball valve will be of brass construction with a stainless steel ball. The system will have an output of 10 GPM at 60 psi. The spray connection will be ½ inch NPT.

D. FLUSH SPRAYS

1. The press will include a single point spray wash system to flush organic residue trapped in the outer trough. The flushing spray will consist of one (1) spray header, one (1) ball valve and one (1) solenoid valve. The solenoid valve body will be of brass construction with Buna seals. The ball valve will be of brass construction with a stainless steel ball. The system will have an output of 15 GPM at 60 psi. The spray connection will be ½ inch NPT.

E. DRIVE SYSTEM

1. The unit drive system will consist of a gearmotor mounted on a sealed drive mounting bracket and a drive shaft that connects the gear reducer output to the shaft of the screw.

a. GEARMOTOR

1) The gearmotor will be a single speed, dual voltage SEW Eurodrive motor direct coupled to an SEW Eurodrive helical gear reducer.

2) The electric motor will be a 3 horsepower for severe duty motor with a 1.15 service factor, rated for use in a 40° C ambient temperature. The TEFC motor will be NEMA design B with Class F insulation, 1800 rpm output speed, and a 230/460 volt, 3-phase, 60 Hz power supply. The motor conduit box will have one (1) 1/2 inch NPT and one (1) 3/4" NPT conduit connection.

3) The gear reducer will be AGMA class II (1.6 service factor) with a minimum 94% efficiency, producing an output speed of 14 rpm and an output torque of 13,900 inch-pounds. Heavy duty tapered roller bearings in the gear reducer will provide a maximum thrust capacity of 6,740 pounds.
4) Gear reducers with service factors of less than 1.4 and efficiencies of less than 94% will not be allowed.

b. DRIVE MOUNTING BRACKET
1) A drive mounting bracket will be provided to mount the gearmotor to the drive end support leg of the unit. The bracket will be made of type 304L stainless steel.
2) A compression type packing gland seal will be provided on the mounting bracket to seal the drive shaft. PTFE packing rings will be fitted into the seal housing, and held in place by a two-bolt stainless steel gland follower.

c. DRIVE SHAFT
1) The drive shaft will be direct coupled to the spiral and constructed of carbon steel. The shaft will be painted, except in the area of the shaft that extends into the hollow bore of the reducer.

F. INLET HOPPER AND COVER
1. A 12 gauge (0.105 inch) stainless steel inlet hopper will be supplied to direct screenings and liquid into the drainage trough. The chute will be flange bolted to the trough, with each side of the chute being a minimum 60 degrees from horizontal.
2. A 12 gauge (0.105 inch) stainless steel cover will be supplied to cover the remaining top of the main body.
3. A gasket will be provided to seal the feed hopper's inspection door cover.

G. DISCHARGE PIPING
1. A 14 gauge (.075 inch) stainless steel discharge pipe will be fitted to the discharge end support leg to direct screenings into a customer provided receptacle. All discharge pipe flanges will be 304L stainless steel. Aluminum flanges will not be allowed.
2. The discharge pipe will be fitted with 10 watt per foot, self-regulating heating cable, 1-1/2 inch thick closed cell foam insulation, and a 0.08 inch thick polyethylene jacket. This option is for sites where a portion of the discharge pipe is exposed to below freezing ambient temperatures.

H. PIPE SUPPORTS
1. Pipe supports will be supplied by Parkson.

I. FASTENERS
1. All fasteners will be type 18-8 stainless steel.

J. FABRICATION
1. Weld size, type, and procedure will provide the necessary strength and facilitate the manufacturing of the specific component.

K. SURFACE FINISH

1. All stainless steel components will have standard mill finish and will be mechanically cleaned to remove weld discoloration and fabrication markings.
2. The screw and drive shaft will be finished with an enamel coating.
3. The motor and gear reducer will have the standard manufacturer's finish.

L. ELECTRICAL DEVICES AND CONTROLS
1. Electrical device interconnecting conduit and wiring will be the responsibility of the installing contractor. In addition to the drive motor, the following electrical devices will be furnished with the unit:
   a. SOLENOID VALVES
      1) Two (2) 120 volt, single phase, 60 Hz solenoid valves for the wash zone and flush spray washes housed in NEMA 4X enclosures will have 18-inch long integral leads and will have 1/2 inch NPT conduit connections.
   b. EMERGENCY STOP LOCAL PUSH BUTTON STATION
      1) A NEMA 4X polycarbonate emergency stop push button will be mounted to the end flange and will have a 1/2 inch NPT conduit connection.
   c. CONTROL PANEL
      1) See screen specification.

M. SEQUENCE OF OPERATION
1. HAND OPERATION.
   a. When HAND mode is selected, the screw will run continuously. When either spray wash HAND mode is selected, the spray wash will run continuously.
2. INTERMITTENT AUTOMATIC OPERATION.
   a. The control panel will be equipped to control the wash cycle, screw movement and flush cycle. Each wash or flush cycle and the screw movement will be controlled independently through the use of timers and counters. The drive motor and spray washes will be controlled automatically when the selector switches are placed in the AUTO position.
      1) The press motor starts after an adjustable accumulated run time from the interlocked feeding equipment. The press motor will have a staging timer where it will run for an adjustable length of time, typically set at 0.3 seconds.
      2) The press motor continues to run for an adjustable length of time (cycle on timer), typically set at 3-5 seconds. The press motor stops for an adjustable length of time (cycle off timer), typically set at 5 seconds. The wash solenoid valve opens and closes per the (wash cycle water duration timer) typically set at 8-10 seconds.
      3) Motor stop/start cycle repeats for an adjustable number of counts (wash cycle counter) typically set at 4-7.
      4) The press motor runs for an adjustable length of time (discharge timer), typically set at 13.5 seconds, to dewater and discharge the screenings.
      5) The flush solenoid opens for an adjustable length of time after the press motor stops (flush off delay), typically set at 10 seconds. The system will reset after the flush solenoid closes.
3. EMERGENCY STOP

a. The unit can be deactivated at any time by pressing either the control panel mounted or unit mounted Emergency Stop push buttons.

4. FAULT CONDITIONS

a. Motor overload or high motor current conditions will stop the motor and illuminate the fault light.

2.4 CONTRACTOR RESPONSIBILITIES

A. The Contractor will be responsible for reviewing the design of the equipment provided by the manufacturer, so that it fits properly in the structure and interfaces properly with associated equipment provided by others.

B. The Contractor will be responsible for receiving the equipment, unloading it from the common carrier, and storing it safely until it is ready to be installed.

C. The Contractor will install the manufacturer's equipment in accordance with the manufacturer's Installation, Operation and Maintenance instructions.

D. The Contractor will provide all field wiring between the electrical devices on the screen (motors, switches, valves, etc.) and the control panel. Contractor will also provide all required local disconnects and junction boxes.

E. The Contractor will provide all field piping, fittings, isolation valves, and components required to supply the necessary wash water to the spray system (as specified in Paragraph 1.8 A 5 a).

F. The Contractor will be responsible for providing and installing 1/2"-13UNC by 5-1/2" long type 304 stainless steel expansion anchor bolts for each unit.

PART 3 EXECUTION

3.1 INSPECTION AND STORAGE

A. The equipment will be shipped assembled and as much as possible (depending on size of unit, drives and supports may be shipped loose). The Contractor will be responsible for inspecting the equipment upon receipt of goods at the jobsite, unloading, and storing the equipment in a reasonable manner and protecting the motors, gearboxes, and controls from the weather in accordance with the Installation Operation and Maintenance manual.

3.2 INSTALLATION

A. The Contractor will install the equipment in the structure, according to the Contract Documents and the approved submittals provided by the manufacturer, following the instructions detailed in the Installation Operation and Maintenance manual.

B. Upon completion of installation by the Contractor and startup of the equipment by the manufacturer's field service representative, the equipment will be operated under the supervision of the Contractor for a minimum of eight (8) hours to ensure that all operating characteristics are within acceptable limits.

3.3 STARTUP AND FIELD SERVICE ASSISTANCE

A. See screen specification.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 46_23_24

GRIT REMOVAL, WASHING & DEWATERING

PART 1 GENERAL

1.1 SUMMARY

A. The contractor shall furnish and install four (4) 360 PISTA® Model 7.08B with V-FORCE BAFFLE™ Grit Removal Systems in accordance with the drawings. Each PISTA® Grit Chamber shall be complete with the following equipment: gear motor, gear head, air bell, propeller drive tube, axial flow propeller, Gorman Rupp self-priming grit removal pump, grit washer, controls and auxiliary equipment as specified herein. All wetted parts shall be constructed of 316 stainless steel.
   1. Northside WWTP – two (2) systems
   2. Southside WWTP – two (2) systems

B. The PISTA® V-FORCE BAFFLE™ Grit Chamber shall operate on the vortex principle, and shall be capable of removing grit from raw waste or process water and depositing the grit in a storage hopper. No moving parts subject to wear or stoppage shall be below the water surface. An integral grit transporting means shall be provided to transport the grit from the storage hopper to the disposal means. To minimize the possibility of clogging, all internal openings in the piping to the grit pumping device as well as the grit pumping device shall be large enough to pass a 3" sphere. No bends or elbows will be allowed in the piping on the suction side of the grit pump. All drives, lubrication and bearings shall be readily accessible from walkways above the operating water level. To minimize the possibility of organic capture, the floor of the grit separation chamber shall be flat and there shall be no greater than a 3" opening for grit to pass through to the storage hopper. Sloping floors in the upper chamber will not be allowed due to reduced grit removal efficiency and extra construction costs. The PISTA® V-FORCE BAFFLE™ Grit Chamber shall be manufactured by Smith & Loveless®, Inc., Lenexa, Kansas.

C. An influent baffle and inlet coanda ramp shall be provided to enhance the coanda effect and direct the grit downward to the bottom of the separation chamber as well as enhance chamber flow patterns.

D. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents and include at least the following:

1. Complete catalog information, descriptive literature, specifications, and complete parts list with identification of materials of construction.
2. Installation instructions (assembly, alignment, and adjustment procedures).
3. Total weight of the equipment including the weight of the single largest item for each equipment assembly
4. Certified structural, mechanical, and electrical drawings showing important details of construction, equipment dimensions, size, anchor bolt locations, and locations of external utility piping and electrical connections and requirements.
5. Motor data including material of construction, dimensions, rpm at full load, frequency, voltage, full load current, code and design letter, efficiency, horsepower, number of phases, time rating, temperature rise, service factor and bearing life rating. Include motor manufacturer's recommended lubrication requirements.
6. Power and control wiring diagrams including terminals and numbers.
7. Shop painting systems including specifications to indicate compliance with Contract Documents.
8. Factory test report of inspection.
9. Full-scale test data demonstrating the performance and grit removal efficiency of the equipment furnished under this section. Data from a full-scale test previously performed for a unit in a similar installation will be acceptable.
10. Special shipping, storage and protection, and handling instructions.
11. A list of manufacturer's recommended replacement parts required to maintain the equipment for a period of one year, with current price information.
12. A list of special tools, materials, and supplies furnished with the equipment for use prior to and during startup, and for future maintenance.

B. Submit Operation and Maintenance Manuals.

C. Submit an Equipment Warranty and Certification

1.4 QUALITY ASSURANCE

A. Qualifications

1. The specifications and drawings detail Smith & Loveless equipment and represent the minimum standard of quality for both equipment and materials of construction. The contractor shall prepare his bid on the basis of this equipment for the purpose of determining the low bid without consideration of a possible substitute. A single

manufacturer shall furnish all the equipment specified under this Section (with exception of Grit Pump which shall be supplied by Gorman Rupp), and shall be standard units of proven ability as manufactured by a competent organization that is fully experienced, reputable and qualified in the manufacture of the equipment to be furnished. The manufacturer shall have a minimum of 10 years of successful experience and 50 installations in the design, construction and operation of the equipment specified herein.

2. All equipment furnished under this Section shall be new and unused and shall be the standard products of the manufacturer.
3. Five (5) grit removal efficiency tests shall be provided from installations where similar equipment by the Manufacturer is currently in similar service. Each grit removal efficiency test shall meet the removal efficiency in 1.05.A. Manufacturers that do not have test data acceptable to the Engineer shall not be considered as an approved equal, or will be required to provide grit testing of the installed equipment, with test results that meet 1.05.A.
4. Manufacturer shall have an operational grit removal system with a minimum 4.0 MGD capacity at their facility, and upon request from the Engineer, the operational unit may be witnessed by the Engineer and/or representative of their choice.
5. These Specifications are intended to give a general description of what is required, but do not cover all details which may vary in accordance with the exact requirements of the equipment as offered. They are, however, intended to cover the furnishing, delivery, installation, field testing and field calibration of all materials and apparatus as required. Any additional equipment necessary for the proper operation of the proposed installation not specifically mentioned in these Specifications or shown on the Drawings shall be furnished and installed at no change in Contract Price or Time.

1.5 CONDITIONS OF OPERATION

A. The grit removal device shall be capable of removing the following at the rated hydraulic peak flow rate, with no decrease in efficiency will be allowed at flows less than this design rate.
   1. 95% of the grit down to 140-mesh (105 microns) in particle size.

B. Each PISTA® 360™ Grit Chamber with V-FORCE BAFFLE™ shall handle all flows equal to, or less than, a hydraulic peak flow of 5.3 MGD. The influent flume, transporting the liquid waste to the grit chamber, shall be of the size and shape shown on the contract drawings to assure that grit does not settle in the inlet flume and to provide for proper operation of the grit chamber. The effluent flume shall be a free-flowing flume for maintaining proper velocity within the chamber.

C. The flow in the chamber shall travel a full 360° rotation through the inlet and outlet, providing maximum travel for effective grit removal.

D. Before the bid, any alternate grit removal system manufacturer shall submit to the consulting engineer, performance test data from ten (10) currently operating installations showing through previous certified tests the stated grit removal efficiency of 95% down to 140-mesh (105 microns) in particle size. The stated performance must be proven in full scale field testing utilizing certified grit removal efficiency test procedures as performed by qualified factory payroll personnel who have at least one (1) year experience performing the test.

E. To maximize grit removal efficiency, the grit chamber hydraulics shall incorporate a toroidal flow path enhanced by a slow vortex. Grit chambers incorporating the gravity principle will not be acceptable due to the turbulence in the flow, which prevents gravity settling from being effective and due to the extra area needed for settling fine grit. Aerated grit chambers, including those incorporating conventional settling criteria, are also specifically unacceptable.

F. To ensure the efficient transport of the grit and simultaneous lifting and discharge of the organic material, the bottom of the upper chamber covering the storage hopper shall be constructed of structural grade 316 stainless steel plate, free from rotation and shall be flat.

G. The grit moving across the bottom of the grit chamber shall be hydraulically scoured as the propeller blades, moving within 6" of the grit, pass over the moving grit and cause hydraulic currents to lift up the organics. The grit scouring intensity shall be adjustable. Propellers running with a center line greater than 8" from the bottom of the chamber will not be acceptable. The grit shall pass from the removal chamber through an opening in the transition plate and drop into a grit storage hopper.

H. The PISTA® 360™ Grit Chamber shall be equipped with the V-FORCE BAFFLE™, which is an integral flow control baffle for both the inlet and outlet of the main chamber. The V-FORCE BAFFLE™ shall be designed to direct the inlet flow into the chamber in a manner ensuring the proper vortex flow and to prevent short-circuiting. The V-FORCE BAFFLE™ on the outlet shall direct the flow out of the unit, and to act as a "slice weir" to control the water level in the main chamber and in the inlet channel. No additional downstream flow control device shall be required to keep the velocity between 3.5 fps at peak flow and 1.6 fps at minimum flow with a 10:1 turn down. The V-FORCE BAFFLE™ shall be 316 stainless steel. The installing contractor shall attach the V-FORCE BAFFLE™ to the concrete structure using 5/8" anchor bolts, as shown on the drawings.

1.6 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year from final acceptance by Owner, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

E. It is not intended the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacture, delays in delivery, replacement, or otherwise.

PART 2 PRODUCTS

2.1 MECHANICAL DRIVE

A. The PISTA® Grit Removal Unit shall have an axial flow propeller connected by a drive tube through gearing to a 3-phase, 60cycle, 460 volt, totally enclosed helical gear motor. The minimum rated horsepower of the motor shall be 1.0 HP.

B. The drive tube shall be driven by a large, totally enclosed combination spur gear and turntable bearing. The maximum output speed of the drive shall be 21 RPM. Pinions and gears shall be high quality steel, machined and hardened for high strength and long wear. Propeller blades shall be tapered, with generously rounded leading edge, to reduce energy consumption and prevent foreign material from fouling the propeller.

C. A pinion mounted on the output shaft of the helical gear motor shall drive a large spur tooth bull gear enclosed in a heavy cast-iron case. The spur gear pinion shall be cut from heat-treated steel. The bull gear shall rotate with a minimum 21" diameter turntable bearing for durability and stability. The pinion and bull gear shall have a service factor of 5.0 or greater at standard operating speeds.

D. All bearings of the drive unit, including the motor, shall have a minimum B 10 bearing life of 100,000 hours, except for the 21"diameter turntable bearing supporting the propeller assembly which shall have a minimum B 10 life of 20 years.

E. The bull gearbox shall be specifically designed for this service. It shall have an opening for the 10-3/4" diameter torque tube driving the propeller. The gearbox shall be sealed and the bottom opening shall have an air bell around the torque tube to prevent water from entering the gearbox in case of flooding. The top of the gearbox shall have a bolted flanged connection for the grit discharge pipe. Clarifier drives, which are modified to meet the higher propeller speed, specifically will not be acceptable. The drive motor shall have normal starting torque and low starting current. The motor shall not be overloaded beyond the nameplate rating under any normal conditions encountered.

2.2 PISTA® GRIT FLUIDIZER™

A. The PISTA® Grit Collection System shall be equipped with PISTA® Grit FLUIDIZER™ vanes. The PISTA® Grit FLUIDIZER™ vanes shall be located within 6" of the elevation of the pump suction inlet. The PISTA® Grit FLUIDIZER™ vanes shall be bolted to the propeller drive tube in a helical fashion so as to gently pump the grit upward and keep the grit fluidized at the grit pump suction inlet.

B. The PISTA® Grit FLUIDIZER™ vanes shall be fabricated of the same material as the drive tube. The PISTA® Grit FLUIDIZER™ vanes shall be bolted to the drive tube to facilitate easy removal of the drive tube.

C. The PISTA® Grit FLUIDIZER™ shall be a helical pump that provides two (2) functions.
   1. One, the PISTA® Grit FLUIDIZER™ vanes shall continuously pump the grit upward at the center of the PISTA® Grit Collection Chamber. This gentle pumping action shall prevent the grit from packing down around the pump suction pipe. The fluidizing action shall prevent grit that has a sticky or greasy consistency from packing together to the point where the pull of water created by the pump might not break it loose. The PISTA® Grit FLUIDIZER™ vanes shall keep the grit fluidized at the suction inlet so packing cannot occur.
   2. Second, the upward pumping action of the PISTA® Grit FLUIDIZER™ vanes shall enhance the performance of the propeller in keeping organics in suspension. This shall cause the heavier grit to fall downward through the gently circulating water, and enable the organics to be more readily swept away by the currents induced by the PISTA® propeller.

2.3 GRIT STORAGE HOPPER

A. A grit storage hopper with a 60° sloped bottom shall be provided. The effective storage volume shall be 35 cubic feet. To prevent squatty storage chambers the maximum diameter shall be 3'- 0". The minimum depth shall be 5'-6". This is to allow for adequate volume for grit pile expansion if backwashing is performed plus allow adequate storage to prevent excessive numbers of grit removal cycles and grit handling equipment wear. As an integral part of the equipment installation, the Manufacturer shall supply a floor plate to cover the storage hopper. The plate shall consist of two (2) sections with lifting slots to allow access to the storage area. Attaching this plate as part of the rotating assembly will not be allowed.

2.4 GORMAN RUPP GRIT PUMP – TOP MOUNTED

A. Supply Gorman Rupp self-priming grit pump w/ casing heater designed to accommodate Pista Grit system per Drawings and manufacturer's requirements.

2.5 PLC ELECTRICAL CONTROLS FOR AUTOMATIC GRIT REMOVAL

A. The grit system control equipment shall be mounted in a NEMA Type 4X 316 stainless steel enclosure with hinged, lockable doors.

B. All components within the control panel shall be UL listed or recognized, and the complete grit system control panel itself shall be labeled as a UL 508A General Use Industrial Control Panel.

C. To facilitate wire tracing and servicing, the control wiring shall be run in enclosed wireways, with removable covers, rather than tied up in bundles. All switches and components shall be labeled and a coded wiring diagram shall be provided.

D. Control relays up to 6-amp capacity shall be the modular, plug-in type, with integral LED indicating lights to show activation. Larger control relays shall be enclosed to be "finger safe".

E. A duplex GFI protected convenience outlet shall be provided in the panel for operation of 120-volt AC devices.

F. Thermal magnetic air circuit breakers shall be provided for branch disconnect service and short-circuit protection of all auxiliary circuits, and thermal magnetic circuit breakers with lockout capability shall be provided for each drive and pump motor, matched to the motor inrush current.

G. A NEMA 1 rated, reversing, magnetic across the line starter with overload coils for each phase shall be provided for the PISTA□ TURBO™ Grit Washer Drive Motor.

H. Magnetic across-the-line starters with 24-volt coils and solid-state overload protection for each phase shall be provided for each motor to give positive protection against phase unbalance, thermal overload, phase loss and ground fault. To provide the fastest trip speed and for ground fault protection, only solid-state overload protection will be used, and motor starters using heater coils will not be acceptable. Each single-phase auxiliary motor shall be equipped with an over-current protection device in addition to the branch circuit breaker, or shall be impedance protected. Circuit breakers shall be used in lieu of fuses, to eliminate the need for stocking spare fuses. All switches shall be labeled and a coded wiring diagram shall be provided.

I. Individual NEMA 4 oil-tight Hand-Off-Automatic selector switches shall be provided for the pump and dewatering device drives.

J. An On Off selector switch shall be provided to operate the propeller drive motor starter.

K. To control the operation of the grit removal and dewatering system, and monitor the control, environmental and alarm functions, a specially preprogrammed, dedicated microprocessor-based control system shall be provided. The controller shall interface with the panel display unit, motor starters, flush water, accessories and alarm functions through digital and analog input and output ports as required. The digital controls shall operate on 24 volts or less, to eliminate shock hazard.

L. The Programmable Logic Controller shall have a 20k-Hz high-speed counter and 6K-word non-volatile memory (4K-word maximum program and 2K-word maximum data) and use RSLogic programming software. It shall have 14 inputs and 10 outputs and a built-in RS-232-C port for external interfacing. A real-time clock module shall control scheduling of the grit washing and discharge cycles

M. The 24-volt DC power supply shall be overload protected to be "crowbar safe" and will return to operation when a short is removed. Program integrity shall be maintained by battery-backed RAM. A surge suppressor with power filter shall be provided for the control circuits.

N. A properly sized insulating-type control transformer shall be provided by the controls Manufacturer to supply power for controls and auxiliary devices necessary to semi-automatic operation. The control transformer shall have volt AC primary, 120-volt AC secondary, Class F insulation; with temperature rise not to exceed 115°C above a 40°C ambient.

O. A NEMA 4 rated display unit shall be mounted through the front of the panel to provide operator input to and visual output from the microprocessor controller. This interface shall be a 5.7" (145 mm) graphic interface with DSTN 256-color Liquid Crystal Display with

backlighting and resistive-type touch screen, with audible feedback on touch, for data input and programming. The display shall have a "sleep" feature to prolong screen life.

P. An aluminum hood to shade the HMI display from direct sunlight shall be mounted on the face of the control panel. The metal shade shall cover the entire display, shield the top and sides of the display, and shall be hinged to fold over the display and stow against the front of the panel.
   1. Display Functions:
      a. "Run – Off" indication for drives and pump.
      b. Grit removal cycle time settings and indication of remaining run time.
      c. Set time intervals for pump run time, prime fail alarm, dewatering device run time.
      d. View current status.
      e. Alarm list/status and diagnostics.
      f. Lubrication notification on paddle drive, grit pump, and grit dewatering equipment motor.

Q. Provisions shall be made to allow interfacing the grit system PLC with a Customer supplied SCADA system, using an Ethernet IP connection.

R. The PLC controller shall provide the necessary control functions to properly operate the PISTA☐ TURBO™ Grit Washer through its various cycles and to control the operation of the air infusion, grit wash water, spray water and organic drain solenoid valves, in proper sequence, taking input from the liquid and grit level detectors and the grit pump "run" signal. It shall provide the necessary output signals, interlock and timing functions, as programmed.

S. Grit washing shall begin when the grit pump starts and begins delivering the recovered grit slurry to the PISTA☐ TURBO™ Grit Washer or after a pre-programmed time interval from the completion of the last cycle. This shall initiate spray washing, multiple agitation cycles, air infusion and drain-refill cycles, all field-adjustable for optimum organics removal.

T. The grit discharge sequence shall be initiated by a sonic grit level sensor which is actuated when the collected grit reaches a predetermined level in the main wash chamber. The discharge cycle shall include grit agitation, washing and ejection, and shall be field adjustable for maximum efficiency.

U. To control the operation of the grit pump, a manual Hand-Off-Automatic selector switch shall be provided. In the Automatic position, control shall be from the PLC program, with a manual push button to override the timed program and initiate a pumping cycle. A manual push button shall also be provided to reset the grit removal cycle. The program shall be capable of initiating grit pumping cycles at adjustable intervals throughout the day. The pumping cycle and dewatering device cycle lengths shall also be programmable.

V. All necessary capacitors, relays, diodes, etc., shall be provided as shown on the schematic diagram. In order to ensure continuity of operation, the Manufacturer of the PISTA® Grit Chamber shall provide these controls, and the full opening pneumatically controlled pinch valve for installation on the grit discharge line as shown on the drawings.

2.6 PNEUMATICALLY CONTROLLED DISCHARGE PINCH VALVE

A. A pneumatically controlled discharge pinch valve shall be furnished for installation in the vertical discharge piping run, and the controls shall be located in the vacuum priming control panel. The controls shall include an oil-less air compressor and solenoid valve. The operation of the discharge pinch valve shall be tied into the cycle timer and the SONIC START☐ level sensor, so as to be fully automatic.

2.7 PISTA® GRIT CONCENTRATOR – 250 GPM

A. The second stage PISTA® 250 GPM Grit Concentrator shall be provided as shown on the drawings for secondary treatment of organics and secondary grit dewatering. The PISTA® 250 GPM Grit Concentrator shall operate on the constant rate vortex principle. Design shall be such that a small volume of water and the grit will discharge at the bottom for final dewatering and ultimate disposal of the grit.

B. As a minimum, 93 to 94 percent of the water pumped to the PISTA® 250 GPM Grit Concentrator and 95 to 96 percent of the residual organic material shall flow out the top and be returned to the inlet channel to the PISTA® Grit Chamber. The unit shall be capable of intermittent operation with minimal variation in removal efficiency. There shall be less than 5% putrescible material in the recovered grit from the underflow.

C. The 2-piece 250 GPM PISTA® Grit Concentrator™ shall be constructed of a Ni-Hard top section, with a minimum thickness of ½" in high wear areas, and a bottom cone constructed of the same material, with a minimum thickness of ¾", and which shall be readily replacable. Inlet and outlet connections shall be as shown on the drawings. The 250 GPM PISTA® Grit Concentrator™ shall be provided by the Manufacturer of the PISTA® GRIT CHAMBER™, for installation by the contractor. The operating range shall be compatible with the total PISTA® GRIT REMOVAL SYSTEM™ as described herein.

2.8 MODEL 250 PISTA® TURBO™ GRIT WASHER WITH PARALLEL PLATE SEPARATOR

A. The PISTA® TURBO™ Grit Washer shall have 3 wash levels: High air scour, intense flushing with water and thorough agitation. The high air scour and intense flushing with water shall occur in the inlet hopper of the grit washer. The flights on the screw shall be specially designed to further clean the grit through additional agitation, dewater the grit and dispose of the cleaned, dewatered grit.

B. The PISTA® TURBO™ Grit Washer device shall be capable of the following conditions of operation when operated at the specified rate of grit input and hydraulic peak flow rate, and proceeded by a ¼" or less screen.
1. Organic Removal: Less than or equal to 5% putrescible material remaining in the washed grit.
2. Water Content: Less than or equal to 10% in the washed grit and capable of passing a "Paint Filter" test.
3. Retention of Grit: 95% of Grit > 140 mesh (106 microns) in particle size, removed by the PISTA® TURBO™ Grit Washer.
4. Maximum Grit Slurry Feed Rate
   a. Model 250: 250 – 275 GPM
5. Capacity
   a. Model 250 – 41 ft3/hr. 2.47 tons/hr.

6. Piping Connections
   a. Model 250: 4" inlet to PISTA® Grit Concentrator – plain end
   b. 4" overflow – flanged hopper
   c. 6" overflow – flanged PISTA® Grit Concentrator
   d. 3" organic drain – threaded
   e. 2" NPT drain (2 typ.)
   f. 1" NPT water connection
   g. ¼" NPT air connection

C. FLUSH WATER REQUIREMENTS: 20 GPM @ 60 psi. Intermittent. To aid in organics separation.

D. AIR REQUIREMENTS: 5 SCFH @ 70 psi. Intermittent. To aid in organics separation.
   1. The air requirement shall be provided by an air compressor package in a NEMA 4 enclosure, consisting of a 1/3 hp 1/60/115v oil-less motor-compressor unit with intake filter/silencer and a 2-gallon air storage tank with pressure switch, regulator and associated piping. The compressor shall have permanently lubricated bearings, stainless steel valves and lightweight aluminum construction. The air storage tank shall have a pressure gauge and safety relief valve.

E. The PISTA® TURBO™ Grit Washer shall be constructed of 316 stainless steel, including the screw. The inlet hopper receives the mixture of water and grit, and shall be equipped with an energy dissipation zone to prevent turbulence in the remaining portion of the hopper. The hopper shall have parallel plates located in the settling zone to improve retention of the fine grit. An overflow weir trough shall be provided to return the water to the system. The conveyor shall be freestanding with support legs to hold the conveyor at an angle of approximately 22°. The discharge shall be 8" diameter, plain-end pipe. The drive assembly shall be located at the discharge end.

F. The PISTA® TURBO™ Grit Washer shall have an open, 3/16" thick steel U trough. The screw shall be 9" in diameter with mixer PISTA® Grit Fluidizing Vanes in the inlet hopper and shall have a continuous shaft design off the flight segment. The conveyor shall be 15' in length, with overall dimensions as shown on the drawing. The hopper shall have a full-width outlet weir trough to minimize the carryover of the fine grit. The projected separator plate settling area shall be a minimum of 17.0 square feet.

G. The screw shall run on anti friction bearings at the outlet end, and a bronze bushing at the inlet end. The inlet end shaft bushing shall be capable of being greased. The inlet end shall have two 2" drains. Clearance between the legs and the discharge outlet shall be as shown on the drawing.

H. The drive to the PISTA® TURBO™ Grit Washer shall be a parallel shaft, direct drive, 3-stage, high efficiency, single case, shaft-mounted helical gear reducer. The motor shall be 3 HP, 1760 RPM, TEFC 3-phase, 60 cycle, 460 volt with a 1.0 Service Factor. The screw speed shall be 10 RPM. The drive shall be mounted on a plate at the discharge end and the plate shall be bolted to the flanges on the trough.

I. A 1/8" (3 mm) thick expanded metal-flattened mesh (micron) cover, matching the construction of the PISTA® TURBO™ Grit Washer, shall be provided over the hopper and trough openings, as shown on the drawings.

J. All structural stainless steel shall be thoroughly cleaned and then blasted for a uniform finish. The blasted surfaces shall then be protected by the application of a low viscosity oil with penetrating, lubricating and corrosion resistance properties.

K. All carbon steel surfaces shall be cleaned and coated with 6-8 mils dry film thickness of VERSAPOX® epoxy coating, Factory-applied prior to shipment.

L. STANDARD ACCESSORIES

1. LUBRICATOR. The PISTA® TURBO™ Grit Washer shall be provided with automatic spring-loaded lubricator, which employs the movement of the bearings to pull grease from a refillable reservoir to the bearing surface. The reservoir and base shall be constructed of clear polycarbonate, to allow for visual inspection and monitoring of the grease supply. The lubricator shall have a thread size of 1/8" NPT, a grease storage capacity of 6 oz. and have a minimum size of 3" diameter x 6" tall. The operating temperature range shall be from -10°F (23°C) to 250°F (121°C).
2. FLOWMETER. The flow rate of the wash water shall be controlled by a manual valve and measured by a flowmeter. The variable flowmeter shall be constructed with a tough machined acrylic meter body, highly polished to a clear finish with a direct reading permanent scale. The float and guide rod shall be constructed of 316 stainless steel. The F/NPT adapters shall be constructed with high-grade Vitron O-ring seals and aluminum stress ring thread supports. The flowmeter shall be capable of usage in direct sunlight.
3. ROTOMETER. The flow rate of the scouring air shall be controlled by a manual valve and measured by a rotometer. The low flow rotometer shall have body constructed of one-piece welded 316 stainless steel with a clear, polycarbonate plastic tube shield and Borosilicate glass tube. The float shall be constructed of 316 stainless steel. The FNPT adapters shall be constructed with high grade Buna-N O-Ring seals.
4. GRIT LEVEL SENSOR. A sonic level limit switch with direct contact probe shall send a signal to the controller to begin the grit discharge cycle, in response to the level of the grit in the grit hopper. This switch shall not be affected by external vibration. It shall actuate a dedicated DPDT DC relay in the PISTA® TURBO™ Grit Washer control panel. The electronic enclosure of the switch shall be NEMA 4X. The probe shall be constructed of 316 stainless steel with a 1-1/2" NPT mounting connection.

M. HEAT TRACING

1. All flushing and spray water lines on the PISTA TURBO™ Grit Washer shall be provided with thermostatically controlled electrical heat tracing and insulated for cold weather protection.

PART 3 EXECUTION

3.1 MANUFACTURING QUALITY

A. The specified Manufacturer markets, designs, fabricates and manufactures the grit chamber equipment at its own U. S. facility. The Manufacturer shall have on staff registered engineers, both in process and design. This would be for providing current capabilities in these areas as well as future capabilities after the equipment is installed and

operating, for the best long term interest of the Owner. Alternate manufacturers will be required to show that they meet these criteria also.

3.2 INSTALLATION AND OPERATING INSTRUCTIONS

A. Installation and operation shall be in accordance with instructions provided by the Manufacturer.

3.3 START-UP

A. The Manufacturer shall provide the services of a Factory-trained representative for a maximum period of three (3) days on-site to assist with the initial startup, and to instruct the Owner's operating personnel in the operation and maintenance of the equipment.

END OF SECTION

SECTION 46_33_33

POLYMER BLENDING AND FEED SYSTEM

PART 1 GENERAL

1.1 SUMMARY

A. The polymer system shall be the standard equipment of the supplier involved in the manufacture of similar type equipment
   1. Northside – 2 units, complete
      a. Review and match required capacity of Belt Filter Press, minimum
      b. Prominent PROMIX Model M_0-1200X2-10.3DA
      c. Tote w/ listed accessories
   2. Spare Parts
      a. Two (2) replacement neat polymer Delta Series pumps w/ duplicate set of all required components for complete replacement/changeout of pumps
      b. One (1) replacement 1 HP Mixer Motor w/ duplicate set of all required components for complete replacement/changeout of motor
      c. One (1) replacement tote mixer, complete

B. Equipment included with the polymer system includes:
   1. Non-Mechanical/Mechanical Multi-stage Polymer Activation & Blending Chamber.
   2. Dilution water controls
   3. Neat polymer pump
   4. System Controls

C. The polymer system shall be a skid mounted system with interconnecting piping and wiring complete within skid limits.

D. Supplier / manufacturer to review and match requirements of Belt Filter Press. Those requirements supercede any conflicting information provided herein (including pump sizing.)

E. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

1.5 DELIVERY, STORAGE & HANDLING

A. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address, and weight. Packing list shall be provided with equipment at time of delivery.

B. Any electrical equipment shall be kept thoroughly dry at all times and stored indoors. Equipment storage shall be protected and maintained in accordance with the Manufacturer's recommendations. Equipment shall not be stored directly on the ground.

C. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

1.6 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition,

the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

E. It is not intended the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacture, delays in delivery, replacement, or otherwise.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Polymer Activation & Blending Chamber.

1. These specifications are based on a multi-stage, multi-zone, Hydro-Mechanical polymer activation and blending technologies. Alternate technologies will only be considered if proven to provide an equal level of performance, versatility, reliability and quality, otherwise the following technology will be provided without exception.
2. In order to provide control and versatility to optimize the performance of the wide range of polymers the following available and to optimize system reliability, a multi-stage Hydro-Mechanical polymer blending technology shall be provided with both a non-mechanical and mechanical mixing stage.
3. Non-Mechanical Stage: To optimize reliability, the device shall be capable of activating and blending polymer based on plant water pressure alone at 30 psi or greater. Polymer shall be injected directly into a water jet by means of an injection quill positioned such that the non-mechanical mixing energy is no way diminished such that the velocity of the mixing energy-producing water jet is maintained or increases as flow decreases.
4. The Hydro-Mechanical mixing stage: In order to provide optimal polymer performance under all operating conditions and to provide total control over mixing energy. In addition to the non-mechanical mixing stage the device shall be capable of producing its mixing energy independent of plant water pressure through a variable intensity, controllable stainless steel hydro-mechanical mixer. The mixing impeller shall be fully controllable and capable of inducing ultra-high, non-damaging mixing energy at all flow rates. This shall be accomplished by controlling mixing intensity and preventing over exposure to, or damaging recirculation through the impeller. The polymer mixing impeller shall be designed to produce both axial and radial flow to optimize mixing effectiveness and to effectively inducing high, non-damaging mixing energy over the systems full range. Mixers that rely solely on plant water pressure and or flow for mixing energy will not be acceptable. Mixers where performance is affected by the flow rate and therefore retention time resulting in under or over exposure to mixing energy, or which rely on constant speed impellers or that rely on close tolerances for blending shall not be acceptable.
5. In order to prevent polymer build-up, the mixing chamber shall maintain high velocity in the entire chamber – at no time shall there be low velocity within any

portion of the mixing chamber. The mixing impeller shall be controlled by a SCR motor controller and driven by a wash-down motor. The motor should be mounted horizontally or above the mixing chamber. Motors mounted under the mixing chamber where seal failure or leaks can damage the motor shall not be acceptable. The mixer drive shaft shall be sealed by a mechanical seal which integrally mounted and factory plumbed seal flush. A drain port behind the seal shaft shall be provided in the mixing chamber in the mixing chamber to drain the polymer solution in case of a seal failure. The seal shall be easily accessible for replacement. Systems without a seal flushing system shall not be considered. All bearings shall be external form the mixing chamber. Internal bearings shall not be acceptable.

6. Both mechanical and non-mechanical mixing zones shall be clear polycarbonate to view the mixing action and blending effectiveness. Acrylic chambers prone to becoming brittle over time cracking, or opaque pipe shall not be acceptable to meet this requirement. The mixing chamber shall have a maximum rated pressure of 100 psi. Provide a pressure relief on the mixing chamber factory set at 75 psi. Provide a neat polymer check valve specifically designed to isolate neat polymer from dilution water. The valve shall be designed with an open, unobstructed path to the valve seat. To minimize check valve plugging due to normally occurring polymer agglomerations, the minimum open area up to and including the valve seat shall be 3/16" without exception. The valve body shall be constructed of Teflon and Viton seats. The valve poppet and spring shall be shall be stainless steel. The spring shall be outside the of the polymer flow path to prevent plugging. The locking pin used to hold the valve in place shall be attached to the mixing chamber with lanyard. The valve shall be readily accessible for cleaning and shall not require tools for removal, cleaning or replacement. Conventional check valves, valves that rely on ball seats, and or check valve that are installed inside the mixing chamber, or which require mixing chamber disassembly for service will not be accepted.

B. Dilution Water Control

1. The Dilution water flow rate shall be monitored by a Rotameter paddle type flow meter having the range as specified. Unions and flanged shall be provided on the flow meter to allow easy removal for cleaning. The unit shall have an electric motor operated ball solenoid valve for on/off control of total dilution water flow. The unit shall have a linear actuated variable rate control valve to automatically proportion water flow to polymer

C. Pump

1. Unit shall have a neat polymer metering pump.
   a. Diaphragm Metering Pump
      1) The polymer pump shall be a microprocessor controlled solenoid driven diaphragm metering pump. All pump functions shall be accessible via an illuminated LCD screen and a membrane style keypad.
      2) The pump shall be programmable so that the stroking speeds can be modified to accommodate various polymer viscosities.
      3) Polymer pump shall accept a 4-20mA signal for speed control. Pump will also accept a 0-10 VDC or pulse input for speed control.
      4) The pump shall be equipped with a fault annunciating relay which will be monitored by the system controller.

5) The pump shall supply a Pump Running feedback signal which will be monitored by the system controller.
6) In the case of a diaphragm pump installation the system shall have the provision to mount the neat polymer pump in either a flooded suction or suction lift configuration depending on the application requirements.

b. Provide a calibration column with two full port PVC ball valves having a Viton o-rings. The column shall be calibrated for a one minute draw-down and read in GPH and milliliters. The calibration column shall be rigidly mounted to the skid frame with a minimum of two heavy duty brackets. Mounting the calibration to the neat polymer inlet piping shall not be accepted. Provide a pressure relief on the discharge of the metering pump, adjustable between 25 to 100 psi. The valve factory plumbed to the suction of the pump. The valve shall have a stainless steel or PVC body with stainless steel, Viton and Teflon internals. Brass pressure relief valves not acceptable. Provide a pressure gauge / switch assembly with a stainless steel diaphragm isolator to monitor polymer line pressure. Provide an optical type loss of polymer flow sensor. Flow sensor that restrict flow or rely on a sensing probe and therefore are prone to polymer build-up and failure shall not be used. Provide a 2-1/2" stainless steel liquid filled pressure gauge to monitor system discharge pressure. Provide a swing type check valve to prevent back flow. The check valve shall be sized for the total for the total solution flow of the system, constructed of PVC or Viton.

D. Controls
1. A control panel integral to the system frame shall be provided. The enclosure shall be rated NEMA 4X and constructed of FRP. The control panel shall consist of all controllers, digital displays, potentiometers, switches, lights, relays and other control devices required for a complete operational system. The control panel and all components shall be industrial duty. All skid mounted electrical components interconnected to the control panel shall terminate at numbered and labeled terminal blocks. The terminal blocks shall be sized for 14 gauge wire. Wire shall be neatly run through wire race-way and numbered with shrink tubing type labels. Adhesive labels shall not be used. The control panel shall be positioned such that there are no obstructions in front of the control panel per related NFPA requirements.
2. Power; 120 VAC, 1Ph, 60/50 Hz with a 10' power cord and receptacle.
3. A circuit breaker on the main control circuit and on each motor shall be provided as manufactured by Allen Bradley or equal. Fuses shall not be used for the circuit protection.
4. Operator interface- Discrete Selector Switch:
   a. System ON/OFF (reset) / Remote
   b. One-Turn Potentiometer – Mixer Speed
   c. Ten-Turn Potentiometer – Progressive Cavity Metering Pump Control
5. Status / Alarm Indicators:
   a. Main Power On
   b. Low Water Differential Pressure Alarm
   c. Low Polymer Flow Alarm
6. Inputs (signals by others)
   a. Remote Start / Stop (discrete dry contact)

b. Pacing Signal Based on Process Flow (4-20mA)

7. Outputs:
   a. System Running (discrete dry contact)
   b. Remote Mode (discrete dry contact)
   c. Common Alarm (discrete dry contact)
   d. Polymer Pump Rate (4-20mA)

2.2 TECHNICAL DATA

A. Connections – Plumbing
   1. Dilution water inlet, 1.5" FNPT
   2. Neat polymer inlet, 0.5" FNPT
   3. Solution discharge, 1.5" FNPT

B. Connections – Electrical
   1. Standard, grounded male plug – 120 / 1/ 60, 20 amps
   2. Plug in connection – 4-20 mA signal input
   3. Terminal blocks – dry contact input for remote start
   4. Terminal blocks – dry contact alarm output
   5. Terminal blocks – dry contact run output
   6. Terminal blocks – control switch status output

C. Dimensions
   1. Frame – 34" wide x 24" deep x 75" high

D. Materials of Construction
   1. Structural frame – 304 stainless steel
   2. Plumbing – Schedule 80, PVC
   3. Mixing chamber – PVC, Clear Polycarbonate

E. Performance
   1. Dilution water –60-1200 gph primary mixing

   2. Metering pump –0.25- 10.3 gph neat polymer

PART 3 EXECUTION

3.1 INSTALLATION

A. The equipment shall be installed per the contract documents and manufacturer's recommendations.

3.2 WARRANTY

A. Polymer feed system shall be warranted for a period of 12 months from the date of final acceptance of the entire project by the Owner.

B. In addition, supplier shall warrant the system to operate in accordance with the performance requirements of the belt filter press.

3.3 MANUFACTURER'S SERVICES

A. Provide the services of a Representative of the Manufacturer to assist in adjusting and testing the equipment, to supervise initial operation, and to assist in making final adjustments and the tests specified, or which may be necessary to assure the Engineer the equipment is in satisfactory operating condition.

3.4 ADDITIONAL EQUIPMENT TO BE PROVIDED

A. Tote:
   1. Provide two (2) 275 gallon totes with integral electric chemical transfer pump system attached to allow chemicals to be transferred from a new tote/barrel being delivered. Tote to have connection at or near the base for attachment of suction assembly (see below.) Tote shall be equipped with mounting location for tote pump.

B. Tote Accessories (provide 2 each of the following)
   1. Tote Mixer for up to 275 gallon totes. The tote mixer shall have a ¾ HP, 115VAC, 350 RPM, TEFC gear motor, with thermal overload protection. The mixer shaft shall be stainless steel and have a thrust bearing external from the motor support. The bearing frame shall be stainless steel. Two 5" impellers shall be provided. The tote mixer controls shall be integral to the motor and include an ON/OFF switch, and 0-60 minute timer and 10' Power lead. The mixer frame shall be constructed of stainless steel and have lifting handles. Movable Brackets shall be included to adjust the width of the mixer for the tote being used. A stainless steel wall mounting bracket with a drip pan shall be supplied to support the mixer and collect the polymer drips while the mixer is not in use.
   2. Provide a polymer tote pump suction assembly. The assembly shall include a tee with two (2) quick disconnect cam-lock fittings, two (2) 1" full port ball valves, and two (2) lengths of 15 feet of 1" braided PVC hose w/ 1" full port ball valve on one end and any/all required additional components to connect to the tote and blending/feed system inlet.
   3. Provide a tote scale

C. Tote Mover:
   1. Provide Toyota 6BWC20 Tote Mover

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 46_41_23

SUBMERSIBLE MIXERS

PART 1 GENERAL

1.1 SUMMARY

A. This specification covers the work necessary to furnish and install two (2) submersible mixers as specified herein and as shown on the plans
   1. Northside WWTP
      a. 2 units
      b. Wilo USA LLC TR75-2.19-6/16

B. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.
   1. The Contractor shall submit information for the units that he proposes to supply, showing thrust, propeller diameter, propeller speed, gear ratios, brake horsepower, power input to electric drive motor for the various conditions under which the units are to operate along with descriptive data and specifications describing in detail the construction of the complete units.
   2. The parameters thrust and power input to the electrical drives shall have been measured in accordance with ISO 21630 during product development.

3. The successful bidder shall submit to the Engineer for approval, shop drawings, showing all weights and dimensions necessary for the installation of foundations and anchor bolts.

1.4 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The municipal-use submersible mixers and their motors shall be covered by a non-prorated four (4) year warranty against defects in materials and workmanship that shall include 100% parts and labor. This warranty shall not be limited by hours of running time or operation from variable speed drives.

C. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. MANUFACTURER
1. Submersible mixers shall be manufactured by Wilo USA LLC or pre-approved equal.
2. Any mixer manufacturer, other than specified, proposing to offer the following equipment must submit a pre-bid qualification package to the Engineer to determine that the equipment complies with the requirements of the Contract Documents. The Engineer must receive this information not less than 14 days prior to the Bid Date. The Engineer will issue an addendum prior to the bid date that lists any pre-approved equipment. Contractors and manufacturers are advised that a manufacturer named as an approved supplier is not excused from meeting all of the technical and performance requirements of this specification. The pre-bid qualification package shall include complete mixer performance data, evidence of compliance with the installation experience requirements of this Section and a letter from an officer of the company of the mixer manufacturer listing all exceptions to the specifications.

B. PERFORMANCE
1. Furnish two (2) submersible mixers for the Pre-EQ basin. The basin(s) shall contain wastewater mixed liquor of a solids concentration of not more than 1% total suspended solids (TSS) by weight. Each mixer shall be capable of the following performance:

a.	Parameter	Pre-EQ Basin
b.	Number of basins	1
c.	Number of mixers per basin	2
d.	Basin dimensions, L x W x H x SWD, ft	78.67 x 49.33 x __ x 22
e.	Basin TSS, %	1
f.	Model	TR75-2.19-6/16
g.	Minimum Propeller Diameter, in. (mm)	29.5 (750)

h.	Number of Propeller Blades	3
i.	Maximum Propeller Speed, rpm	192
j.	Minimum Flow, gpm (m^3/s)	13,310 (0.84)
k.	Minimum Thrust, lbf (N)	357 (1590)
l.	Maximum Motor Speed, rpm	1,100
m.	Maximum Rated Motor, hp/unit	6.0
n.	Motor voltage, v / phase	460 / 3
o.	Minimum Motor Reserve at rated duty, %	6
p.	Minimum Water Level above Propeller	3.6 (1100)

2.2 MIXER CONSTRUCTION

A. GENERAL
1. The mixer shall be the submersible type and shall be installed in location as shown in the plans.
2. All mating surfaces of the major castings requiring a watertight seal shall be machined and fitted with FPM (Viton) O-rings.
3. All nuts, bolts, washers, and other fastening devices supplied with the mixer shall be AISI 316 stainless steel.

B. MIXER HOUSING
1. All major components of the mixing unit (i.e. stator housing, seal housing, and cable entry) shall be manufactured from close-grained ASTM A48 Class 35 (GG25) or higher cast iron.

C. PROPELLER
1. Propellers shall be manufactured from closed cell polyurethane (PUR). No welded steel or stainless steel propeller shall be accepted.
2. The propeller shall have a swept-back profile and at least three (3) blades. The propeller blades shall be thicker on the leading edge than the trailing edge and thicker towards the hub than at the tip to allow the propeller to free itself from rags as it turns. The blades shall be smooth, finished throughout, and shall be free from sharp edges.
3. Propellers shall be statically and dynamically balanced.
4. Propellers shall be slip fit and securely held to the shaft by a stainless steel washer and bolt assembly that is enclosed in a separate hub chamber. The hub chamber is fitted with an O-Ringed cap that seals the entrance of the propeller hub chamber device. The output shaft shall be splined to mate with the matching spline insert of stainless steel that forms the hub of the propeller.

D. PROPELLER SHAFT
1. The shaft connecting the propeller to the gear reducer shall be constructed of AISI 329 (1.4462) stainless steel.
2. Minimum propeller shaft diameter (D), measured at the outermost bearing, shall be 1.77-in (45-mm).
3. The propeller shaft shall be supported such that the length (L) from the outermost bearing to the hub of the propeller shall not exceed 3.88-in (98.5-mm). The shaft overhang ratio of the distance from the bearing to the hub of the propeller (L) divided by diameter of the shaft at the bearing (D) shall not exceed 2.2.

E. BEARINGS

1. Each mixer shall be furnished with a minimum of four (4) sets of bearings spaced to minimize shaft deflection to offer maximum bearing life. At a minimum, at least two sets of the bearings shall be of double row design. Designs with fewer than four (4) sets of bearings shall not be allowed.
2. A minimum of two sets of bearings shall support the propeller shaft (shaft from gear box to the propeller). Designs where the propeller shaft is supported solely by the gearbox shall not be acceptable.
3. Mixer shaft overhang and bearing design shall provide a minimum B-10 life of 100,000 at the rated duty.
4. Bearings shall be sealed, grease lubricated and maintenance-free.

F. MECHANICAL SEALS
1. Each submersible mixer shall be provided with two separate seal chambers. The inner chamber shall be located between the dry stator chamber and the gear reduction chamber. The outboard seal chamber shall be located between the gear reduction chamber and the outside of the mixer at the hub of the propeller.
2. Each seal chamber shall be provided with an independent set of mechanical seals and a lip seal running in an oil bath. The inboard set of seals shall be mounted in the chamber between the motor and gearbox. The outboard set of seals shall be mounted between the gearbox and the propeller.
3. Each mechanical seal set shall be provided with solid sintered silicon carbide seal face material on both the stationary and rotating components. Both the inboard mechanical seal set and the outboard mechanical seal set shall be silicon carbide.
4. The metal components of the mechanical seal case shall be constructed of AISI 316 stainless steel.
5. A moisture sensor probe shall be furnished in the outboard seal oil chamber of each mixer. The sensor shall be wired to the control panel and shall activate an alarm light upon moisture intrusion.
6. The outboard seal sensor probe shall be externally located and accessible for maintenance without the need to disassemble the mixer for service or replacement.

G. GEAR REDUCER
1. The motor shall drive the submersible mixer propeller through a planetary gear reduction drive system that locates the motor shaft in line with the propeller shaft.
2. The motor shaft shall be fitted with a keyed sun gear that uses high efficiency straight cut teeth to engage the planetary gear section.
3. The sun gear system shall be custom matched to the planetary gear system to allow for propeller speed changes in the field by a simple exchange of the sun gear and the planetary gear plate.
4. The planetary gear section shall consist of three identical gears mounted on a stainless steel backing plate designed to withstand 100% lock stress from the propeller without gear or bearing damage.
5. Each planetary gear shall be supplied with precision needle bearings, which are lubricated by the gear lubricant in the gear chamber.
6. There shall be a minimum of three planetary gears spaced 120 degrees around the central sun gear.
7. The planetary gear section shall be easily removed and shall be interchangeable with other ratios and for simplified spare parts inventory.
8. The planetary gear section shall also engage a ring gear mounted in the outer surface of the gear chamber, which shall cause the motor rotation to also rotate

the planetary gear plate that shall be fitted to the output propeller shafting by the use of a straight splined connection.

9. The planetary gear plate shall be retained on the output propeller shaft by the use of a snap ring and snap ring groove in the output shaft.
10. The planetary design shall be designed such that with regular oil changes, no further maintenance should be required during the life of the submersible mixer in the installation. The gears shall have a minimum L-10 life of not less than 100,000 hours at the rated duty.
11. Gear oil changes shall be easily made using external stainless steel pipe plugs that are sealed via nylon washers.
12. Standard 80 to 90-weight gear oil either normal or synthetic shall lubricate the gear section.

2.3 MOTORS

A. SUBMERSIBLE MOTORS

1. Each mixer shall be furnished with a squirrel cage, induction motor enclosed in a watertight housing suitable for use and compatible with all variable frequency drive systems. Motor cooling shall be accomplished by submergence in liquid.
2. The motor shall be air-filled and constructed with moisture resistant NEMA Class H insulation and Class H slot liners and constructed to NEMA B design standards. The copper wound stator shall be dipped in epoxy enamel and hardened to withstand a temperature of 180 ☐C as defined in NEMA Standard MG-1. Each winding phase or layer shall be laced with Class H glass lined paper. The use of cable ties to restrain windings shall not be allowed. The rotor shall be statically and dynamically balanced after fabrication. The rotor shall utilize aluminum amortisseur bars and short circuit rings. The motor shall be certified for continuous duty with a service factor of 1.10.
3. The motor shall be capable of sustaining 15 starts per hour (unlimited starts with VFD) at an ambient temperature of 40 °C.
4. The motor shall be capable of uninterrupted operation with a voltage drop of 10%.
5. Thermal switches shall be furnished to monitor stator temperatures. The stator shall be equipped with two (2) thermal switches. Thermal switches shall automatically de energize the motor when its temperature exceeds a preset limit as recommended by the manufacturer.
6. The motor shall bear the FM (Factory Mutual) explosion-proof label certifying its use in a Class 1, Division 1, Groups C & D hazardous location.
7. The mixer manufacturer's nameplates shall be engraved, laser etched or stamped on stainless steel and fastened to the motor casing.

B. SHAFTS

1. The motor shaft shall be constructed of AISI 420 (1.4021) stainless steel. Carbon steel shafts or shafts with sleeves of any type are not acceptable. The shaft shall be one-piece construction without joints or stubs attached.
2. Minimum shaft diameter shall be 1.375-in (35-mm) at the double-row motor shaft bearing.

C. POWER AND CONTROL CABLES

1. Power and control cables shall be furnished in lengths to run un-spliced from the mixer to the control panel or disconnect as shown on the Contract Drawings and as specified herein (40-ft). Cables shall terminate with conductor sleeves that

bundle the entire group of strands of each phase to improve termination at the control panel. The sleeves shall be provided to confirm that all strands of each conductor are terminated properly.

2. Cables shall be of the "NSSHOU" type and shall be approved by the MSHA for use in hazardous locations and shall conform to industry standards for loads, resistance under submersion against sewage, and be of stranded construction. The cables shall enter the mixer motor through a heavy duty galvanized cast iron entry assembly that shall be provided with an external clamp assembly to protect against tension once secured providing a strain relief function as part of standard construction.
3. The cables for each mixer motor shall pass through the galvanized cast iron strain relief component and then through a series of stainless steel disks and Buna-n grommet that is sandwiched between the disks to control compression of the grommet. The cable entry design shall be of the type recommended in the Factory Mutual Research Corporation specifications for Explosion Proof Certification. The entry shall be comprised of the cast iron fitting that will include the Buna-N strain relief grommet coupled with a poured conductor section. In the poured section, only Factory Mutual approved sealant shall be used to wick into each conductor strand that has the insulation removed in this area to provide a positively leak proof seal for the power and sensor cords.

2.4 REMOVAL SYSTEM

A. GUIDE RAIL (MAST) SYSTEM

1. A guide rail of AISI 304SS shall be used to mount each mixer during operation and to guide the units during installation and removal for service. The system shall consist of a bottom assembly, mixer support assembly, 120-mm by 120-mm guide pipe, upper support and positioning device. The system shall be fixed at the bottom of the tank in a pivot that shall allow horizontal rotation of the mast through not less than 120 degrees. All brackets shall be constructed of AISI 316 stainless steel. The mast bearings shall be constructed of Hostaform (POM). Power/control cable holders shall be provided every five feet.
2. The bottom assembly shall be bolted to the floor of the tank, and provide support for the guide pipe. It shall also include a hole to accept the guide pipe bottom plug. The bottom console shall be constructed of AISI 316Ti stainless steel.
3. The assembly shall be strong enough to support the weight of the mixer, the guide pipe and the mixer preload force. The assembly shall be positioned in such a manner so as to prevent the mixer propeller tips from hitting the basin floor. The mixer shall rest upon a support foot.
4. The upper guide holder assembly shall secure the system to the tank edge or platform. It shall also provide the lateral support for the guide pipe. The assembly shall contain a location to secure the electrical motor cable holder.
5. The mixer support frame assembly (including angular adjustment brackets) shall be manufactured from AISI 316Ti stainless steel.

B. HOIST (CRANE) ASSEMBLY

1. A hoist system shall be used for lifting and lowering of the mixer on the guide rail during installation and maintenance. The system shall be capable of 360 degree-rotation. Each hoist assembly shall be rated at a minimum of 550-lbs (250-kg). All crane and receiving boxes shall be constructed of AISI 304 stainless steel. The sleeves and the bearings in the receiving box shall be constructed of Nylon (PA).

2.5 SHOP PAINTING

A. Primer and Finish Paint-Shop apply to all exterior ferrous surfaces of the mixer and motor.
   1. Solids by volume: 97%
   2. Type: Solvent-free ceramic coating, impregnated with aluminum oxides
   3. Total Dry Film Thickness: 400 microns (15 mils) minimum
   4. Minimum Adhesion: 15-N/mm2 (2,030-psi) per ISO 4624.
   5. Minimum Hardness: 110 on Buchholz Indentation scale
   6. Resistance: Level 1 (continuous duty) for sewage with pH of 6-11, Level 1 for saltwater, Level 3 (not recommended) for 10% hydrochloric acid.

B. Surface Preparation-Prepare all surfaces to receive coating system.
   1. Method: Blasting per ISO 12944-4
   2. Standard Cleanliness Grade: 2.5
   3. Minimum Peak to Valley Height: 70 microns (2.75 mils)

PART 3 EXECUTION

3.1 FIELD QUALITY CONTROL

A. The manufacturer shall provide the services of a factory trained service technician to inspect the installation, assist in the successful start-up of the mixers, and instruct the Owner in proper operation and maintenance of the equipment for a period of not less than one (1) eight (8) hour day.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

SECTION 46_51_55

LOW PROFILE CASCADE AERATOR

PART 1 GENERAL

1.1 SUMMARY

A. This section covers furnishing a complete cascade post aerator system as specified herein. The cascade post aerator, further described as a low profile cascade aerator (LPCA), is designed for installation in a concrete basin as shown on the Plans and Drawings and shall be a rectangular, open channel type, low profile, free flowing aerator.
   1. Northside WWTP
      A. Hydraulic loading capacity of 4.5 MGD average daily flow
      B. 11 MGD peak
      C. D.O. minimum of 0.0 mg at influent
      D. D.O. 6.0 mg/l in the aerobic effluent.

B. The LPCA equipment shall consist of a plurality of channel dividers with Inlet Flow Control Optimizer / Equalizer Gate and weirs. The inlet weirs shall be for flow control and each shall increase in height from one channel to the next. Each channel shall be provided with a plurality of low head aeration baffles spaced as shown on plans. Each aeration baffle shall be provided with patented trapezoidal air infusion plates as shown to provide optimum transfer efficiency. At peak flow the system will offer even flow distribution to each channel. To prevent short circuiting and critical for system process performance, channels and aeration baffles are constructed so as to eliminate all gaps.

C. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.
   1. Manufacturer's literature, illustrations, and engineering data including total weight of each unit, connection details, and performance data.
   2. Drawings shall show dimensions, overall arrangement of equipment and materials of construction.
   3. Literature describing the equipment and showing all important details of construction and dimensions. Dimensions shall show overall size and space requirements including that for installation, leveling, dismantling and maintenance.
   4. Cross sections and details, as to show that all components are in conformance with the intent of the specification and are satisfactory from the standpoint of design and physical arrangement.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.
   1. American Society for Testing and Materials (ASTM)
   2. ASTM A167 – Type 304L & 316L Stainless Steel
   3. American National Standards Institute (ANSI)
   4. American Welding Society (AWS)

1.5 DELIVERY, STORAGE & HANDLING

A. The trapezoidal Air Infusion Plates and Air Infusion Baffles shall be factory assembled to the channel dividers and shall be shipped in sections. All equipment shall be shipped with suitable in-transit protection.

B. Lifting straps in lieu of chains are to be employed when applicable (by Contractor).

C. Equipment shall be stored and protected in accordance with the manufacturer's recommendations.

1.6 QUALITY ASSURANCE

A. One Cascade Post Aerator Manufacturer shall supply all equipment specified in this Section.

B. Basis of Design
   1. The structural, mechanical and process design for the cascade post aerators are based on information provided by the first-listed low profile cascade aerator Manufacturer. The cost of any changes and modifications due to furnishing equipment other than that specified shall be borne solely by the Contractor. The Contractor shall also be responsible for any substitute equipment furnished complying with the full intent of the specifications, and be responsible for any patent infringement to the LPCA.
   2. Fundamental changes in the configuration of the post aerator system will not be allowed. LPCA equipment submitted as equivalent products shall not require

additional basin area or depth to achieve the designated performance requirements. The Contractor shall submit complete drawings, specifications and supporting documents, identifying all proposed changes, a list of installations and certified performance data, to the Engineer for approval at least 14 days prior to bid date.

C. Responsibilities

1. The LPCA Manufacturer is responsible for delivery of equipment and supplies required under these specifications. The Contractor is responsible for proper off-loading and storage at the delivery location, and coordination and integration of all equipment required for installation in the concrete basin, and all other associated work shown on the drawings and specified in the Contract Documents. The Contractor is responsible for ensuring that the LPCA system shall be properly coordinated and will function as a unit in accordance with these specifications. The Contractor shall bear ultimate responsibility for equipment coordination, installation, operation, and guarantees.

D. Workmanship

1. Workmanship in the fabrication of the LPCA system shall be of high quality and include the following requirements. The assembled channel aeration baffle assembly shall have members that are straight and true. Structural distortions, warps, and other defects shall not be present in the aeration assemblies before or after installation in the basins. The topmost corners of all Air Infusion Plates shall be ground round and smooth.

1.7 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

PART 2 PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. The equipment shall be manufactured by:
   1. Jim Myers & Sons, Inc. (JMS)
   2. Smallberry Manufacturing
   3. No 'Or Equals' will be accepted

B. The equipment described by this specification defines minimum equipment requirements as supplied by the first-listed manufacturer. All unforeseen costs associated with any deviation from this specification shall be the sole responsibility of the Contractor.

C. The equipment shall be the product of a manufacturer engaged in the design and manufacture of similar equipment in successful operation in similar applications. The manufacturer shall have experience with 20 installations of the same type of equipment as specified herein with successful operation for a minimum of 10 years.

D. Pre-qualification requires manufacturers to submit the following 30 days prior to bid:
   1. A list of at least 10 previous installations, including contact information, of similar size, design, and complying with the requirements as set forth within this specification.
   2. Preliminary drawings and process calculations specific to this project.
   3. A letter stating that their proposed design complies with all requirements as specified herein. If there are deviations from the specification a letter must address each deviation in detail.
   4. Equipment shall be manufactured in the United States by US citizens fully certified by the American Welding Society for the tungsten inert gas (TIG) welding process to standard AWS D1.6. Letters of current certification shall be provided prior to bid and within the submittals.

2.2 MATERIALS OF CONSTRUCTION

A. LPCA equipment shall be supplied by Manufacturer and shall be fabricated of Type 304 stainless steel and shall include all necessary stainless steel anchor bolts, seals, and accessories.
   1. Channels, Air Infusion Plates, Aeration Baffles and Closure Plates are to be fabricated with Type 304 SS with a minimum thickness of 0.120" (11 gauge).
   2. Influent Flow Control Optimizer / Equalizer Gate, trapezoidal in design, is to be fabricated with Type 304 SS.

B. Hardware: All field assembly anchor bolts, bolts, nuts, washers and seal material shall be supplied by Manufacturer:
   1. Nuts, fasteners, and anchor bolts (3/8" diameter) are to be Type 304 SS.
   2. Seal Material: 3M 3/8" round ribbon sealant to be provided by Manufacturer.

2.3 LOW PROFILE CASCADE AERATOR (LPCA) SYSTEM

A. The LPCA system shall be fabricated in accordance with the details indicated on the drawings and the requirements specified herein.

B. The LPCA is a static system design and is designed and constructed for the minimum flow and maximum flow as specified and utilized in the treatment plant's post aeration process to increase the aerobic effluent dissolved oxygen content.

C. The LPCA as specified is designed for installation (insertion) in the treatment plant post aeration concrete structure (by Contractor) as shown on the Plans, and utilized to increase the plant effluent dissolved oxygen content.

D. The unit shall be structurally reinforced by attaching structural bracing to the top of the channel dividers as shown on the drawings. The unit shall be sealed under the channel dividers and anchored in the concrete channel as directed by the manufacturer's instructions. Said sealing of all channels to the concrete channel floor to eliminate all gaps is critical for system process performance.

E. The Influent Flow Control Optimizer / Equalizer Gate, for the specified design minimum and maximum influent hydraulic loading, directs the variable influent flow to the appropriate channel or channels to optimize system performance and offers a patented integral air infusion plate for greater aeration performance during periods of low flow. Air infusion plates and aeration baffles will be trapezoidal shaped to optimize air infusion at minimum flows and achieve the effluent dissolved oxygen concentration at the full range of flow per 1.1.A. At peak flow the system must be designed to offer even flow distribution to each channel.

PART 3 EXECUTION

3.1 INSTALLATION

A. The Contractor shall install the aerator equipment where indicated on the contract drawings and in strict accordance with the manufacturer's recommendations.

B. Conform to the requirements of Section 03300, and the following:
1. Set all anchor bolts using templates as required.
2. The LPCA shall be fabricated for insertion into a concrete basin/channel as shown on the Drawings.
3. All smooth concrete surfaces shall be true plane within 1/4" in 10'-0" as determined by a 10'-0" straight edge placed anywhere on the surface, in any direction.
4. Abrupt irregularities shall not exceed 1/8".
5. 5The unit shall be structurally reinforced by attaching structural angle bracing to the top of the channel dividers as directed by the manufacturer's instructions.
6. Per manufacturer's instructions, the unit shall be sealed under the channel dividers and aeration baffles by Contractor with seal stripping (furnished by Manufacturer) and anchored in the concrete basin to eliminate short circuiting. Said sealing of all channels to the concrete encasement floor to eliminate all gaps is critical for system process performance.

C. Concrete basin (by Contractor) as shown on the Plans is to include influent and effluent chambers to be sized so as to not exceed indicated maximum water elevations. Influent chamber (by Contractor) to include energy dissipation device if necessary to reduce water velocity impact on influent distribution and to evenly distribute flow to Influent Flow Control Optimizer / Equalizer Gate.

D. Contractor will provide concrete encasement/basin with the sloped floor and dimensions as specified on Contract Drawings. Contractor understands the slope and finish tolerances are critical to the performance of the post aerator and are as noted in 3.1.B., Contract Drawings and Manufacturer's recommendations.

E. Contractor must connect accessory parts as required to ensure a complete and operable system as intended. Contractor to exercise great care in erecting and leveling the weir plates so that the units are at the elevations shown on the Drawings or specified herein, and to ensure the aeration system is mounted and sealed to floor and walls to eliminate short-circuiting as intended and per Manufacturer's Instructions.

F. Lubricants
   1. Anti-seize shall be applied to the threads of all stainless steel bolts before assembly at the factory and field assembly.

3.2 MANUFACTURER'S SERVICES

A. Manufacturer's Field Services: The Contractor shall provide the following services in addition to any other services specified herein, and required by these Specifications.
   1. A factory trained manufacturer's representative shall be provided for a minimum of one (1) trip and a minimum of eight (8) hours to provide installation supervision, start-up and field testing services, and O&M training services. The installation services shall be coordinated between the Contractor and the Manufacturer. The start-up and field testing services, and the O&M services shall be coordinated with the Engineer.
   2. After installation supervision and field testing services by the manufacturer, the Conctractor shall submit to the Engineer, a certification letter on the manufacturer's letterhead and signed by the manufacturer certifying that the equipment was installed per the manufacturer's recommendations.
   3. The manufacturer shall provide start-up reports covering installation inspection and start up activities.
   4. The manufacturer shall provide operator training to all required plant personnel.

B. All costs, including travel, lodging, meals and incidentals for Manufacturer service shall be included in the Contractor's bid.

END OF SECTION

SECTION 46_52_57

SBR & AEROBIC DIGESTER

PART 1 GENERAL

1.1 SUMMARY

A. The activated sludge treatment system selected for this project is the Sequencing Batch Reactor (SBR) process. The system shall consist of Three (3) SBR Tanks and Two (2) Aerobic Digesters, as shown on the project plans. Equipment furnished under this section shall include aeration systems with Pumps, floating decanters, flow control manifolds, automatic valves (listed in this section), blowers, waste sludge pumps, control panel, and necessary components to provide a completely functional system. Only SBR systems utilizing true batch characteristics with intermittent feed steps will be acceptable.

B. The plans and specifications are based on the EcoCycle SBR™ as manufactured by Parkson Corporation, Shawnee, KS., as the basis of design.

C. The valves, equipment, materials of construction, and controls specified under this section supersede any other specifications located elsewhere in the contract documents as they pertain to this specific equipment.

D. Contractor to coordinate with SBR/Digestor supplier to verify scope of supply and interaction with outlined piping systems on Drawings. Fittings, piping, and miscellaneous components required for a complete and functional system shall be provided complete in Contractor's bid.

E. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 DESIGN CONDITIONS & EFFLUENT REQUIREMENTS

A. Design Conditions

Influent Parameter	Value	Unit
Average Daily Flow (ADF)	4.5	MGD
Peak Daily Flow(PDF)	11	MGD
BOD	250	mg/l at ADF
TSS	250	mg/l at ADF
Ammonia	33	mg/l at ADF
TKN	50	mg/l at ADF
Phosphorous	7.1	mg/l at ADF
Elevation	1,060	feet

Max wastewater temperature	12	Degrees Celsius
Min wastewater temperature	25	Degrees Celsius

B. Effluent Requirements

Effluent Parameter	Value	Unit
BOD	20	mg/l
TSS	30	mg/l
NH3-N	10	Mg/l

1.3 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.4 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.5 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

1.6 SYSTEM REQUIREMENTS

A. The SBR shall operate as a true batch system with the tanks filled in series. The SBR treatment cycles shall consist of anoxic fill, aerated fill, react, settle, and decant.
   1. Anoxic Fill
      a. During anoxic fill, the influent valve is opened allowing raw influent to enter the basin. No aeration occurs during this period so that anaerobic and anoxic conditions are present to discourage the growth of filamentous

bacteria. The anoxic condition also encourages the growth of well settling, facultative bacteria.

2. Aerated Fill
   a. The aeration system is turned on, allowing biodegradation and simultaneous nitrification / de-nitrification to begin.
3. React
   a. The influent valve is closed. Aeration and mixing occurs until full treatment has been achieved. No flow enters the basin preventing potential for short circuiting.
4. Settle
   a. The aeration and mixing system is turned off creating a perfect quiescent condition. Liquid / solids separation occurs.
5. DECANT
   a. The effluent valve is opened allowing treated effluent to discharge from the reactor.

B. Design parameters for the SBR shall be per the following table:

	SBR	Digester
Number of Basins	3	2
Minimum Total Volume (MG)	4.12	1.40
Tank dimensions (ft)	167′ x 50′ x 24′	92′ x 46′ x 24′
Tank SWD (ft)	22′	22′
Maximum MLSS at TWL (mg/l)	2,713	N/A
Minimum oxic SRT (days)	6.0	N/A
Actual Oxygen Required, AOR (lbs/d)	16,735	3,148
Alpha	0.85	0.70
Beta	0.95	0.95
Standard Oxygen Required , SOR (lbs/d)	26,534	6,006
Number of cycles per basin per day	4.0	N/A
Minimum anoxic fill percentage	70%	N/A
Maximum daily aeration time / basin (hrs)	12	24
SOTE (maximum)	27.1	15.8
Minimum settle time per cycle (minutes)	45	N/A
Maximum decant time at ADF (minutes)	48	N/A
Maximum average decant rate (gpm)	7,800	Limit to 900 gpm

1.7 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year from the date of final acceptance by Owner, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

E. It is not intended the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacture, delays in delivery, replacement, or otherwise.

PART 2 PRODUCTS

2.1 FLOW CONTROL MANIFOLDS - SBR

A. An 18" flow control manifold shall be provided for each SBR basin. Manifolds shall be designed and sized to distribute the influent flow evenly across the reactor floor during the fill period. Manifolds shall be sized such that the maximum exit velocity through the openings at peak flow conditions is < 0.5 feet per second. Manifolds shall extend a minimum of 50% across the basin length or diameter. Each manifold shall terminate with a flanged connection as shown on the plans. Manifolds shall be constructed of filament wound FRP manufactured in accordance with ASTM D-2996 standards.

2.2 JET AERATION HEADERS - SBR

A. The jet aeration system shall be designed to transfer the oxygen specified in Table 1.04a. A minimum of one (1) dual directional aeration manifolds shall be provided in each SBR basin. Each manifold shall consist of liquid line, air line, and jet nozzle assemblies. The liquid line, air line, and jet nozzles shall be permanently laminated together to form an integral assembly. The manifolds will be shipped to the jobsite in section up to 40' in length. Fiberglass field weld kits shall be provided to connect manifold sections in the field. Labor to apply the field weld kits shall be provided by the installing contractor.

B. Re-circulated liquid shall enter the lower liquid manifold through a flanged connection as shown on the plans. The liquid header shall be cylindrical having jet nozzles mounted on a horizontal plane. Liquid flow path shall be free of burrs or rough edges that may collect debris.

C. Low pressure air shall be fed through the upper air line and air drop pipe which will terminate with a flanged connection near the top of the SBR basin. The air line shall also be cylindrical and mounted above and parallel to the liquid manifold. The air line shall be provided with orifices which allow the flow of air into the air chambers mounted to each jet assembly. The air chamber shall provide a flow path for the air to enter the outer air jet and shall also act as a support to hold the airline in place. Individual feeds at each jet shall insure uniform distribution of air across the length of the manifold.

D. The liquid and air piping shall be fabricated of corrosion resistant, structurally sound, machine filament wound thermosetting resin pipe conforming to ASTM D2996. Minimum pressure rating of piping shall be 75 psi. Internal pressure ratings shall exceed 5:1 safety factor for short term burst per ASTMD-1599 and shall exceed 1.8:1 safety factor based on ASTM D-2992 for long term hydrostatic design basis (HDB) per AWWA C-950. Hand layed FRP piping, PVC, stainless steel, or any other types are not acceptable. Minimum acceptable pipe wall thickness (including 20 mil corrosion liner) shall be per the following table:

Table 2.02a Filament Wound Pipe Thicknesses

Diameter	Wall Thickness
4″	0.100
6″	0.145
8″	0.145
10″	0.185
12″	0.185
14″	0.230
16″	0.270
18″	0.270
20″	0.315
24″	0.350
30″	0.440

E. A total of fifty-two (52) jet nozzle assemblies shall be provided in each SBR basin. Each jet aerator assembly shall consist of an inner liquid nozzle, and an outer air/liquid delivery nozzle. The jets shall be molded and assembled to be concentric with the inner liquid and outer air/liquid discharge nozzle in axial alignment. The air/liquid discharge nozzle shall be of constantly decreasing cross sectional area to increase the velocity of the air / liquid mixture as it passes through the nozzle. The inner liquid nozzle shall be constantly reducing in the direction of the flow path. The outer air jets shall also be constantly reducing in the direction of the flow path and shall be designed to achieve substantial air entrapment in the motive liquid. The outlets of both the inner and outer nozzles shall be circular and shall be designed to pass a 1-1/2″solid. The inner and outer nozzles shall be laminated together to form a single unit. The jet aerator assembly shall be joined to the liquid duct and the air manifold and laminated for strength to form a single integrated unit. Systems with non-integral jets will not be accepted. The base of the jet aerator assembly shall match the contour of the liquid pipe to provide a smooth liquid flow path. No portion of the jet nozzle assembly shall protrude into the liquid pipe. Nozzles shall be manufactured in the USA.

F. Molded parts (inner nozzles, outer nozzles, air chambers) shall be fabricated of isophthalic or vinyl ester laminating resin, reinforced with chopped strand mat to create a minimum nominal laminate thickness of 3/16″. The interior of each air and liquid nozzle shall contain a chemical and abrasion liner consisting of a minimum of 2 layers of 0.010 inch synthetic Nexus or C-glass surfacing veil. The interior liner shall be a resin-rich surface layer containing no more than 20% by weight of glass. Exterior of outer nozzles and air chambers shall be protected with a separately cured gel coat containing a wax solution and either pigmented or provided with UV inhibitor to protect from UV degradation. All

construction and laminate quality guidelines shall be in accordance with the National Bureau of Standards (NBS) PS 15-69.

2.3 AIRLIFT FLUSHOUT SYSTEM - SBR

A. An airlift (pneumatic) type flush-out system shall be provided. The system utilizes the blowers to create an air lift effect in the flushout riser so that a reverse liquid flow occurs across the jets. The aeration system manufacturer shall provide the air lift riser, flushout valve, and supports. Supports shall be provided for both the riser and the valve. The valve shall be plug style and shall be located for easy access by the plant operator. Mounting hardware and gaskets shall be provided by the Manufacturer.

2.4 AIR PIPING - SBR

A. In-basin air drop pipe shall be provided by the aeration system manufacturer. The air drop pipe shall connect to the airline of the jet manifolds by means of an adhesive or FRP field weld connection which shall be installed by the Contractor. The upper end of the air drop shall terminate with a flanged connection near the top of the tank wall as shown on the plans. Hardware required to complete this flanged connection will be supplied by the Contractor. In-basin air piping shall be machine filament wound, fiberglass reinforced thermosetting resin pipe fabricated in accordance with ASTM D-2996. Any in-basin air piping beyond the air drop flanged connection shall be by Others. All flanges connecting to FRP must be flat faced.

2.5 LIQUID PIPING - SBR

A. In-basin process equipment shall include adequate pipe, fittings, and supports to connect to Contractor supplied flanged interfaces as indicated on the plans. A flanged connection shall be provided at this interface point, and hardware to complete this flanged connection shall be supplied by the Contractor. In-basin liquid piping shall be machine filament wound, fiberglass reinforced thermosetting resin pipe fabricated in strict accordance with ASTM Specification D-2996. All flanges connecting to FRP must be flat faced.

2.6 SUPPORTS - SBR

A. Aeration equipment, in-basin liquid and air piping, flow control manifolds, and decanters shall be provided with adequate supports to accommodate loads and buoyancy factors experienced by the equipment during operation. Jet manifold supports shall be of the "H" type utilizing a cross support with two Schedule 40 support legs welded to a base plate. Single leg supports used for other in-basin piping shall be constructed of Schedule 40 pipe field welded to a support base. Supports shall be designed to allow for vertical adjustment of equipment to maintain elevations as indicated on the plans. Field welding of supports shall be by the Contractor. Supports shall be constructed of type 304 stainless steel.

B. Pipe supports shall consist of a contoured upper and lower saddle constructed of 3/16" thick stainless steel with a Buna-N or neoprene liner to prevent abrasion of the FRP. Base plates shall be anchored with anchor bolts and grouted in place, if necessary. Anchor bolts and fastening hardware shall be Type 304 stainless steel.

2.7 ANCHOR BOLTS

A. Anchor bolts shall be provided for mounting in-basin equipment provided by the SBR manufacturer. Anchor bolts shall consist of stud, flatwasher, lockwasher, and hex nut. Anchor bolts shall be constructed of type 304 stainless steel. Anchor bolts shall be adhesive type utilizing an acrylic resin and hardener contained in a dual cartridge with static dispensing nozzle. Anchor bolts must be installed to full embedment depth. Mechanical or expansion anchors are not acceptable.

2.8 DIGESTER COARSE BUBBLE DIFFUSERS

A. Aeration system shall be provided with an adequate number of Wide-Band type coarse bubble diffusers to deliver the air rate for the Digester blower as specified in Table 2.12a.

B. Air drop pipe to be provided for the diffuser grid shall be stainless-steel with horizontal 150# flange located at the top of the drop pipe. A stainless steel gasketed coupling shall be provided for connection to the diffuser manifold at the lower end of the drop pipe. Welded stainless-steel components shall be constructed of 304L S.S. Non-welded stainless-steel components shall be fabricated from type 304 SS. All welds and weld surfaces shall be cleaned to remove weld spatter and shall be fully immersed in a pickling solution to remove carbon deposits.

C. Pipe supports shall be provided to support the manifolds and air distributer piping.

2.9 DECANTERS - SBR

A. One (1) floating decanter shall be provided in each SBR basin to remove treated effluent from the SBR reactor. Decanters shall be designed to accommodate the full range of travel between TWL and decanter rest elevation and shall remove a full SBR decant volume within the time specified in Table 1.04a. Decanter main components and materials of construction shall be as outlined in the table below.

Table 2.09a Decanter Components

Float	ASTM D2996 FRP filled with closed cell foam
Draw tube	ASTM D2996 FRP
Drain tube	ASTM D2996 FRP
Flex connector	Natural Rubber / Neoprene (wire re-enforced)
Knee joint assembly	304 stainless steel
Lower mitered elbow	304 stainless steel
Decanter rests	304 stainless steel

B. The draw tube and float assembly are located in parallel and permanently connected using laminated FRP supports. The drain tube is located in the center of the draw tube and provides a flow path for effluent to exit the basin through the flex hose and lower mitered elbow. Miter joint connecting the draw tube and drain tube must be re-enforced with FRP hoop wraps to provide added strength. Drain tube, flex connector, and lower mitered elbow shall be connected by flanged connections with hardware and gaskets provided by the manufacturer. A knee brace assembly shall be provided to allow vertical articulation

of the decanter as water levels move up and down in the reactor. The knee brace assembly shall support the flex connector and prevent lateral movement of the decanter unit. Flex connector shall be suitable for abrasive materials, and shall be rated at 30 inches mercury vacuum and 15 PSI working pressure. Fixed or retractable decanters will not be accepted.

C. The draw tube shall contain an adequate number of solids excluding valves (SEV) to accommodate the average design flow rate based on site hydraulic conditions. The SEV assemblies are designed to isolate the draw tube from the surrounding mixed liquor during the mixing and aeration steps. SEV assemblies shall be mounted to the draw tube using hardware connections to allow for field replacement. The SEV assembly shall consist of stainless steel body, orifice plug with drive rod, stainless steel compression spring, and mounting hardware / gasket. The SEV assemblies shall maintain a liquid tight seal when the effluent control valve is closed. When the effluent control valve is opened, hydraulic head differential is used to over-come the compression spring tension which allows the plugs to un-seat and treated effluent is allowed to enter the draw tube. Plant hydraulics must be such that a minimum of 3.5 feet of static head differential (plus out of basin pipe friction losses) is available between SBR bottom water level and the water level at the effluent discharge. The point of effluent discharge downstream of the SBR shall be either constantly submerged, or designed with a water trap. Decanters must employ positive mechanical type seals for excluding solids from the draw tube. Decanters having an open conduit or any open areas exposed to the mixed liquor during react, or that require additional equipment or motors for pressurization, wear movement, or complete removal out of the liquid, are unacceptable.

2.10 DECANTERS - DIGESTERS

A. One (1) floating decanter shall be provided in each digester to remove supernatant from the basin. Decanters shall be designed to accommodate the full range of travel between TWL and decanter rest elevation and shall remove a full decant volume at an average rate of 1,590 gpm. Decanter main components and materials of construction shall be as outlined in the table below.

Table 2.10a Decanter Components

Float	ASTM D2996 FRP filled with closed cell foam
Draw tube	ASTM D2996 FRP
Drain tube	ASTM D2996 FRP
Flex connector	Natural Rubber / Neoprene (wire re-enforced)
Knee joint assembly	304 stainless steel
Lower mitered elbow	304 stainless steel
Decanter rests	304 stainless steel

B. The draw tube and float assembly are located in parallel and permanently connected using laminated FRP supports. The drain tube is located in the center of the draw tube and provides a flow path for supernatant to exit the basin through the flex hose and lower mitered elbow. Miter joint connecting the draw tube and drain tube must be re-enforced with FRP hoop wraps to provide added strength. Drain tube, flex connector, and lower mitered elbow shall be connected by flanged connections with hardware and gaskets provided by the manufacturer. A knee brace assembly shall be provided to allow vertical

articulation of the decanter as water levels move up and down in the reactor. The knee brace assembly shall support the flex connector and prevent lateral movement of the decanter unit. Flex connector shall be suitable for abrasive materials, and shall be rated at 30 inches mercury vacuum and 15 PSI working pressure. Fixed or retractable decanters will not be accepted.

C. The draw tube shall contain an adequate number of machined orifices to accommodate the average design flow rate based on site hydraulic conditions. Machined orifices shall be located on the upper side of the draw tube.

2.11 SBR PUMPS

A. See Specification Section 43_25_13.23 SBR Motive Pumps. The SBR manufacturer shall be responsible for supplying pumps as listed in the following table.

Table 2.11a Pumps

Location	Type	Quantity	Flow (gpm)	Head (ft)	Hp
Jet Motive	Sub.	3	9519	19	75

2.12 BLOWERS

A. See Specification Section 43_11_16 High Efficiency Blowers. The SBR manufacturer shall be responsible for providing blowers per the following table.

Location	Type	Quantity	Flow (scfm)	Pressure (psi)	Hp
SBR	Centrifugal	4	2,625	9.3	150
Digester	Centrifugal	2	2,721	9.9	200

2.13 VALVES AND VALVE ACTUATORS

A. Valves specified in the table below shall be provided by the SBR manufacturer. Electric actuators shall operate from 460 volts, 3 phase, 60 Hz per source.

Table 2.13a Valves

Function	Quantity	Size	Type	Operator
Influent	3	18″	Plug	Electric
Effluent	3	18″	Butterfly	Electric
Jet Flushout	3	12″	Plug	Manual
Spare Blower Isolation	3	12″	Butterfly	Manual
Supernatant	2	10″	Plug	Manual

B. Plug Valves

1. All plug valves shall be permanently lubricated and shall be of the tight-closing, rubber seat type. Valves shall be suitable for sewage and wastewater application, shall have throttling capability, and shall be rated 150 lb. WOG. Valve bodies shall be cast iron. Valve plugs shall be balanced type and constructed of either cast iron or ductile iron. Passage size shall be a minimum of 80% of the full port area for valves through 20" size and a minimum of 70% of the full port area for valves 24" and larger. Upper and lower bearing shall be either stainless steel or bronze and permanently lubricated. Packing shall be O-ring, U-cup or V-type, and shall be self-adjusting or externally adjustable by means of an external packing gland. Packing gland shall be visible through a standoff between the valve bonnet and actuator base. Packing shall be replaceable without removing the valve actuator or bonnet. All valves shall be leak tested to their full rating prior to shipment. Manual plug valves shall have worm gear actuators with handwheels. Actuators shall be sized for 50 PSI reverse shut off pressure against the face of the plug. Gearing shall be enclosed in a semi-steel housing and be suitable for running in a lubricant. Seals shall be provided on all shafts to prevent entry of dirt and water into the actuator.

C. Butterfly Valves

1. Valves shall be specifically designed for air service and clean water service. All valves shall have a maximum of 50 PSI pressure rating and valves for air service shall have a temperature rating of 250°F. Valves shall be either wafer or lug design with cast iron body. Valve disc shall have an uninterrupted 360° seating surface and shall be aluminum bronze, ductile, or cast iron with an appropriately suitable edging. Shafts shall be one piece and shall be of hi-strength carbon steel with phosphate coating, or stainless steel. Shaft bearings shall be self-lubricating, and corrosion resistant. Packing materials shall be either adjustable or self-adjustable and shall be suitable for the intended temperature and service conditions. Manual butterfly valves 4" and smaller shall be provided with lever actuators. Manual butterfly valves 6" and larger shall be provided with geared actuators with handwheels. Valves shall be sized appropriately for the service conditions and specific application. Lever operated valves shall latch in the open, closed, or several intermediate positions. Gearboxes shall be self locking.

D. The electric motor operator shall consist of motor, reduction gearing, position limit switches and torque limiting switches mounted in a NEMA 4X/6 housing. Actuators shall be sized for 50 PSI working pressure. Actuators shall be supplied with local Open / Stop / Close pushbuttons, Local / Off / Remote selector switch, and Open / Close / Fault indicating lights. Open / close switches shall also be provided for hand operation of valves at the SBR control panel.

E. The motor shall be of the high torque type, designed for a minimum 15 minute duty rating. Motors and wiring shall have Class "B" or better insulation. Overload protection shall be provided by auto-reset thermal trip circuit breakers embedded in the motor windings. All motor leads shall be terminated at an internal terminal strip. Actuators shall be provided with integral motor starters (if required). All termination caps shall be plug and socket connection permitting removal without disturbing field wiring. Power for all automatic valves shall be the responsibility of the installing contractor. Valves shall not be powered from the SBR control panel.

F. The integral self-locking power gearing shall be compound epicyclic or combined helical and worm gear type only. Motor breakers are unacceptable. Gearing shall be grease or oil lubricated with high speed parts running on anti-friction bearings. Motor shall operate from open to full close in 60 seconds. Disassembly of gears shall not be required to remove the motor. Motor wiring shall be connected by plug and socket connection.

G. The handwheel shall not rotate during electrical operation. When the unit is being operated manually, it shall automatically return to electric operation when the actuator motor is energized. The transfer from electrical operation to manual operation shall be accomplished by a declutching mechanism, which will disengage the motor mechanically. The unit shall be capable of being clutched or declutched while the motor is energized with no damage to the clutch or gear mechanism. Clockwise rotation of the handwheel shall close the valve. If the motor is energized during manual operation, the unit shall remain in manual mode without endangering personnel operating the unit.

H. Failure of the motor or motor gearing shall not hinder manual operation. Limit switches set at the open and close positions shall be provided. Limit switch adjustment shall be possible with no more than 5 turns of the limit adjuster. Switches shall be mechanical and shall include provisions for powered or isolated contacts for remote indication.

I. A double-acting torque limiting switch shall be provided, which is responsive to the mechanical torque developed by seating or an obstruction. Torque shall be directly measured from the worm shaft through a series of compressible washers and mechanical torque arm and switch.

2.14 SUBMERSIBLE LEVEL TRANSMITTERS / ETWL FLOATS

A. One (1) submersible pressure level transmitter shall be provided for each SBR and Digester basin. Transmitters shall be rated IP 68 for permanent submersion in water and wastewater. Body material shall be stainless steel with 3 wire polyurethane shielded cable. Output shall be 4-20 mA with an accuracy of 0.25% of span. Transmitters shall be WIKA Model LS-10 or approved equal.

B. A 4" diameter schedule 40 PVC stilling well shall be provided to house each transmitter. Stilling wells shall contain equalization ports facing the wall and shall extend from a point six inches above the floor to a point six inches below the top of the wall. Mounting supports shall be provided by the manufacturer.

C. One (1) float switch shall be provided for each SBR basin. The float shall be mounted 12” above the normal TWL and shall indicate an emergency top water level condition. Float shall be Type S Roto Float as manufactured by Anchor Scientific, or equal. Mounting bracket shall be provided by the manufacturer.

2.15 PROCESS CONTROLS

A. SBR Control panel provider shall be Integrated Controls of Olathe, KS.

B. A process control panel to control sequencing and operation of the SBR equipment shall be provided by the SBR manufacturer. Control panel enclosure shall be rated NEMA 12 and shall be constructed of 12 gauge steel with ANSI 61 gray powder paint exterior finish

and white, polyester powder paint inside. Enclosure shall include 3 point latch with locking handle and thermoplastic data pocket.

C. A programmable logic controller (PLC) shall be utilized to control sequencing of the SBR. PLC shall include 750 kbytes of battery-backed static RAM, Ethernet IP port, RS232 port, and shall be capable of supporting up to 16 I/O modules. Power supply shall be DIN mounted, fused, rated for 120/220 VAC. Controller shall be Allen Bradley CompactLogix series as manufactured by Rockwell Automation.

D. Discrete I/O cards shall be 16 channel and analog I/O cards shall include 8 channels. All wiring to modules will terminate on terminal strip. Individual lamps for each input or output shall be provided on each card. A minimum of 10% spare I/O shall be provided.

E. Operator interface (OIT) shall be minimum 10" viewable TFT color touch screen with 26MB minimum of user memory. The OIT shall be able to display 64K colors in SVGA screen resolution (800x600) minimum. OIT's rated for less than NEMA 4X or with a backlight half-life of less than 50,000 hours are not acceptable. The operating temperature shall be 0-50 degrees C and the power consumption shall not exceed 18W at 24VDC. The OIT shall have a built-in Ethernet port, shall support Ethernet or USB connection for programming software and shall be able to utilize Ethernet or serial communication to the PLC. The Ethernet port shall also be able to be utilized for advanced features such as email, web serving, FTP access, and remote access as supplied. OITs that required additional software or hardware for these features must be provided configured to support this. USB connection for external USB drive and Optional CF card shall be supported for data logging.

F. Hand-Off-Auto (HOA) switches for rotating equipment and Open-Auto-Close (AOC) switches for valves shall be provided on the panel front to allow for manual control of equipment. LED indicating lights shall be provided to indicate status of equipment. Overload and seal fail indication for submersible equipment shall be provided.

G. Wiring. All wiring to module will terminate on terminal strip. Panel wiring shall be:
1. Type MTW, sized per applicable codes.
2. 16 gauge minimum wire size for 120 VAC.
3. 20 gauge minimum wire size for 24 VDC.

H. Wiring shall be color coded as follows:
1. 120 VAC (unswitched).....black
2. Neutral.....white
3. Ground.....green
4. +24 V.D.C. .....red
   24 V (return) .....blue
5. 120 VAC (switched).....yellow
6. Dry Contact (remote power).....orange

I. The operating software used to control the SBR shall utilize constant level measurement analysis to determine rate of influent flows and adjust treatment steps dynamically. The control system software shall measure rise rate in the SBR to determine flow rate as a percentage of normal design flow based on an operator adjustable flow averaging period. The process computer software shall be programmed to automatically adjust treatment steps and overall treatment cycle length to optimize treatment performance at all flow ranges between minimum and maximum flow conditions. Adjustments to treatment steps

shall be dynamic and not limited to pre-programmed "storm modes" designated to make stepped adjustments at designated peaking thresholds. The software shall also include provisions to automatically reconfigure tank set points when a tank is taken off line, allowing an operator to simply switch a tank from automatic to manual without the need to manually enter new set points for the remaining tanks. The software shall be capable of controlling up to 8 SBR tanks operating in sequence.

J. The SBR control software shall include a first response initiative which will automatically remove a tank from service in the event of a critical equipment failure. Selection of critical equipment shall be operator adjustable on a tank by tank basis. First response shall be initiated 5 minutes following the critical equipment failure to allow the operator time to respond. The software shall automatically re-adjust cycle structures in the remaining tanks in the event a tank is automatically taken offline. The first response software feature shall be capable of being enabled / disabled by the operator. Software shall also include a provision to automatically initiate corrective action in the event the emergency top water level float switch is tripped indicating a potential failure of the level transmitter.

2.16 D.O. CONTROL

A. A dissolved oxygen control system shall be provided by the SBR system manufacturer. The D.O. control system shall utilize operator adjustable D.O. setpoints to control blower on / off operation during the aeration period. One (1) D.O. probe with mounting bracket and one (1) analyzer shall be provided for each SBR basin. Probes shall be continuous reading type utilizing luminescent sensor technology. Probes shall be Hach LDO with Hach SC200 analyzer, or equal.

PART 3 EXECUTION

3.1 FIELD SERVICE

A. The SBR system manufacturer shall provide on-site services as outlined below. A written service report shall be provided following dry inspection and wet start up. Contractor shall be responsible for correcting any deficiencies identified during the service visits.

Table 3.0a Manufacturer service requirements

Dry inspection	One trip / 2 man days
Wet start up	Two trips / 8 man days
Post start up	One trip / 2 man days

SECTION 46_66_57

UV DISINFECTION EQUIPMENT

PART 1 GENERAL

1.1 SUMMARY

A. Furnish all labor, materials, equipment and appurtenances required to provide an open channel, gravity flow, and low pressure high intensity ultraviolet lamp (UV) disinfection system complete with an automatic chemical/mechanical cleaning system and variable output lamp drivers. The UV system shall be complete and operational with all control equipment and accessories as shown and specified herein. This system will be capable of disinfecting effluent to meet the water quality standards listed in this section.

1. Northside WWTP – 4 units (3 duty, 1 redundant)
2. TrojanUVSigna™, as manufactured by Trojan Technologies
3. Current Peak Flow: 12 MGD
4. Average Flow: 4.50 MGD
5. Minimum Flow: 1 MGD
6. Total Suspended Solids: 30 mg/L, 30 Day Average grab samples
7. Effluent Temperature Range: 33 to 85 F (1 to 30 C)
8. Ultraviolet Transmittance @ 253.7 nm: 65%, minimum
9. Effluent standards to be achieved: 200 Fecal Coliform/100 ml based on a 30 day Geometric Mean of daily samples for the effluent standard as specified in a) through f).
10. Effluent standards will be guaranteed regardless of influent count to UV system
11. The UV system must fit within the UV channel(s) as indicated on the Drawings without modification. Verify exact dimension on Drawings prior to bid.

B. Spare Parts

1. One (1) complete set of replacement UV lamps for each of the specified units (4 sets total)
2. 16 Quartz Sleeves
3. 32 Lamp Wiper Seals
4. 4 Operators Kit that includes UV-resistant face shield, gloves and cleaning solution.

C. The ultraviolet disinfection system will be purchased from Trojan Technologies by the Contractor. The system to be installed by the Contractor and tested and commissioned by Trojan Technologies, as specified in this section. The Owner will consider alternates if all requirements of this specification are met without exception including Pre-qualification Requirements in section 1.2 Quality Assurance.

D. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents showing at a minimum:
1. Complete description in sufficient detail to permit an item comparison with the specification.
2. Dimensions and installation requirements.
3. Descriptive information including catalogue cuts and manufacturers' specifications for major components.
4. Electrical schematics and layouts.
5. Hydraulic calculations demonstrating compliance with the required hydraulic characteristics.
6. Independent bioassay validation and dosage calculations demonstrating compliance with the specified RED requirements.
7. Lifetime disinfection performance guarantee.

1.4 QUALITY ASSURANCE

A. Pre-qualification Requirements: Any alternate UV manufacturer that is not named or listed as approved equal must submit the following 15 days prior to bid to be considered for approval:
1. The manufacturer will be regularly engaged in the design, manufacture and servicing of UV systems for municipal wastewater disinfection. Manufacturer to submit evidence of a proven track record with at least five hundred (500) operating UV installations at municipal wastewater treatment plants over a design flow of 10 MGD (1577 m3/hr).
2. The manufacturer will provide documentation of previous experience with municipal UV disinfection systems in wastewater applications with variable output electronic drivers and automatic cleaning systems.
3. For evaluation, the manufacturer will submit a reactor (bioassay) validation report and calculation justifying the sizing for the proposed reactor, without exception. The bioassay will have been completed by an independent third party and have followed applicable sections and protocols described in the NWRI Ultraviolet

Disinfection Guidelines for Drinking Water and Water Reuse (2003, 2012) and 2006 USEPA Ultraviolet Disinfection Guidance Manual (UVDGM). The bioassay must demonstrate that the proposed UV system design and number of lamps will deliver the specified Reduction Equivalent Dose (RED) based on the water quality and operating conditions specified herein.

4. Independent certification of the lamp aging factor must be submitted if values other than the specified default values are being proposed. The lamp aging (or end-of-lamp-life) factor must be determined using the protocol described in the NWRI Ultraviolet Disinfection Guidelines for Drinking Water and Water Reuse (2003, 2012).
5. Independent certification of the fouling factor shall only be accepted if performed on the UV lamp and quartz sleeve combination equal to that being proposed by the UV manufacturer. The fouling factor must be conducted on municipal wastewater effluent using the protocol described in the NWRI Ultraviolet Disinfection Guidelines for Drinking Water and Water Reuse (2003, 2012).
6. Documentation of UV manufacturer's service capabilities including location and experience.
7. Sample of lifetime disinfection performance guarantee including scope and duration of guarantee.
8. Pre-qualification submittals from manufacturers will include a complete and detailed proposal of equipment offered, including the number of lamps proposed, bioassay calculation and a detailed description of all exceptions taken to the specification.
9. All UV manufacturers will be required to pre-qualify, unless the manufacturer is the base bid manufacturer.

B. Design Criteria:

1. Provide equipment that will disinfect effluent with the following characteristics:
   a. Current Peak Flow: 12 MGD
   b. Average Flow: 4.50 MGD
   c. Minimum Flow: 1 MGD
   d. Total Suspended Solids: 30 mg/L, 30 Day Average grab samples
   e. Effluent Temperature Range: 33 to 85 F (1 to 30 C)
   f. Ultraviolet Transmittance @ 253.7 nm: 65%, minimum
   g. Effluent standards to be achieved: 200 Fecal Coliform/100 ml based on a 30 day Geometric Mean of daily samples for the effluent standard as specified in a) through f). Effluent standards will be guaranteed regardless of influent count to UV system.
2. The UV system is to be installed in 1 open channel(s) having the following dimensions unless otherwise indicated on drawings (not including the water level controller):
   a. Length: 35.6 feet
   b. Width: 2.9 feet
   c. Depth: 7.8 feet
3. System configuration:
   a. The UV system must fit within the UV channel(s) as stated without modification. Verify exact dimension on Drawings prior to bid.
4. The UV system configuration will be as follows:
   a. Number of Channels: 1
   b. Number of Banks per Channel: 4 (3 Duty, 1 Redundant)
   c. Lamps per Bank: 10

d.	Total Number of Lamps in the UV System:	40
e.	Number of System Control Centers:	1
f.	Number of UV Sensors:	1 per bank
g.	Number of Power Distribution Centers:	1
h.	Number of Level Controllers:	1

C. Performance Requirements:

1. Provide a UV disinfection system complete with UV Banks and lifting mechanism, System Control Center, Power Distribution Centers, and Water Level Controller(s) as shown on the contract drawings and as herein specified.
2. The ultraviolet disinfection system will produce an effluent conforming to the following discharge permit: 200 Fecal Coliform/100 ml, based on a 30 day Geometric Mean. Grab samples will be taken in accordance with the Microbiology Sampling Techniques found in Standard Methods for the Examination of Water and Wastewater, 21st Ed.
3. The UV system will be designed to deliver a minimum RED of 30 mJ/cm2 MS2 at peak flow, in effluent with a UV Transmission of 60% at end of lamp life (EOLL) after reductions for quartz sleeve fouling. The basis for evaluating the RED will be the independent third party bioassay, without exception. Bioassay validation methodology to follow applicable protocols described in NWRI Ultraviolet Disinfection Guidelines for Drinking Water and Water Reuse (May 2003, 2012) and 2006 USEPA UVDGM.
4. The RED will be adjusted using an end of lamp life factor of 0.5 to compensate for lamp output reduction over the time period corresponding to the manufacturer's lamp warranty. The use of a higher lamp aging factor will be considered only upon review and approval of independent third party verified data that has been collected and analysed in accordance with protocols described in the NWRI Ultraviolet Disinfection Guidelines for Drinking Water and Water Reuse (May 2003, 2012).
5. The RED will be adjusted using a quartz sleeve fouling factor of 0.8 to compensate for quartz sleeve transmission reduction due to wastewater effluent fouling. The use of a higher quartz sleeve fouling factor will be considered only upon review and approval of independently verified data that has been collected and analysed in accordance with protocols described in the NWRI Ultraviolet Disinfection Guidelines for Drinking Water and Water Reuse (May 2003, 2012). The data recorded for the determination of the validated fouling factor must be obtained by testing in secondary wastewater effluent utilizing the same lamp, quartz sleeve and cleaning system proposed by the UV manufacturer.
6. Independent validation for use of higher factors (lamp aging and sleeve fouling) must be submitted to the Engineer for consideration a minimum of fifteen (15) days prior to bid. The independent validation shall have oversight by a qualified registered professional engineer with knowledge and experience in testing and evaluation of UV systems as defined in the EPA UVDGM (Appendix C, Section C.3.3)
7. The system will be designed for complete outdoor installation.

1.5 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year from date of final acceptance by owner, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

E. It is not intended the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacture, delays in delivery, replacement, or otherwise.

F. UV Lamps:
1. The UV lamps will be warranted for a minimum of 15,000 hours when operated in automatic mode, prorated after 9,000 hours. On/off cycles are limited to an average of four (4) per day accumulated over the guaranteed life of the lamp.

G. Lamp Drivers:
1. Lamp drivers will be warranted for 10 years, prorated after 1 year.

H. UV Intensity Sensors:
1. UV Intensity Sensors will be warranted for 5 years, prorated after 1 year.

PART 2 PRODUCTS

2.1 MANUFACTURER

A. The physical layout of the system shown on the contract drawings and the equipment specified herein are based on the TrojanUVSigna™, as manufactured by Trojan Technologies, London, Ontario, Canada.

B. If other equipment is proposed, the Contractor will demonstrate to the Engineer and the Owner that all requirements of materials, performance, and workmanship have been met or exceeded by the equipment proposed. Contractors proposing alternate manufacturers will be responsible for all costs associated with system evaluation and redesign including all electrical, mechanical and civil aspects of the installation.

2.2 DESIGN, CONSTRUCTION AND MATERIALS

A. General:
1. All UV Bank metal components in contact with effluent will be Type 316 stainless steel.

2. All wiring exposed to UV light will be Teflon™ coated.

B. Lamp Array Configuration:
1. The lamp array configuration will be in a staggered inclined arrangement.
2. The system will be designed for complete submersion of the UV lamps under all flow conditions including both electrodes and the full length of the lamp arc.
3. To maximize performance and ensure safety, bank light locks will be used in each bank to prevent potential short circuiting over the top of the lamps.
4. For any UV inclined system that does not contain UV bank light locks to prevent short circuiting, the system shall be supplied with 1 additional UV bank to compensate for short-circuiting over the top of the lamps.

C. UV Bank:
1. Each UV bank will consist of UV lamps, quartz sleeves and an automatic chemical/mechanical cleaning system mounted in a Type 316 stainless steel frame.
2. Each lamp will be enclosed in its individual quartz sleeve, one end of which will be closed and the other end sealed by a lamp end seal. To be considered as an alternate, lamp quartz sleeves that are open at both ends will be supplied with twice the amount of specified spare seals and lamps.
3. The closed end of the quartz sleeve will be held in place by a retaining O-ring. The quartz sleeve will not come in contact with any steel in the frame.
4. Each UV bank will contain a pre-formed Type 316 stainless steel wall on each side to prevent possible short-circuiting at the side walls of the reactor.
5. Each UV bank will contain light locks at the top of the bank to prevent short circuiting over the top of the lamps and maximize disinfection efficiency.
6. Each UV bank will be rated Type 6P. UV banks that are not Type 6P rated are not acceptable.
7. To minimize maintenance, equipment must be provided by the UV manufacturer to enable lifting a complete bank of lamps from the channel at once for inspection and/or servicing.

D. UV Lamps:
1. Lamps will be high intensity low pressure amalgam design. Lamps that are not amalgam will not be allowed.
2. The filament shall be significantly rugged to withstand shock and vibration.
3. Electrical connections for the lamp will consist of four (4) pins at one end of the lamp only. Lamp wiring shall be Teflon insulated stranded wire.
4. Lamps without maintenance coating or that do not have four (4) pins are considered instant-start and are not acceptable due to reduced reliability and increased maintenance and operating costs.
5. Lamps will be rated to produce zero levels of ozone.
6. The lamp shall withstand an average of four (4) on/off cycles per day without reducing lamp life, warranty or causing any damage to the lamp.
7. Lamps will be operated by electronic lamp drivers with variable output capabilities ranging from 30% to 100% of nominal power. The lamp assembly shall incorporate active filament heating to maintain a minimum lamp efficiency of 35% across varying water temperatures and between the minimum and maximum stated lamp power levels.

E. Lamp Plugs:

1. Each lamp plug will be accessible from the top of the UV bank to facilitate lamp removal without moving the UV banks or any other components.
2. Each lamp plug shall have provisions for a light emitting diode (LED) visual indicator that indicates on/off status for each lamp.
3. An integral safety interlock in the lamp plug will prevent removal of energized lamps.
4. The lamp plug shall be rated Type 6P.

F. Lamp Drivers:
1. Each lamp driver will independently power two (2) UV lamps. Failure of one lamp will not affect operation of the other lamp.
2. The lamp driver will have a power factor correction circuit to ensure minimum 99% power factor and less than 5% total harmonic distortion (THD) current at the maximum power level and nominal input voltage.
3. The lamp driver electrical efficiency will be minimum 95% at the maximum power level.
4. The lamp driver will be programmed-start type utilizing filament preheat followed by a high voltage pulse to ignite the lamp.
5. During lamp operation, variable filament heating current shall be provided according to a predetermined curve to maintain optimum filament temperature and amalgam temperature to ensure maximum lamp life and maintain a minimum lamp efficiency of 35% across varying water temperatures and between the minimum and maximum stated lamp power levels.
6. A ground fault in the output circuit shall be detected and communicated as a warning to the external controls system while the corresponding lamp operates undisturbed.
7. The communication protocol shall be Modbus implemented on an RS485 electrical interface.
8. Local visual diagnostic will be provided with LEDs for lamp driver status, lamp status (on, idle, preheat, fault), power and communication status.
9. For reliability and to facilitate trouble shooting, at a minimum, the following external indicators (protections, status, warnings and alarms) shall be provided: lamp status, driver status, ground fault, and communication time-out.
10. The lamp driver shall be UL, CE, and RoHS compliant.

G. Quartz Sleeves:
1. Quartz sleeves will be clear fused quartz circular tubing containing 99.9% silicon dioxide.
2. Sleeves will have minimum UV transmittance at 254nm of 87% (2.5mm wall thickness).
3. Sleeves will be open at one end only and domed at the other end.

H. Cleaning System:
1. An automatic in-situ cleaning system will be provided to clean the quartz sleeves using both chemical and mechanical methods. Wiping sequence will be automatically initiated with capability for manual override.
2. The cleaning system shall also incorporate an integrated debris removal device to clear the quartz sleeves of any large solids or debris to maximize the life of the chemical/mechanical cleaning system.
3. The wiper on the cleaning system shall be parked out of the effluent when not in use.

4. Cleaning systems that utilize a screw drive, or park the wiper in the effluent while not in use shall not be acceptable due to collection of debris in and around the wetted parts of the wiper.
5. The cleaning system will be fully operational while UV lamps and modules are submerged in the effluent channel and energized.
6. To minimize maintenance, UV System will be designed such that cleaning solution replacement can be performed while the UV Bank and lamps are in place and operational in the channel.
7. Cleaning sequence frequency will be field adjustable to enable optimization with effluent characteristics.
8. Cleaning system operation will be remote auto (default) or remote manual.
9. The cleaning system will be provided with the required solutions necessary for initial equipment testing and for equipment start-up.
10. The wipers shall travel the full length of the UV lamp arc. Designs in which the wipers only travel part way along the sleeves will not be acceptable.
11. The UV intensity sensor shall be cleaned utilizing the same chemical/mechanical cleaning method as that of the lamp quartz sleeves. UV intensity sensors that only utilize a mechanical means shall not be acceptable.
12. To be considered as alternate, systems that use only mechanical wiping must have the ability to periodically be cleaned out of channel using a chemical bath. Out of channel cleaning will include lifting slings, removable banks, cleaning tanks, agitation system and air compressors, as required. The UV manufacturer will be responsible for supplying all equipment including any equipment not specifically listed required to perform out of channel chemical cleaning. Contactor will be responsible for installation.

I. Effluent Level Controller:
   1. Level Control Weir
      a. To be located at the discharge end of the UV channel.
      b. Weir will be designed to maintain the minimum channel effluent level required to keep lamps submerged at all times.
      c. Weir to be constructed of Type 304 stainless steel.

J. Light Locks
   1. Light locks, two (2) per bank, will be provided to force effluent through the UV treatment zone maximizing disinfection performance.
   2. The entire length of the lamp arc will remain submerged to maximize UV dose delivered to the effluent and to prevent any UV exposure above the water free surface.

K. Electrical:
   1. All applicable electrical components will be UL-listed to ensure safety standards are met.
   2. Each UV lamp within a bank will be powered from a Power Distribution Center.
   3. UV Manufacturer to supply all cabling between lamps and drivers.
   4. Each electronic lamp driver will power two lamps.
   5. Power factor will not be less than 99% leading or lagging.
   6. Electrical supply to each Power Distribution Center will be 480/277V 60Hz, 45.0 kVA.
   7. Electrical supply to the Hydraulic System Center will be 480V 60Hz, 2.5 kVA

8. Electrical supply to the low water level sensor box will be from 120V, 1 Phase, 2 Wire + GND.
9. Electrical supply to the System Control Center will be 120V 60Hz, 1.8 kVA

L. Power Distribution Center (PDC):
1. The configuration of Power Distribution Centers shall be lamps per pdc.
2. PDC enclosure material will be 304 Stainless Steel.
3. All internal components will be sealed from the environment.
4. All Power Distribution Centers to be UL approved or equivalent.
5. An internal heater will be provided in the PDC to prevent condensation when the external temperature drops below the dew point.
6. Each PDC shall be able to electrically isolate each bank of lamp drivers and safely replace a lamp driver without de-energizing any other operating banks.

M. Hydraulic System Center:
1. The Hydraulic System Center (HSC) houses the components required to operate the automatic cleaning system and bank Automatic Raising Mechanism (ARM).
2. HSC enclosure material will be 304 Stainless Steel (Type 4X, IP 66) (Type 4X).
3. The HSC will contain hydraulic power unit complete with pump, fluid reservoir, manifolds, valves and filter.

N. Control and Instrumentation:
1. System Control Center (SCC):
   a. The monitoring, operation and control of the TrojanUVSigna is managed at the System Control Center (SCC) by a CompactLogix with a SCC HMI Beijer -12" (Outdoor 4X Rated) HMI screen.
   b. If the SCC is installed outdoors, the operator interface shall be positioned out of or away from direct sunlight and shall include a sunshade. The operator interface screen will be designed for a rugged outdoor environment capable of operating at ambient temperatures between -30 Deg C and +70 Deg C with a high brightness display (minimum 1000 Nit). HMI screen shall be certified for outdoor use (UL50E Type 4X Outdoor)
   c. Alarms will be provided to indicate to plant operators that maintenance attention is required or to indicate an extreme alarm condition in which the disinfection performance may be jeopardized. The alarms will include, but not be limited to:
      1) Individual Lamp Failure
      2) Multiple Lamp Failure
      3) Low UV Intensity
      4) Bank Communication Alarm
   d. The 100 most recent alarms will be recorded in an alarm history register and will be displayed when prompted.
   e. Mode of operation for UV Banks can be manual, automatic or remote.
   f. Elapsed time of each bank will be recorded and displayed on the display screen when prompted.
2. Low Water Level Sensor:
   a. The UV Manufacturer will provide one (1) low water level sensor for each UV channel.
   b. During all modes of system operation (manual, automatic and remote), the water level sensor will ensure that lamps extinguish automatically if the water level in the channel drops below an acceptable level.

3. UV Intensity Sensors:
    a. A UV sensor will continuously monitor the UV intensity produced within each UV Bank.
    b. The sensors will measure only the germicidal portion of light emitted by the lamps.
    c. The UV sensor shall be factory-calibrated to US National Institute for Standards and Technology (NIST). Sensors requiring field-calibration are not acceptable.
    d. The sensor shall be digitally calibrated to ensure calibration accuracy.
    e. To ensure continuous disinfection, the sensor shall be accessible without shutting down the system, lifting a bank/module or removing lamps.
    f. Sensors will be designed to provide UV intensity data for dose monitoring and control functions. Dose pacing program will enable use of measured UV intensity along with flow rate and UVT to determine the delivered dose during operation.
    g. Sensors will be designed such that reference sensor readings can be taken without interrupting disinfection and without removing UV lamps, banks/modules or sleeves.
4. Dose-Pacing:
    a. A dose-pacing system will be supplied to modulate the lamp UV output in relationship to a 4-20 mA DC signal from an effluent flow meter (supplied and installed by Others) and UV intensity sensor(s).
    b. The system to be dose-paced such that as the flow and effluent quality change, the design UV dose is delivered while conserving power.
    c. The dose-pacing system will allow the operator to vary the design dose setting. Logic and time delays will be provided to regulate UV Bank ON/OFF cycling.

O. UV Bank Lifting Device:
1. The lifting device for UV Banks will be supplied by the UV Manufacturer.
2. An Automatic Raising Mechanism (ARM) will be designed and supplied to facilitate lifting a UV bank from the channel without use of ancillary equipment.
3. The ARM will be integrated into the UV Bank for simple and seamless operation.
4. The UV Bank will be raised from the channel for easier access and maintenance.
5. The ARM design will provide access to components without having to break electrical connections thus reducing wear on connectors.

P. Spare Parts:
1. The following spare parts and safety equipment will be supplied.
2. One (1) complete set of replacement UV lamps for each of the specified units (4 sets total)
3. 16 Quartz Sleeves
4. 32 Lamp Wiper Seals
5. 4 Operators Kit that includes UV-resistant face shield, gloves and cleaning solution.

PART 3 EXECUTION

3.1 3.1 INSTALLATION

A. In accordance with contract drawings, manufacturers' shop drawings, instructions and installation checklist. Contractor Installation Checklist to be completed and returned at least two (2) weeks prior to date requested for commissioning. Photographs illustrating site readiness are required. The Contractor assumes all responsibility for the installation readiness of the UV system.

B. All labor, materials and test apparatus necessary for completing the installation shall be furnished by the Contractor at no additional cost to the Manufacturer.

3.2 MANUFACTURER'S SERVICES

A. Installation assistance only provided if in scope.

B. Start-up and field testing
1. Start-up and Field Services will only be scheduled upon written request. Contractor shall notify Trojan of schedule requirements at least ten (10) working days in advance.

C. Operator Training
1. Comply with training requirements as outlined in Specifications.

D. Warranty Service: As outlined in the warranty agreement. Anything in the Contract Documents that conflict with warranty agreement, Contract Documents govern.

SECTION 46_76_21.03

BELT FILTER PRESS SYSTEM

PART 1 GENERAL

1.1 SUMMARY

A. This specification section covers the labor and materials necessary to furnish and install all equipment required to provide a complete and operable system belt filter press system as described herein.
   1. Northside WWTP – 2 Units; Komline-Sanderson Model GRSL-2 Series III
   2. Spare Parts:
      a. Eight complete set of dewatering belts
      b. Eight complete set of dewatering blades
      c. Four complete set of containment seals
      d. Four complete set of washwater box seals
      e. Eight press roller bearing of each different size used
      f. Six fuses of each size used
      g. Two oil filters for the hydraulic power unit

B. Components shall be of the same manufacturer or supplier to obtain standardization of performance, operation, spare parts, maintenance and manufacturer's services.

C. The Contractor shall furnish and install all equipment required to provide a complete and operable system as described herein.

D. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents and shall at a minimum included:

1. Detailed specifications
2. Equipment agreement
3. Detailed electrical data (as applicable)
4. Installation instructions
5. Written warranty
6. Equipment storage requirements
7. Any other information relating to delivery, storage, installation , operations and maintenance of the equipment

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

1.5 DELIVERY, STORAGE & HANDLING

A. Equipment shall be delivered to the jobsite completely factory assembled in accordance with manufacturer's recommendations. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address and packing list shall be provided with equipment at time of delivery.

B. Equipment shall be kept thoroughly dry at all times and shall be stored indoors. Equipment storage shall be protected and maintained in accordance with the manufacturer's recommendations. Equipment shall not be stored directly on the ground.

C. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment. The Contractor shall be responsible for equipment damaged during unloading transportation and storing at no additional cost to the Owner.

1.6 QUALITY ASSURANCE

A. Equipment furnished and installed under this section shall be fabricated, assembled, erected, and placed in proper operating condition in full conformity with drawings, specifications, Engineering data, instruction, and recommendations of the equipment manufacturer unless exceptions are noted by the Engineer. The equipment manufacturer must have at least five (5) of similar size installed and operating in the State of Oklahoma for a minimum of five (5) years. Equipment and associated appurtenances shall be provided by the same supplier.

B. Acceptable Manufactures/suppliers
   1. Komline-Sanderson

1.7 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

E. It is not intended the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacture, delays in delivery, replacement, or otherwise.

PART 2 PRODUCTS

2.1 BELT FILTER PRESS

A. The contractor shall furnish and install two (2) belt filter press complete with sludge conditioning unit, hydraulic power unit, belt washwater booster pump, electrical control panel, and spare parts as specified herein and shown on the drawings for the dewatering of aerobically digested sludge. Each press shall have an effective belt width of 2.0 meters with a measured belt width of 2.2 meters. In addition, the contractor shall furnish and install all necessary valves, interconnecting piping and wiring, instrumentation, anchor bolts and other necessary appurtenances for a complete and operating installation.

B. Each belt filter press shall be of the continuous belt design with three distinct dewatering zones including an extended length gravity dewatering zone, an adjustable wedge or low pressure zone and a shear/pressure zone and shall consist of a structural frame, dewatering belts, an inlet distributor, belt support/wiper bars, drainage elements, drums, rollers, bearings, discharge blades, a belt drive unit, belt tracking and tensioning systems, a belt wash system and a filtrate/belt washwater drainage system. Each belt filter press shall be factory assembled including all internal piping, valving, wiring and control devices and shall be shipped as a complete assembly except that the dewatering belts shall be shipped separately in suitable containers to prevent accidental damage.

C. The manufacturer shall have a belt filter press of the type specified herein successfully operating for a minimum of five years in each of at least ten wastewater treatment plants in the USA. Manufacturers who cannot meet this experience requirement shall furnish the owner a bond in the amount of 150% of the belt filter press equipment cost which will provide for replacement of the equipment if necessary within the first five years of operation.

D. Compliance with the performance requirements of the specifications will not relieve the contractor of his responsibilities of supplying equipment having the specified structural, mechanical, corrosion resistant and operational features. Deviations from the requirements specified shall not be permitted.

2.2 PERFORMANCE REQUIREMENTS

A. Each belt filter press shall be capable of operating satisfactorily under the following performance conditions:
1. Type of sludge: Aerobically digested WAS.
2. Sludge feed concentration: Range 1 % dry solids, average 0.5 % dry solids.
3. Hydraulic throughput, solids throughput, cake solids concentration, solids capture (combined filtrate and washwater) and polymer use requirements:

Feed Solids %	Hydraulic Throughput GPM	Solids Throughput Lbs DS/hr	Cake Solids %	Solids Capture %	Polymer Use Lbs
0.5-2.0	140	1,400	16	95	10

2.3 BASIS OF DESIGN

1. The plans and specifications have been prepared based on an extended gravity section belt filter press and appurtenances. If alternate equipment is proposed which requires an arrangement differing from that shown on the plans or if the details of design and construction are different from those specified, the contractor shall prepare and submit for review the necessary design calculations along with the necessary structural, electrical, instrumentation, mechanical and architectural drawing revisions. The manufacturer shall prepare and submit for review along with the required shop drawings, a specific listing of the material, design and construction differences between the proposed equipment and the specified equipment. All work associated with accommodating alternate equipment shall be at no additional cost to the owner even if the proposed substitution is rejected.

2.4 GENERAL SYSTEM REQUIREMENTS

A. After proper flocculation of the sludge with polymer, initial dewatering shall occur by gravity drainage through a filter belt traveling horizontally along the press. Further dewatering shall occur by squeezing the sludge between two tensioned pressure belts, first through a wedge zone then over and under a minimum of eight drums forcing entrained water from the sludge through both pressure and shear action. Dry cake discharge shall be assisted by doctor blades at each belt. Each belt shall be subsequently washed with high pressure, low volume water from spray headers before it returns to the head of its section of the

press. Washwater and filtrate shall be collected in drain pans for direction to a curbed concrete drainage basin surrounding the press.

B. The equipment furnished shall be designed and constructed in accordance with the best practices and methods and for continuous service at maximum conditions. All parts shall be so designed and proportioned as to have liberal strength, stability and stiffness and to be fully suitable for the intended conditions of service. Provisions shall be made for easy lubrication, adjustment or replacement of all parts. Corresponding parts of multiple units shall be interchangeable. Except as otherwise specified, steel plates and shapes shall have a minimum thickness of 3/8 inch, sheet metal shall be 14 gauge minimum and bolts shall be 1/2 inch diameter minimum. All welding shall be in accordance with the latest applicable codes of the American Welding Society. All materials used shall be of the best quality and fully suitable in every respect for the service intended. Unless otherwise specified, all materials in direct contact with sludge, polymer or filtrate shall be type 316 stainless steel or plastic. All fasteners shall be type 316 stainless steel.

2.5 SLUDGE CONTROL SYSTEM

A. Each sludge conditioning system shall consist of an in line polymer injection ring, a variable orifice venturi type mixing valve and a press mounted flooded bottom distribution system for final flocculation as well as even distribution of sludge across the full width of the press.

B. The polymer injection ring shall be of the multiport type to assure optimum polymer usage, shall be of polyethylene construction and shall be supplied with a polyethylene injection manifold complete with tubing and fittings for distributing polymer to the injection points on the ring. The mixing valve shall be of cast type 316 stainless steel construction and shall include provisions to vary the throat area through an external adjustably weighted lever arm for most effective instantaneous polymer/sludge mixing. The mixing valve shall also include a removable inspection cover.

C. Each injection ring and mixing valve shall form a sludge/polymer mixing assembly which shall be located directly in the sludge feed line. The contractor shall provide spool pieces to simulate the mixing assembly at two additional locations in each sludge feed line to allow for repositioning the mixing assembly for most effective floc formation. The contractor shall also provide the necessary polymer piping and valving to accommodate the alternate mixing assembly locations.

D. The flooded bottom distribution system shall be mounted on the feed end of the press and shall be sized to provide an adequate residence time for effective floc formation. The distribution system shall consist of a lower inlet section or feed hopper and an upper distribution and exit section. All parts of the system shall be constructed of type 316 stainless steel. Sludge shall directly overflow the hopper onto the full width of the distribution section. The sludge inlet line to the tank shall incorporate a means of draining the feed hopper. The hopper shall also be provided with a drain connection. The contractor shall provide a quick opening valve and PVC piping to the drain basin below. No mechanical or static mixing devices shall be included in the hopper or distributor as such devices become fouled and require frequent cleaning.

2.6 PRESS FRAME

A. Each side frame shall be constructed of welded members formed from 3/8 inch thick ASTM A36 structural steel plate. A minimum of five cross members shall be bolted to the side frames to form a rigid structure, properly stiffened for supporting the belt press rollers and other components and to withstand the applied loading without deflection, deformation or vibration during operation. All mainframe members shall be 7 inch channel shapes with minimum moment of inertia of 44 inches4. Channel flanges shall be turned out to allow for convenient and thorough washdown. Frame construction shall allow easy access to and visual contact with all internal press components.

B. The frame shall have minimum safety factors of sixteen times the allowable yield strength in bending and nineteen times the allowable shear stress at an applied belt tension of 50 pounds per linear inch. Frame deflection shall not exceed 0.002 inch under the same belt tension load. Design calculations shall be submitted to substantiate the required frame safety factors and deflection limit.

C. After fabrication all frame members shall be hot dipped galvanized per ASTM A123 to a thickness of 5 to 7 mils to assure complete and thorough corrosion protection. Painted or flame sprayed coatings are not acceptable since adequate surface protection at boltholes, slots and inaccessible areas is not assured. Stainless steel local side panels shall be provided where necessary to contain spray mist and provide operator protection from moving parts.

2.7 GRAVITY DRAINAGE SECTION

A. Each belt filter press shall contain an extended length gravity drainage section consisting of an inlet distributor, a filter belt, belt supports, sludge containment seals, drainage elements, a discharge chute and a filtrate collection pan.

B. Conditioned sludge shall be fed to the press by gravity overflow from the feed hopper onto a sludge distributor constructed of type 316 stainless steel. Even distribution of the sludge across the entire belt width shall be achieved by the use of the flooded bottom distribution system without the use of a driven spreader mechanism.

C. Gravity dewatering shall occur on a horizontal traveling belt section with a minimum active dewatering length of 10 feet and a minimum active dewatering area of 70 square feet through which free water drainage shall occur. Inclined gravity drainage areas shall not be allowed due to the cloth blinding effect caused by pooling of fragile sludges. The belt shall be supported in this section by full width ultra high density molecular weight polyethylene support/ wiper bars 1 3/4 inches in diameter with minimum 3-1/2 inch spacing. The bars shall assure maximum free water drainage by repeatedly breaking the surface tension of the water on the underside of the belt. The bars shall be mounted in type 316 stainless steel support brackets. The bars shall be fabricated with square type 316 stainless steel plugs on each end which shall allow each bar to be rotated in 90 degree increments for extended life and reduced maintenance cost. The gravity drainage zone shall be so designed that the filter belt does not have to be removed to rotate or replace support bars. Replaceable rubber side seals with type 316 stainless steel holders shall be provided to contain the sludge on the belt. These seals shall not require bolted connections so that they may be easily and quickly replaced. A type 316 stainless steel discharge chute

shall be provided at the discharge end of the gravity section to provide a gentle transition to the wedge zone to prevent floc shear of the thickened sludge at this point.

D. In order to minimize polymer use, maximize hydraulic and solids loading rates and promote more rapid drainage of free water from the sludge, a combination of plows shall be located in the gravity drainage zone. A minimum of eight rows of plows shall be furnished for thorough sludge dispersion along the entire length of the gravity zone. To facilitate convenient operator cleaning and to provide flexibility of operation, the plows shall be mounted on crossbars with lifting handles to raise and lock each row in an upright, out of service position. The crossbars shall be type 304 stainless steel; associated mounting and lifting hardware shall be hot dipped galvanized malleable iron. Each plow shall be of ultra high density molecular weight polyethylene and shall be mounted on a type 316 stainless steel holder which in turn shall be mounted on the crossbar and spaced on 6 inch centers. The plows shall be individually adjustable on the crossbars to allow for more flexibility. A total of 68 plows shall be provided in the gravity drainage zone. They shall also be designed to be self cleaning by being mounted to allow them to freely and independently rotate and/or raise to prevent solids build up.

E. A 14 gauge type 316 stainless steel drain pan shall be provided beneath the gravity drainage section to collect the filtrate and to direct it to the collection sump beneath the press through rigid PVC pipes of sufficient size to handle the drainage from the combined sludge and polymer feed streams. Other drain pan materials of construction are not acceptable due to possible cracking or breaking or failure of any applied corrosion resistant coating.

2.8 WEDGE SECTION

A. Each press shall contain a wedge or low pressure section consisting of a pair of converging pressure belts, belt supports, troughing seals, a filtrate collection pan and provisions to adjust the angle of convergence of the belts.

B. The wedge section shall receive thickened sludge discharged from the gravity zone, shall be horizontal and shall provide a zone wherein the two pressure belts gradually converge and begin to apply pressure to the sludge contained between the two tensioned belts. The wedge section shall have a minimum dewatering length of 6 feet and a minimum dewatering area of 40 square feet figured on the basis of one belt. The carrying belt shall be supported in this section by full width ultra high density molecular weight polyethylene support/wiper bars 1-3/4 inches in diameter spaced on 3-1/2 inch centers. The bars shall be mounted in type 316 stainless steel support brackets, shall have square type 316 stainless steel end plugs, shall be rotatable in 90° increments for extended life and shall be rotated or replaced without removing the belts.

C. For process flexibility a manually adjustable roller shall be provided above the upper belt at the entrance to the wedge section to adjust the angle of convergence of the two belts to provide a means for adjusting the amount of pressure exerted on the sludge before entering the shear/pressure section of the press. Adjustable troughing seals shall be provided under both sides of the lower belt to prevent sludge migration beyond the belt edges and allow the application of mild pressure without process upset.

D. A 14 gauge type 316 stainless steel drain pan shall be provided beneath the wedge section to collect the filtrate and to direct it to the collection sump beneath the press through rigid PVC pipes. Other drain pan materials of construction are not acceptable.

2.9 SHEAR/PRESSURE SECTION

A. Each press shall include a shear/pressure section containing a minimum of eight dewatering drums in a horizontal plane which shall apply compression and shear reversals to the sludge by passing the sludge cake sandwiched between the two tensioned belts alternately over one drum and under the next. Designs that include the pressure roll profile in a vertical plane are not acceptable. The shear/pressure section shall begin with a 30 inch diameter perforated drum which shall be self bailing to provide unimpeded filtrate drainage without rewetting of downstream cake and provide a gradual transition into the shear/pressure section. The remainder of the dewatering drums shall be solid surface drums and shall vary from 20 to 10 inches in diameter to provide the proper combination of dewatering area, applied pressure profile and time under pressure. The shear/pressure section configuration shall provide a minimum belt length in actual contact with the drums of 17 feet and a minimum dewatering area in actual contact with the drums of 129 square feet figured on the basis of one belt. Inactive belt runs between dewatering drums shall be kept to a minimum.

2.10 BELTS

A. Each press shall be provided with two dewatering belts which shall be seamed and shall be fabricated of wear resistant monofilament polyester. The mesh design, porosity and tensile properties shall be selected for optimum dewatering of the specific sludge to be processed and for a minimum life of 2000 hours of continuous failure free operation. Each belt shall be a minimum of 87 inches wide, providing an effective 2.0 meter operating belt width in contact with the sludge.

B. Belt edges shall be heat sealed and bonded for stability. A low profile type 316L stainless steel clipper seam shall be used to join the belt ends. Multiple coats of polyurethane adhesive shall be applied to the belt/clipper seam joint to provide a full and uniform bond at the joint, to reinforce the joint and to provide a smooth transition from belt to seam for proper doctor blade and drainage system element interface.

C. Belts shall be designed for ease of replacement with a minimum of press downtime. Belt replacement shall be such that disassembly of the equipment is not required.

2.11 BELT WASH SYSTEM

A. Each press shall be furnished with a belt wash system consisting of a spray header, a spray containment housing and a washwater collection box for each belt to thoroughly clean both belts after cake discharge. ~~The belt wash system shall be suitable for use with plant effluent water furnished at a line pressure of 60 psig at the belt press locale. A washwater booster pump shall be furnished with each press to provide the required operating pressure to the belt wash system when adequate line pressure is not available.~~ The system demand for each press shall be 80 GPM at 85 psig furnished direct from nonpotable water pumps.

B. Self cleaning spray headers shall be furnished for each belt consisting of a schedule 10 type 316 stainless steel header, a series of replaceable type 317LM stainless steel spray

nozzles providing an overlapping spray pattern on each belt, a replaceable stainless steel nozzle cleaning brush inside the header and an external handwheel operator which shall make the header self cleaning. A full turn of the handwheel shall cause the brush to clean the nozzle orifices and shall allow the flushing water to pass through the header for discharge directly to the collection basin beneath the press through a rigid PVC pipe. Presses without this or similar direct individual nozzle cleaning provisions shall not be acceptable.

C. A 14 gauge type 316 stainless steel enclosure shall surround each wash header both to contain spray mist and to collect and discharge the spent washwater. The wash header enclosures shall include a housing above and below the filter belt to contain all mist and spray water and shall include easily replaceable brush type seals above and below the belt at both the entry and exit of the enclosures to prevent the escape of spray mist. Seal replacement shall be convenient and quick and shall not involve the use of bolted connections. Spent washwater shall be directed to the collection sump under the press through rigid PVC piping. Other enclosure materials of construction shall not be acceptable due to possible cracking or breaking or failure of any applied corrosion resistant coating.

D. The spray headers shall be piped to a common washwater inlet connection on the press. A NEMA 4X solenoid valve and NEMA 4X pressure switch shall be provided in the water inlet manifold both for on off control and to provide an alarm signal in the event of low washwater pressure. Each spray header shall have a 150 psi Victaulic clamp connection to the water inlet manifold to allow for belt spray direction adjustment.

E. A washwater booster pump shall be furnished for each press to raise the system water pressure to the required operating level. The pump shall be a horizontal end suction centrifugal pump in type 316L stainless steel construction with mechanical shaft sealing. The pump shall be driven by a direct coupled 5 HP, 3600 RPM, TEFC motor and shall be furnished with a common steel channel base for the motor and pump and a coupling guard.

2.12 BELT TRACKING SYSTEM

A. Each press shall be furnished with a continuous automatic belt tracking system consisting of a belt edge location sensor, a proportional tracking valve, a steering roller and a hydraulic cylinder for steering roller control for each of the belts along with a common hydraulic control system. Electro-mechanical belt tracking systems and belt tracking systems that are non continuous shall not be permitted. The system shall constantly monitor belt location and through the proportional sensor continuously adjust each belt path as necessary to maintain a central location on the rollers thereby preventing over steering and belt wrinkling and providing longer belt life.

B. A stainless steel sensing arm shall be in continuous contact with each belt edge and its location shall govern the position of a proportional pilot valve which in turn shall affect the position of a hydraulic cylinder which shall be connected to a pivotable belt steering roller. The cylinder shall cause the roller to skew from its transverse position and cause the belt to track centrally on the press rollers. The alignment system shall operate with smooth and slow motions resulting in a minimum of belt travel from side to side. Limit switches in NEMA 4X enclosures shall be furnished on both sides of each belt to sense gross belt misalignment and provide a signal to immediately shut the entire system down and sound an alarm in the event of a tracking system failure of either of the belts.

C. A hydraulic control system shall be provided. For maximum corrosion resistance each hydraulic cylinder shall have Ryertex "G-10" heads, a fiberglass body, a chrome plated rod and stainless steel hardware. Belt tracking and tension controls shall be located on the hydraulic power unit. All hydraulic lines shall be stainless steel tubing, neatly arranged and run along and across the press framing.

D. A hydraulic power unit shall be furnished for each press consisting of a 2 HP, 1800 RPM, TEFC motor, a variable volume pressure compensated pump, a system pressure gauge, a tension control/relieving valve, a tension system pressure gauge, a breather type filler cap, a return filter with bypass, a level sight gauge and a thermometer all mounted on a 5 gallon type 316 stainless steel reservoir. The power unit shall be mounted on the press frame. All system hydraulic piping and tubing shall be factory furnished and installed. A NEMA 4X pressure switch shall be included to sense low system pressure and provide a signal to shut the entire system down and sound an alarm in the event of the loss of system pressure.

2.13 BELT TENSIONING SYSTEM

A. Each press shall be furnished with a belt tensioning system for each of its belts consisting of a tension roller, hydraulic cylinders to apply tension to the belt, a rack and pinion mechanism to synchronize the hydraulic cylinder motions and a hydraulic control system. The tensioning system shall be such that dewatering pressure is directly proportional to belt tension and that adjustments in belt tension shall result in immediate changes in dewatering pressure.

B. A tension roller shall be provided for each belt and it shall be powered by a hydraulic cylinder on each end of the roller. The motion of each cylinder shall be synchronized with its opposite side cylinder. This cylinder synchronization arrangement shall consist of a frame mounted rack and a tension assembly mounted pinion on each side of the press. The pinions, rigidly connected to a cross shaft, shall provide parallel movement of the tension roll ends thereby preventing belt tracking and alignment problems. For maximum corrosion resistance the pinions and racks shall be nylon; the hydraulic cylinders shall be furnished with Ryertex "G-10" heads and fiberglass bodies, chrome plated rods and stainless steel hardware.

C. Belt tension shall be controlled at the hydraulic power unit by means of a tension control valve as previously described. A common control shall be furnished such that both belts are tensioned equally preventing operational difficulties due to unequal belt tensions. Once set, the dewatering pressure shall be maintained automatically regardless of process changes. The belt tension system shall be designed to provide belt tensions varying from 0 to 50 pounds per linear inch throughout the shear/pressure section of the press. A directional control valve shall also be provided on the press for retraction of the tension cylinders when required.

2.14 BELT DRIVE SYSTEM

A. Each press shall be provided with a belt drive system consisting of a rubber covered belt drive roll for each belt, a common AC drive motor for variable frequency control for the two belts and reduction gearing. Hydraulic belt drive motors shall not be permitted.

B. The belt drive motor shall be a 3 horsepower, 1800 RPM, TEFC, severe duty AC motor. The motor shall be C face mounted to a hollow shaft, torque arm helical bevel reducer, AGMA Class II rated, which shall be shaft mounted on the drive roll. The belt speed range shall be adjustable over a range of 2 to 20 feet per minute. For positive belt traction the belt drive roll shall be rubber covered. The drive roll body shall be a minimum of 9-1/2 inches in diameter with a 1/4 inch thick minimum rubber covering on top of that.

C. Each drive motor shall contain a thermal sensor imbedded in the windings which shall provide a signal for alarm and system shutdown if excessive motor temperature develops. Loss of motion detectors shall be provided on the press to sense belt drive failure or a broken belt condition and provide signals for system shutdown and sound an alarm in the event that either of these conditions occur. The drive motor shall be located above the discharge rolls and away from high moisture areas. A variable frequency controller shall be furnished in the belt press electrical control panel to provide power and speed control for the belt drive motor.

2.15 DISCHARGE BLADES

A. Each press shall contain two discharge blades to assist in removing dewatered sludge cake from the belts at the discharge end of the press. The lower blade shall also direct the sludge cake to the receiving device (conveyor, container, chute, etc.). The discharge blades shall be replaceable and shall be made from high density polyethylene and each shall have two beveled edges for doubling the life of the blade. The blades shall be mounted on hot dipped galvanized, stiffened, pivotable support members with arms at each end for mounting adjustable counterweights for maintaining the proper pressure between the blades and the discharge rolls thereby reducing belt and closure wear. Lockable handles shall be provided so that the blades can be easily positioned away from the belts for cleaning.

2.16 DRUMS AND ROLLERS

A. Each press shall be furnished with the necessary drums and rollers to provide gravity dewatering, shear/pressure dewatering, belt drive, belt tension, belt tracking and general belt support. A minimum of one perforated drum shall be furnished, all others shall be solid surface drums and rollers.

B. Type 316 stainless steel shall be used for the perforated drum body and its end plates. The body shall be 3/16 inch thick and end plates 1/2 inch thick. Perforated drum shafts shall be type 17-4 PH stainless steel. All other drums and rollers shall be constructed of ASTM A 53 Grade B or ASTM A 106 Grade B carbon steel with wall thicknesses of 1/2 inch minimum. Larger diameter major load carrying drums shall have welded double end plate supported stub shaft construction on each end with 5 inch diameter minimum type 17-4 PH stainless steel shaft stock for the drive rolls and 5 inch diameter minimum AISI 4140 heat treated steel shaft stock for the dewatering drums. Smaller diameter nominal load carrying rollers shall have either welded double end plate supported stub shaft construction with AISI 1045 steel shafts or deep bored shrink fit and welded solid journal AISI 1045 steel stub shaft construction on each end. Shaft diameters through the support bearings shall be 2-13/16 inches diameter minimum for pressure drums and 2-11/16 inches diameter minimum for rollers.

C. Belt drive rollers shall have a 1/4 inch thick 80 durometer vulcanized rubber covering for gripping the belts and for corrosion protection and shall have type 316 stainless steel end plates. All other solid surface drums and rollers shall have a 30 mil thick black fusion bonded applied nylon coating for corrosion protection which shall cover the roll body, ends and shafts up to the point of insertion into the bearings.

D. All drums and rollers shall be designed to withstand the stress reversals inherent in rotating elements and shall be designed with a minimum factor of safety of 2 over fatigue failure of the material for shafts and 5 over fatigue failure for drum and roller bodies. Drum and roller design shall be based on operating at rated belt speed, a belt tension of 50 pounds per linear inch on each belt and rated drive horsepower. Shaft stress concentration shall be minimized by the use of generous, well polished radii. Deflection of all drums and rollers whether major load carrying or not, shall be limited to 0.040 inch over the full width of the drum or roll body when operating at a belt tension of 50 pounds per linear inch per belt at rated drive horsepower. Calculations shall be furnished substantiating shaft sizing, drum and roll construction design, fatigue failure safety factors and drum and roller deflection.

2.17 BEARINGS

A. The shafts of all drums and rollers on each press shall contain heavy duty self aligning double row spherical roller bearings in split case four bolt base cast iron pillow block housings. Self alignment shall occur within the housing. The housings shall permit the changing of bearings without disturbing the factory set alignment of the rollers.

B. Bearings shall be arranged for tapered adapter mounting to the drum and roller shafts. Bearings shall contain Triple Chek contact seals and shaft mounted splashguards on the shaft side to provide adequate sealing from moisture and grime. Non-shaft sides of bearing housings shall be solid. Bearing housings shall have a factory applied 12 mil thick black fusion bonded applied nylon coating for added corrosion resistance. All bearing hardware shall be stainless steel. All roller bearings shall be main frame mounted and shall be greaseable while the press is in operation.

C. All roller bearings shall have an L-10 bearing life in excess of 800,000 hours with belts tensioned at 50 pounds per linear inch and with belts traveling at rated speed. Calculations shall be furnished demonstrating compliance with these provisions.

2.18 MISCELLANEOUS

A. Each press shall be provided with two yellow safety trip cords at each side of the press, one at a lower elevation and one at a higher elevation. Each cord shall be connected to a NEMA 4X lever operated emergency stop switch which shall immediately stop the belt drive and shut down the entire system upon actuation of the switch. These switches shall be independent of the gross belt misalignment switches and shall require resetting at the press before the equipment can be restarted.

B. Each press shall be complete with all intra unit power and control wiring terminating in a single press mounted NEMA 4X stainless steel junction box. All wiring shall be run in PVC coated rigid conduit for added corrosion resistance.

C. Each press shall be complete with all intra unit piping including all filtrate and washwater drain lines directed to the collection basin beneath the press, all washwater supply piping terminating at a single washwater inlet connection and all hydraulic piping and tubing.

D. For maximum corrosion resistance all miscellaneous parts such as brackets, spacers, etc. shall be fabricated from type 304 stainless steel, hot dipped galvanized steel or plastic and all guards shall be fabricated from type 304 stainless steel.

2.19 ELECTRICAL CONTROL PANEL

A. An electrical control panel shall be furnished with each belt filter press to control the belt press functions and those of the related auxiliary equipment specified herein. The panel shall be preassembled and prewired and shall include all controls necessary for semi automatic system operation with provisions also for manual control of individual items when desired. The panel shall be suitably wired for connection to a 480 volt, 3 phase, 60 Hertz power source.

B. The enclosure shall be fabricated from 14 gauge type 304 stainless steel, shall be floorstand mounted and constructed to NEMA 4X standards. Instruments and control devices mounted on the enclosure door shall be rated for or installed in such a manner as to maintain the NEMA 4X integrity. Nameplates shall be engraved laminated phenolic with black background and white letters to identify each component mounted on the panel face. Letter height shall not be less than 3/16 inch. Additionally, the complete panel, as an assembly, shall be built in accordance with UL 508A and shall have a UL serialized label.

C. Wiring shall be accomplished in a neat workmanlike manner and run in PVC wiring duct where practical. Where not practical it shall be supported and tied in position with nylon cable ties. All wiring shall be identified with a number code and all wiring for external connection shall be brought to a numbered terminal strip. Wiring shall comply with the applicable requirements of the latest edition of the National Electrical Code. Interconnecting wiring between this panel and the press and other related equipment shall be the responsibility of the contractor.

D. The enclosure shall house a flange mounted dead front main disconnect, all motor starters, variable frequency controls, a programmable logic controller, interlocks, alarms, indicating lights and operator controls required for the operation of the belt filter press and auxiliary equipment described in this specification section. Each AC motor, contactor and wiring shall be protected by a properly sized motor starter protector and overload relays. Variable frequency drives shall be protected by properly sized fuses. Indicating lights and operator controls only as required shall be included in this panel for other system auxiliary equipment items described in other sections of the specifications. Starters, variable speed drives, controllers, etc. for such other items shall be furnished by others and shall be located elsewhere. The following control interfaces shall be provided for this auxiliary equipment: dry contacts rated at 10A 125V for start/stop control, PLC inputs to accept dry contact 'on' status and motor overload/fail signals, 4 20 madc signals or high/low speed switch contact closures as required for speed command signals. System interlocking and logic shall be provided by an industrial grade programmable logic controller meeting the following minimum requirements:
   1. Total input/output: As required, expandable I/O.
   2. Memory: EEPROM or FLASH.
   3. Acceptable Allen Bradley Micrologix Series.

E. Components shall be selected and the enclosure sized to limit the enclosure internal heat rise to 10°C while operating in a 40°C ambient. Calculations or method of determining compliance shall be submitted to the Engineer with the initial drawing submittal. A minimum of 20% spare terminal blocks shall be provided. The control panel shall be completely tested under simulated field conditions by the press manufacturer prior to shipment. The Operation and Maintenance Manual shall contain complete as built drawings including schematics, physical layout and terminal connections. It shall also contain tabulated maintenance procedures.

F. The control panel face shall include the following controls and indicators. All start/stop controls shall be of the illuminated pull to start push to stop type with status lights indicating steady on for run and flashing for fail or overtemperature.
1. Main disconnect switch.
2. System automatic cycle start/stop control with on status light.
3. Hydraulic power unit start/stop control with on status/motor fail light.
4. Belt washwater booster pump start/stop control with on status/motor fail light and/or washwater solenoid valve to open/close appropriately.
5. Belt drive start/stop control with on status/motor overtemperature light, speed control potentiometer and speed indicator.
6. Sludge feed pump start/stop control with on status/motor fail light, speed control and speed indicator as required.
7. Polymer feed pump start/stop control with on status/motor fail light, speed control and speed indicator as required.
8. Sludge cake conveyor start/stop control with on status/motor fail light if required.
9. Start/stop controls with on status/motor fail lights for any other auxiliary equipment items if required.
10. Belt prewet and post wash cycle indicator lights.
11. Motor run/jog selector switch.
12. Emergency stop pushbutton with alarm/emergency trip light.
13. Gross belt misalignment alarm light.
14. Low system hydraulic pressure alarm light.
15. Low system washwater pressure alarm light.
16. Belt drive fail/broken belt alarm light.
17. Alarm lights as required for other specified alarm conditions.
18. Audible alarm horn.
19. Alarm acknowledge pushbutton.
20. Alarm reset/lamp test pushbutton.

G. Semi automatic operation of the entire system shall be controlled by a single start/stop cycle control. This control along with status and alarm contacts shall provide inputs to the programmable controller (PLC). The controller shall continuously scan the inputs and according to a logic program stored in its memory shall develop the appropriate run, stop, status or alarm signals for devices connected to its output. The PLC shall cause specific functions to be interlocked, timed, started or stopped as required during the start up, run and shutdown modes of operation. These modes of operation may be operator initiated or caused by one of the inputs. Essentially, the PLC shall initiate and monitor each step of the cycle, check that all interlocks are satisfied and drive start ups are confirmed before proceeding to the next step, provide for prewetting the belts before sludge is introduced to the press on start up and provide for the proper timed intervals for complete discharge of sludge cake and thorough belt washdown during the shutdown cycle. The control system shall allow unattended operation in the semi automatic mode. In the manual mode of

operation, the system shall be started and stopped by the actuation of each individual component control.

H. During operation in either mode, any of the following alarm conditions shall activate the alarm horn and respective alarm light or motor status indicator light causing the entire system to shut down either instantaneously or in the normal programmed sequence as appropriate: gross belt misalignment, low system hydraulic pressure, low washwater pressure, emergency stop at the press, belt drive fail, broken belt, belt drive motor overheated, auxiliary DC motors overheated, auxiliary AC motors overloaded or emergency stop at the control panel. Alarm annunciation shall follow ISA sequence AM. The motor status light shall serve as the alarm light, flashing for motor fault conditions or, in the case of remotely located starters, for overload trip or power off. If the operator can correct an alarm condition during programmed shutdown, the PLC shall allow continuation of full operation by reactivation of the cycle control.

I. For either semi automatic system operation where the programmable logic controller assumes control or manual control where an operator assumes control, the sequence of operation shall be as follows:
   1. Start up Sequence:
      a. Start the hydraulic power unit.
      b. Start the belt washwater booster pump and/or open the washwater solenoid valve.
      c. Start the belt drive.
      d. Start the conveyor.
      e. After allowing the belts to become wet, start the sludge feed pump and the polymer feed pump.
      f. Start any other auxiliary equipment item at the appropriate time during the sequence.
      g. Adjust belt speed and/or sludge and polymer feed rates if appropriate.
   2. Shutdown Sequence:
      a. Stop the sludge and polymer pumps.
      b. After allowing sludge to discharge completely from the belts and allowing for complete belt washdown, stop the washwater booster pump and/or close the solenoid valve.
      c. Stop the belt drive.
      d. Stop the hydraulic power unit.
      e. Stop the conveyor.
      f. Stop any other auxiliary equipment at the appropriate time during the sequence.

2.20 SPARE PARTS

A. The following spare parts shall be furnished for each belt filter press:
   1. Four complete set of dewatering belts (8 total)
   2. Four complete set of dewatering blades (8 total)
   3. Two complete set of containment seals (4 total)
   4. Two complete set of washwater box seals (4 total)
   5. Four press roller bearing of each different size used (8 total)
   6. Three fuses of each size used (6 total)
   7. One oil filter for the hydraulic power unit (2 total)

2.21 SURFACE PROTECTION

A. Belt filter press materials of construction (stainless steel, fiberglass, plastic, etc.) and protective coatings and coverings (hot dipped galvanizing, fusion bonded nylon, rubber, etc.) shall be completely corrosion resistant such that shop or field applied paint coating is not required.

B. Miscellaneous parts such as brackets, spacers, guards, etc. shall be fabricated from type 304 stainless steel, galvanized steel or plastic and shall not require shop or field applied paint coating.

C. Items such as motors, gear reducers, pumps, hydraulic power units and the like shall receive standard manufacturer's finish coatings.

2.22 WARRANTY

A. The equipment shall be guaranteed against defects in material and workmanship under normal use and service for a period of one year after start up not to exceed eighteen months after shipment during which time repairs or replacements shall be made without charge. Further, an additional four year warranty (total of five years) shall be provided for the belt press frame and its coating, the belt press rollers and their coatings and the belt press roll bearings.

2.23 MANUFACTURER'S SUPERVISORY SERVICES

A. The belt press manufacturer shall furnish the services of a competent and experienced person for a period of ten days to be covered in two trips to job site to check the installation, supervise the start up, supervise the performance testing and provide operator instruction for the equipment furnished. Additional service, if requested, shall be available at the manufacturer's portal to portal per diem rate in effect at the time of service delivery, plus all travel and living expenses.

2.24 PERFORMANCE TESTING

A. The equipment manufacturer shall conduct a performance test to demonstrate that the installed equipment can meet the specified performance requirements. One press shall be selected for testing. The test shall occur as soon as possible after successful equipment start up and process and system stabilization has been accomplished.

B. The test period shall consist of two five hour steady state test runs on two consecutive days with sludge feed, sludge cake and effluent (combined filtrate and washwater) samples taken at the start of each run and every hour thereafter resulting in a total of twelve samples of each type. The sludge feed and effluent samples shall be analyzed for total suspended solids content; the cake samples shall be analyzed for total solids content. The resulting solids contents shall be averaged and the average value of each type shall be used to judge satisfactory performance. Polymer solution strength and flow rate shall be recorded. Sludge feed rate shall be recorded.

C. The press manufacturer's representative shall operate the equipment during the test. The owner shall furnish personnel to assist in the operation and to take samples. The owner shall also furnish sludge, water, polymer, utilities, sludge cake disposal, routine test

equipment and laboratory services for analyzing the samples. The belt press manufacturer shall recommend the most suitable polymer which shall be furnished by the owner. The contractor shall provide any special instrumentation for measuring sludge feed or polymer feed rates.

D. The equipment shall have passed the performance test if the specified cake solids, solids capture and polymer use requirements are met with the press operating at the specified hydraulic and solids loading rates.

E. Should the installed equipment fail to meet the specified performance requirements, the manufacturer shall within 30 days make changes in the equipment or method of operation as necessary and the equipment shall be retested. If after a second 30 day period, the equipment still does not meet the performance criteria, the equipment shall have failed the performance test and the owner shall require its removal and replacement with the specified equipment at no additional cost to the owner.

PART 3 EXECUTION

3.1 GENERAL

A. The General Contractor shall assume full responsibility for coordination of the entire project, including verification of all structures, piping, coating systems and equipment components are compatible. The general contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal or manufacturer's shop and installation drawings, test results or other data as specified herein. Installation of equipment shall be in full conformance with the manufacturer shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between manufacturer's instructions and the contract documents, the contractor shall follow the Engineer's decision at no additional cost to the Owner.

C. Installation of equipment shall be in full conformance with the manufacturer's shop drawings and requirements.

3.2 WORKMANSHIP

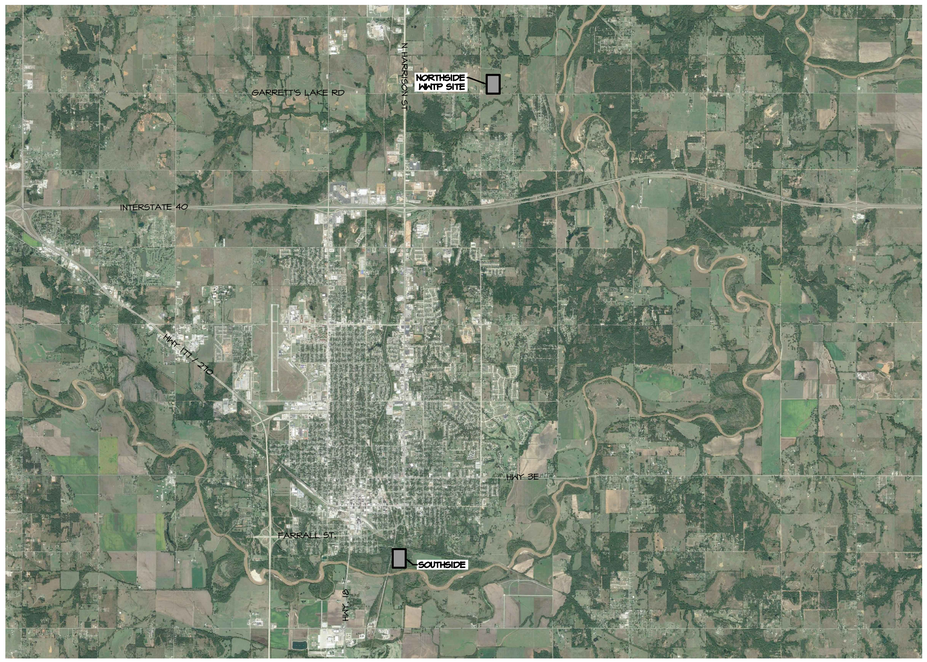
A. Handle carefully and protect the equipment and appurtenances to avoid damage.

B. The equipment shall be safely secured to the wall and floor in accordance with the Engineer's design drawings. All plumbing and electrical shall be in accordance with state and federal codes. All piping and tubing shall be sealed for leaks.

C. Any evidence of improper installation shall be corrected by the Contractor. Care during storage, installation and startup shall be in strict accordance with manufacturer's recommendations.

D. MANUFACTURER'S SERVICES

E. The Contractor shall require the manufacturer to furnish the services of a qualified field Engineer to perform the following functions in the designed periods of time. These services are to be performed at the jobsite. A minimum of two (2) visits to the job site shall be required.



1. Check-out of installation, start-up of equipment and initial operator instruction. This service shall take place after all mechanical equipment associated with the control system is installed and mechanically operable. One (1) 8-hour man day, minimum.
2. After equipment is fully operational, and before Owner will assume responsibility for the operation of the equipment, the equipment manufacturer's operation specialists shall instruct the Owner's operating personnel in the care, maintenance and proper operation of the equipment.
3. All costs for the above manufacturer functions including travel, lodging, meals, and incidentals shall be considered to have been included in the contractor's lump sum bid price.
4. Prior to plant startup, all equipment described herein shall be inspected for proper alignment, quiet operation, proper connections, and satisfactory performance by means of a functional test.
5. During plant start-up all equipment described herein shall be inspected for proper connections and satisfactory performance by means of a function test.
6. The equipment system and associated accessories shall be field tested to verify adequate performance.
7. Units apparently failing to meet the Specifications must be corrected to provide proper service. Should the problem persist due to a flaw in material and/or in the design of the equipment, new equipment must be provided by the Contractor to meet the specifications.

F. Operation and Maintenance

1. The equipment manufacturer shall be responsible for supplying written instruction, which shall be sufficiently comprehensive to enable the operator to operate and maintain and all equipment supplied by the manufacturer. Instructions shall assume that the operator is familiar with related equipment and controls, but that he has not previously operated and/or maintained the exact equipment supplied.
2. The instruction shall be prepared as a system manual applicable solely to the equipment supplied by the manufacturer to these specifications, and shall include those devices and equipment supplied by him.
3. Operation and maintenance instruction shall be specific to the equipment supplied in accordance with these specifications.
4. Manufacturer’s Costs:
   a. All costs for the above manufacturer functions including travel, lodging, meals, and incidental shall be considered to have been included in the Contractor's lump sum bid price.

LEGAL DESCRIPTION (DEED)

Beginning at the Southwest Corner of the Southwest Quarter of Section Twenty-one (21), Township Eleven (11) North, Range Four (4) East of the Indian Meridian, Pottawatomie County, Oklahoma;

thence East along the South line of said SW/4 a distance of 328.17 feet;

thence North and parallel to the West line of said SW/4 a distance of 33 feet to the true point of beginning;

thence East parallel to and 33 feet North of the South line of said SW/4 a distance of 991.83 feet;

thence North and parallel to the West line of said SW/4 a distance of 1287 feet;

thence West and parallel to the South line of said SW/4 a distance of 660 feet;

thence South and parallel to the West line of said SW/4 a distance of 600 feet;

thence East and parallel to the South line of said SW/4 a distance of 130 feet;

thence South and parallel to the West line of said SW/4 a distance of 210 feet;

thence West and parallel to the South line of said SW/4 a distance of 210 feet;

thence North and parallel to the West line of said SW/4 a distance of 150 feet;

thence West and parallel to the South line of said SW/4 a distance of 547 feet to a point 33 feet East of the West line of said SW/4;

thence South parallel to and 33 feet East of the West line of said SW/4 a distance of 331.83 feet to a point, said point being 328.17 feet North of and 33 feet East of the Southwest Corner of the Southwest Quarter;

thence East and parallel to the South line of said SW/4 a distance of 295.17 feet;

thence South and parallel to the West line of said SW/4 a distance of 295.17 feet to the true point of beginning; said tract containing 25.62 acres, more or less.

SURVEYOR'S LEGAL DESCRIPTION (FIELD)

SURVEYOR'S LEGAL DESCRIPTION
(Based on Field Survey)

A parcel of land situated in the Southwest Quarter of Section 21, Township 11 North, Range 4 East of the Indian Meridian, Pottawatomie County, Oklahoma, and being more particularly described by metes and bounds as follows:

Commencing at the Southwest Corner of said Southwest Quarter;

Thence North 89° 38' 25" East, along the south line of said Southwest Quarter, a distance of 328.17 feet;

Thence North 00° 21' 35" West, perpendicular to the south line of said Southwest Quarter, a distance of 33.00 feet to a point on the north statutory right-of-way line of Garrett's Lake Road and the POINT OF BEGINNING (a #4 Bar with CA6975 Cap set for corner);

Thence North 89° 38' 25" East, parallel with the south line of said Southwest Quarter and along said north statutory right-of-way line, a distance of 991.74 feet (to a #4 Bar with CA6975 Cap set for corner);

Thence North 00° 14' 53" East a distance of 1286.69 feet (to a bald #4 Bar found for corner);

Thence South 89° 41' 28" West a distance of 659.54 feet (to a bald #5 Bar found for corner);

Thence South 00° 17' 50" West a distance of 600.49 feet (to a bald #5 Bar found for corner);

Thence North 89° 38' 25" East a distance of 130.24 feet (to a #4 Bar with CA6975 Cap set for corner);

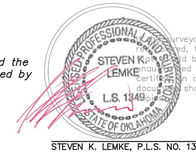
Thence South 00° 24' 02" West a distance of 209.70 feet (to a #4 Bar with CA6975 Cap set for corner);

Thence South 89° 38' 25" West a distance of 209.76 feet (to a bald #5 Bar found for corner);

Thence North 00° 24' 02" East a distance of 149.89 feet (to a #4 Bar with CA6975 Cap set for corner);

Thence South 89° 38' 25" West a distance of 545.50 feet to a point on the east statutory right-of-way line of North Bryan Street (a #4 Bar with CA6975 Cap set for corner);

Thence South 00° 24' 02" West, parallel with the west line of said Southwest Quarter and along said east statutory right-of-way line, a distance of 331.83 feet (to a #4 Bar with CA6975 Cap set for corner);



Thence North 89° 38' 25" East a distance of 295.17 feet (to a #4 Bar with CA6975 Cap set for corner);

Thence South 00° 24' 02" West a distance of 295.17 feet to the POINT OF BEGINNING and containing 25.6065 acres more or less and subject to easements and/or rights-of-way that may or may not be of record.

Basis of Bearings: Grid North of the Oklahoma State Plane Coordinate System – NAD83(86) – South Zone

Note: This Surveyor's Legal Description describes a parcel identical to that described in Warranty Deed recorded at Book 691, Page 8, Pottawatomie County Clerk Register of Deeds.

CERTIFICATION:
This is to certify that this PLAT OF SURVEY and the field survey that it is based upon were conducted by me and by others operating under my direct supervision.

STEVEN K. LEMKE, P.L.S. NO. 1349 DATED: February 24, 2021

Last Site Visit: April 20, 2020

NOTE:
Completion and Delivery of this PLAT OF SURVEY was delayed due to cyber attack (ransomware virus) of Surveyor's electronic file system and the subsequent recovery and replacement of project files by the Surveyor.

GENERAL

1. ALL NOTES LISTED ON THIS SHEET APPLY TO ALL SHEETS OF THE DRAWINGS AS IF THEY WERE WRITTEN ON EACH SHEET.
2. NOTIFY OWNER 48 HOURS PRIOR TO CONSTRUCTION.
3. VERIFY ALL EXISTING CONDITIONS AND OBSTRUCTIONS INCLUDING LOCATION AND DIMENSIONS BEFORE STARTING WORK AND SHALL NOTIFY THE ENGINEER OF ANY DISCREPANCIES.
4. PRIOR TO INSTALLATION OF RELEVANT FACILITIES CONTRACTOR SHALL, AT HIS OWN EXPENSE, UNCOVER AND OTHERWISE DETERMINE THE DEPTH OF UTILITIES WHICH, IN HIS OPINION, COULD INTERFERE WITH CONSTRUCTION.
5. ALL DIMENSIONS SHOWN WITH ± SHALL BE CONFIRMED BY THE CONTRACTOR ACCORDING TO ACTUAL FIELD CONDITIONS OR EQUIPMENT/STRUCTURE REQUIREMENTS.
6. ALL MISCELLANEOUS REMOVAL ITEMS REQUIRED FOR CONSTRUCTION SHALL BE FIELD LOCATED BY THE CONTRACTOR PRIOR TO BIDDING. THESE ITEMS WILL NOT BE MEASURED FOR PAYMENT AND SHALL BE INCLUDED IN THE PRICE BID FOR ASSOCIATED ITEMS OF WORK.
7. TRAFFIC CONTROL DEVICES SHALL BE FURNISHED AND MAINTAINED BY THE CONTRACTOR THROUGHOUT THIS PROJECT IN ACCORDANCE WITH THE LATEST VERSION OF THE MANUAL OF UNIFORM TRAFFIC CONTROL DEVICES AND/OR AS REQUIRED BY THE DEPARTMENT OF TRANSPORTATION OR COUNTY PERMITS FOR CONSTRUCTION IN RIGHT-OF-WAY.
8. SUBMIT AN EROSION CONTROL PLAN (SWPPP) PRIOR TO CONSTRUCTION AND SHALL MAINTAIN SWPPP THROUGHOUT DURATION OF CONSTRUCTION IN ACCORDANCE WITH SPECIFICATIONS.
9. EXISTING FACILITY AND UTILITY INFORMATION SHOWN ON THE DRAWINGS WAS OBTAINED FROM AVAILABLE RECORDS, LOCATES, AND AVAILABLE FILES. NEITHER THE OWNER NOR THE ENGINEER ASSUMES ANY RESPONSIBILITY FOR FACILITIES AND UTILITIES NOT SHOWN OR NOT IN THE LOCATION SHOWN. THE CONTRACTOR SHALL FIELD VERIFY ALL LOCATIONS, SIZES, MATERIALS, TYPES, AND ELEVATIONS SHOWN AROUND OR NEAR AREAS OF CONSTRUCTION PRIOR TO THE START OF CONSTRUCTION.
10. PERFORM ALL WORK WITHIN DESIGNATED EASEMENTS. CONTRACTOR SHALL NOT ENCROACH OR TRESPASS INTO PRIVATE PROPERTY WITHOUT WRITTEN APPROVAL FROM THE PROPERTY OWNER.
11. MAINTAIN LOCAL AND THROUGH TRAFFIC FOR ALL STREETS AT ALL TIMES WITHOUT CLOSURES OR RESTRICTIONS EXCEPT AS PART OF THE TRAFFIC CONTROL PLAN.
12. MAINTAIN REASONABLE ACCESS TO ALL PROPERTIES AT ALL TIMES. DO NOT RESTRICT DRIVEWAY ACCESS WITHOUT OWNER'S APPROVAL. RESTORE DRIVEWAY ACCESS AT THE END OF EACH DAY. PROVIDE TEMPORARY MEASURES AS NEEDED (SUCH AS GRAVEL) TO MAINTAIN DRIVEWAY ACCESS.
13. KEEP ACCURATE RECORDS OF ALL CONSTRUCTION THAT DEVIATES FROM THE DRAWINGS. THE CONTRACTOR SHALL FURNISH TO THE ENGINEER ACCURATE "AS-BUILT" RED LINE DRAWINGS FOLLOWING COMPLETION OF CONSTRUCTION.
14. TAKE SPECIAL PRECAUTIONS IN THE VICINITY OF ANY OVERHEAD AND UNDERGROUND ELECTRIC LINES. CONTRACTOR SHALL ABIDE BY THE MOST RECENT NATIONAL ELECTRIC CODE FOR WORKING AROUND OVERHEAD ELECTRIC LINES AS WELL AS OTHER LOCAL, STATE OR FEDERALS LAWS / REQUIREMENTS.
15. CONFORM TO ALL APPLICABLE FEDERAL, STATE AND LOCAL LAWS GOVERNING EXCAVATION. TRENCH SIDE SLOPES SHALL MEET OSHA REQUIREMENTS THAT ARE IN EFFECT AT THE TIME OF CONSTRUCTION. CONTRACTOR SHALL SUBMIT A TRENCH SAFETY PLAN PRIOR TO CONSTRUCTION.
16. THIS PROJECT IS SUBJECT TO AMERICAN IRON AND STEEL (AIS) REQUIREMENTS. ALL IRON AND STEEL PRODUCTS FOR CONSTRUCTION, ALTERATION, MAINTENANCE, OR REPAIRS INCORPORATED MUST BE PRODUCED IN THE UNITED STATES.
17. PROVIDE DUST CONTROL AT ALL TIMES DURING CONSTRUCTION.
18. ANY WORK PERFORMED WITHOUT THE KNOWLEDGE OF THE ENGINEER, INSPECTOR OR OWNER'S REPRESENTATIVE IS SUBJECT TO REMOVAL AND REPLACEMENT AT THE CONTRACTOR'S EXPENSE.

EARTHWORK

1. ALL COMPACTED SUBGRADE AND BASE NOT ACCESSIBLE TO MECHANICAL COMPACTION EQUIPMENT SHALL BE HAND COMPACTED USING WHACKER PACKERS.
2. SUBGRADE PREPARATION FOR ALL STRUCTURES AND BUILDINGS ON DRAWINGS SHALL BE AS FOLLOWS: OVER-EXCAVATE 30 INCHES BELOW BASE OF CONCRETE, SCARIFY AND COMPACT TOP 12", COMPACT TO 95% STANDARD PROCTOR DENSITY, INSTALL NON-WOVEN NEEDLE PUNCHED GEOTEXTILE FABRIC, INSTALL 30 INCHES OF CRUSHER RUN AGGREGATE BASE IN 10" LIFTS, COMPACT TO 95% MODIFIED PROCTOR DENSITY. BASE OF CONCRETE SHALL BE CONSIDERED THE BOTTOM OF SLAB AND NOT THE BASE OF FOOTINGS/STEM WALLS. OVER EXCAVATION MAY BE DELETED WHERE ROCK IS PRESENT. #57 ROCK SHALL BE SUBSTITUTED FOR AGG BASE WHERE GROUNDWATER IS PRESENT. ALL FILL MATERIAL REQUIRED TO ACHIEVE FINAL GRADE BELOW THE 30" ROCK LAYER SHALL BE CONSTRUCTED WITH ONSITE OR IMPORTED FILL MATERIAL COMPACTED TO 95% STANDARD PROCTOR DENSITY.
3. ELEVATIONS GIVEN ARE FINISHED GRADE UNLESS OTHERWISE NOTED.
4. NO FIRES WILL BE ALLOWED UNLESS OTHERWISE NOTED. TREES AND BRUSH SHALL BE REMOVED AND DISPOSED OF OFF SITE.
5. NO BLASTING WILL BE ALLOWED.
6. ALL SURFACE DRAINAGE IMPACTED SHALL BE RESTORED TO AS GOOD OR BETTER CONDITION.
7. ALL DISTURBED AREAS SHALL BE LEFT FREE OF RUTS AND TRACKS AND SHALL BE FULLY GRADED TO DRAIN.

GRASSING

1. ANY AND ALL DISTURBED AREAS OUTSIDE OF PLANT FENCING SHALL BE TOPSOILED, HYDROMULCHED, AND WATERED UNTIL ESTABLISHED. ANY AND ALL DISTURBED AREAS INSIDE PLANT FENCING SHALL BE SOLID SLAB SODDED PER SPECIFICATIONS & WATERED UNTIL ESTABLISHED.
2. FOR PIPELINE CONSTRUCTION EXTERNAL TO THE TREATMENT PLANT, ANY AND ALL DISTURBED AREAS SHALL BE TOPSOILED, HYDROMULCHED, AND FERTILIZED, WITH THE EXCEPTION OF RESIDENTIAL YARDS WHICH SHALL RECEIVE SOLID SLAB SOD IN LIEU OF HYDROMULCHING PER SPECIFICATIONS. THIS WORK WILL NOT BE MEASURED FOR PAYMENT. COST SHALL BE INCLUDED IN THE PRICE BID FOR ASSOCIATED ITEMS OF WORK.

DUCTILE IRON PIPE & FITTINGS

1. ALL BURIED DUCTILE IRON PIPE AND FITTINGS SHALL BE PROTECTED IN ACCORDANCE WITH ANSI/AWWA C105/A21.5 "POLYETHYLENE ENCASEMENT FOR GRAY AND DUCTILE IRON PIPE FOR WATER AND OTHER LIQUIDS." THIS ITEM SHALL NOT BE MEASURED FOR PAYMENT AND SHALL BE INCLUDED IN THE PRICE BID FOR ASSOCIATED ITEMS OF WORK.
2. ALL DUCTILE IRON AIR PIPING SHALL BE UNLINED WITH EPDM GASKETS RATED FOR COMPRESSED AIR USAGE (PRESSURE & TEMPERATURE.)
3. ALL DUCTILE IRON PIPING SHALL BE RESTRAINED JOINT.
4. ALL DUCTILE IRON PIPE CONNECTIONS TO P.V.C. SHALL BE MADE WITH A BOLTED CAST TRANSITION COUPLING.
5. ALL EXPOSED FITTINGS SHALL BE FLANGED FITTINGS W/ XYLAN COATED BOLTS AND THICKNESS.
6. ALL MECHANICAL JOINT, FLANGE & MISC. FITTINGS TO HAVE XYLAN COATED BOLTS, NUTS & WASHERS.
7. ALL BURIED FITTINGS SHALL BE D.I. MECHANICAL JOINT (M.J) RESTRAINED (MEGALUG.)
8. WALL PIPES SHALL BE USED WHEREVER PIPING PASSES FROM A STRUCTURE TO EARTHEN BACKFILL.
9. PROVIDE 1/4" ANTI-SEEPAGE RINGS A MINIMUM OF 2" WIDE WELDED TO ALL PIPES PIERCING WATER HOLDING TANKS TO PREVENT SEEPAGE OF WATER BETWEEN PIPE AND CONCRETE. WALL PIPES MAY BE USED IN LIEU OF WELDED RINGS.
10. ALL DUCTILE IRON PIPING LARGER THAN 10" DIAMETER SHALL HAVE CONCRETE SUPPORTS UNLESS OTHERWISE DETAILED. SMALLER PIPING MAY HAVE METAL STAND TYPE SUPPORTS.

CONCRETE

1. CONSTRUCTION JOINTS TO FACILITATE CONSTRUCTION SHALL BE LOCATED AND DETAILED ON THE SHOP DRAWINGS FOR REVIEW. UNLESS INDICATED OTHERWISE, ALL CONSTRUCTION JOINTS SHALL BE KEYED. HORIZONTAL CONSTRUCTION JOINTS SHALL NOT BE PERMITTED IN WALLS AND BEAMS, UNLESS SHOWN ON THE DRAWINGS OR APPROVED BY THE ENGINEER.
2. ALL EXPOSED CORNERS OF CONCRETE STRUCTURES REGARDLESS OF LOCATION SHALL HAVE A 3/4 INCH MINIMUM CHAMFER.
3. ALL EXPOSED EXTERIOR CONCRETE SHALL BE COATED WITH THEROSEAL OR TNEMEC ENVIROCRETE (8ML THICKNESS). SURFACE PREPARATION AND COATING TO BE PER MANUFACTURER'S REQUIREMENTS.
4. ALL GROUTED AREAS OVER 8" THICK SHALL BE REINFORCED WITH WELDED WIRE MESH, 6x6-W2.0xW2.0 MATTS AT 8'-0" CTRS MAX.
5. ANCHOR BOLTS NOT SPECIFIED BY ENGINEER SHALL BE DESIGNED AND STAMPED BY A REGISTERED PROFESSIONAL ENGINEER, RETAINED BY THE CONTRACTOR IN ACCORDANCE WITH APPLICABLE PROJECT AND CODE REQUIREMENTS. SUBMIT AS A SHOP DRAWING FOR REVIEW AND APPROVAL BY THE ENGINEER. COORDINATE LOCATION, SIZE AND EMBEDMENT PRIOR TO CASTING CONCRETE.
6. EXPANSION JOINTS SHALL BE USED WHERE EXTERIOR OF ALL EXISTING AND PROPOSED STRUCTURES AND BUILDINGS ABUT CONCRETE PAVING WHETHER SHOWN ON THE DRAWINGS OR NOT.
7. NO FLY ASH SHALL BE PERMITTED IN CONCRETE MIX DESIGN.
8. TREMIES REQUIRED ON ALL POURS DEEPER THAN 10 FEET.
9. VAPOR BARRIER (10 MIL) REQUIRED BENEATH ALL SLABS.
10. WALKWAYS AND SIDEWALKS SHALL BE POURED WITH SLIGHT SLOPE AND NO LOW SPOTS SO THEY WILL DRAIN FREELY.
11. ALL STRUCTURAL JOINTS SHALL RECEIVE 6" RUBBER CENTER BULB PVC WATERSTOP PLACED AT ALL WATERTIGHT JOINTS.
12. VERTICAL WATERSTOP SHALL BE FULLY EMBEDDED IN SLAB POUR AND WELDED TO ALL ADJACENT WATERSTOP.
13. WHEN WATERSTOP IS PLACED HORIZONTALLY IN SLABS, THE CONTRACTOR SHALL TEMPORARILY TIE UP OR WRAP UP THE WATERSTOP UNTIL THE CONCRETE IS PLACED TO SLIGHTLY ABOVE THE DEPTH OF THE WATERSTOP.
14. ALL CONCRETE SHALL HAVE XYPEX ADMIXTURE PER MANUFACTURE'S SPECIFICATIONS.

BUILDING

1. ALL EXTERIOR DOORS ON ALL BUILDINGS SHALL HAVE R-PANEL AWNING SUPPLIED INTEGRAL WITH METAL BUILDINGS. AWNING ROOF PANELS SHALL MATCH MAIN BUILDING ROOF. AWNINGS SHALL INCLUDE FULL WIDTH GUTTER WITH DOWNSPOUTS.
2. ALL EXTERIOR EXPOSED CMU SHALL BE SPLIT FACE ARCHITECTURAL BLOCK UNLESS OTHERWISE NOTED.
3. ANY R-PANEL USED IN THE BUILDING CONSTRUCTION WHERE NO GAUGE IS SPECIFIED SHALL BE 24 GA. MINIMUM.

PIPING & APPURTENANCES

1. MANHOLES SHALL BE GROUTED INSIDE AND OUT AT ALL JOINTS.
2. ALL NON-POTABLE WATER LINES SHALL BE IN PURPLE COLORED PIPE AND LABELED "DO NOT DRINK". THE WARNING LABEL SHALL BE LOCATED ON OPPOSITE SIDES OF ALL PIPES AND REPEATED EVERY THREE (3) FEET OR LESS.
3. ALL PIPING THAT CROSS VERTICALLY SHALL HAVE AT LEAST 6" SEPARATION.
4. ALL UNDERGROUND FITTINGS SHALL BE DUCTILE IRON MECHANICAL JOINTS (MEGALUG), UNLESS OTHERWISE NOTED.
5. ALL VALVE ASSEMBLIES, VAULTS, PULLS BOXES AND MANHOLES CONSTRUCTED SHALL BE ADJUSTED TO BE FLUSH WITH FINISHED GRADE UNLESS OTHERWISE NOTED. MANHOLES SET IN OPEN FIELDS SHALL BE SET TWELVE INCHES ABOVE FINISHED GRADE AND VAULTS SHALL BE SET 6 INCHES ABOUT FINISHED GRADE.
6. ALL VALVE ASSEMBLIES, VAULTS, PULLS BOXES AND MANHOLES CONSTRUCTED SHALL BE ADJUSTED TO BE FLUSH WITH FINISHED GRADE UNLESS OTHERWISE NOTED.
7. ANY BY-PASS PUMPING AND/OR BY-PASS PIPING INSTALLED SHALL BE OPERATED AND MAINTAINED BY THE CONTRACTOR AT CONTRACTOR'S EXPENSE. THE CONTRACTOR IS RESPONSIBLE FOR ANY UNAUTHORIZED DISCHARGES.
8. CONNECTIONS TO EXISTING UTILITIES SHALL BE MADE IN A TIME AND UNDER CONDITIONS WHICH WILL LEAST INTERFERE WITH SERVICE OF THE OWNER, AND AS AUTHORIZED BY THE ENGINEER AND OWNER. FACILITIES SHALL BE PROVIDED FOR PROPER DEWATERING AND FOR DISPOSAL OF ALL WATER/WASTEWATER REMOVED TO ADJACENT PROPERTY FROM DEWATERED LINES WITHOUT DAMAGE.
9. MAINTAIN THE REQUIRED 10 FOOT HORIZONTAL AND 2 FOOT VERTICAL SEPARATION BETWEEN SANITARY SEWER AND POTABLE WATER MAINS. ALL OTHER PIPING SHALL MAINTAIN A MINIMUM OF 5' SEPARATION.
10. ORDER MANHOLES IN PAVEMENT LOWER THAN PROPOSED GRADE AND BRING THEM TO EXACT GRADE WITH LEVEL RINGS.
11. PROVIDE FREEZE PROTECTION FOR ANY EXPOSED PIPING. FREEZE PROTECTION SHALL CONSIST OF WRAPPED PIPE W/ RIGID ALUMINUM COVERS. FREEZE PROTECTION/INSULATION WILL NOT BE REQUIRED FOR PIPING INSIDE BUILDING, AIR PIPING OR SCADA INSTRUMENTATION CONDUIT.
12. CONTRACTOR SHALL SCHEDULE AND CONDUCT OPERATIONS TO LIMIT AMOUNT OF TRENCH OPENED TO INCLUDE ONLY THAT WHICH MAY BE COVERED IN 2 (TWO) DAYS TIME TO A MAXIMUM OF 200'. ANY TRENCH LEFT OPEN OVERNIGHT SHALL BE BARRICADED AND PROTECTED AS DETAILED IN THE MOST CURRENT EDITION OF THE MANUAL OF UNIFORM TRAFFIC CONTROL DEVICES.
13. SEWER MAINS SHALL BE CONSTRUCTED UTILIZING A LASER WITH GRADE ESTABLISHED THROUGH SEWER PIPE.
14. WHEN TIE-INS TO EXISTING MANHOLES ARE TO BE MADE, CONTRACTOR SHALL VERIFY MANHOLE FLOW LINE AT AN INTERVAL PRIOR TO MANHOLE TO ENSURE ADEQUATE DEPTH OF NEW LINE. WHEN CONSTRUCTING A MANHOLE OVER AN EXISTING LINE, CONTRACTOR SHALL VERIFY EXISTING LINE DEPTHS PRIOR TO MANHOLE CONSTRUCTION.
15. MATERIAL EXCAVATED FROM TRENCH & PIPE BEDDING MATERIALS SHALL NOT BE PLACED ON ADJACENT ASPHALT OR CONCRETE PAVING.
16. A SILT AND VARMINT CAP AND/OR PLUG SHALL BE IN PLACE ON THE OPEN END OF PIPES AT ALL TIMES.
17. DO NOT EXCEED 75% OF MANUFACTURE'S RECOMMENDED MAXIMUM DEFLECTION FOR PIPE JOINTS UNLESS OTHERWISE NOTED.
18. INSTALL TEMPORARY FENCES TO PROTECT HORSES AND LIVESTOCK WHEN NECESSARY.
19. REMOVAL AND REPLACEMENT OF STREET TRAFFIC SIGNS, MAIL BOXES AND OTHER STRUCTURES BY THE CONTRACTOR TO FACILITATE CONSTRUCTION SHALL BE CONSIDERED INCIDENTAL AND BE INCLUDED IN THE PRICE BID.
20. ALL EXISTING PAYMENT TO REMAIN SHALL BE SAWCUT TO ENSURE A STRAIGHT SMOOTH SURFACE. ALL CUTS MADE IN DRIVEWAYS OR OTHER PAVEMENTS SHALL BE MADE IN STRAIGHT PERPENDICULAR LINES. COST TO BE CONSIDERED SUBSIDIARY TO CONTRACTOR'S BID.
21. INSTALL METALLIC TRACER WIRE AND TAPE ON ALL PIPING INSTALLED IN ACCORDANCE WITH SPECIFICATIONS.

TREATMENT PLANT

1. ALL EXPOSED COMPONENTS REGARDLESS OF LOCATION TO BE CORROSION RESISTANT. (GALVANIZED, ALUMINUM, SST, FRP, ETC).
2. PROPERLY INSULATE, GASKET AND PROTECT TRANSITIONS TO DISSIMILAR METALS (DUCTILE-STAINLESS).
3. ALL EXPOSED VALVES SHALL HAVE HANDWHEELS OR LEVERS. CHAINWHEELS TO BE PROVIDED ON ALL ELEVATED VALVING.
4. ALL PLANT PIPING, CONDUIT, DRAINS, EQUIPMENT, PIPING, ELECTRICAL, COMPONENTS, ETC., SHALL BE PROVIDED WITH PIPE AND EQUIPMENT SUPPORTS, PIPE AND EQUIPMENT HANGERS FOR ALL BRACING AND STABILIZATION FOR A COMPLETE SYSTEM AND PROVIDE WALKING ACCESS AREAS FREE AND CLEAR. ALL PIPE SHALL BE PROPERLY PAINTED OR COATED WITH APPROVED PAINT. CONTRACTOR SHALL LABEL UNITS, PIPING, VALVES, TANKS, ETC., WITH PROPER FLOW DIRECTION AND TYPE. LOCATION AND NUMBER OF PIPE HANGERS AND PIPE SUPPORTS SHOWN IN ONLY APPROX. CONTRACTOR SHALL DESIGN SUPPORTS AS SPECIFIED.
5. ALL PVC/CPVC VALVES AND COMPONENTS FOR USE IN CHEMICAL FEED AND AIR PIPING SHALL HAVE VITON SEALS AND SHALL BE RATED FOR PRODUCT BEING CARRIED.
6. ALL SUSPENDED PIPING SHALL BE SUPPORTED AT NOT LESS THAN EVERY 10 FEET. ALL PIPING LARGER THAN 6" DIAMETER MAY REQUIRE ADDITIONAL SUPPORTS PER SUPPORT SUPPLIERS RECOMMENDATIONS AND/OR SPECIFICATION REQUIREMENTS.
7. ALL WATERTIGHT STRUCTURES CONCRETE SHALL HAVE 72 HOUR WATER TEST FOR LEAKAGE ON STRUCTURE BEFORE BACKFILL.
8. DISSIMILAR METALS IN CONTACT SHALL BE PROVIDED WITH GALVANIC SEPARATION.
9. CONTRACTOR SHALL COORDINATE WITH SUPPLIERS AND PROVIDE DRAIN CONDUIT (2" MINIMUM) FOR ANY/ALL ANALYZERS, RPZ, AIR/VAC VALVES, SAMPLERS OR ANY OTHER ITEM INSIDE BUILDING WHICH DISCHARGES INTERMITTENT WATER AND ROUTE TO DRAIN. NO SURFACE DRAINAGE WILL BE PERMITTED.
10. SUPPLY ONE SPARE WASHWATER PUMP.
11. SUBMIT FOR REVIEW ALL EQUIPMENT SIZES, OPERATING WEIGHTS, VIBRATION FORCES, SUPPORT LOCATIONS, ALONG WITH ANY FLOOR OPENINGS, NOTCHES, AND RECESSES REQUIRED BY SUCH EQUIPMENT. CONCRETE SUPPORT PADS AND/OR FRAMING REQUIRED TO SUPPORT SAID EQUIPMENT SHALL NOT BE FABRICATED AND PLACED UNTIL THE CONCRETE SUPPORT PADS AND/OR FRAMING IS APPROVED TO SUPPORT THE EQUIPMENT.
12. PROCESS EQUIPMENT DELIVERIES SHALL BE COORDINATED SO THAT EQUIPMENT COMES TO SITE NO MORE THAN 30 DAYS PRIOR TO INSTALLATION, UNLESS STORED INDOORS WITH CLIMATE CONTROL.
13. AT ALL POINTS UNDERGROUND WHERE PIPING EXITS STRUCTURES AND TRANSITIONS TO NATURAL GROUND OR OTHER AREAS SUBJECT TO GROUND SETTLING OR OTHER POTENTIAL INTRODUCED STRESSES AFTER INSTALLATION, A BELL-FLANGE WALL PIPE W/SEEP RING AND RESTRAINED MECHANICAL JOINT SHALL BE PROVIDED TO ALLOW FOR DEFLECTION WHETHER BEING SHOWN ON DRAWINGS OR NOT.
14. ALL PIPING 18" AND LARGER SHALL HAVE A MINIMUM COVER OF 48"; AND PIPE SMALLER THAN 18" SHALL HAVE A MINIMUM COVER OF 36" UNLESS OTHERWISE NOTED. PIPE SHALL BE ROUTED AS SHOWN UNLESS MINOR REVISIONS ARE NECESSARY TO AVOID EXISTING PIPES, STRUCTURES, ETC. CONTRACTOR SHALL BE RESPONSIBLE FOR FURNISHING ALL FITTINGS AND ADAPTERS REQUIRED TO MAKE THE ROUTING CHANGES. CONTRACTOR SHALL INCLUDE COST IN PRICE BID.
15. WHERE CONFLICTS OCCUR BETWEEN CIVIL AND MEP DRAWINGS CIVIL DRAWINGS SHALL GOVERN. ELECTRICAL CONTRACTOR IS RESPONSIBLE FOR VERIFICATION AND ANY MINOR MODIFICATIONS REQUIRED TO FACILITATE INSTALLATION AS OUTLINED ON CIVIL DRAWINGS.
16. REVIEW OF ANY/ALL SCOPE AND PROPOSALS FURNISHED BY EQUIPMENT SUPPLIERS AND SHALL VERIFY ALL REQUIREMENTS OUTLINED IN PROPOSED EQUIPMENT SCOPE/PROPOSAL HAVE VERIFIED AGAINST THE DRAWINGS PRIOR TO BID. ANY ADJUSTMENTS AND/OR ADDITIONAL WORK/MATERIALS REQUIRED ARE THE RESPONSIBILITY OF THE CONTRACTOR AND NO ADDITIONAL COMPENSATION WILL BE PROVIDED.
17. MAKE CONNECTIONS TO EXISTING PIPE, EQUIPMENT, ETC. AS REQUIRED AND SHALL PROVIDE ALL FITTINGS, ADAPTERS AND APPURTENANCES REQUIRED TO MAKE THE CONNECTIONS. PROVIDE SUPPORTS REQUIRED FOR A RIGIDLY SUPPORTED SYSTEM.
18. TEMPORARILY RELOCATE PIPING AS REQUIRED TO MAINTAIN SERVICE TO THE EXISTING PLANT.
19. MECHANICAL AND ELECTRICAL EQUIPMENT SUPPORTS, ANCHORAGES, OPENINGS, RECESSES, AND REVEALS NOT SHOWN ON THE STRUCTURAL DRAWINGS THAT ARE REQUIRED BY OTHER CONTRACT DRAWINGS SHALL BE PROVIDED PRIOR TO CASTING CONCRETE.
20. PRIOR TO FABRICATION OF NEW PIPING, INCLUDING SPECIAL FITTINGS AND EXCAVATIONS FOR NEW STRUCTURES, ELECTRICAL CONDUIT AND/OR OTHER PROPOSED UTILITIES, CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING THE LOCATION OF ALL EXISTING PIPING AND UTILITIES IN THE CONSTRUCTION AREA. AT TIE-IN LOCATIONS, VERIFY THE SIZING OF EXISTING PIPING BEFORE FABRICATION OF NEW PIPING AND FITTINGS. THE CONTRACTOR SHALL INCLUDE THE COST IN HIS BID FOR TEMPORARILY RELOCATING AND REINSTALLING EXISTING UTILITIES AS REQUIRED FOR CONSTRUCTION OF PROPOSED ITEMS.
21. ANY PLANT UTILITY, PIPING, CONDUIT, COMMUNICATION SYSTEM, ELECTRICAL OR INSTRUMENTATION WIRING DAMAGED DURING CONSTRUCTION SHALL BE REPAIRED AND PLACED BACK IN SERVICE BY THE CONTRACTOR ON THE SAME DAY THAT THE DAMAGE OCCURRED. AFTER 24 HOURS OUT OF SERVICE, OWNER WILL HAVE THE OPTION OF HAVING THE REPAIRS MADE BY A SEPARATE CONTRACTOR AND DEDUCTING THE COST OF SAID REPAIRS FROM THE CONTRACT AMOUNT.
22. GALVANIZED STEEL PRODUCTS SHALL NOT BE USED FOR ANY TREATMENT PLANT STRUCTURE / EQUIPMENT CONSTRUCTION UNLESS SPECIFICALLY CALLED OUT / APPROVED.
23. ALL NEW UNISTRUT, ANCHORS, SUPPORT SYSTEMS AND FASTENING HARDWARE TO BE 316 STAINLESS STEEL.
24. BACKFILLING AGAINST STRUCTURES WHICH HAVE A TOP SLAB SHALL BE DONE ONLY AFTER THE TOP SLAB IS IN PLACE AND THE CONCRETE HAS CURED TO 2/3 OF ITS DESIGN STRENGTH, BUT IN NO CASE LESS THAT 4 DAYS.
25. STAGING AREA WILL ONLY BE USED FOR CONSTRUCTION EQUIPMENT AND MATERIALS USED IN THE CONSTRUCTION OF THE PROJECT. CONSTRUCTION DEBRIS SHOULD NOT BE ALLOWED TO ACCUMULATE AND SHOULD BE REMOVED ON A WEEKLY BASIS.
26. INSTALL METALLIC TRACER WIRE AND COLOR CODE FOR ALL PIPE INSTALLED.
27. IN ACCORDANCE WITH OAC 252:656-5-4(C)(1), SANITARY SEWER MUST BE AT LEAST 10-FEET FROM AN EXISTING OR PROPOSED WATERMAIN AND AT LEAST 5-FEET ELECTRICAL OR PETROLEUM LINES. SANITARY SEWERS MUST CROSS AT LEAST 24 INCHES ABOVE OR BELOW WATERMAINS.
28. THE CONTRACTOR SHALL NOT OPEN OR CLOSE ANY VALVES AT THE TREATMENT PLANT AND SHALL ASK FOR THE OWNER'S ASSISTANCE.

ELECTRICAL/CONTROLS/SCADA

1. ALL ELECTRICAL CONSTRUCTION SHALL BE IN STRICT ACCORDANCE WITH ALL N.E.C. AND LOCAL ELECTRICAL CODES.
2. ALL MECHANICAL EQUIPMENT (INCLUDING MCC & PANELS) SHALL RECEIVE HOUSEKEEPING PADS WITH #4 BARS @ 12" O.C.E.W. MINIMUM THICKNESS SHALL BE 6" OR AS REQUIRED FOR ANCHOR BOLT CLEARANCE. ANCHOR BOLTS SLEEVES MAY BE USED PROVIDED THE SLEEVES ARE NON-SHRINK GROUT FILLED WITH 1-1/2" GROUT UNDER EQUIPMENT BASE. ALL PADS SHALL BE ANCHORED TO CONCRETE SLABS BY L BARS (#3 @ 12" O.C.) OR EPOXY ANCHORS.
3. ALL SCADA SYSTEM WIRING SHALL BE CONDUIT ENCASED AND IS NOT SHOWN FOR CLARITY. CONTRACTOR TO PROVIDE PROPOSED CONDUIT LAYOUT WITH SCHEDULE TO ENGINEER FOR APPROVAL PRIOR TO CONSTRUCTION.
4. ALL SURFACE MOUNTED PANELS AND PANEL BOARDS ON THE INTERIOR OF EXTERIOR WALLS OR IN OTHER LOCATIONS CONSIDERED DAMP OR WET AND SHALL BE MOUNTED SO AS TO MAINTAIN A 1/4" MINIMUM AIR SPACE BETWEEN THE ENCLOSURE AND THE WALL.
5. ALL EXTERNAL DISPLAYS SHALL BE PROVIDED WITH A WEATHER SHIELD.
6. REVIEW OF ANY/ALL SCOPE AND PROPOSALS FURNISHED BY EQUIPMENT SUPPLIERS AND SHALL VERIFY ALL ELECTRICAL REQUIREMENTS OUTLINED IN PROPOSED EQUIPMENT SCOPE/PROPOSAL HAVE BEEN ACCOMMODATED BY ELECTRICAL CONTRACTOR.
7. THE WIRING DIAGRAMS, QUANTITY AND SIZE OF WIRES AND CONDUITS REPRESENT A SUGGESTED ARRANGEMENT BASED UPON SELECTED STANDARD COMPONENTS OF ELECTRICAL EQUIPMENT. IF EQUIPMENT SUPPLIED BY THE MANUFACTURER HAS A LARGER LOAD THAN THE VALUE SHOWN OR INDICATED, THE CABLE, CONDUIT AND ELECTRICAL EQUIPMENT SHALL BE ENLARGED AS REQUIRED TO ACCOMMODATE THE HIGHER LOADING. HOWEVER, THE BASIC SEQUENCE AND METHOD OF CONTROL MUST BE MAINTAINED AS INDICATED ON THE DRAWINGS AND/OR SPECIFICATIONS. CONTRACTOR TO PROVIDE PROPOSED CONDUIT LAYOUT WITH SCHEDULE TO ENGINEER FOR APPROVAL PRIOR TO CONSTRUCTION.

UTILITY WARNING:
The underground utilities shown have been located from record documents or field locations by the operator. The surveyor makes no guarantee that the underground utilities shown comprise all such utilities in the area either in service or abandoned. The surveyor further does not warrant that the underground utilities shown are in the exact location indicated although the surveyor does certify that they are located as accurately as possible from the information available. The surveyor has not physically located the underground utilities.

Utility elevations and sizes may have been measured under adverse field conditions. Upon exposing the utility, elevations and line sizes should be verified by the contractor prior to construction. Contractor should verify critical elevations using the benchmark provided by the surveyor or engineer. Any discrepancies should be immediately brought to the engineer's and surveyor's attention.

LEGEND

INITIAL DEMOLITION W/ SLUDGE REMOVAL/DISPOSAL

DEMOLITION SCOPE OF WORK (PRIOR TO PRIMARY CONSTRUCTION)

1. DEWATER & REMOVE SLUDGE FROM DRYING BEDS.
2. DEMOLISH DRYING BEDS & PIPING AS REQUIRED.

NOTES:

1. SLUDGE TO BE REMOVED AND DISPOSED OF BY A SLUDGE REMOVAL CONTRACTOR WITH EXPERIENCE REMOVING & DISPOSING OF MUNICIPAL WASTEWATER TREATMENT PLANT SLUDGE. SEE 02_41_00 DEMOLITION.
2. CUT/PLUG EXISTING MAINS AT LIMITS OF DEMOLITION.

LEGEND

TO BE DEMOLISHED/REMOVED

DEMOLITION SCOPE OF WORK (AFTER STARTUP ON PROPOSED EQUIPMENT)

1. COMPLETE CONSTRUCTION, STARTUP, TESTING AND INITIAL OPERATION.
2. CLOSE ALL EXISTING VALVES AND RAW WASTEWATER LINES. VERIFY POSITIVE CLOSURE ON VALVES.
3. DISCONNECT ALL INCOMING ELECTRICAL W/POSITIVE VERIFICATION FROM POWER COMPANY. OFFICE/SHOP ELECTRICAL TO REMAIN.
4. CUT AND PLUG W/ CONCRETE EXISTING WATER/WASTEWATER LINES.
5. DEWATER AND DEMOLISH EXISTING STRUCTURES TO A DEPTH OF 4' BELOW FINAL GRADE.
6. ALL EQUIPMENT, PIPING & MISCELLANEOUS ITEMS IN EXISTING BUILDINGS 'L' & 'M' TO BE REMOVED AND DISPOSED OF.
7. BACKFILL STRUCTURES WITH SELECT FILL AND COMPACT. GRADE TO DRAIN.
8. DISPOSE OF DEMOLISHED MATERIALS OFF SITE IN A LOCATION PROVIDED BY THE CONTRACTOR PER STATE AND FEDERAL REGULATIONS. DISPOSAL INSIDE EXISTING BASINS WILL BE ACCEPTABLE PROVIDED 4' SOIL COVER REQUIREMENTS ARE MET.
9. TOPSOIL AND HYDROMULCH DISTURBED AREAS & WATER UNTIL ESTABILISHED.

NOTES:

1. SLUDGE TO BE REMOVED AND DISPOSED OF BY A SLUDGE REMOVAL CONTRACTOR WITH EXPERIENCE REMOVING & DISPOSING OF MUNICIPAL WASTEWATER TREATMENT PLANT SLUDGE. SEE 02_41_00 DEMOLITION.

2. ALL STRUCTURES AND BUILDINGS SCHEDULED TO REMAIN ARE TO HAVE MISCELLANEOUS EQUIPMENT, PUMPS, ETC. REMOVED & DISPOSED OF.

FE: EMBEDDED FRAME
HC: HAND CRANK
GS: GALVANIZED STEEL
CW: CHANNEL WALL
SQN: SQUARE NUT

NOTES:
1. ALL ABOVE GROUND PIPING 4" AND SMALLER . PIPING AND FITTINGS SMALLER THAN 4" SHALL BE 316 SST (GROOVED).
2. USE VICTAULIC FITTINGS AS REQUIRED.
3. GATE WIDTHS LISTED ARE NOMINAL.
4. CONTRACTOR SHALL ADJUST LOCATION OF GRIT WASHER CONVEYER TO ALLOW FOR USE OF ONE DUMPSTER.
5. THERE SHALL NOT BE ANY GRATING OVER GATES WHICH WOULD INTERFERE WITH OPERATION.
6. ALL EXPOSED PIPING SHALL BE FREEZE PROTECTED BY HEAT TRACE AND INSULATED.
7. GRIT PUMPS SHALL BE EQUIPPED WITH CASE HEATING AND FREEZE PROTECTION PER MANUFACTURERS RECOMMENDATIONS.
8. PW WATER CONNECTION TO EQUIPMENT SHALL BE INSTALLED WITH CONNECTION SOLENOID VALVE SUPPLIED BY MANUFACTURER. FIELD ROUTE ELECTRICAL/CONTROLS PER MANUFACTURERS RECOMMENDATIONS.
9. CONTRACTOR SHALL VERIFY WITH OWNER DUMPSTER DIMENSIONING PRIOR TO PLACEMENT OF CLASSIFIER/COMPACTOR DISCHARGE OUTLETS.
10. ALL PIPING AND CONNECTIONS SHALL BE PER MANUFACTURERS RECOMMENDATIONS.
11. ALL ELECTRONICALLY ACTUATED VALVES TO ALSO BE EQUIPPED W/HANDWHEEL OPERATORS.
12. SLIDE GATES TO BE MOUNTED PER MANUFACTURERS RECOMMENDATIONS.
13. CONTRACTOR TO INSTALL A 2" RADIUS FILLET BEFORE AND AFTER THE SCREENS TO PREVENT SEDIMENTATION OF SOLIDS. CONTRACTOR SHALL VERIFY WITH MFR. THAT APPROPRIATE CHANNEL VELOCITY WILL BE MAINTAINED.
14. ACTUATED SLIDE GATE EMERGENCY FLOAT TO AUTOMATICALLY CLOSE GATE IN THE EVENT WATER RISES TO HEADWORKS FLOOR.
15. AT CONTRACTORS OPTION, FLOOR OF HEADWORKS MAY BE POURED LEVEL AT ELEVATION GROUTED TO PROPOSED FLOW LINE ELEVATION.
16. COORDINATE LOCATIONS FOR REQUIRED WASH WATER NON POTABLE WATER MAINS WITH HEADWORKS EQUIPMENT SUPPLIER PRIOR TO INSTALLATION.
17. ELECTRONICALLY OPERATED GATE SHALL BE 480 VOLTS/3 PHASE.
18. CONTRACTOR SHALL SUBMIT A COMPLETE PIPING PLAN FOR APPROVAL.
19. CONTRACTOR SHALL PROVIDE PIPING SUPPORTS AS NEEDED REGARDLESS OF BEING SHOWN ON DRAWINGS.
20. 1.5% SLOPE TOWARD CHANNELS MAY BE GROUTED OR CONSTRUCTED WITH THICKENED SLAB. SLOPE TO START AT TOP OF WALL (T.O.W.) ELEVATION & EXTEND OUTWARD.
21. ALL OPEN AREAS OF HEADWORKS STRUCTURE ARE TO RECEIVE GRATING. SOME GRATING IS NOT SHOWN FOR CLARITY.
22. COORDINATE WITH EQUIPMENT SUPPLIER FOR EXACT REQUIREMENTS OF INLET WATER PIPING PRIOR TO BID.
23. EQUIPMENT DRAINS NOT SHOWN IN PIPING SHALL BE FIELD ROUTED TO HEADWORKS CHANNELS PER MANUFACTURER RECOMMENDATIONS.
24. ENTIRE SYSTEM SHALL BE EQUIPPED WITH A FACTORY DESIGNED FREEZE PROTECTION SYSTEM CONSISTING OF HEAT TAPE, CASE HEATERS AND INSULATION. FREEZE PROTECTION SYSTEM SHALL BE DESIGNED TO ENSURE PROPER OPERATION INDEFENITELY AT -15° FAHRENHEIT. PROVIDE INFORMATION ON FREEZE PROTECTION SYSTEM WITH THE EQUIPMENT SUBMITTAL.
25. ALL EXPOSED PIPING IN HEADWORKS AREA 6" AND SMALLER TO BE GROOVED 316 STAINLESS STEEL. COMPLETE SYSTEM TO BE DESIGNED AND PROVIDED BY VICTAULIC.

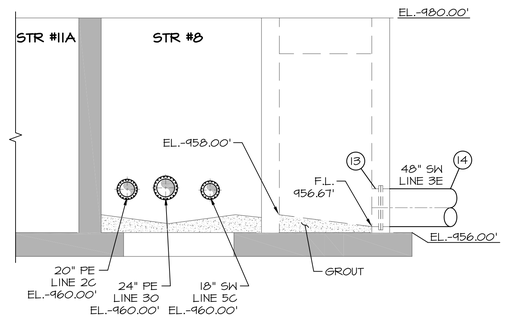
MIXER DETAIL

SCALE: 3/4"=1'-0"

NOTES:



1. COORDINATE WITH MANUFACTURER FOR ADDITIONAL INSTALLATION DETAILS INCLUDING MOUNTING AND ANCHORING.
2. COORDINATE WITH MANUFACTURER FOR NUMBER AND SPACING OF WALL SUPPORTS REQUIRED FOR INSTALLATION.

C PEQ-1 **SECTION**

SCALE: 1/8"=1'-0"

B PEQ-1 **SECTION**

SCALE: 1/8"=1'-0"

NOTES:

1. SEAL CONDUITS TO KEEP WET WELL GASSES OUT OF CONTROL PANEL.
2. LOCATE FLOATS AND CABLE HOLDER AWAY FROM INLET PIPE.
3. WETWELL FLOOR SHALL SLOPE TO PUMPS AS SHOWN.
4. ALL COMPONENTS SHALL BE DUCTILE IRON OR STAINLESS STEEL.
5. ALL ELECTRONICALLY ACTUATED VALVES TO ALSO BE EQUIPPED WITH HAND WHEEL OPERATORS.
6. PIPE SUPPORT LOCATIONS ARE FOR REFERENCE ONLY & MORE MAY BE REQUIRED PER SPECIFICATION REQUIREMENTS AND/OR INDUSTRY STANDARD.
7. WETWELL TO BE EQUIPPED WITH A LEVEL TRANSDUCER AND 3 BACKUP FLOATS (LOW LEVEL ALARM, INFLUENT CLOSE).
8. PROVIDE MOTORIZED TROLLEY HOIST CAPABLE OF LIFTING SUBMERSIBLE PUMPS FROM WET WELL FOR MAINTENANCE AND REPAIR.
9. HOIST SUPPLIER SHALL INSPECT AND CERTIFY HOIST INSTALLATION MEETS MINIMUM STANDARDS AND IS APPROPRIATE FOR THIS APPLICATION.

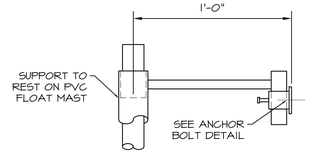
RETRIEVABLE FLOAT MAST

SCALE: NOT TO SCALE

GENERL NOTES:



1. SOCKET JOINTS SHALL BE MADE WITH THE USE OF ADHESIVE KITS FURNISHED BY SUPPLIER. FIBERGLASS PROCESS PIPING FIELD JOINTS SHALL BE PROVIDED WITH EXTRA MATERIAL TO ALLOW FOR TOLERANCES AND EXACT FIELD ALIGNMENT. TRIMMING WILL BE REQUIRED.
2. BUTT-WRAP JOINTS SHALL BE A BUTT AND STRAP CONNECTION WITH A PRESSURE RATING OF 75 PSI. MATERIALS TO MAKE EACH CONNECTION SHALL BE FURNISHED BY SUPPLIER AND SHALL INCLUDE FIBERGLASS MAT AND RESIN. THE BROWN TOP-COAT RESIN SHOULD BE APPLIES AFTER COMPLETION OF DRY INSPECTION PROCEDURES. FIBERGLASS PROCESS PIPING FIELD JOINTS SHALL BE PROVIDED WITH EXTRA MATERIAL TO ALLOW FOR TOLERANCES AND EXACT FIELD ALIGNMENT (EXCLUDING HEADER & DECANTER JOINTS).
3. FRP PIPE AND FITTINGS SHALL BE 75 PSI MIN. PRESSURE RATING. PIPE TO BE P.E.x.P.E.
4. SUPPORTS AND STEELWORK FURNISHED BY SUPPLIER SHALL BE 316 STAINLESS STEEL.
5. FLANGES FURNISHED BY SUPPLIER SHALL MEET OUTSIDE DIAMETER, BOLT CIRCLE DIAMETER, NUMBER AND SIZE OF HOLES PER ANSI B.16.1 125 LB. CAST IRON, AND ANSI B16.5 150 LB. STEEL FLANGE SPECIFICATIONS.
6. GASKETS SUPPLIED BY SUPPLIER SHALL BE 3/16" THICK, FULL FACE BUNA-N RUBBER, WITH A DUROMETER HARDNESS OF 40-50 ON THE SHORE-A SCALE.
7. SUPPORT AND CONNECTING HARDWARE FURNISHED BY SUPPLIER SHALL BE TYPE 18-8 STAINLESS STEEL. TORQUE (+0/-5%) ON STAINLESS STEEL BOLTS USED WITH METAL ASSEMBLIES SHALL BE:
   - 20 FT. LBS. FOR 3/8" BOLTS
   - 40 FT. LBS. FOR 1/2" BOLTS
   - 125 FT. LBS. FOR 3/4" BOLTS
   - 150 FT. LBS. FOR 7/8" AND LARGER BOLTS
8. ANCHOR BOLTS SHALL BE TYPE 18-8 STAINLESS STEEL. ANCHOR BOLTS SHALL BE SET TO FULL EMBEDMENT AS SHOWN IN THE ANCHOR BOLT DETAIL INTO STRUCTURAL CONCRETE UNLESS OTHERWISE NOTED. USE A LOCK WASHER UNDER THE NUT. TORQUE ON STAINLESS STEEL ANCHOR BOLTS SHALL BE:
   - 22-25 FT. LBS. FOR 1/2" BOLTS
   - 55-80 FT. LBS. FOR 5/8" BOLTS
   - 276-330 FT. LBS. FOR 1" BOLTS
9. FIBERGLASS AND PVC PIPE SHALL BE STORED WITH A MAXIMUM OF 8'-0" BETWEEN SUPPORTS.

HANDRAIL/WALKWAY NOTES:

1. COMPLETE HANDRAIL SYSTEM (INCLUDING STAIRS AND PUMP MAINTENANCE PLATFORM) TO BE FURNISHED AS A SYSTEM (INCLUDING PRE-EQ BASIN) FROM A SINGLE SUPPLIER. COMPLETE SYSTEM TO BE STAMPED BY AND OKLAHOMA STRUCTURAL ENGINEER (S.E.).
2. HANDRAIL/WALKWAY SUPPLIER TO COORDINATE STAIRS/STEPS OF ADEQUATE CLEARANCE FOR LOCATIONS WHERE AIR/SLUDGE/MISC. PIPING EXTENDS OVER TOP OF WALL. SUBMITTAL REQUIRED.

NOTES:

1. ALL COMPONENTS SHALL BE DUCTILE IRON OR STAINLESS STEEL.
2. ALL ELECTRONICALLY ACTUATED VALVES TO ALSO BE EQUIPPED WITH HAND WHEEL OPERATORS.
3. PIPE SUPPORT LOCATIONS ARE FOR REFERENCE ONLY & MORE MAY BE REQUIRED PER SPECIFICATION REQUIREMENTS AND/OR INDUSTRY STANDARD.
4. ALL AERATION COMPONENTS INTERNAL TO BASINS TO BE STAINLESS STEEL. SYSTEM TO BE DESIGNED AND FURNISHED BY SUPPLIER. COORDINATE WITH SUPPLIER FOR INSTALLATION DETAILS AND CONSTRUCTION INFORMATION.
5. MUD VALVES SHALL BE FURNISHED WITH STEM, WALL ANCHORS, AND HANDWHEEL OPERATOR IN A COMPLETE SYSTEM FOR WALL MOUNTING WITH WHEEL OPERATOR AT WALKWAY LEVEL. SUBMITTAL REQUIRED.
6. GLOBE VALVES TO BE USED TO FILL SBR DECANTER TO RELEASE AIR.
7. AIR PIPING TO BE SUPPORTED TO PREVENT SLIPPAGE AND TO BE LOOSELY ATTACHED TO ALLOW PIPE MOVEMENT.

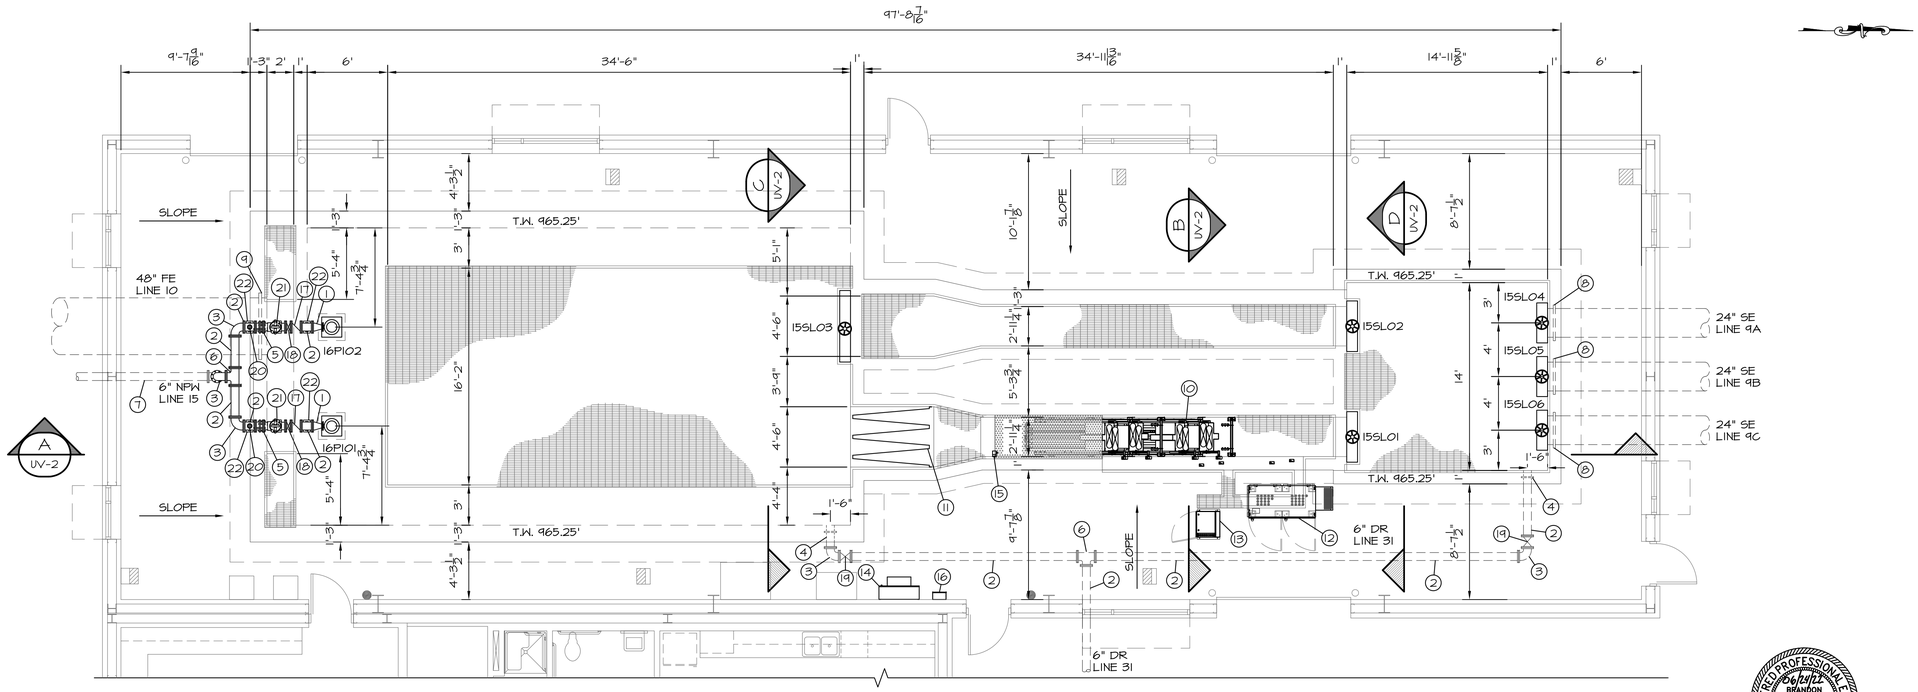
3. SEE HN-5 FOR GATE DETAIL AND COORDINATE W/MANUFACTURER FOR ADDITIONAL INFORMATION.

NON-POTABLE WATER PUMP SCHEDULE - STRUCTURE #16



NO.	FLOW	TDH-DES	FUNCTION	CONTROL	HP
16P101-16P102	400 GPM	235'	PRIMARY	VFD	±40

PUMP NOTES:

1. PUMP SHALL BE GORMAN RUPP T3AS-E5 SELF PRIMING PUMP.
2. 4" SIMPLEX STRAINER SHALL BE EATON MODEL 72 OR APPROVED EQUAL AND SHALL HAVE PIPE SUPPORTS UNDER THE PROCESS PIPING NEAR THE INLET AND OUTLET CONNECTIONS (SEE PIPE SUPPORT DETAIL SHEET DT-03).
3. STRAINER DRAIN SHALL BE FIELD ROUTED INTO BASIN THROUGH APPROPRIATELY SIZED SCH. 80 PVC CONDUIT PER MANUFACTURES REQUIREMENTS.
4. GRATING OVER UV CHANNELS SHALL BE SIZED TO BE EASILY REMOVED BY ONE PERSON.
5. INVERT MOUNTING PER GATE MANUFACTURER REQUIREMENTS/RECOMMENDATIONS SUBMITTAL REQUIRED.
6. COORDINATE WITH PUMP SUPPLIER FOR CONCRETE PENETRATION REQUIREMENTS.

UV NOTES:

1. UV CHANNEL TO HAVE HIGH LEVEL ALARM.
2. SUBMIT WIRING PLAN TO ENGINEER FOR APPROVAL PRIOR TO STARTING WORK.
3. COORDINATE WITH UV SUPPLIER FOR EXACT WIRING AND EQUIPMENT REQUIREMENTS PRIOR TO BID.
4. EQUIPMENT LOCATION IS FOR REFERENCE ONLY. PROVIDE EQUIPMENT LAYOUT TO ENGINEER FOR APPROVAL PRIOR TO CONSTRUCTION.
5. DO NOT SLOPE CHANNEL FLOOR.
6. CHANNEL WIDTH MUST BE KEPT WITHIN A TOLERANCE OF ± 1-1/2" AT UV BANK FRAME AND ±¼" FOR REST OF CHANNEL.
7. ALL CHANNEL ELEVATIONS MUST BE KEPT WITHIN A TOLERANCE OF ± ¼".
8. REMOVABLE GRATING SECTIONS SHALL BE EASILY REMOVED BY ONE PERSON. MAXIMUM WEIGHT OF THE SECTIONS SHALL BE IN ACCORDANCE WITH REQUIREMENTS OF THE APPLICABLE JURISDICTION.
9. CONTRACTOR TO REVIEW ALL TROJAN TECHNOLOGIES INSTALLATION INSTRUCTIONS PRIOR TO EQUIPMENT INSTALLATION.
10. HYDRAULIC HOSE ELEVATIONS NOT TO EXCEED 12" ABOVE HSC MOUNTING ELEVATION.
11. SOLID GRATING REQUIRED TO BLOCK ULTRAVIOLET (UV) LIGHT. IN AREAS SPECIFIED.
12. COORDINATE EXACT DIMENSIONS WITH SUBMITTAL DRAWING.
13. HOUSE KEEPING PADS REQUIRED FOR ALL EQUIPMENT.
14. DURING NORMAL OPERATIONS IF HIGH LEVEL ALARM IS INDICATED, INFLUENT GATES SHOULD CLOSE AND/OR BYPASS GATES OPEN.

NOTE:
CONCRETE TO SLOPE CONTINUOUS FROM EXTERIOR FINISH FLOOR ELEVATION OF 965.33 TO TOP OF WALL ELEVATION OF 965.25 TO FACILITATE DRAINAGE.

LOW PROFILE AERATION SYSTEM NOTES:

1. MATERIALS OF CONSTRUCTION TO BE T-304 STAINLESS STEEL.
2. SLOPE OF CONCRETE FLOOR AND LEVEL OF CONCRETE FLOOR ACROSS WIDTH OF BASIN IS CRITICAL TO PROPER SYSTEM PERFORMANCE.
3. CONCRETE SURFACE TO BE FLAT AND SMOOTH (¼" IN 10' IN ALL DIRECTIONS), AND IS CRITICAL FOR PROPER SEALING.
4. PLACE SEAL MATERIAL BETWEEN MATING STEEL AND CONCRETE SURFACES BEFORE ANCHORAGE. COORDINATE WITH MANUFACTURER.
5. PROVIDE SEALING AND EQUIPMENT INSTALLATION PLAN TO ENGINEER AND MANUFACTURER FOR APPROVAL PRIOR TO CONSTRUCTION.

HOIST NOTES:

1. PROVIDE MOTORIZED TROLLEY HOIST CAPABLE OF LIFTING SUBMERSIBLE PUMPS FROM WET WELL FOR MAINTENANCE AND REPAIR.
2. HOIST SUPPLIER SHALL INSPECT AND CERTIFY HOIST INSTALLATION MEETS MINIMUM STANDARDS AND IS APPROPRIATE FOR THIS APPLICATION.

L12FPV01	PLUG	6"	YES

NOTES:

1. SLOPE FLOOR TO DRAIN.
2. ELECTRICAL & CONTROL CONDUIT WILL BE UNDER THE CONCRETE SLAB. (NO ELECTRICAL EQUIPMENT WILL BE MOUNTED ON THE FIBERGLASS ENCLOSURE.)
3. ALL FITTINGS FROM THE PLUG VALVES TO THE PUMPS WILL HAVE RESTRAINT GLANDS.
4. 90° BENDS, BOTH SUCTION & DISCHARGE AT THE PUMPS, SHALL BE TAPPED FOR PRESSURE GAUGES.
5. CONTRACTOR SHALL SUBMIT A DETAILED PLAN SHOWING PIPING ARRANGEMENT PIPE SIZES, LENGTHS, ELEVATIONS FOR PUMP STATIONS TO ENGINEER FOR APPROVAL PRIOR TO STARTING THIS WORK.
6. WAS PUMP BUILDING SHALL BE EQUIPPED WITH BREAKER PANEL, LIGHTING, ELECTRICAL RECEPTACLES, 18" EXHAUST FAN & LOUVER, AND 5KW HEATER WTHERMOSTAT. SUBMITTAL REQUIRED.
7. ENCLOSURE SHALL BE MOUNTED WITH ⅜"x6" SST. EXPANSION ANCHORS ON 12" CENTERS. "RED HEAD" TYPE. SEAL EXTERIOR CONNECT WITH MASTIC.
8. ROUTE AIR RELEASE DISCHARGE TO FLOOR DRAIN (SCH 40 PVC).
9. DUCTILE IRON PIPING SYSTEM TO BE DESIGNED AND FURNISHED COMPLETE BY VICTAULIC.

EQUIPMENT ITEM REFERENCE (001)

A.D.A. TURNING SPACE AREA (S)

GENERAL NOTES:

1. DO NOT SCALE THESE DRAWINGS AS PRINTING AND REPRODUCTION MAY ALTER THE SCALE SLIGHTLY. NOTIFY THE ARCHITECT WITH ANY DISCREPANCIES.

2. CONSTRUCTION SHALL COMPLY WITH ALL LOCAL, STATE, AND NATIONAL CODES AND AGENCIES WHICH GOVERN THE WORK TO BE PERFORMED.

3. THE CONTRACTOR SHALL OBTAIN AND PAY ALL NECESSARY PERMITS AND FEES TO COMPLETE CONSTRUCTION TO INCLUDE TAPS FEES, METER CHARGES, AND UTILITY FEES ASSOCIATED WITH THE PROJECT.

4. CONSTRUCTION SHALL BE A.D.A. COMPLIANT WITH THE AMERICANS WITH DISABILITIES ACT AND STANDARDS FOR ACCESSIBLE AND USABLE BUILDINGS AND FACILITIES (ICC A117.1).

5. LEAD-BASED PAINT OR ASBESTOS CONTAINING MATERIAL SHALL NOT BE USED IN CONSTRUCTION FOR THIS PROJECT.

6. APPLICABLE CODES:
   2015 INTERNATIONAL BUILDING CODE
   2015 INTERNATIONAL FIRE CODE
   2015 INTERNATIONAL MECHANICAL CODE
   2015 INTERNATIONAL PLUMBING CODE
   2014 NATIONAL ELECTRICAL CODE

7. REFERENCED CODE:
   2015 NFPA 101 LIFE SAFETY CODE

ARCHITECTURAL SPECIFICATIONS:

CAST-IN-PLACE CONCRETE:

A. Testing: One set of test cylinders shall be prepared by an ACI Certified Technician according to ACI standards of any concrete placed during any one day. For each test make four (4) cylinders from same batch. Cylinders shall be field cured and protected for two (2) days then remove to testing laboratory. Break cylinders as follows: one at seven (7) days and two (2) at twenty-eight (28) days. Break the fourth cylinder only if tests do not indicate required strength. Instruct testing lab to immediately forward test results by fax to Architect. Note: required strength at seven days to be at least 65% of ultimate strength specified or 1950 psi for 3,000 psi concrete mix and 2,275 psi for 3,500 psi design mix.

B. Formwork:
   i. Provide concrete forms, accessories, shoring, and bracing as required to accomplish cast-in-place concrete work.
   ii. Design and construct to provide resultant concrete that conforms to design with respect to shape, lines, and dimensions.
   iii. Curb Forming: Provide reinforced section as indicated on Drawings.
   iv. Form Materials: choice of standard products with sufficient strength to withstand hydrostatic head without distortion in excess of permitted tolerances.

C. Reinforcement:
   i. Reinforcing steel shall be ASTM A 615/A 615M Grade 60 (420).
      a. Type: Deformed billet-steel bars.
      b. Finish: Unfinished, unless otherwise indicated.
   ii. Reinforcing steel shall be free of rust, scale, grease, paint or other defects which may destroy or reduce bond. Bars to be free of seams, slivers, flaws and other defects affecting continuity or strength.
   iii. Reinforcement Accessories:
      a. Tie Wire: Annealed, minimum 16 gage.
      b. Chairs, Bolsters, Bar Supports, Spacers: Sized and shaped for adequate support of reinforcement during concrete placement.

D. Concrete Materials:
   i. Cast-In-Place Concrete: All concrete shall be ready-mixed and delivered according to "Specifications for Ready-Mixed Concrete" (ASTM C94, latest revision).
   ii. Materials: Crushed rock 3/4" to 1-1/2" in accordance to ASTM C33, latest revision. Portland Cement Type 1, ASTM C150, latest revision, minimum of 5-1/2 sacks per cubic yard. Comply with requirements of ASTM C494, latest revision, Type "A".
   iii. Mixing: Water-to-cement proportions to obtain a 28 day break at least 3,500 psi for exterior paving and curbs. Slump to be 4" maximum.
   iv. Concrete: (S) Concrete strength for drives and curbs, use 3,500 psi in 28 days. Use air entrainment admixture additive to each cubic yard of concrete for paving, drives, curbs, sidewalks and at any other miscellaneous exterior concrete work.
   v. Concrete Mix: (S) Use mixing proportions to obtain ASTM C-94 that will assure a 28 day break at design strength for all new concrete work. See structural drawings for additional information. Materials for mixes in one cubic yard is as follows:
      a. 3,500 psi in 28 days Mix Design per Yard
      b. Cement - 5.5 sack minimum (as required for 3500 psi)
      c. Fly Ash - 15% (max) Class "C"
      d. Sand and Gravel - Weight proportion
      e. Water/Cement Ratio - not to exceed 0.55 (as required for 3500 psi)
      f. Maximum Slump - 5"
      g. Air Entrainment - 5% to 7%
      h. Water Reducing Agent - As per manufacturer's specs (not to exceed 7" slump)
      i. Note: Calcium chloride shall not be used

E. Accessory Materials:
   i. Construct forms to withstand deflection, movement and/or leakage. Forms to be cleaned, reconditioned and recoated with non-staining form release agent prior to each use. Unused tie holes in forms should be properly plugged and filled to prevent telegraphing. Form construction method must be sufficient in stability and strength to result in a smooth and even exposed concrete face after stripping.
   ii. Curb Forming: Forming for curbs shall be a smooth rounded radius to the dimensions shown. Segmented connection of straight-line forming at curbs will not be accepted.
   iii. Do not remove forms or bracing until concrete has gained sufficient strength to carry its own weight and imposed loads.
   iv. Formwork: Comply with requirements of ACI 301. Design and fabricate forms to support all applied loads until concrete is cured, and for easy removal without damage to concrete.
   v. Verify that anchors, anchor bolts, seats, plates, reinforcement and other items to be cast into concrete are accurately placed, positioned securely, and will not cause hardship in placing concrete. Embedments must be supported by formwork or tied to reinforcement. Under no circumstances should embedments be welded to reinforcement.

F. Concrete Moisture Vapor Reduction Admixture:
   i. Basis-of-Design "Barrier One High Performance Moisture Vapor Reduction Admixture" manufactured by Barrier One, Inc..; 522 S. Hunt Club Blvd., #303, Apopka, Florida 32703; Contact Manufacturer's representative: P: 877.224.5850, F: 866.594.3490 or Email at: info@barrierone.com or equal.
   ii. Concrete moisture vapor reduction admixture (MVRA) for all interior slab (on ground and elevated) and structural roof deck construction shall be a non-toxic, liquid admixture that is free of all volatile organic compounds (VOC). It shall be specifically designed to have a natural chemical reaction with pre-existing elements inside the concrete to eliminate the route of moisture vapor emission through the slab by restricting the integral capillary system. Chemical reaction shall form a permanent barrier (capillary break) that is integral to the concrete, insoluble, and irremovable.
      1. Hydraulic conductivity: Project specific maximum of 6.0 E-8 cm/s per ASTM D5084
      2. Toxicity: None
      3. Odor: None
      4. Flammability: None
      5. VOC levels: zero
      6. Solvent: water
      7. Freeze Temp: 32 degrees Fahrenheit (0°C) (store above 36° F (2.3° C))
      8. Acid resistance: Excellent
      9. Hazardous vapors: None
      10. Installation: All concrete
      11. Capillary break: Calcium Silicate Hydrate
      12. pH: 11.3
      13. weight: 10.3 lbs/gal (net)
      14. Integral biocide to inhibit growth of mold and bacteria

CONCRETE MASONRY UNITS:

A. Concrete Masonry Units (CMU): Architectural grade, load bearing ASTM C90, Type-1, Grade N-1, with integral water repellent admixture.
   i. Units shall be uniform in all directions with texture straight and free from cracks, spalls, and other defects. Do not use damaged, cracked, or otherwise defaced masonry units.
   ii. Face Dimensions: Concrete Masonry Units nominal sizes are as follows: Nominal 4"x8"x16" and 8"x8"x16".
   iii. Shapes: Provide all shapes as shown on the Plans.

CONCRETE MASONRY UNITS (CONTINUED):

   iv. Concrete blocks shall be cured by the auto-claved method, conforming to ASTM C-331.
B. Mortar Components:
   i. Masonry Cement: Shall conform to ASTM Spec. C-91, Type II.
   ii. Portland Cement: Shall conform to ASTM Spec. C-150, Type I, natural colors.
   iii. Hydrated Lime: Shall coform to ASTM Spec. C-207 and be equal to Type S.
   iv. Sand: Clean natural colored sand conforming to ASTM Spec C-144.
   v. Mixing Water: Water must be clean and potable.
   vi. Pigmented Color Additive shall meet or exceed ASTM C-979.
C. Mortar: Shall conform to ASTM spec. C-270. Submit colors for selection.
D. Grout: Shall conform to ASTM spec. C-476.
E. Anchors and Accessories:
   i. Provide masonry wall ties, reinforcing and accessories as specified herein or as required by work conditions.
   ii. Brick ties shall be 22 gauge galvanized corrugated steel ties that attach to the building structure and permit differential movement between masonry and building structure.
   iii. Ties shall be sized to provide not more than 1" and not less than 1/2" of mortar coverage from masonry face.
F. Cleaner: "Sure Klean" as manufactured by PROCESS SOLVENT CO, INC approved equal or as recommended by masonry manufacturer.
G. Topical Water Repellent: Use CHEMICAL PRODUCTS COMPANY "CP-500" chemical water repellent or approved equal.

CULTURED STONE:

A. Manufacturers: Stone product and materials shall be equal to CORONADO "Freedom Building Stone" series.
B. Stone Materials:
   i. Portland Cement: ASTM C150 Type 1, 2, or 3 depending upon color to be produced.
   ii. Course Aggregates: ASTM C330 lightweight type, color as necessary to obtain final color stone.
   iii. Sand: ASTM C144, special color if required to match approved samples.
   iv. Water: Clean and free of deleterious substances.
C. Building Stone:
   i. Standard Colors: Alamo Sands, Bunker Hill, Independence Blend, Kings Mountain, Liberty Brown, Patriot Blend, Providence, Texas Cream, Yorktown, or any custom color.
   ii. Grout Joint Width: Standard 1/2" average grout joint or varies from 3/8" - 3/4" average grout joint.
   iii. Grouting Options: Deep raked, full brushed, full smooth tooled, overgrout, or rough brushed.
   iv. Grout Joint Color: Natural Grey or complementary color.
   v. Accessories: Complementary Tiles, Wall Caps, Post Caps and more.
   vi. Size: Stone sizes are 3', 6", 9", and 12" (1-1/2" to 8") in height and range from 3" to 21" in length (nominal). The small size ashlar pattern includes a higher ratio of pieces 6" in height.
   vii. Thickness: 3" (1-1/2" to 1-5/8") nominal.
   viii. Weight: 18 to 22 lbs per square foot.
   ix. Packaging: Available in big boxes (70sf flats).
D. Mortar shall be composed of Cement: ASTM C150, Type I or masonry cement meeting ASTM C91; Masonry sand, complying with ASTM C144, natural or manufactured; Pigments meeting ASTM C979 mineral oxide type.

COLD FORMED METAL FRAMING:

A. Manufacturer: Dietrich Metal Framing www.dietrichindustries.com.
B. Framing System: Provide framing members, bridging, bracing, plates, gussets, clips, fittings, reinforcement, and fastening as required to provide a complete system.
C. Framing Materials:
   i. Studs and Track: non-structural metal framing: Comply with ASTM C645. Use 20 gauge wall framing equal to ProSTUD drywall stud system. Install lateral bracing for all walls of 10'-0" in height or taller. Install 18 gauge studs at fire rated wall.
   ii. Joists and Purlins: Fabricated from ASTM A653/A653M steel sheet, with G90/Z275 hot dipped galvanized coating.
   iii. Framing Connectors: Factory-made formed steel sheet, ASTM A653/A653M SS Grade 50, with G60/Z180 hot dipped galvanized coating and factory punch holes.
   iv. Install lateral bracing in non-load bearing walls at 4'-0" o.c. for walls 10' in height or taller.
   v. Install UL listed assemblies where shown on drawings.
D. Accessories: Formed sheet steel, thickness determined for conditions encountered and finish to match framing components.
E. Fasteners:
   i. Self-Drilling, Self-Tapping Screws, Bolts, Nuts, and Washers: hot dipped galvanized per ASTM A153/A153M.
   ii. Power Activated Anchorage Devices.

ROUGH CARPENTRY:

A. Provide framing and blocking members as indicated or as required to support finishes, fixtures, specialty items, and trim.
B. In metal stud walls, provide continuous blocking around door and window openings for anchorage of frames, securely attached to stud framing.
C. In walls, provide blocking attached to studs as backing and support for wall-mounted items, unless item can be securely fastened to two or more studs or other method of support is explicitly indicated.

FINISH CARPENTRY:

1. PLASTIC LAMINATE-FACED ARCHITECTURAL CABINETS
   A. Quality Standard: Unless otherwise indicated, comply with the "Architectural Woodwork Standards" for grades of architectural plastic-laminate cabinets indicated for construction, finishes, installation, and other requirements.
      1. Grade: Custom
      2. Type of Construction: Face Frame
      3. Cabinet, Door and Drawer Front Interface Style: Flush overlay
   B. High-Pressure Decorative Laminate: NEMA LD 3, grades as indicated or if not indicated, as required by woodwork quality standard.
      1. Basis-of-Design Product: Subject to compliance with requirements, provide Wilsonart LLC; Decorative Plastic Laminates or a comparable product.
   C. Laminate Cladding for Exposed Surfaces: (including countertops)
      1. Horizontal Surfaces: Grade HGS.
      2. Postformed Surfaces: Grade HGP.
      3. Vertical Surfaces: Grade HGS.
      4. Edges: ABS/PVC extruded fabrication.
   D. Materials for Semiexposed Surfaced:
      1. Surfaces Other Than Drawer Bodies: High-pressure decorative laminate, NEMA LD 3, Grade VGS.
         a. Edges of Plastic-Laminate Shelves: ABS/PVC extruded fabrication.
         b. For semiexposed backs of panels with exposed plastic-laminate surfaces, provide surface of high-pressure decorative laminate, NEMA LD 3, grade VGS.
      2. Drawer Sides and Backs: Thermoset decorative panels with ABS/PVC extrusion banding.
      3. Drawer Bottoms: Thermoset decorative panels.
   E. Concealed Backs of Panels with Exposed Plastic-Laminate Surfaces: High-pressure decorative laminate, NEMA LD 3, Grade BKL.
   F. Drawer Construction: Fabricate with exposed fronts fastened to subfront with mounting screws from interior of body.
      1. Join subfronts, backs, and sides with glued rabbeted joints supplemented by mechanical fasteners.
   G. Colors, Patterns, and Finishes: Provide materials and products that result in colors and textures of exposed laminate surfaces complying with the following requirements:
   H. Wood Products: Provide materials that comply with requirements of referenced quality standard for each type of woodwork and quality grade specified unless otherwise indicated.
      1. Wood Moisture Content: 5 to 10 percent.
   I. Composite Wood Products: Products shall be made without urea formaldehyde.
      1. Medium-Density Fiberboard: ANSI A208.2, Grade 130
      2. Particleboard: ANSI A208.1, Grade M-2.
      3. Particleboard: Straw-based particleboard complying with requirements in ANSI A208.1, Grade M-2, except for density.
         a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
            1) Environ Biocomposites Manufacturing LLC.
            2) Sorm Incorporated.
      4. Softwood Plywood: DOC PS 1, medium-density overlay.
      5. Thermoset Decorative Panels: Particleboard or medium-density fiberboard finished with thermally fused, melamine-impregnated decorative paper and complying with requirements of NEMA LD 3, Grade VGL, for test methods 3.3, 3.4, 3.6, 3.8, and 3.10.
         a. Basis-of-Design Product: Subject to compliance with requirements, provide Wilsonart Thermally Fused Laminate Panels or an approved equal.
   J. Cabinet Hardware: Provide cabinet hardware and accessory materials associated with architectural cabinets except for items specified in Section 08 71 00 "Door Hardware (Descriptive Specification)."
      1. Butt Hinges: 2-3/4-inch, five-knuckle steel hinges made from 0.095-inch- thick metal, and as follows:
         a. Semiconcealed Hinges for Flush Doors: BHMA A156.9, B01361.
      2. Wire Pulls: Back mounted, solid metal, 5/16 inch in diameter, 5 inches long, 2-1/2 inches deep, and 5/16 inch in diameter.
      3. Catches: Magnetic catches, BHMA A156.9, B03141.

(ARCHITECTURAL SPECIFICATIONS CONTINUED)

FINISH CARPENTRY (CONTINUED):

5. Shelf Rests: BHMA A156.9, B04013; metal.
6. Drawer Slides: BHMA A156.9.
   a. Grade 1 and Grade 2: Side mounted, full-extension; zinc-plated steel with polymer rollers.
   b. Grade 1HD-100 and Grade 1HD-200: Side mounted; full-extension type; zinc-plated-steel ball-bearing slides.
   c. For drawers not more than 3 inches high and not more than 24 inches wide, provide Grade 1.
   d. For drawers more than 3 inches high but not more than 6 inches high and not more than 24 inches wide, provide Grade 1.
   e. For drawers more than 6 inches high or more than 24 inches wide, provide Grade 1HD-100.
7. Door Locks: BHMA A156.11, E07121.
8. Drawer Locks: BHMA A156.11, E07041.
9. Door and Drawer Silencers: BHMA A156.16, L03011.

K. Furring, Blocking, Shims, and Hanging Strips: Softwood or hardwood lumber, kiln dried to less than 15 percent moisture content.

L. Anchors: Select material, type, size, and finish required for each substrate for secure anchorage. Provide metal expansion sleeves or expansion bolts for post-installed anchors. Use nonferrous-metal or hot-dip galvanized anchors and inserts at inside face of exterior walls and at floors.

M. Shop-cut openings to maximum extent possible to receive hardware, appliances, electrical work, and similar items. Locate openings accurately and use templates or roughing-in diagrams to produce accurately sized and shaped openings. Sand edges of cutouts to remove splinters and burrs. For decorative plastic laminates, comply with manufacturer's written fabrication instructions.

2. SOLID SURFACE WINDOW SILL
   A. Acceptable Product: "Wilsonart Solid Surface", or approved equal.
   B. Composition: Acrylic resins, fire-retardant mineral fillers, and proprietary coloring agents. Through-the-body color for full thickness of sheet material.
   C. Material Thickness: 1/2 inch, nominal.
   D. Color, Pattern, and Finish Design: To be selected from manufacturer's standard offerings.
   E. Edge Detail: 1" bullnose as indicated on Drawings.
   F. Siliconized Acrylic Sealant: Siliconized acrylic latex sealant. For general applications to fill gaps between countertops and at terminating substrates. Complies with ASTM C 834, Type OP, Grade NF, and SCAQMD Rule 1168.
      1. Product: "Wilsonart Color Matched Caulk" or approved equal.
      2. Color: Selected from sealant manufacturer's standard offerings.
   G. Construction Adhesive: Countertop manufacturer's recommended silicone-based construction adhesive for backsplashes, endsplashes, and other applications according to manufacturer's published fabrication instructions.

3. CHEMICAL RESISTANT COUNTERTOPS
   A. Manufacturer's shall be equal to Durcon, Incorporated, 206 Allison Drive, Taylor, TX 76574, 512-595-8000, www.durcon,com.
   B. Solid Epoxy Resin:
      1. Sheets cast from modified epoxy resin and non-asbestos inert fillers; compounded mixture cured and thermoset specifically from formulation to provide exceptional physical and chemical resistance required in medium to heavy duty laboratory environments, in accordance with SEFA 3. Sheets to be monolithic throughout without surface coating application,
      2. Color: Black Onyx
   C. Installation Materials: Manufacturer's joint adhesive, panel adhesive, and sealants as required to suit project conditions.

4. FABRICATION
   A. Plastic Laminate-Faced Architectural Cabinets
      1. Sand lightly to remove raised grain on exposed surfaces before fabrication.
      2. Fabricate cabinets to dimensions, profiles, and details indicated.
      3. Complete fabrication, including assembly and hardware application, to maximum extent possible before shipment to Project site. Disassemble components only as necessary for shipment and installation. Where necessary for fitting at site, provide ample allowance for scribing, trimming, and fitting.
   B. Solid Surface Window Sill
      1. Fabricate components in shop, to greatest extent practicable, in sizes and shapes indicated according to approved shop drawings and manufacturer's published fabrication requirements.
      2. Form joint seams between solid surfacing components with specified seam adhesive. Completed joints inconspicuous in appearance and without voids. Provide joint reinforced if required by manufacturer for particular installation conditions.
      3. Provide holes and cutouts indicated on approved shop drawings. Rout cutouts and complete by sanding all edges smooth.
   C. Chemical Resistant Countertops
      1. Fabricated tops and accessories in accordance with manufacturer's recommendations, approved Shop Drawings, and SEFA 3.
      2. Epoxy Resin Countertops:
         a. Thickness: 1-1/4 inches unless otherwise indicated. Check each sheet at factory for required thickness. Maximum variation in thickness: plus or minus 1/16 inch (1.6 mm) from corner to corner.
         b. Warpage: Inspect tops for warpage prior to fabrication by placing on true flat surface. Maximum allowable warpage: 1/16 inch in 36 inch span.
         c. Fabrication: Shop fabricate in longest practical lengths. Bond joints with highly chemical resistant cement with properties and color similar to base material. Finish exposed edges.
         d. Edge treatment: Standard 1/4 inch (2 mm) radius edge.
         e. Corner treatment: exposed corners shall be eased slightly for safety.
         f. Back and end splashes: Supplied loose for field installation. Material thickness of 1" and 4 " high unless otherwise indicated. Top-mounted end splash where countertop abut adjacent construction at and locations indicated on Drawings. Edges to match countertop surface.
         g. Joints: Maximum 1/8 inch, bonded with epoxy grout.
         h. Make joints between two benches level.
         i. Locate joints away from sinks and over or near supports.
         j. Sink cutouts: Routed for under mount sink.
         k. Allowable tolerances: Plus or minus 1/64 inch for each 12 inches of length. Location of cutouts and drilled openings: Plus or minus 1/8 inch of design dimension. Size of cutouts and drilled openings: Plus 1/8 inch or minus 0 inches.

THERMAL INSULATION:

1. BATT INSULATION MATERIALS
   A. Batt Insulation: ASTM C-665, preformed batt, conforming to the following:
      i. Material: Glass fiber.
      ii. Flame Spread Index: 25 or less, when tested in accordance with ASTM E-84.
      iii. Smoke Development Index: 450 or less, when tested in accordance with ASTM E-84.
      iv. Formaldehyde Content: Zero.
      v. Thermal Resistance: R-30 for Ceiling/Roof Deck and R-19 for exterior perimeter walls.
      vi. Thickness: 10" minimum for Ceiling/Roof Deck and 6" minimum for exterior perimeter Walls. New insulation at roof deck shall be banded.
      vii. Facing: Vapor Barrier Face installed on conditioned side of space.

2. BANDED ROOF INSULATION SYSTEM
   A. Install banded roof insulation system at roof deck throughout building.
   B. Roof insulation system shall be a banded roof insulation system using steel straps and fabric supporting batts with an installed total roof insulation R-value of R-30 and an average installed thickness of 9".
   C. Steel strap: Shall be primed and painted "white" on the exposed side and clear coat primer on the unexposed side. Minimum size shall be 0.02"x1" continuous length.
   D. Fasteners: #12 self-drilling screws and washers for fastening to 12 gauge steel. Always install two fasteners in the end of each strap for safety and to withstand installation stress, and on fastener at all other designated fastening points.
   E. Fabric: Shall be woven reinforced high-density polyethylene yarns. The fabric shall be Class A compliant with a low flame spread index of 25. Pieces shall be fabricated to substantially fit the large defined building areas with a minimum practical sealing to be done on job site. Fabric shall be folded to allow for rapid pull-out on the strap support system.
   F. Sealants: Shall be high tack solvent-based vapor barrier sealant for sealing vapor barrier laps.
   G. Insulation: Shall be formaldehyde-free fiberglass blanket or batt insulation.
   H. Insulation Hangers: Shall be insulation hangers for supporting insulation between wall girt or roof purlins in roof pitches noted on drawings.
   I. Finish: Special attention shall be given to exposed ceiling located in the Lobby, Corridors, and Dining Rooms. The Gym ceiling will be exposed to the metal roof deck with rigid insulation on top. The insulation shall have a "shite" finish throughout. The exposed raised Lobby ceiling and Dining shall be painted "white" after miscellaneous devices are installed. All Corridors shall be exposed and painted "black" after miscellaneous devices are installed.

3. BANDED WALL INSULATION SYSTEM
   A. Install banded wall insulation system at exterior perimeter walls throughout building.

THERMAL INSULATION (CONTINUED):

   B. Wall insulation system shall be a metal strap and fabric system with an installed total roof insulation R-value of R-19 and an average installed thickness of 8 inches. A thermal break shall be applied where there is no existing thermal break between metal panel and metal structure. The thermal break shall be 3/16" x 3" foam tape.
   C. Steel strap shall be primed and painted "white" on the exposed side and clear coat primer on the unexposed side. Minimum size shall be 0.02 x 1" continuous length.
   D. Fasteners: #12 self-drilling screws and washers for fastening to 12 gauge steel or heavier gauge steel. Always install two fasteners in the end of each strap for safety and to withstand installation stress, and one fastener at all other designated fastening points.
   E. Fabric: Shall be woven reinforced high-density polyethylene yarns coated with a continuous white film. The fabric shall be Class A compliant with a low flame spread index of 25. Pieces shall be fabricated to substantially fit the large defined building areas with minimum practical sealing to be done on job site. Fabric shall be folded to allow for rapid pull-out on the strap support system.
   F. Sealants: Shall be high tack solvent-based vapor barrier sealant for sealing vapor barrier laps.
   G. Insulation: Shall be formaldehyde-free fiberglass blanket or batt insulation.
   H. Insulation Hangers: Shall be insulation hangers for supporting insulation between wall girt or roof purlins in roof pitches noted on Drawings.

4. SOUND INSULATION
   A. Install sound insulation to perimeter of all Restrooms, Offices, Classrooms, Mechanical and any areas identified on Drawings.
   B. 3.5 inches thick R-11 friction fit sound insulation batts or rock-wool batts having a 49 STC for sound attenuation.

5. CRACKAGE INSULATION
   A. Use two part mutli-purpose polyurethane low-expandable foam insulation similar to a material manufactured by INSTA-FOAM PRODUCTS, (1-800-800-3626). Apply with wand for filling, sealing, and insulating in and around any voids, holes, conduits and/or irregular surfaces that might allow any air infiltration.
   B. Assure continuation and continuity of insulation envelope around total conditioned area. Any uninsulated voids to receive supplemental insulation with materials to assure comparable "R" factor to adjacent areas. Assure insulation of stud wall tees and corners.

JOINT SEALERS:

   A. Sealants are to be used in any areas having cracks, open joints or subject to movement that might permit entry of moisture, dust, air, insects, etc., into building.
      i. Exterior sealants on building materials shall be equal to "Vulkem" one part high performance polyurethane manufactured by MAMECO INTERNATIONAL or a one part polysulfide base sealant equal to CHEM-CALK 100. Color of sealant to match adjacent material color.
      ii. Interior sealant as CHEM-CALK 600 acrylic latex for areas to be painted. Use recommended primer on porous surfaces or where required.
      iii. Use polyethylene foam rope joint backer rod at joints exceeding 1/2" in depth.
      iv. Exterior sealants at concrete shall be one part high performance polyurethane as SONNEBORN "Sonolastics" SL-1 (self-leveling). Color of sealant to match adjacent material color or as approved by Architect.

METAL DOORS & FRAMES:

1. SHOP-APPLIED PAINT
   A. For steel surfaces, use rust-inhibitive enamel or paint, either air-drying or baking, suitable as a base for specified finish paints.

2. FABRICATION, GENERAL
   A. Fabricate steel door and frame units to be rigid, neat in appearance and free from defects, warp or buckle. Wherever practicable, fit and assemble units in manufacturer's plant. Clearly identify items before shipment, to assure proper assembly at project site. Fabricate exposed faces of doors and panels from only cold-rolled steel. Fabricate frames, concealed stiffeners, reinforcement, edge channels, louvers and mouldings from either cold-rolled or hot-rolled steel (at fabricator's option). Fabricate exterior doors and frames from galvanized sheet steel.

3. STANDARD HOLLOW METAL DOORS
   A. Provide metal doors of dimensions indicated on drawings or schedules and complying with SDI-100 for minimum materials and construction requirements. Interior doors shall be full flush face 20 gauge metal doors with honey comb core as shown on drawings, properly reinforced, drilled and tapped for hardware required. Doors shall be delivered to the job, thoroughly cleaned and primered. Exterior doors shall be 16 gauge galvanized steel with foamed in place insulated core with a minimum R-value of 7.
   B. Subject to same requirements as standard hollow metal doors, provide 1-3/4" thick doors, with 16 gauge steel with flush tubular steel tops. Stile to extend the full height of door and rails internally welded or mechanically joined to form a neat seal on the face, similar to CECO DOOR PRODUCTS - "Trulite Series".

4. METAL FRAMES
   A. Provide metal frames of types, styles and dimensions indicated on drawings or schedules and complying with SDI-100 for minimum materials and construction requirements. Furnish 16 gauge steel for interior frames and 14 gauge galvanized steel for exterior frames. Fabricate frames with 5/8" high formed integral stop having 2" wide face and 1/2" return to wall as shown. See Schedule for door frame width. Reinforce strike and hinge plates; factory drill and tap. Use concealed fasteners, unless otherwise indicated. Fabricate frames of welded construction for both exterior and interior applications. All corners are to be mitered with welds ground smooth.

5. FINISH HARDWARE PREPARATION
   A. Prepare hollow metal units to receive mortised and concealed finish hardware, including cutouts, reinforcing, drilling and tapping in accordance with final HARDWARE SCHEDULE in Section 08710 and templates provided by hardware supplier. Reinforce hollow metal units to receive surface-applied hardware. Drilling and tapping for surface-applied finish hardware may be done at project site. Locate finish hardware drilling for installation as shown on final shop drawings or, if not shown, in accordance with "Recommended Locations for Builder's Hardware", published by the Door and Hardware Institute.

6. DOOR SILENCERS
   A. Drill stops to receive 3 silencers on strike jambs of single swing frames and 2 silencers on heads of double-swing frames. Manufacturer's "stick-on" silencers will not be acceptable in lieu of drilled type.

7. SHOP PAINTING
   A. Clean, treat and paint exposed surfaces of fabricated hollow metal units, including galvanized surfaces. Clean steel surfaces of mill scale, rust, oil, grease, dirt and other foreign materials before the application of shop coat of paint. Grind all welds smooth; fill before priming. Apply shop coat of rust-inhibitive prime paint applied in even consistency to provide a uniformly finished surface ready to receive field-applied paint.
   B. Hardware: Installation to be in strict conformance with manufacturer's specifications and instructions. All hardware to operate smoothly and properly and not bind in opening. Master keys to be delivered to Architect at final inspection.
   C. Guarantee: This contractor will guarantee all labor, equipment and materials for a period of one (1) year from acceptance date. Warranty does not cover vandalism, unauthorized repair attempts or acts of God. Warranties exceeding one (1) year will not be affected by this warranty.
   D. Coordination: All items required to complete this work to be delivered to job site at such time to allow for proper coordination and installation into work. Coordinate with work of other trades. Install members true to line, plumb, level, square and in proper planes with other work, free from sags, waves, buckles or other objectionable defects. Adequately anchor to safety resist all stresses to which the members shall normally be subjected.

ALUMINUM DOORS AND FRAMES:

1. ALUMINUM DOORS
   A. Aluminum entrance doors shall be equal to KAWNEER wide stile 500. Doors shall have full mortise continuous aluminum hinges equal to MARKAR #FM-100, heavy duty closers with A.D.A. pull force. A.D.A. compliant threshold, weather stripping, and A.D.A. compliant pull.

2. ALUMINUM FRAMES
   A. Aluminum frames for doors and windows shall be as shown on the drawings and equal to KAWNEER Trifab 451 using concealed glazing system for 1" thick, dual glazing for exterior frames and 1/4 inch single glazing for interior frames.
   B. Frames shall be fabricated to fit field openings with minimum clearances and shim spacing around perimeter of assembly allowing for dynamic movement of perimeter seal. Caulk perimeter of frames.

3. FINISHES
   A. Finish: Kawneer Permanodic AA-M10C21A44 / AA-M45C22A44, AAMA 611, Architectural Class / Color Anodic Coating (Color "medium" or "dark bronze" finish) or clear finish depending on Owner selection.

4. HARDWARE
   A. Provide door manufacturer's standard heavy-duty hardware units as indicated, scheduled, or required for operation of each door.

5. DOOR FABRICATION
   A. Fabricate doors from aluminum alloy 6063-T5 extruded aluminum.

ALUMINUM DOORS AND FRAMES (CONTINUED):

   B. Required sizes for doors including profile requirements are as indicated on drawings. To greatest extent possible, complete the fabrication, assembly, finishing, hardware application and other work before shipment to project site.
   C. Fabricate doors to facilitate replacement of glass panels without disassembly of door stiles and rails.
   D. For exterior doors, provide compression weatherstripping against fixed stops; at other edges, provide sliding weatherstripping retained in adjustable strip mortised into door edge. Provide EPDM/vinyl blade gasket weatherstripping in bottom door rail, adjustable for contact with threshold.

6. FRAME AND FIXED GLASS WINDOW FABRICATION
   A. Fabricate frames and all other extruded aluminum work from aluminum alloy 6063-T5 extruded aluminum according to sizes indicated on drawings and verified by field measurements.
   B. Required sizes for frames including profile requirements are as indicated on drawings. To greatest extent possible, complete the fabrication, assembly, finishing, hardware application and other work before shipment to project site. Disassemble components only as necessary for shipment and installation.
   C. Perform fabrication operations, including cutting, fitting, forming, drilling and grinding of metal work in manner which prevents damage to exposed finish surfaces. Do not drill and tap for surface-mounted hardware items until time of installation at project site.
   D. Install reinforcing as necessary for performance requirements; separate dissimilar metals with bituminous paint or other separator which will prevent corrosion. Maintain accurate relation of planes and angles, with hairline fit contacting members use concealed fasteners wherever possible.
   E. Provide inside-outside matched resilient flush-glazed system for 1" insulating glass with provisions for glass replacement. Shop-fabricate and preassemble frame components where possible.
   F. Provide snap-on extruded aluminum glazing stops with exterior stops anchored for non-removal.

WOOD DOORS:

1. INTERIOR FLUSH WOOD DOORS
   A. Solid Core Wood Doors to have type I waterproof bond. Core construction to be solid wood block or wood particleboard as required by door manufacturer to comply with specified warranty period. Face panels of manufacturer's standard of 5-ply veneer.
   B. Exposed surfaces of door veneer for interior wood doors as shown on schedule to receive a transparent finish, provide manufacturer's standard thickness face veneers of AWI custom grade face veneers of plain sliced red oak as per schedule. Provide matching hardwood exposed edges and other exposed solid wood components for non-labeled doors to be equal to MARSHFIELD DOOR SYSTEMS, Signature series.
   C. Doors shall be factory prepared to receive door hardware. Preparations shall be in accordance with approved Hardware Schedule following templates and instructions provided by the hardware manufacturer.

2. DOORS
   A. Interior Doors: 1-3/4 inches thick unless otherwise indicated; flush construction.
   B. Provide solid core doors at all locations.
   C. Fire Rated Doors: Tested to ratings indicated on drawings in accordance with International Building Code ("positive pressure"); UL or WH (ITS) labeled without any visible seals when door is open.

3. DOOR AND PANEL CORES
   A. Non-Rated Solid Core and 20 Minute Rated Doors: Type particleboard core (PC), plies and faces as indicated above.
   B. Fire Rated Doors: Mineral core, Type FD, plies and faces as indicated above; with core blocking as required to provide adequate anchorage of hardware without through-bolting.

4. DOOR FACING
   A. Wood Veneer Facing for Stained Transparent Finish: Red oak, veneer grade as specified by quality standard, plain sliced, book veneer match, running assembly match; unless otherwise indicated.
   B. Vertical Edges shall be the same species as the face veneer.

5. DOOR CONSTRUCTION
   A. Fabricate doors in accordance with door quality standard specified.
   B. Cores Constructed with Stiles and Rails.
   C. Factory machine doors for hardware other than surface-mounted hardware, in accordance with hardware requirements and dimensions.
   D. Provide edge clearances in accordance with AWI Quality Standards Illustrated Section 1700.

OVERHEAD COILING DOORS:

1. MANUFACTURER
   A. Overhead Coiling Door: Equal to Overhead Door Corporation; Thermacore Series; Model 625: ww.overheaddoor.com.

2. COILING OVERHEAD DOORS
   A. Exterior Overhead Coiling Doors: Steel slat curtain
      i. Capable of withstanding positive and negative wind loads of 20 psf, without undue deflection or damage to components.
      ii. Sandwich slat construction with insulated core of polyurethane.
      iii. Weatherseals: Vinyl bottom seal, exterior guide and internal hood seals at perimeter of opening.
      iv. Finish: Factory finish powder-coat, both sides interior and exterior, color selected by Owner.
      v. Guides: Angles; galvanized steel.
      vi. Hood Enclosure: Manufacturer's standard; primed steel and painted both sides interior and exterior to match door color.
      vii. Electric Motor Operation: Provide UL listed electric operator, 110V, 1/2 hp by manufacturer to move door in either direction at not less than 2/3 foot nor more than 1 foot per second.
         a. Sensing Edge Protection: Electric. Safety edge take up real.
         b. Operator Controls: Push-button operated control stations with open, close, and stop buttons for surface mounting interior side only.
      viii. Mounting: Within framed opening (between jambs).

DOOR HARDWARE:

1. SCHEDULED DOOR HARDWARE
   A. General: Provide door hardware for each door to comply with requirements in Door Hardware Sets and each referenced section that products are to be supplied under.
   B. Designations: Requirements for quantity, item, size, finish or color, grade, function, and other distinctive qualities of each type of door hardware are indicated in the Door Hardware Sets at the end of Part 3. Products are identified by using door hardware designations, as follows:
      1. Named Manufacturer's Products: Product designation and manufacturer are listed for each door hardware type required for the purpose of establishing requirements. Manufacturers' names are abbreviated in the Door Hardware Schedule.

2. HANGING DEVICES
   A. Hinges: ANSI/BHMA A156.1 certified butt hinges with number of hinge knuckles and other options as specified in the Door Hardware Sets.
      1. Quantity: Provide the following hinge quantity:
         a. Two Hinges: For doors with heights up to 60 inches.
         b. Three Hinges: For doors with heights 61 to 90 inches.
         c. Four Hinges: For doors with heights 91 to 120 inches.
         d. For doors with heights more than 120 inches, provide 4 hinges, plus 1 hinge for every 30 inches of door height greater than 120 inches.
      2. Hinge Size: Provide the following, unless otherwise indicated, with hinge widths sized for door thickness and clearances required:
         a. Widths up to 3'0": 4-1/2" standard or heavy weight as specified.
         b. Sizes from 3'1" to 4'0": 5" standard or heavy weight as specified.
      3. Hinge Weight and Base Material: Unless otherwise indicated, provide the following:
         a. Exterior Doors: Heavy weight, non-ferrous, ball bearing or oil impregnated bearing hinges unless Hardware Sets indicate standard weight.
         b. Interior Doors: Standard weight, steel, ball bearing or oil impregnated bearing hinges unless Hardware Sets indicate heavy weight.
      4. Hinge Options: Comply with the following:
         a. Non-removable Pins: Provide set screw in hinge barrel that, when tightened into a groove in hinge pin, prevents removal of pin while door is closed; for the all out-swinging lockable doors.
      5. Manufacturers:
         a. Bommer Industries (BO).
         b. Hager Companies (HA).
         c. McKinney Products; ASSA ABLOY Architectural Door Accessories (MK).

(ARCHITECTURAL SPECIFICATIONS CONTINUED)

DOOR HARDWARE (CONTINUED):

B. Continuous Geared Hinges: ANSI/BHMA A156.26 Grade 1-600 certified continuous geared hinge. with minimum 0.120-inch thick extruded 6060 T6 aluminum alloy hinge leaves and a minimum overall width of 4 inches. Hinges are non-handed, reversible and fabricated to template screw locations. Factory trim hinges to suit door height and prepare for electrical cut-outs.
   1. Manufacturers:
      a. Bommer Industries (BO).
      b. Hager Companies (HA).
      c. Pemko Products; ASSA ABLOY Architectural Door Accessories (PE).

3. DOOR OPERATING TRIM
   A. Flush Bolts and Surface Bolts: ANSI/BHMA A156.3 and A156.16, Grade 1, certified.
      1. Flush bolts to be furnished with top rod of sufficient length to allow bolt retraction device location approximately six feet from the floor.
      2. Furnish dust proof strikes for bottom bolts.
      3. Surface bolts to be minimum 8" in length and U.L. listed for labeled fire doors and U.L. listed for windstorm components where applicable.
      4. Provide related accessories (mounting brackets, strikes, coordinators, etc.) as required for appropriate installation and operation.
      5. Manufacturers:
         a. Rockwood Products; ASSA ABLOY Architectural Door Accessories (RO).
   B. Door Push Plates and Pulls: ANSI/BHMA A156.6 certified door pushes and pulls of type and design specified in the Hardware Sets. Coordinate and provide proper width and height as required where conflicting hardware dictates.
      1. Push/Pull Plates: Minimum .050 inch thick, size as indicated in hardware sets, with beveled edges, secured with exposed screws unless otherwise indicated.
      2. Offset Pull Design: Size, shape, and material as indicated in the hardware sets. Minimum clearance of 2 1/2-inches from face of door and offset of 90 degrees unless otherwise indicated.
      3. Fasteners: Provide manufacturer's designated fastener type as indicated in Hardware Sets.
      4. Manufacturers:
         a. Rockwood Products; ASSA ABLOY Architectural Door Accessories (RO).

4. CYLINDERS AND KEYING
   A. General: Cylinder manufacturer to have minimum (10) years experience designing secured master key systems and have on record a published security keying system policy.
   B. Source Limitations: Obtain each type of keyed cylinder and keys from the same source manufacturer as locksets and exit devices, unless otherwise indicated.
      1. Manufacturers:
         a. Corbin Russwin Hardware (RU).
         b. Sargent Manufacturing (SA).
   C. Cylinder Types: Original manufacturer cylinders able to supply the following cylinder formats and types:
      1. Threaded mortise cylinders with rings and cams to suit hardware application.
      2. Rim cylinders with back plate, flat-type vertical or horizontal tailpiece, and raised trim ring.
      3. Bored or cylindrical lock cylinders with tailpieces as required to suit locks.
      4. Tubular deadlocks and other auxiliary locks.
      5. Mortise and rim cylinder collars to be solid and recessed to allow the cylinder face to be flush and be free spinning with matching finishes.
      6. Keyway: Manufacturer's Standard.
   D. Keying System: Each type of lock and cylinders to be factory keyed.
      1. Supplier shall conduct a "Keying Conference" to define and document keying system instructions and requirements.
      2. Furnish factory cut, nickel-silver large bow permanently inscribed with a visual key control number as directed by Owner.
      3. New System: Key locks to a new key system as directed by the Owner.
   E. Key Quantity: Provide the following minimum number of keys:
      1. Change Keys per Cylinder: Two (2)
      2. Master Keys (per Master Key Level/Group): Five (5).
   F. Key Registration List (Bitting List):
      1. Provide keying transcript list to Owner's representative in the proper format for importing into key control software.
      2. Provide transcript list in writing or electronic file as directed by the Owner.

5. KEY CONTROL
   A. Key Control Cabinet: Provide a key control system including envelopes, labels, and tags with self-locking key clips, receipt forms, 3-way visible card index, temporary markers, permanent markers, and standard metal cabinet. Key control cabinet shall have expansion capacity of 150% of the number of locks required for the project.
      1. Manufacturers:
         a. Lund Equipment (LU).
         b. Telkee (TK).

6. MECHANICAL LOCKS AND LATCHING DEVICES
   A. Cylindrical Locksets, Grade 2 (Standard Duty): ANSI/BHMA A156.2, Series 4000, Grade 2 Certified Products Directory (CPD) listed.
      1. Locks are to be non-handed and fully field reversible.
      2. Manufacturers:
         a. Corbin Russwin Hardware (RU) - CL3800 Series.
         b. Dormakaba Best (BE) - 7KC Series.
         c. Sargent Manufacturing (SA) - 7 Line.

7. AUXILIARY LOCKS
   A. Cylindrical Deadlocks: ANSI/BHMA A156.36 Grade 1 Certified Products Directory (CPD) listed deadlocks to fit standard ANSI 161 preparation and 1 3/8" to 1 3/4" thickness doors. Provide tapered collars to resist vandalism and 1" throw solid steel bolt with hardened steel roller pins. Deadlocks to be products of the same source manufacturer and keyway as other locksets.
      1. Manufacturers:
         a. Corbin Russwin Hardware (RU) - DL3000 Series.
         b. Sargent Manufacturing (SA) - 480 Series.

8. LOCK AND LATCH STRIKES
   A. Strikes: Provide manufacturer's standard strike with strike box for each latch or lock bolt, with curved lip extended to protect frame, finished to match door hardware set, unless otherwise indicated, and as follows:
      1. Flat-Lip Strikes: For locks with three-piece antifriction latchbolts, as recommended by manufacturer.
      2. Extra-Long-Lip Strikes: For locks used on frames with applied wood casing trim.
      3. Aluminum-Frame Strike Box: Provide manufacturer's special strike box fabricated for aluminum framing.
      4. Double-lipped strikes: For locks at double acting doors. Furnish with retractable stop for rescue hardware applications.
   B. Standards: Comply with the following:
      1. Strikes for Mortise Locks and Latches: BHMA A156.13.
      2. Strikes for Bored Locks and Latches: BHMA A156.2.
      3. Strikes for Auxiliary Deadlocks: BHMA A156.36.
      4. Dustproof Strikes: BHMA A156.16.

9. CONVENTIONAL EXIT DEVICES
   A. General Requirements: All exit devices specified herein shall meet or exceed the following criteria:
      1. At doors not requiring a fire rating, provide devices complying with NFPA 101 and listed and labeled for "Panic Hardware" according to UL305. Provide proper fasteners as required by manufacturer including sex nuts and bolts at openings specified in the Hardware Sets.
      2. Where exit devices are required on fire rated doors, provide devices complying with NFPA 80 and with UL labeling indicating "Fire Exit Hardware". Provide devices with the proper fasteners for installation as tested and listed by UL Consult manufacturer's catalog and template book for specific requirements.
      3. Except on fire rated doors, provide exit devices with hex key dogging device to hold the pushbar and latch in a retracted position. Provide optional keyed cylinder dogging on devices where specified in Hardware Sets.
      4. Devices must fit flat against the door face with no gap that permits unauthorized dogging of the push bar. The addition of filler strips is required in any case where the door light extends behind the device as in a full glass configuration.
      5. Lever Operating Trim: Where exit devices require lever trim, furnish manufacturer's heavy duty escutcheon trim with threaded studs for thru-bolts.
         a. Lock Trim Design: As indicated in Hardware Sets, provide finishes and designs to match that of the specified locksets.
         b. Where function of exit device requires a cylinder, provide a cylinder (Rim or Mortise) as specified in Hardware Sets.
      6. Vertical Rod Exit Devices: Where surface or concealed vertical rod exit devices are used at interior openings, provide as less bottom rod (LBR) unless otherwise indicated. Provide dust proof strikes where thermal pins are required to project into the floor.

DOOR HARDWARE (CONTINUED):

   7. Narrow Stile Applications: At doors constructed with narrow stiles, or as specified in Hardware Sets, provide devices designed for maximum 2" wide stiles.
   8. Dummy Push Bar: Nonfunctioning push bar matching functional push bar.
   9. Rail Sizing: Provide exit device rails factory sized for proper door width application.
   10. Through Bolt Installation: For exit devices and trim as indicated in Door Hardware Sets.
   B. Conventional Push Rail Exit Devices (Heavy Duty): ANSI/BHMA A156.3, Grade 1 Certified Products Directory (CPD) listed panic and fire exit hardware devices furnished in the functions specified in the Hardware Sets. Exit device latch to be stainless steel, pullman type, with deadlock feature.

10. DOOR CLOSERS
   A. All door closers specified herein shall meet or exceed the following criteria:
      1. General: Door closers to be from one manufacturer, matching in design and style, with the same type door preparations and templates regardless of application or spring size. Closers to be non-handed with full sized covers.
      2. Standards: Closers to comply with UL-10C for Positive Pressure Fire Test and be U.L. listed for use of fire rated doors.
      3. Size of Units: Comply with manufacturer's written recommendations for sizing of door closers depending on size of door, exposure to weather, and anticipated frequency of use. Where closers are indicated for doors required to be accessible to the Americans with Disabilities Act, provide units complying with ANSI ICC/A117.1.
      4. Closer Arms: Provide heavy duty, forged steel closer arms unless otherwise indicated in Hardware Sets.
      5. Closers shall not be installed on exterior or corridor side of doors; where possible install closers on door for optimum aesthetics.
      6. Closer Accessories: Provide door closer accessories including custom templates, special mounting brackets, spacers and drop plates as required for proper installation. Provide through-bolt and security type fasteners as specified in the hardware sets.
   B. Door Closers, Surface Mounted (Large Body Cast Iron): ANSI/BHMA A156.4, Grade 1 Certified Products Directory (CPD) listed surface mounted, heavy duty door closers with complete spring power adjustment, sizes 1 thru 6; and fully operational adjustable according to door size, frequency of use, and opening force. Closers to be rack and pinion type, one piece cast iron body construction, with adjustable backcheck and separate non-critical valves for closing sweep and latch speed control.
      1. Manufacturers:
         a. Corbin Russwin Hardware (RU) - DC8000 Series.
         b. Norton Door Controls (NO) - 9500 Series.
         c. Sargent Manufacturing (SA) - 281 Series.
   C. Door Closers, Surface Mounted (Unitrol): ANSI/BHMA A156.4, Grade 1 Certified Products Directory (CPD) listed surface mounted closers with door stop mechanism to absorb dead stop shock on arm and top hinge. Hold-open arms to have a spring loaded mechanism in addition to shock absorber assembly. Arms to be provided with rigid steel main arm and secondary arm lengths proportional to the door width.
      1. Manufacturers:
         a. Corbin Russwin Hardware (RU) - Unitrol Series.
         b. Norton Door Controls (NO) - Unitrol Series.

11. ARCHITECTURAL TRIM
   A. Door Protective Trim
      1. General: Door protective trim units to be of type and design as specified below or in the Hardware Sets.
      2. Size: Fabricate protection plates (kick, armor, or mop) not more than 2" less than door width (LDW) on stop side of single doors and 1" LDW on stop side of pairs of doors, and not more than 1" less than door width on pull side. Coordinate and provide proper width and height as required where conflicting hardware dictates. Height to be as specified in the Hardware Sets.
      3. Where plates are applied to fire rated doors with the top of the plate more than 16" above the bottom of the door, provide plates complying with NFPA 80. Consult manufacturer's catalog and template book for specific requirements for size and applications.
      4. Protection Plates: ANSI/BHMA A156.6 certified protection plates (kick, armor, or mop), fabricated from the following:
         a. Stainless Steel: 300 grade, 050-inch thick.
      5. Options and fasteners: Provide manufacturer's designated fastener type as specified in the Hardware Sets. Provide countersunk screw holes.
      6. Manufacturers:
         a. Rockwood Products; ASSA ABLOY Architectural Door Accessories (RO).

12. DOOR STOPS AND HOLDERS
   A. General: Door stops and holders to be of type and design as specified below or in the Hardware Sets.
   B. Door Stops and Bumpers: ANSI/BHMA A156.16, Grade 1 certified door stops and wall bumpers. Provide wall bumpers, either convex or concave types with anchorage as indicated, unless floor or other types of door stops are specified in Hardware Sets. Do not mount floor stops where they will impede traffic. Where floor or wall bumpers are not appropriate, provide overhead type stops and holders.
      1. Manufacturers:
         a. Rockwood Products; ASSA ABLOY Architectural Door Accessories (RO).

13. ARCHITECTURAL SEALS
   A. General: Thresholds, weatherstripping, and gasket seals to be of type and design as specified below or in the Hardware Sets. Provide continuous weatherstrip gasketing on exterior doors and provide smoke, light, or sound gasketing on interior doors where indicated. At exterior applications provide non-corrosive fasteners and elsewhere where indicated.
   B. Smoke Labeled Gasketing: Assemblies complying with NFPA 105 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for smoke control ratings indicated, based on testing according to UL 1784.
      1. Provide smoke labeled perimeter gasketing at all smoke labeled openings.
   C. Fire Labeled Gasketing: Assemblies complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire ratings indicated, based on testing according to UL-10C.
      1. Provide intumescent seals as indicated to meet UL10C Standard for Positive Pressure Fire Tests of Door Assemblies, and NPFA 252, Standard Methods of Fire Tests of Door Assemblies.
   D. Sound-Rated Gasketing: Assemblies that are listed and labeled by a testing and inspecting agency, for sound ratings indicated.
   E. Replaceable Seal Strips: Provide only those units where resilient or flexible seal strips are easily replaceable and readily available from stocks maintained by manufacturer.
   F. Manufacturers:
      1. Pemko Products; ASSA ABLOY Architectural Door Accessories (PE).

14. FABRICATION
   A. Fasteners: Provide door hardware manufactured to comply with published templates generally prepared for machine, wood, and sheet metal screws. Provide screws according to manufacturers recognized installation standards for application intended.

15. FINISHES
   A. Standard: Designations used in the Hardware Sets and elsewhere indicate hardware finishes complying with ANSI/BHMA A156.18, including coordination with traditional U.S. finishes indicated by certain manufacturers for their products.
   B. Provide quality of finish, including thickness of plating or coating (if any), composition, hardness, and other qualities complying with manufacturer's standards, but in no case less than specified by referenced standards for the applicable units of hardware.
   C. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

16. HARDWARE SETS
   A. Submit hardware sets based on industry standards for this type of project. Note any fire rated assemblies. 90-minute fire rated hardware is required for doors shown on the Drawings.

GLASS AND GLAZING:

1. GLAZING TYPES
   A. Exterior Doors, Side Lites and Windows: Install 1/4" tinted to match Low-E tempered glazing.
   B. Secure Entrance Doors and Windows: Install 1/4" tempered and laminated (PVB) glass.
   C. Interior Side Lites and Windows (non-rated): Install 1/4" clear tempered glazing at non-rated assemblies.
   D. Interior Side Lites (rated): Install 1/4" clear fire rated tempered glazing at assemblies.
   E. Areas not requiring safety glass or rated glass by law shall be 1/4" clear float glass. Install safety glass and rated glass where required by law or identified on Drawings.

2. PRIME (NONPROCESSED) GLASS
   A. Float/Plate Glass: Type 1, Quality q3, 1/4" thick in standard clear float glass.

3. PROCESSED GLASS
   A. Tempered Glass: Provide prime glass of color and type indicated which has been heat treated to strengthen glass in bending to not less than 4.5 times annealed strength.
   B. Laminated glass (tempered) to be fabricated with heat and pressure, free of foreign substances and air pockets.

GLASS AND GLAZING (CONTINUED):

4. COLOR/TINT
   A. All exterior glaing shall have a "gray" tint in manufacturer's standard color; 56% to 59% light transmittance and 56% solar energy transmittance for exterior glazing; outboard pane insulated glass to have color tint; inboard pane of insulated fixed glass shall be clear.
   B. All interior glazing shall be clear.
   C. Single thickness interior fixed glass shall be clear.
   D. Single thickness exterior fixed glass for doors hall be tinted to match insulated glass.

5. INSULATING GLASS
   A. Furnish insulating units for all exterior installations except doors which shall be 1/4" tempered glass.
   B. Twin primary seals of polyisobutylene; tubular aluminum or galvanized steel spacer-bar frame with welded or soldered sealed corners and filled with dessicant; secondary seal outside of bar, bonded to both sheets of glass and bar, of polysulfide, silicone or hot-melt butyl elastomeric sealant (fabricator's option).
   C. Glazing: All exterior openings shall be glazed with 1" insulated glass. Insulated units shall be 1/4" bronze tinted glass on exterior face and 1/4" low E glass on interior face. Low E coating shall be on the 3rd surface and shall be equal to AFG "Comfort E2".
   D. 10 year warranty on factory sealed units.

6. GLAZING SEALANTS AND COMPOUNDS
   A. General: Provide color of exposed sealant/compound indicated, or if not otherwise indicated, as selected by Architect from manufacturer's standard colors. Comply with manufacturer's recommendations for selection of hardness, depending upon the location of each application, conditions at time of installation and performance requirements as indicated. Select materials and variations or modifications, carefully for compatibility with surfaces contacted in the installation. B, 1-Part Silicone Rubber Glazing Sealant: Elastomeric silicone sealant complying with FS TT-S-001543, Class A, non-sag. Provide acid type recommended by manufactures where only nonporous bond surfaces are contacted; provide nonacid type recommended by manufacturer where one or more porous bond surfaces are contacted.

7. MISCELLANEOUS GLAZING MATERIALS
   A. Cleaners, Primers and Sealers: Type recommended by sealant manufacturer.
   B. Setting Blocks: Neoprene, 70-90 durometer hardness, with proven compatibility with sealants used.
   C. Spacers: Neoprene, 40-50 durometer hardness, with proven compatibility with sealants used.
   D. Compressible Filler Rod: Closed-cell or waterproof-jacketed rod stock of synthetic rubber or plastic foam, compatible with sealants used, flexible and resilient.

GYPSUM BOARD ASSEMBLIES:

1. MATERIALS
   A. United States Gypsum Products:
      1. Drywall Panels on interior metal studs - 5/8" thick gypsum wall board with tapered edges. Moisture resistant (green board) in 5/8" thickness shall be used adjacent to all "wet" area locations and/or as substrate for ceramic tile when applied to drywall.
      2. Drywall Panels on interior of ICF Forms - 5/8" thick fire code (type x) gypsum wall board with tapered edges.
      3. Fasteners - Screw Type S, GWB-54 or W.
      4. Metal Trim - No. J200-A "J" Metal Trim;L200-B "L" Metal Trim; U200-A "U" Metal Trim.
      5. Control Joint - No. 093 rolled form zinc.
      6. Joint System - "Perf-a-Tape" Joint Reinforcing Tape with Ready-Mix Joint Compounds.
      7. Metal Studs and Runners for Non-Load Bearing Partitions - Galvanized steel 2 1/2" and 3 5/8" x 22 gauge (heavy duty .0269) standard studs and runners.
      8. Acoustical insulation shall be 3.5 inches thick, friction fit sound insulation batts or rock-wool batts having a A95TC rating.
      9. Metal framing for exterior soffit and fascias - Shall be as specified in Section 05400 of these Specifications or as shown on the drawings. Refer to drawings for stud sizes.

HARD TILE:

1. HARD TILE
   A. ROOM FINISH LEGEND and ROOM FINISH SCHEDULE located on drawings.
2. GROUT MATERIALS
   A. As recommended by tile manufacturer. Submit available color selections.
   B. Minimal grout joints in tile.
   C. Grout: All grout shall conform with applicable ANSI standards and be installed equivalent to description indicated herein:
      1. Ambient temperature to be minimum of 50° and rising before setting or grouting tile with Portland cement. Comply with minimum temperature recommendations of the manufacturer for bonding and grouting materials other than portland cement mortar.
      2. Wall Tile Grout - Use latex materials as LATICRETE #600 series or approved equal; sanded in color as directed.
      3. Substrate Movement: Cover any substrate cracks prior to installing thin-set adhesive material using a DAL-SEAL CIS composite sheet to bridge any concrete separation that is to be covered by floor tile. Minimum sheet width to be 12". Fill or grind substrate as required to obtain a level surface for attaching with manufacturer's recommended adhesive.
      4. Colors: Manufacturer's colors selected from price group 2. Two (2) colors will be used for pattern shown; see wall layout on drawing for details. Provide to Architect a color pallet of sample tiles available in price range specified to be used for color selection.
      5. Sealant over grout: Install sealant that is approved by grout manufacturer over all hard tile grout.

3. EDGE PROTECTION
   A. Schluter Systems, Plattsburgh, NY (1-800-472-4588)
   B. Edge protection for outside vertical corners, edges of tile where bullnose tile is not installed, and transitions in the tile to tile or tile to foreign material where the edge of the tile is exposed.
   C. Finish shall be satin anodized aluminum.

SUSPENDED ACOUSTICAL CEILINGS:

1. ACOUSTICAL UNITS
   A. Manufacturers: Equal to Armstrong World Industries, Inc: www.armstrong.com.
      1. ROOM FINISH LEGEND and ROOM FINISH SCHEDULE located on drawings for ceiling type locations.
   B. Type "A" Acoustical Tiles: Install where shown on drawings.
      1. Cortega #704 white, 24 inch by 24 inch by 5/8 inch with 15/16 inch angled tegular edge.
   C. Type "B" Vinyl Faced Gypsum Board Tiles: Install where shown on drawings.
      1. 24" x 24" x 1/2" thick vinyl face gypsum board lay-in ceiling tiles equal to "Climaplus" manufactured by U.S. GYPSUM.
   E. Fixed Drywall: Install where shown on drawings; 5/8" gypsum board to metal framing system.

2. SUSPENSION SYSTEM(S)
   A. Manufacturers:
      1. Equal to Armstrong World Industries, Inc: www.armstrong.com.
   B. Suspension System shall be compatible with 24 inch by 24 inch grid system in all areas and configuration as indicated on Drawings. System shall consist of 1-1/2 inch by 15/16 inch by .020 main tee; 1-1/2 inch by .020 positive lock cross tee; and .024 inch angle mould. Grid color shall match tile color: White.
   C. Suspension Systems - General: ASTM C 635; die cut and interlocking components, with stabilizer bars, clips, splices, perimeter moldings, and hold down clips as required.
   D. Drywall Suspension System: Short span t-bars shall be double web construction with screw stop reverse hem and knarled surface, 1 1/2" web height and 1 1/2" flange.

LUXURY VINYL TILE:

1. RESILIENT TILE FLOORING MATERIALS
   A. Provide Luxury Vinyl Tile as indicated on Room Finish Schedule and Legend located on the drawings.
      1. Description: A layered construction consisting of a tough, clear, rigid vinyl wear layer protecting a high-fidelity print layer on a solid vinyl backing. Protected by a diamond-infused UV-cured polyurethane finish, the wear surface is embossed with different textures to enhance each of the printed visuals. Colors are insoluble in water and resistant to cleaning agents and light.
      2. Reference specification - ASTM F 1700, "Standard Specification for Solid Vinyl Tile", Class III, Type B - Embossed Surface. Meets requirements for size, squareness, thickness, thickness of wear layer, residual indentation, resistance to chemicals, resistance to light and resistance to heat.
      3. Pattern and Color: See Material Finish Legend, located on drawings.
2. WALL BASE MATERIALS
   A. For top set wall base: Provide 1/8 in. (3.2 mm) thick, 4 in. (10.16 cm) Armstrong Flooring Color-Integrated Wall Base with a matte finish, conforming to ASTM F 1861, Type TP - Rubber, Thermoplastic, Group 1 - Solid, Style B - Cove.
3. ADHESIVES
   A. Provide Armstrong S-288 Flooring Adhesive under the flooring and Armstrong S-725 Wall Base Adhesive at the wall base as recommended by the flooring manufacturer.

(ARCHITECTURAL SPECIFICATIONS CONTINUED)

LUXURY VINYL TILE (CONTINUED):

4. ACCESSORIES
   - A. Provide transition/reducing strips tapered to meet abutting materials.
   - B. Provide threshold of thickness and width as shown on the drawings.
   - C. Provide resilient edge strips of width shown on the drawings, of equal gauge to the flooring, homogeneous vinyl or rubber composition, tapered or bullnose edge, with color to match or contrast with the flooring, or as selected by the Architect from standard colors available.
   - D. Provide metal edge strips of width shown on the drawings and of required thickness to protect exposed edges of the flooring. Provide units of maximum available length to minimize the number of joints. Use butt-type metal edge strips for concealed anchorage, or overlap-type metal edge strips for exposed anchorage. Unless otherwise shown, provide strips made of extruded aluminum with a mill finish.

CARPET TILE:

1. CARPET TILE
   - A. See ROOM FINISH LEGEND and ROOM FINISH SCHEDULE located on drawings.
   - B. All carpet is to be installed using direct glue-down method in strict conformance with recommendations and warranties by carpet manufacturer.
   - C. Install vinyl edge strips and transition strips where carpet joins a different flooring material or unless indicated otherwise.
   - D. At doorways, center seams under door in closed position.

2. ACCESSORIES
   - A. Metal edge/transition strips: Extruded aluminum as manufactured by SCHLUTER SYSTEMS with finish as directed by Architect. Provide height required to protect carpet and of maximum lengths to minimize running joints.
   - B. Adhesive (general): Water resistant, mildew-resistant, non-staining, pressure sensitive type to suit products and subfloor conditions, that complies with flammability requirements for installed carpet and is recommended by the carpet manufacturer.
   - C. Adhesive (area rugs): LokDots adhesive rolls by SHAW CONTRACT GROUP. Install as recommended by manufacturer.

PAINTS & COATINGS:

1. MANUFACTURERS
   - A. Provide all paint and coating products from the same manufacturer to the greatest extent possible.
   - B. Paints: Acceptable manufacturers are limited to the following:
     - i. Glidden: www.glidden.com
     - ii. Pittsburgh: www.pittsburghpaints.com
     - iii. Pratt & Lambert: www.prattandlambert.com
     - iv. Sherwin-Williams: www.sherwin-williams.com
     - v. Benjamin Moore & Co: www.benjaminmoore.com.

2. MATERIALS - GENERAL
   - A. Paints and Coatings: Provide products listed in Master Painters Institute Approved Product List, current edition available at www.paintinfo.com, for specified MPI Categories, except as otherwise indicated.
     - i. Provide ready mixed paints and coatings, except field-catalyzed coatings.
     - ii. Provide materials that are compatible with one another and the substrates indicated under conditions of service and application, as demonstrated by manufacturer based on testing and field experience.

3. PAINT SYSTEMS
   - A. Provide Premium Grade systems (2 top coats) as defined in MPI Architectural Painting Specification Manual, except as otherwise indicated.

4. PAINT SYSTEMS
   - A. General: Provide Premium Grade systems (2 top coats) as defined in MPI Architectural Painting Specification Manual, except as otherwise indicated.
   - B. The following Specification for finishes is not intended to mention every particular item which will receive painters finish, but is intended to establish type and quality of finish which will be required on various materials.
   - C. Exterior Work:
     - i. Ferrous Metals - Steel, hollow metal doors and frames (additional primer coat required if factory primed; touch-up as required).
       - a. Primer - One coat "Kem Bond HS" Red or White primers, 3.6 mils dft/coat.
       - b. Finish - Two coats "DTM Industrial" exterior-interior semi-gloss enamel, 6.0 mils dft/coat.
       - c. NOTE: Spot prime any abraded areas.
     - ii. Galvanized Metals - Flashing, fascia, vents.
       - a. Primer - One coat "Galvite HS" galvanized steel primer, white; 4 mils dft coat (as required).
       - b. Finish - Two coats "Industrial Enamel HS"; exterior-interior gloss enamel; 3.6 mils dft/coat.
       - c. NOTE: Surface must be free from grease, dirt, rust, and all other surface contaminants. All rust spots must be properly cleaned and primed.
   - D. Interior Work:
     - i. Exposed Metal - Hollow metal frames and doors, handrails, and other items of exposed metal, unless factory finished.
       - a. Primer - One coat "Kem Kromik" universal inhibitive metal primer; 3.6 mils dft/coat as required.
       - b. Finish - Two coats "ProMar 200" interior alkyd egg-shell enamel (B33), 3.5 mils dft/coat.
       - c. NOTE: Spot prime any abraded areas. Expanded metal Catwalk and Fly Loft flooring will not receive final painting; only full shop primer coverage.

IDENTIFICATION DEVICES:

1. SIGNAGE APPLICATIONS
   - A. Accessibility Compliance: All signs are required to comply with ADAAG and ANSI/ICC A 117.1 and applicable building codes, unless otherwise indicated; in the event of conflicting requirements, comply with the most comprehensive and specific requirements.
2. SIGN TYPES
   - A. Room Signs: Install modular curved interior wall-mounted sign frames equal to VISTA SYSTEMS, series VLetter #WFP84 for Classrooms, and Safe Room. Signage shall allow inserts of 8-1/2 inch by 11 inch paper. Paper inserts shall be furnished by Owner. Install where indicated on Signage Plan.
   - B. Restroom Signs: Install modular curved interior wall/door mounted signs equal to VISTA SYSTEMS series V150 #WFP33 with raised A.D.A. compliant Braille lettering and symbol for all Restrooms. Install signs in full compliance with A.D.A. and ICC/ANSI 117.1 requirements. Insert color shall be selected by the Owner's representative during the submittal stage. Install where indicated on Signage Plan.
   - C. Plaque: Furnish and install 24" x 16" cast aluminum plaque containing Name of Project, Owner Names, Engineer/Architect, Contractor, and Date. Architect will supply plaque layout and arrangement upon receipt of submittal. Plaque to have Helvetica upper and lower case letters, a matte background in color selected by Architect and have No. 512 border design. Final location to be determined by Architect at time of installation. Height of plaque center to be at 5'-0" above finished floor. Mounting of plaque to be flush-to-wall with threaded studs. Wet with Pro-Rock cement. A sign elevation will be provided by the Architect. Install where shown on the Partial Floor Plan. (1 required)
   - D. Exterior Building Signage (front): Install painted face and edge cast metal letters as manufactured by A.R.K. RAMOS ARCHITECTURAL SIGNAGE SYSTEMS or approved equal. Letters shall be 12-inch height by 1-inch depth. Submit painted color chip samples for Owner selection. Provide all necessary accessories to install individual letters over cultured stone for Building Sign using "FM-4" mounting system. Use Helvetica font. See Building Elevation drawings for additional information.
   - E. Exterior Metal Door Signs: Install injection moulded sign with tactile characters on the Kitchen Deliver and exterior Mechanical metal doors, one each. Raised border shall be 3/8" wide with raised corners. All letters shall contrast with their background. Characters and background shall have a matte finish. Lettering style shall be standard medium, upper case or other sans or simple type face.

METAL LOCKERS:

1. LOCKERS
   - A. Single Tier Ventilated Metal Lockers:
     1. Location - In Locker Rooms.
     2. Type - Heavy duty metal Competitor Collection.
     3. Sizes - 12" w x 12" d x 60" h. (42 required - 21 per room)
     4. Construction - Frames and body - 16 gauge body with 18 gauge backs
     5. Ventilation - Front and sides - diamond perforated.
     6. Doors - 14 gauge door with 16 gauge reinforcement channel.
     7. Hinges - 16 gauge continuous piano style.
     8. Finish - epoxy/polyester power coat in color to be selected by Architect from manufacturer's standard colors.
     9. Locker shall have standard lockable handles.
     10. Lockers shall be furnished with number plates consecutively numbered with numbering as provided by Architect.
     11. Provide and install finished ends, filler, trim strips as shown or as required for a completed installation.

PRE-ENGINEERED METAL BUILDING SYSTEM:

1. WARRANTY: Provide twenty (20) year manufacturer warranty for roof sheet finishes. Include coverage for exterior pre-finished surfaces to cover pre-finished color coat against chipping, cracking or crazing, blistering, peeling, chalking, or fading. Include coverage for weather tightness of building enclosure elements after installation.

2. PRE-ENGINEERED COMPONENTS:
   - A. The pre-engineered canopy contains welded steel rigid frame and framing with hipped ends and custom roof slope as shown on Drawings. Manufacturer's standard components may be used, providing that components, accessories, and complete structure conform to Architectural design appearance shown and to specified requirements contained herein.
   - B. Primary Framing: Rigid frame of rafter beams and columns, wind bracing canopy beams and canopy beams.
   - C. Secondary Framing: Purlins, Girts, Eave struts, Flange bracing, Sill supports, Clips, and opening framing, and other items detailed.
   - D. Wall System: Preformed metal panels of vertical profile, with sheathing, insulation, and accessory components.
   - E. Roof System: Preformed metal panels oriented parallel to slope.
   - F. Roof Slope: See Building Elevations for roof slope.
   - G. All interior metal building components shall be galvanized to resist a corrosive environment. Galvanized components include: rigid frames, secondary framing, wall girts, roof purlins, angles, clips, bolts, interior liner panels, and miscellaneous metal building materials located in the corrosive environment.
   - H. The Office area (Lab/Break Room to Storage/Electric Room) shall use 10" deep straight leg rigid frame columns to allow metal stud framing to conceal the rigid frame columns.
   - I. The Metal Building shall be designed rigid enough by the Metal Building Manufacturer to support anchoring concrete masonry units (CMU) where shown on the Floor Plans.

3. MATERIALS:
   - A. Metal Roofing: Roof panels shall be structural standing seam metal pans, 16" wide x nominal 2" deep, 24 gauge with striations equal to MBCI "Batten Lok" system. Factory painted steel using KYNAR 500 finish with color selected by Owner from manufacturer's standard KYNAR color options. Sheets shall have a minimum yield strength of 50 ksi, designed to support 20 psf over a clear span of 5'-0", and be weather tight when installed. Roof panels shall be installed over roof purlins using concealed fastening system. Design roof panels to withstand uplift load of 90 psf (UL 90 rated) with provisions for horizontal and longitudinal expansion and contraction designed into the system. Roof sheets to be formed in a full length with no joint form ridge to eave.
   - B. Exterior Wall Panels: Wall panels shall be 24 gauge factory painted using KYNAR 500 finish. Panels shall have a deep profile equal to Alliance Steel, Oklahoma City "LT3.3" panel. Install wall panels on 1-1/2" hat channels installed vertically to metal building framing.
   - C. Fascia Panels: Shall be 24 gauge factory painted steel to match roof panels. Rib height may be reduced, however, panel width shall match roof panels.
   - D. Soffit Panels: Shall be 12" wide X 1" deep factory painted 24 gauge sheet metal with concealed fasteners and interlocking joints. Install panels as shown on Details. Vent every 4th panel.
   - E. Gutters and Downspouts (box gutter profile): Shall be fabricated from 24 gauge factory painted finish over prepared and shaped galvanized 4" x 5" gutter and 4" x 4" matching downspout to match existing gutter profile. Gutters shall be 20' minimum length with expansion joints at 60'-0" o.c., Attach downspout with concealed straps. Gutter to be attached level and uniformly as indicated by Drawing details.
   - F. Flashing, Vents and Flues: Install neoprene and metal roof jacks at all mechanical and plumbing piping penetration through roof, at flashing for furnace and fresh air vent projection. Seal with approved mastic as per roof manufacturer's recommendations to assure weather tightness. All exposed flue pipes, vent caps, flashing and other penetrations must be finished with paint.
   - G. Accessories: Provide overhangs, flashings, closures, fillers and trim as indicated or required. Use flexible closure strips of expanded cellular rubber matching configuration of roof or wall sheets, release-paper backed sealing tape or elasomeric polyurethane joint sealer to ensure weathertight construction.
   - H. Fasteners: Provide self tapping screws, bolts, nuts, self locking rivets, self locking bolts and other miscellaneous required fastening devices as required by the manufacturer to withstand the design loads. Fasteners shall be concealed. Exposed fasteners will be allowed only where concealed installation is not possible.
   - I. Sealants: Field applied material shall be Vulkem one part Polyurethane sealant or approved equal. Field applied sealants in conjunction with TC95 modified isobutylene, tripolymer mastic tape shall be used at all end laps, curbs, roof jacks, ventilators and gutters.
   - J. Downspouts and Elbows (square profile): Shall be 4" x 4" 24 gauge factory painted sheet metal. Furnish metal straps as shown on Drawings.
   - K. Flashings and Trim: Use 24 gauge factory painted sheet metal of shape and design as shown on drawings. Ridge caps and hip flashings shall be formed to provide weather tight seal. Manufacturer's standard component shapes may be used in lieu of shapes shown on the drawings with Architects approval.
   - L. Exterior Metal Finish: All exposed metal roofing, fascias, soffit, flashings and trim shall be galvalume coated and factory painted with KYNAR 500 Finish System, Color of roofs, fascias, gutters and flashings shall be as selected by Architect.
   - M. Interior Metal Finish: Mainframes, secondary framing, wall girts, roof purlines, fasteners, flashing, trim, and miscellaneous interior finishes shall have galvanized finish to resist a corrosive environment.
   - N. Liner Panel: Use 24 gauge galvalume OR factory painted sheet metal purlin bearing "M" profile panel with equal rib spacing.
   - P. Snow Guards: Shall be by LMCurbs S-5 ColorGard 24 gauge factory painted steel to match roofing or approved equal. Install 2" height by 2" wide by 8' lengths attached to S-5 clamps attached to the standing seam with stainless steel bolts provided by manufacturer.

4. INSULATION:
   - A. Roof Insulation: Install banded Roof Insulation System throughout entire building at roof deck. Roof insulation system shall be banded using steel straps and fabric supporting batts with an installed total roof insulation value of R-30 and an average installed thickness of 9 inches. Steel strap shall be primed and painted "white" on the exposed side, minimum size to be 0.02"x1" continuous length. Attached steel strap to framing using #12 self-drilling screws and washers for 12 gauge steel. Fabric shall be woven reinforced high-density polyethylene yarns with flame spread index of 25. Finish shall be "white".
   - B. Wall Insulation: Install banded Wall Insulation System throughout entire building perimeter walls and between Office area and UV / Belt areas. System shall be a metal strap and fabric system with an installed total wall insulation value of R-19 and average installed thickness of 8 inches. Steel strap shall be primed and painted "white" on the exposed side, minimum size to be 0.02"x1" continuous length. Attached steel strap to framing using #12 self-drilling screws and washers for 12 gauge steel. Fabric shall be woven reinforced high-density polyethylene yarns with flame spread index of 25. Finish shall be "white".

5. ERECTION - FRAMING:
   - A. Erect framing in accordance with AISC 360 - Specification for Structural Steel Buildings.
   - B. Framing System: Erect all framing in accordance with MBMA Low-Rise Building Systems Manual, Common Industry Practices. Prior to erecting components, clean all mud and dirt from exposed surfaces.
   - C. Set structural frames accurately to lines and elevations indicated. Align and adjust various members forming part of complete frame or structure before permanently fastening. Clean bearing surfaces and other areas which will be in permanent contact before assembly. Perform necessary adjustments to compensate for discrepancies in elevations and alignment. Level and plumb individual members of structure within specified AISC tolerances. Do not enlarge misaligned holes in members by burning and do not use gas cutting to correct fabrication errors. All errors and misalignments shall be resolved with the component manufacturer.
   - D. Furnish temporary guys and bracing where needed for squaring, plumbing and securing the structural framing against loads, such as wind loads acting on the exposed framing and seismic forces, as well as loads due to erection equipment and erection operation, but not including loads resulting from the performance of work by others. Bracing furnished by the manufacturer for the metal building system cannot be assumed to be adequate during erection. The temporary guys, braces, falseworks and cribbing shall be removed immediately upon completion of erection.

6. ERECTION - WALL AND ROOF PANELS:
   - A. Roof System: Install according to building manufacturer's shop drawings and installation manual. Apply insulation blanket and sheeting to structural support members, properly aligned, level and plumb.
   - B. Exercise care when cutting pre-finished materials to ensure that cuttings do not remain on finished surfaces. Insulation blankets shall be stretched tight over framing member and shall not be allowed to droop or sag. Overlap vapor barrier tabs and secure insulation with white tape where required. Exercise care to ensure insulation vapor barrier is not torn or damaged. Minor damage may be repaired with white tape, however extensive damage will require replacement of the entire blanket.

7. ERECTION - GUTTERS AND DOWNSPOUTS:
   - A. Rigidly support and secure components, Join lengths with formed seams sealed watertight. Flash and seal gutters to downspouts.
   - B. Seal all roof and wall accessories weather tight. All work shall be performed in the best workmanlike manner.

AREA (PER FLOOR)	23,000sf	AREA (PER FLOOR)	14,093sf
AREA (TOTAL)	46,000sf	AREA (TOTAL)	14,093sf

BUILDING AREA MODIFICATIONS (SECTION 506)
BUILDING AREA IS WITHIN LIMITS SPECIFIED IN TABLE 506.2 - AREA INCREASE IS NOT REQUIRED

MIXED USED AND OCCUPANCY (SECTION 508)
BUILDING HAS ACCESSORY OCCUPANCIES THAT ARE ANCILLARY TO THE MAIN OCCUPANCY (SECTION 508.2).
ACCESSORY OCCUPANCIES INDIVIDUALLY CLASSIFIED (SECTION 508.2.1):
-BREAK ROOM, MUD ROOM, STORAGE, ELECTRIC, CHEMICAL ROOM, SLUDGE LOADING, RESTROOMS

INCIDENTIAL USES (SECTION 509)
NOT APPLICABLE

TYPES OF CONSTRUCTION
(IBC CHAPTER 6)

FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (TABLE 601) TYPE IIB

BUILDING ELEMENT	HOURLY RATING REQUIRED	HOURLY RATING PROVIDED	METHOD OF ACHIEVING RATING
PRIMARY STRUCTURAL FRAME	0	0	N/A
BEARING WALLS - EXTERIOR	0	0	N/A
BEARING WALLS - INTERIOR	0	0	N/A
NONBEARING WALLS - EXTERIOR	0	0	N/A
NONBEARING WALLS - INTERIOR	0	0	N/A
FLOOR CONSTRUCTION AND SECONDARY MEMBERS	0	0	N/A
ROOF CONSTRUCTION AND SECONDARY MEMBERS	0	0	N/A

FIRE-RESISTANCE REQUIREMENTS FOR EXTERIOR WALLS BASED ON FIRE SEPARATION DISTANCE (IBC, TABLE 602) - NOT APPLICABLE

FIRE AND SMOKE PROTECTION FEATURES
(IBC CHAPTER 7)

MAXIMUM AREA OF EXTERIOR WALL OPENINGS BASED ON FIRE SEPARATION DISTANCE AND DEGREE OF OPENING PROTECTION (TABLE 705.8)
NOT APPLICABLE

FIRE WALL FIRE-RESISTANCE RATINGS (TABLE 706.4)
NOT APPLICABLE

FIRE-RESISTANCE RATINGS FOR FIRE BARRIER ASSEMBLIES OR HORIZONTAL ASSEMBLIES BETWEEN FIRE AREAS (TABLE 707.3.10)
2-HOUR PROVIDED BETWEEN BUSINESS AND UTILITY AREAS

FIRE PARTITIONS (SECTION 708)
CORRIDORS NOT REQUIRED TO BE RATED (TABLE 1020.1, EXCEPTION #4)

INTERIOR FINISHES
(IBC CHAPTER 8)

INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY (TABLE 803.11)

	SPRINKLERED			NONSPRINKLERED		
GROUP	EXITS	CORRIDORS	ROOMS	EXITS	CORRIDORS	ROOMS
B - BUSINESS	CLASS-B	CLASS-C	CLASS-C	CLASS-A	CLASS-B	CLASS-C
U - UTILITY	N/R	N/R	N/R	N/R	N/R	N/R

FIRE PROTECTION SYSTEMS
(IBC CHAPTER 9)

AUTOMATIC SPRINKLER SYSTEMS (SECTION 903)

STATUS	AUTOMATIC SPRINKLER SYSTEM IS NOT REQUIRED OR PROVIDED
GROUP	BUSINESS B (SECTION 903)

ALTERNATIVE AUTOMATIC FIRE-EXTINGUISHING SYSTEMS (SECTION 904)

STATUS	AUTOMATIC FIRE-EXTINGUISHING SYSTEM IS NOT REQUIRED OR PROVIDED
WHERE	N/A

PORTABLE FIRE EXTINGUISHERS (SECTION 906)

FIRE EXTINGUISHERS FOR CLASS A FIRE HAZARDS (SECTION 906.3(1))

	ORDINARY (MODERATE) HAZARD OCCUPANCY	EXTINGUISHERS AS PROVIDED
MIN. RATED SINGLE EXTINGUISHER	2-A	
MAXIMUM FLOOR AREA PER UNIT OF A	3,000sf	14,093sf / 3,000sf = 5 EXTINGUISHERS
MAXIMUM FLOOR AREA FOR EXTINGUISHER	11,250sf	BUILDING AREA LESS THAN MAX. FLOOR AREA
MAXIMUM TRAVEL DISTANCE TO EXTINGUISHER	75 FEET	

FIRE ALARM AND DETECTION SYSTEMS (SECTION 907.2.2)

GROUP B - BUSINESS		
FIRE ALARM SYSTEM	MANUAL	NOT REQUIRED
SMOKE DETECTION SYSTEM	AUTOMATIC	NOT REQUIRED
OCCUPANCY NOTIFICATION SYSTEM	AUTOMATIC	NOT REQUIRED
EMERGENCY LIGHTING	AUTOMATIC	REQUIRED
EXIT SIGNS		REQUIRED

MEANS OF EGRESS
(IBC CHAPTER 10)

FLOOR AREA ALLOWANCE PER OCCUPANT (TABLE 1004.1.2)

OCCUPANCY TYPE	SF/PERSON	OCCUPANCY LOAD
B - BUSINESS	100 GROSS	20 OCCUPANTS
U - UTILITY	300 GROSS	29 OCCUPANTS
TOTAL OCCUPANT LOAD		49 TOTAL OCCUPANTS

OCCUPANCY SUMMARY	
OFFICES	4 OCCUPANTS
CONFERENCE	10 OCCUPANTS
LIBRARY / CONTROL RM	3 OCCUPANTS
LAB	3 OCCUPANTS
UV ROOM	14 OCCUPANTS
BELT FILTER	15 OCCUPANTS
TOTAL	49 TOTAL OCCUPANTS

MEANS OF EGRESS SIZING (SECTION 1005)

EGRESS WIDTH	MIN. EGRESS WIDTH (0.2 INCH PER PERSON)	TOTAL EGRESS WIDTH S DESIGNED
PATH-A (CONTROL ROOM / CONFERENCE)	0.2 x 13 OCCUPANTS = 2.6 INCH (32 MIN.)	36 INCH
PATH-B (OFFICES)	0.2 x 4 OCCUPANTS = 0.8 INCH (32 MIN.)	36 INCH
PATH-C (LAB)	0.2 x 3 OCCUPANTS = 0.6 INCH (32 MIN.)	36 INCH
PATH-D (CHEM STORAGE)	0.2 x 5 OCCUPANTS = 1 INCH (32 MIN.)	36 INCH
PATH-E (BELT FILTER)	0.2 x 5 OCCUPANTS = 1 INCH (32 MIN.)	36 INCH
PATH-F (BELT FILTER)	0.2 x 5 OCCUPANTS = 1 INCH (32 MIN.)	36 INCH
PATH-G (UV ROOM)	0.2 x 7 OCCUPANTS = 1.4 INCH (32 MIN.)	36 INCH
PATH-H (UV ROOM)	0.2 x 7 OCCUPANTS = 1.4 INCH (32 MIN.)	36 INCH

MEANS OF EGRESS ILLUMINATION (SECTION 1008)

EMERGENCY LIGHTING	AUTOMATIC	REQUIRED

ACCESSIBLE MEANS OF EGRESS (SECTION 1009)
ACCESSIBLE SPACES SHALL BE PROVIDED WITH NOT LESS THAN ONE ACCESSIBLE MEANS OF EGRESS. WHERE MORE THAN ONE MEANS OF EGRESS IS REQUIRED BY SECTION 1006.2 OR 1006.3 FROM ANY ACCESSIBLE SPACE, EACH ACCESSIBLE PORTION OF THE SPACE SHALL BE SERVED BY NOT LESS THAN TWO ACCESSIBLE MEANS OF EGRESS.

DOOR SWING (SECTION 1010.1.2.1)
DOOR SHALL SWING IN THE DIRECTION OF EGRESS TRAVEL WHERE SERVING AN OCCUPANT LOAD OF 50 OR MORE PERSONS.

EXIT SIGNS (SECTION 1013)

EXIT SIGNS	AUTOMATIC	REQUIRED

EXIT AND EXIT ACCESS DOORS SHALL BE MARKED BY AN APPROVED EXIT SIGN READILY VISIBLE FROM ANY DIRECTION OF EGRESS TRAVEL.

EXIT ACCESS TRAVEL DISTANCE (SECTION 1017, TABLE 1017.2)

OCCUPANCY	COMPONENT	EXIT TRAVEL DISTANCE	
		ALLOWABLE	AS DESIGNED
BUSINESS (B)	COMMON PATH OF TRAVEL	200 FEET (WITHOUT SPRINKLER)	84 FEET (SEE LIFE SAFETY PLAN)
	DEAD END CORRIDORS	50 FEET (PER IBC) 20 FEET (NFPA 101)	**NO DEAD END CORRIDORS
	TRAVEL TO EXIT	200 FEET (NFPA 101 14.2.6.2)	

CORRIDOR FIRE RESISTANCE RATING (TABLE 1020.1)
0-HOUR DUE TO OCCUPANT LOAD PER 1020.1 EXCEPTION #4 AND SECTION 1006.2.

CORRIDOR WIDTH (IBC, SECTION 1020.2)
36 INCHES, WITH AN OCCUPANT LOAD OF LESS THAN 50.

PLUMBING SYSTEMS FEATURES
(IBC CHAPTER 29)

GENERAL NOTES

FOUNDATION & EXCAVATION NOTES:

1. FOUNDATIONS HAVE BEEN DESIGNED IN ACCORDANCE WITH THE GEOTECHNICAL REPORT PREPARED FOR THIS PROJECT BY HINDERLITER GEOTECHNICAL ENGINEERING (PROJECT NO. WE-20-03), DATED JUNE 17, 2020.

2. ALL VEGETATION, TOP SOIL, PAVING, AND ANY LOOSE MATERIAL BENEATH THE PROPOSED BUILDING SITE SHALL BE STRIPPED AND REMOVED. EXPOSED SUBGRADE SHALL BE PROOF-ROLLED AND SOILS WHICH ARE OBSERVED TO RUT AND DEFLECT EXCESSIVELY SHALL BE UNDERCUT AND REMOVED ALSO.

3. AFTER ALL STRIPPING AND CUTTING OPERATIONS WITHIN THE BUILDING AREA ARE COMPLETE THE SUBGRADE SHALL THEN BE SCARIFIED TO A MINIMUM DEPTH OF 8 INCHES AND COMPACTED TO AT LEAST 95 PERCENT OF ITS STANDARD PROCTOR DENSITY WITHIN THE RANGE OF -2 PERCENT TO +2 PERCENT OF THE OPTIMUM MOISTURE CONTENT. THE GRADE SHALL THEN BE RAISED TO 8 INCHES BELOW FINISHED FLOOR ELEVATION WITH LOW VOLUME CHANGE MATERIAL. FILL MATERIAL SHALL BE PLACED IN LIFTS OF 9" OR LESS AND SHALL BE COMPACTED AS STATED ABOVE.

4. LOW VOLUME CHANGE MATERIAL SHALL MEET THE FOLLOWING REQUIREMENTS:

AMOUNT FINER THAN 3" SIEVE	= 100 PERCENT
LIQUID LIMIT	= 40 MAXIMUM
PLASTICITY INDEX (PI)	= 18 MAXIMUM
	= 5 MINIMUM

5. THE FLOOR SLAB SHOULD BE CONSTRUCTED ON 4 INCHES OF CRUSHED ODOT TYPE A AGGREGATE BASE.

6. SHALLOW SPREAD FOOTINGS AND CONTINUOUS WALL FOOTINGS HAVE BEEN DESIGNED FOR AN ALLOWABLE SOIL BEARING PRESSURES OF 2,000 PSF. FOOTINGS SHALL BEAR A MINIMUM OF 2.5 FEET BELOW FINISHED GRADE.

7. THE CONTRACTOR SHALL NOTIFY THE ARCHITECT OR ENGINEER OF RECORD IMMEDIATELY IN THE EVENT THAT THE SOILS CONDITIONS ENCOUNTERED VARY FROM THOSE SHOWN ON THE BORING LOGS.

REINFORCING STEEL NOTES:

1. ALL REINFORCING STEEL SHALL BE DETAILED, FABRICATED AND PLACED IN ACCORDANCE WITH THE REQUIREMENTS OF ACI 318 (LATEST EDITION), "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" AND ACI 315 (LATEST EDITION), "STANDARD DETAILING MANUAL".

2. REINFORCING STEEL SHALL MEET ASTM A-615, GRADE 60.

3. PROVIDE BENT BARS AT ALL CORNERS. THE MINIMUM LENGTH OF EACH LEG OF THE BENT BAR SHALL BE AS GIVEN BELOW.

#3 BARS	16"	#4 BARS	22"
#5 BARS	27"	#6 BARS	35"
#7 BARS	48"	#8 BARS	63"
#9 BARS	80"	#10 BARS	102"
#11 BARS	113"		

4. UNLESS SHOWN OTHERWISE ON THE PLANS, BARS THAT ARE TOO LONG TO BE PLACED IN ONE PIECE SHALL BE LAP SPLICED A DISTANCE AS GIVEN ABOVE AND SPLICES SHALL BE STAGGERED. FOR HORIZONTAL BARS WITH MORE THAN 12" OF CONCRETE CAST BELOW, USE 1.4 TIMES THE DISTANCES SPECIFIED IN NOTE 3.

5. REINFORCING SHALL NOT BE WELDED IN ANY MANNER UNLESS APPROVED BY THE ENGINEER.

CONCRETE NOTES:

1. ALL CONCRETE SLABS-ON-GRADE SHALL HAVE A MINIMUM 28-DAY COMPRESSIVE STRENGTH OF 3,500 PSI. ALL OTHER CONCRETE SHALL HAVE A MINIMUM 28-DAY COMPRESSIVE STRENGTH OF 3,000 PSI UNLESS NOTED OTHERWISE.

2. CONCRETE WORK SHALL CONFORM TO ALL REQUIREMENTS OF ACI 301 LATEST EDITION,"SPECIFICATIONS FOR STRUCTURAL CONCRETE FOR BUILDINGS", AND ACI 318 LATEST EDITION, "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE".

3. ALL EXPOSED EDGES OF CONCRETE SHALL BE CHAMFERED 3/4", UNLESS NOTED OTHERWISE.

4. CLEAR DISTANCES FROM CAST-IN-PLACE CONCRETE SURFACES TO REINFORCING SHALL BE NO LESS THAN THE FOLLOWING UNLESS NOTED OTHERWISE:
   - SIDES OF FOOTINGS. . . . . 3"
   - BOTTOM OF FOOTINGS . . . . . 3"
   - SLABS-ON-GRADE. . . . . 2" FROM TOP
   - SUPPORTED SLABS . . . . . 1"

5. PROVIDE ALL ACCESSORIES NECESSARY TO SUPPORT REINFORCEMENT AT POSITIONS SHOWN ON THE PLANS AND DETAILS. PLASTIC COATED ACCESSORIES SHALL BE USED IN ALL EXPOSED CONCRETE WORK.

6. THE GENERAL CONTRACTOR SHALL CHECK WITH CIVIL, ARCHITECTURAL, MECHANICAL AND ELECTRICAL DRAWINGS AND THE SUB-CONTRACTORS FOR OPENINGS, SLEEVES, ANCHORS, HANGERS, INSERTS, SLAB DEPRESSIONS AND OTHER ITEMS RELATED TO THE CONCRETE WORK AND SHALL ASSUME RESPONSIBILITY FOR THEIR PROPER LOCATION.

METAL BUILDING SYSTEMS NOTES:

1. ALL COLUMNS, BEAMS, PURLINS, GIRTS, METAL SIDING, ROOFING, WIND BRACING AND OTHER STRUCTURAL APPURTENANCES NECESSARY TO COMPLETE THE SHELL OF THE BUILDING SHALL BE DESIGNED AND FABRICATED BY AN MBMA PRE-ENGINEERED METAL BUILDING MANUFACTURER, AND ERECTED BY AN EXPERIENCED METAL BUILDING ERECTOR.

2. ALL STRUCTURAL COMPONENTS AND THEIR CONNECTIONS, INCLUDING FOUNDATION ANCHOR BOLTS, SHALL BE DESIGNED FOR THE METAL BUILDING MANUFACTURER BY A PROFESSIONAL ENGINEER, REGISTERED IN THE STATE OF OKLAHOMA, WHO SHALL AFFIX HIS SEAL TO THE ERECTION DRAWINGS.

3. ALL STRUCTURAL MILL SECTIONS OR WELDED PLATE SECTIONS SHALL BE DESIGNED IN ACCORDANCE WITH THE LATEST EDITION OF AISC "SPECIFICATIONS FOR THE DESIGN, FABRICATION, AND ERECTION OF STRUCTURAL STEEL FOR BUILDINGS," AND ALL COLD-FORMED STEEL STRUCTURAL MEMBERS SHALL BE DESIGNED IN ACCORDANCE WITH THE LATEST EDITION OF AISI "SPECIFICATIONS FOR THE DESIGN OF COLD-FORMED STEEL STRUCTURAL MEMBERS".

4. THE FOLLOWING LOADING CRITERIA SHALL BE INCORPORATED IN THE DESIGN:

   A. "RECOMMENDED DESIGN PRACTICES MANUAL" OF THE METAL BUILDING MANUFACTURERS ASSOCIATION (LATEST EDITION).

   B. COMBINATION DESIGN LOADS CONDITIONS SHOULD COMPLY WITH MBMA SPECIFICATIONS.
      - DL
      - DL + LL
      - DL + LL + WL
      - DL + LL + SEISMIC FORCE

   C. ALL ROOF PURLINS SHALL BE DESIGNED TO SUPPORT ALL DEAD LOADS, LIVE LOADS, WIND LOADS, AND A 10 PSF ALLOWANCE FOR SUSPENDED MECHANICAL EQUIPMENT, LIGHT FIXTURES, CEILINGS, ETC.

   D. THE BUILDING FRAME SHALL BE DESIGNED TO LIMIT THE LATERAL DEFLECTION TO H/260 AT THE BUILDING EAVE FOR THE BASIC WIND SPEED STATED IN THE MISCELLANEOUS NOTES.

   E. UNLESS WIND BRACING IS USED TO TAKE LATERAL LOADS, LOAD TESTS ON METAL PANEL WALLS AND ROOF MUST BE SUBMITTED WHERE THESE ARE USED AS A DIAPHRAGM.

   F. LOCATE WIND BRACING ONLY IN LOCATIONS THAT WILL NOT INTERFERE WITH ARCHITECTURAL, MECHANICAL, OR ELECTRICAL ELEMENTS.

   G. ALL METAL BUILDING COMPONENTS SHALL BE GALVANIZED TO RESIST A CORROSIVE ENVIRONMENT

5. RIGID FRAMES

   A. RIGID FRAMES SHALL CONSIST OF WELDED PLATE SECTION COLUMNS AND ROOF BEAMS COMPLETE WITH THE NECESSARY SPLICE PLATES FOR BOLTED FIELD ASSEMBLY.

      1. ALL BASE PLATES, CAP PLATES, COMPRESSION PLATES AND STIFFENER PLATES SHALL BE FACTORY WELDED INTO PLACE AND HAVE THE CONNECTION HOLES SHOP FABRICATED.

      2. ALL SPLICE PLATES SHALL BE SHOP FABRICATED COMPLETE WITH BOLT CONNECTION HOLES.

      3. COLUMNS AND ROOF BEAMS SHALL BE FABRICATED COMPLETE WITH HOLES IN WEBS AND FLANGES FOR THE ATTACHMENT OF SECONDARY STRUCTURAL MEMBERS AND BRACING.

   B. ALL BOLTS FOR FIELD ASSEMBLY OF FRAME MEMBERS SHALL BE HIGH STRENGTH BOLTS UNLESS INDICATED OTHERWISE ON THE ERECTION DRAWINGS.

6. ENDWALL STRUCTURALS

   A. BEAM AND POST ENDWALL. THE ENDWALL STRUCTURALS SHALL BE MEMBERS DESIGNED IN ACCORDANCE WITH THE LATEST EDITION OF AISI "SPECIFICATIONS FOR THE DESIGN OF COLD-FORMED STEEL STRUCTURAL MEMBERS."

   B. ENDWALL FRAMES SHALL CONSIST OF ENDWALL CORNER COLUMNS AS REQUIRED BY DESIGN CRITERIA.

      1. ALL SPLICE PLATES AND BASE CLIPS SHALL BE SHOP FABRICATED COMPLETE WITH BOLT CONNECTION HOLES.

      2. BEAMS AND COLUMNS SHALL BE SHOP FABRICATED COMPLETE WITH HOLES FOR THE ATTACHMENT OF SECONDARY STRUCTURAL MEMBERS.

7. PURLINS AND GIRTS

   A. PURLINS AND GIRTS SHALL BE "Z" SHAPED, PRECISION ROLL FORMED.

   B. EAVE STRUTS SHALL BE "C" SECTIONS.

   C. VERTICAL DEFLECTION SHALL BE LIMITED TO A MAXIMUM 1/240 OF SPAN.

8. WELDING

   A. WELDING PROCEDURE AND OPERATOR QUALIFICATIONS AND WELDING QUALITY STANDARDS SHALL BE IN ACCORDANCE WITH AWS D-1.1 "STRUCTURAL WELDING CODE." INSPECTION SHALL BE AS DEFINED BY AWS PARAGRAPH 8.15.1.

   B. CERTIFICATION OF WELDER'S QUALIFICATIONS SHALL BE SUPPLIED WHEN REQUESTED.

9. STRUCTURAL PAINTING

   A. PRIOR TO PAINTING, THE FABRICATOR SHALL CLEAN THE STEEL OF LOOSE RUST, LOOSE MILL SCALE, DIRT, AND OTHER FOREIGN MATERIAL.

   B. THE FABRICATOR SHALL THEN FACTORY COAT ALL STEEL WITH PRIMER PAINT AS INDICATED IN THE SPECIFICATIONS.

10. METAL BUILDING FABRICATOR SHALL BE A MEMBER OF MBMA.

11. METAL BUILDING SHOP ERECTION DRAWING SHALL BE DETAILED USING GRIDS AS SHOWN ON THE STRUCTURAL DRAWINGS. THE METAL BUILDING DETAILER WILL BE PERMITTED TO CREATE ADDITIONAL GRIDS BUT THOSE GRID SHALL BE REFERENCED BACK TO THE EXISTING GRIDS ON THE STRUCTURAL DRAWINGS. IN NO CASE SHALL THE ERECTION DRAWING CONTAIN GRIDS WHICH HAVE IDENTICAL MARKS TO THE STRUCTURAL DRAWINGS BUT WITH DIFFERENT DIMENSIONS.

MASONRY NOTES:

1. CONCRETE MASONRY WORK SHALL CONFORM TO ALL REQUIREMENTS OF ACI 530/ASCE 5 (LATEST EDITION), "BUILDING CODE REQUIREMENTS FOR MASONRY STRUCTURES" AND ACI 530.1/ASCE 6 (LATEST EDITION), "SPECIFICATIONS FOR MASONRY STRUCTURES".

2. AT ALL CONCRETE BLOCK WALLS PROVIDE TROUGH BLOCK BEAM COURSES AT DOOR HEADS, WINDOW HEADS, AND ABOVE ALL MECHANICAL OPENING OVER 32". PROVIDE KNOCK-OUT BOND BEAM COURSES AT TOP COURSES, BOTTOM COURSES, BELOW WINDOWS, AND AT EVERY 6TH COURSE. BEAM COURSES ABOVE DOORS, WINDOWS, AND MECHANICAL OPENINGS SHALL EXTEND A MINIMUM OF 24" EITHER SIDE OF OPENINGS. BEAM COURSES SHALL BE REINFORCED AS FOLLOWS:
   - 4" BLOCK . . . . . 1-#3

3. VERTICAL CELLS OF CMU WALL SHALL BE REINFORCED WITH 1-#3 BAR AT 48 INCHES ON CENTER.

4. DOWELS SHALL EXTEND FROM THE FOUNDATION INTO THE CONCRETE MASONRY WALLS AT ALL LOCATIONS OF VERTICAL WALL REINFORCEMENT. DOWEL SIZE SHALL BE #3 BARS AND SHALL BE DRILLED AND EPOXIED WITH A MINIMUM EMBEDMENT DEPTH OF 4 INCHES.

5. ALL CONCRETE BLOCK TROUGHS AND CELLS THAT ARE REINFORCED SHALL BE FILLED WITH CONCRETE GROUT (NOT MORTAR) HAVING A COMPRESSIVE STRENGTH OF 3,000 PSI.

6. AT ALL LOCATIONS WHERE MASONRY WALLS INTERSECT, WALLS SHALL BE CONNECTED WITH 50-PERCENT OF UNITS INTERLOCKED AT THE WEB-FLANGE INTERFACE (I.E. RUNNING BOND).

NON-SHELTER CODES, STANDARDS, AND DESIGN CRITERIA:

1. BUILDING CODE: 2015 INTERNATIONAL BUILDING CODE (IBC-2015)

2. ROOF DEAD LOADS:

METAL BUILDING	SELF WEIGHT
COLLATERAL LOAD	10 PSF

3. LIVE LOADS:

ROOF	20 PSF

4. SNOW LOADS:

GOVERNING CODE	ASCE 7-10
GROUND SNOW LOAD, Pg	10 PSF

5. WIND LOADS:

GOVERNING CODE	ASCE 7-10
DESIGN WIND SPEED	120 MPH
WIND EXPOSURE CLASSIFICATION	C
RISK CATEGORY	II
INTERNAL PRESSURE COEFF, GCpi	+/- 0.18

6. SEISMIC LOADS:

GOVERNING CODE	ASCE 7-10
RISK CATEGORY	II
IMPORTANCE FACTOR, Ie	1.0
SOIL SITE CLASSIFICATION	C
MAPPED SPECTRAL ACCELERATION, Ss	0.205
MAPPED SPECTRAL ACCELERATION, S1	0.073
DESIGN SPECTRAL ACCELERATION, Sds	0.164
DESIGN SPECTRAL ACCELERATION, Sd1	0.083
SEISMIC DESIGN CATEGORY	B
RESPONSE MODIFICATION FACTOR, R	3

BASIC SEISMIC FORCE-RESISTING SYSTEM:
STEEL SYSTEM NOT SPECIFICALLY DETAILED FOR SEISMIC RESISTANCE

ANALYSIS PROCEDURE: EQUIVALENT LATERAL FORCE PROCEDURE

MISCELLANEOUS NOTES:

1. ALL DIMENSIONS ON STRUCTURAL DRAWINGS TO BE CHECKED AGAINST CIVIL, ARCHITECTURAL, MECHANICAL, AND ELECTRICAL DRAWINGS BY THE GENERAL CONTRACTOR BEFORE PROCEEDING WITH CONSTRUCTION AND ANY DISCREPANCIES ARE TO BE REPORTED TO THE ARCHITECT IMMEDIATELY.

2. THE CONTRACTOR SHALL ASSUME RESPONSIBILITY, UNRELIEVED BY REVIEW OF SHOP DRAWINGS OR PERIODIC OBSERVATION OF CONSTRUCTION, FOR COMPLIANCE WITH THE CONTRACT DOCUMENTS, FOR FABRICATION PROCESSES AND CONSTRUCTION TECHNIQUES, AND FOR SAFE CONDITIONS ON THE JOB SITE.

3. THE STEEL FABRICATOR SHALL BE RESPONSIBLE FOR FURNISHING ALL MISCELLANEOUS STEEL SHOWN ON THE ARCHITECTURAL DRAWINGS.

4. CONTROL AND CONSTRUCTION JOINTS SHALL BE LOCATED AS DIRECTED ON THE PLANS OR AS DIRECTED BY THE ARCHITECT.

SHOP DRAWING NOTES:

1. REPRODUCTION OF THESE DRAWINGS FOR USE AS SHOP DRAWINGS, FABRICATION DRAWINGS OR ERECTION DRAWINGS IS NOT AUTHORIZED AND, IF SUBMITTED, WILL BE REJECTED WITHOUT BEING CHECKED. A LICENSE TO USE ANY PORTION OR ALL OF THE STRUCTURAL CAD FILES FOR THE LIMITED PURPOSE OF ASSISTING THE CONTRACTOR'S PREPARATION OF SHOP DRAWINGS FOR SUBMITTAL UNDER THE CONSTRUCTION CONTRACT MAY BE PURCHASED FROM THE STRUCTURAL ENGINEER UNDER A STANDARD FORM OF AGREEMENT FOR A FEE OF $150.00. UNDER SUCH AN AGREEMENT, THESE FILES WILL BE PROVIDED IN AUTOCAD VERSION 2013.

2. SHOP DRAWING SUBMITTALS SHALL CONSIST OF PDF FILES. THESE FILES SHALL ALLOW ELECTRONIC STAMPING, REDLINING AND MARKUPS AND THEREFORE SHALL NOT BE LOCKED FROM EDITING.

3. AFTER SHOPS DRAWING REVIEW, RETURNED SHOP DRAWINGS WILL BE MARKED WITH EITHER "APPROVED", "APPROVED AS NOTED" OR "REVISE AND RESUBMIT". NONE OF THIS DESIGNATIONS RELIEVE THE CONTRACTOR OR SUBCONTRACTOR FROM COMPLIANCE WITH ALL OF THE CONSTRUCTION DOCUMENTS INCLUDING THE STRUCTURAL DRAWINGS AND SPECIFICATIONS. ANY REQUEST FOR DEVIATION FROM THESE DRAWINGS AND SPECIFICATION MUST BE MADE IN A "REQUEST FOR INFORMATION" THROUGH THE ENGINEER'S OFFICE.

STATEMENT OF STRUCTURAL SPECIAL INSPECTIONS

STATEMENT OF SPECIAL INSPECTIONS NOTES:

1. THIS STATEMENT OF SPECIAL INSPECTIONS IS INCLUDED AS REQUIRED BY SECTION 1704 OF THE 2015 INTERNATIONAL BUILDING CODE.

2. THE OWNER SHALL EMPLOY ONE OR MORE QUALIFIED SPECIAL INSPECTORS FOR THIS PROJECT. THE SPECIAL INSPECTOR SHALL PROVIDE WRITTEN DOCUMENTATION TO THE BUILDING OFFICIAL DEMONSTRATING THEIR COMPETENCE AND RELEVANT EXPERIENCE OR TRAINING. EXPERIENCE OR TRAINING SHALL BE CONSIDERED RELEVANT WHEN THE DOCUMENTED EXPERIENCE OR TRAINING IS RELATED IN COMPLEXITY TO THE SAME TYPE OF SPECIAL INSPECTION ACTIVITIES FOR PROJECTS OF SIMILAR COMPLEXITY AND MATERIAL QUALITIES.

3. SPECIAL INSPECTOR(S) SHALL KEEP RECORDS OF SPECIAL INSPECTIONS AND TESTS. INSPECTION REPORTS SHALL BE FURNISHED BY THE SPECIAL INSPECTOR(S) TO THE BUILDING OFFICIAL, AND TO THE REGISTERED DESIGN PROFESSIONALS IN RESPONSIBLE CHARGE. SUCH REPORTS SHALL BE SUBMITTED AT THE COMPLETION OF EACH ITERATION OF A SPECIAL INSPECTION/SITE VISIT. REPORTS SHALL INDICATE THAT WORK INSPECTED WAS OR WAS NOT COMPLETED IN CONFORMANCE TO APPROVED CONSTRUCTION DOCUMENTS. DISCREPANCIES SHALL BE BROUGHT TO THE IMMEDIATE ATTENTION OF THE CONTRACTOR FOR CORRECTION. IF THEY ARE NOT CORRECTED, THE DISCREPANCIES SHALL BE BROUGHT TO THE ATTENTION OF THE BUILDING OFFICIAL AND TO THE REGISTERED DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE PRIOR TO THE COMPLETION OF THAT PHASE OF THE WORK. A FINAL REPORT DOCUMENTING REQUIRED SPECIAL INSPECTIONS AND CORRECTION OF ANY DISCREPANCIES NOTED IN THE INSPECTIONS SHALL BE SUBMITTED AT A POINT IN TIME AGREED UPON PRIOR TO THE START OF WORK BY THE APPLICANT TO THE BUILDING OFFICIAL.

4. THE CONTRACTOR IS RESPONSIBLE FOR PROVIDING REASONABLE NOTICE TO THE SPECIAL INSPECTOR(S) REGARDING WHEN ELEMENTS OF THE PROJECT WILL BE READY FOR EFFICIENT IMPLEMENTATION OF SPECIAL INSPECTIONS. THE CONTRACTOR SHALL PROVIDE ACCESS TO THE LATEST VERSION OF ALL APPROVED PLANS AND SHOP DRAWINGS AS REQUIRED FOR THE SPECIAL INSPECTOR'S USE IN PERFORMING SPECIAL INSPECTIONS. THE CONTRACTOR SHALL GRANT ACCESS TO THE OWNER'S SPECIAL INSPECTOR(S) AS IS REASONABLY NECESSARY FOR THE PROPER PERFORMANCE OF SPECIAL INSPECTIONS.

5. SPECIAL INSPECTIONS DO NOT RELIEVE THE CONTRACTOR OF RESPONSIBILITY TO COMPLY WITH ALL REQUIREMENTS OF THE CONTRACT DOCUMENTS. CONSTRUCTION MEANS AND METHODS AND JOBSITE SAFETY ARE SOLELY THE RESPONSIBILITY OF THE CONTRACTOR.

6. REFER TO PROJECT SPECIFICATIONS FOR ADDITIONAL SPECIAL INSPECTION REQUIREMENTS. IF CONFLICTING REQUIREMENTS ARE FOUND, THE MORE STRINGENT PROVISION SHALL CONTROL UNLESS DIRECTED OTHERWISE IN WRITING BY THE STRUCTURAL ENGINEER OF RECORD.

INSPECTION OF FABRICATORS:

WHERE FABRICATION OF STRUCTURAL, LOADBEARING, OR LATERAL LOAD-RESISTING MEMBERS AND ASSEMBLIES IS BEING PERFORMED ON THE PREMISES OF A FABRICATOR'S SHOP, SPECIAL INSPECTION OF THE FABRICATED ITEMS SHALL BE REQUIRED IN ACCORDANCE WITH SECTION 1704.2 OF THE 2015 INTERNATIONAL BUILDING CODE AND AS REQUIRED ELSEWHERE IN THE CODE. (EXCEPT WHERE THE FABRICATOR IS APPROVED IN ACCORDANCE WITH SECTION 1704.2.2)

SUCH SPECIAL INSPECTIONS SHALL BE PERFORMED BY A PROFESSIONAL ENGINEER OR AN EMPLOYEE OF AN APPROVED TESTING AGENCY.

INSPECTION OF STRUCTURAL STEEL CONSTRUCTION:

SPECIAL INSPECTIONS AND NON-DESTRUCTIVE TESTING OF STRUCTURAL STEEL ELEMENTS IN BUILDINGS, STRUCTURES, AND PORTIONS THEREOF SHALL BE IN ACCORDANCE WITH THE QUALITY ASSURANCE INSPECTION REQUIREMENTS OF AISC 360. (NOTE: ALL FIELD WELDS SHALL BE INSPECTED BY AN AWS CERTIFIED WELDING INSPECTOR.)

WELDING INSPECTION AND SPECIAL INSPECTOR QUALIFICATION FOR STRUCTURAL STEEL SHALL BE IN COMPLIANCE WITH AWS D1.1.

INSPECTION OF COLD-FORMED STEEL DECK:

SPECIAL INSPECTIONS AND THE QUALIFICATION OF THE SPECIAL INSPECTOR(S) FOR COLD-FORMED STEEL FLOOR AND ROOF DECK SHALL BE IN ACCORDANCE WITH THE QUALITY ASSURANCE INSPECTION REQUIREMENTS OF SDI QA/QC.

WELDING INSPECTION AND SPECIAL INSPECTOR QUALIFICATION FOR COLD-FORMED STEEL FLOOR AND ROOF DECKS SHALL BE IN COMPLIANCE WITH AWS D1.3

INSPECTION OF CONCRETE CONSTRUCTION:

SPECIAL INSPECTIONS AND TESTS OF CONCRETE CONSTRUCTION SHALL BE PERFORMED IN ACCORDANCE WITH SECTION 1705.3 OF THE 2015 INTERNATIONAL BUILDING CODE AND WITH TABLE 1705.3.

IN THE ABSENCE OF SUFFICIENT DATA OR DOCUMENTATION PROVIDING EVIDENCE OF CONFORMANCE TO QUALITY STANDARDS FOR MATERIALS IN CHAPTER 19 AND 20 OF ACI 318, THE BUILDING OFFICIAL SHALL REQUIRE TESTING OF MATERIALS IN ACCORDANCE WITH THE APPROPRIATE STANDARDS AND CRITERIA FOR THE MATERIAL IN CHAPTERS 19 AND 20 OF ACI 318

WELDING INSPECTION AND SPECIAL INSPECTOR QUALIFICATION FOR REINFORCING STEEL SHALL BE IN COMPLIANCE WITH AWS D1.4 AND ACI 318.

INSPECTION OF SOILS:

SPECIAL INSPECTIONS AND TESTS OF EXISTING SITE SOIL CONDITIONS, FILL PLACEMENT, AND LOAD-BEARING REQUIREMENTS SHALL BE PERFORMED IN ACCORDANCE WITH SECTION 1705.6 OF THE 2015 INTERNATIONAL BUILDING CODE AND TABLE 1705.6. THE APPROVED GEOTECHNICAL REPORT AND THE CONSTRUCTION DOCUMENTS PREPARED BY THE REGISTERED DESIGN PROFESSIONALS SHALL BE USED TO DETERMINE COMPLIANCE. DURING FILL PLACEMENT, THE SPECIAL INSPECTOR SHALL VERIFY THAT PROPER MATERIALS AND PROCEDURES ARE USED IN ACCORDANCE WITH THE PROVISIONS OF THE APPROVED GEOTECHNICAL REPORT.

STATEMENT OF RESPONSIBILITY:

EACH CONTRACTOR RESPONSIBLE FOR THE CONSTRUCTION, FABRICATION, OR INSTALLATION OF A MAIN WIND OR SEISMIC FORCE-RESISTING SYSTEM OR A WIND OR SEISMIC FORCE-RESISTING COMPONENT LISTED IN THE STATEMENT OF SPECIAL INSPECTIONS SHALL SUBMIT A WRITTEN STATEMENT OF RESPONSIBILITY TO THE AUTHORITY HAVING JURISDICTION, THE RESPONSIBLE DESIGN PROFESSIONAL AND THE OWNER PRIOR TO THE COMMENCEMENT OF WORK ON THE SYSTEM OR COMPONENT. THE CONTRACTOR'S STATEMENT OF RESPONSIBILITY SHALL CONTAIN THE FOLLOWING:

A. ACKNOWLEDGEMENT OF AWARENESS OF THE SPECIAL REQUIREMENTS CONTAINED IN THE STATEMENT OF SPECIAL INSPECTIONS.

B. ACKNOWLEDGEMENT THAT CONTROL WILL BE EXERCISED TO OBTAIN COMPLIANCE WITH THE CONSTRUCTION DOCUMENTS.

C. PROCEDURES FOR EXERCISING CONTROL WITHIN THE CONTRACTOR'S ORGANIZATION, THE METHOD AND FREQUENCY OF REPORTING, AND THE DISTRIBUTION OF REPORTS.

D. IDENTIFICATION AND QUALIFICATIONS OF THE PERSON(S) EXERCISING SUCH CONTROL AND THEIR POSITION(S) IN THE ORGANIZATION.

REQUIRED VERIFICATIONS AND SPECIAL INSPECTIONS FOR STEEL CONSTRUCTION

CHECK IF REQUIRED	CHECK IF REQUIRED	VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC
☑		1. MATERIAL VERIFICATION OF STRUCTURAL STEEL AND COLD-FORMED STEEL DECK ELEMENTS:		
		A. FOR STRUCTURAL STEEL, IDENTIFICATION MARKINGS SHALL CONFORM TO AISC 360-10		✖
		B. FOR OTHER STEEL, IDENTIFICATION MARKINGS SHALL CONFORM TO ASTM STANDARDS SPECIFIED IN THE APPROVED CONSTRUCTION DOCUMENTS		✖
☐		2. INSPECTION OF STEEL ELEMENTS OF COMPOSITE CONSTRUCTION PRIOR TO CONCRETE PLACEMENT:		
		A. PLACEMENT AND INSTALLATION OF STEEL DECK	QC & QA	
		B. PLACEMENT AND INSTALLATION OF STEEL HEADED STUD ANCHORS	QC & QA	
		C. DOCUMENT ACCEPTANCE OR REJECTION OF STEEL ELEMENTS	QC & QA	

TABLE 1705.3: REQUIRED SPECIAL INSPECTIONS AND TESTS OF CONCRETE CONSTRUCTION

CHECK IF REQUIRED	VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC
☑	1. INSPECT REINFORCEMENT, INCLUDING PRESTRESSING TENDONS, AND VERIFY PLACEMENT		✖
☑	2. REINFORCING BAR WELDING:		
	A. VERIFY WELDABILITY OF REINFORCING BARS OTHER THAN ASTM A706		✖
	B. INSPECT SINGLE-PASS FILLET WELDS, MAX. $\frac{5}{16}$"; AND		✖
	C. INSPECT ALL OTHER WELDS	✖	
☑	3. INSPECT ANCHORS CAST IN CONCRETE		✖
☑	4. INSPECT ANCHORS POST-INSTALLED IN HARDENED CONCRETE MEMBERS		
	A. ADHESIVE ANCHORS INSTALLED IN HORIZONTALLY OR UPWARDLY INCLINED ORIENTATIONS TO RESIST SUSTAINED TENSION LOADS	✖	
	B. MECHANICAL ANCHORS AND ADHESIVE ANCHORS NOT DEFINED IN 4.A.		✖
☑	5. VERIFY USE OF REQUIRED DESIGN MIX		✖
☑	6. PRIOR TO CONCRETE PLACEMENT, FABRICATE SPECIMENS FOR STRENGTH TESTS, PERFORM SLUMP AND AIR CONTENT TESTS, AND DETERMINE THE TEMPERATURE OF THE CONCRETE	✖	
☑	7. INSPECT CONCRETE AND SHOTCRETE PLACEMENT FOR PROPER APPLICATION TECHNIQUES	✖	
☑	8. VERIFY MAINTENANCE OF SPECIFIED CURING TEMPERATURE AND TECHNIQUES		✖
☐	9. INSPECT PRESTRESSED CONCRETE FOR:		
	A. APPLICATION OF PRESTRESSING FORCES; AND	✖	
	B. GROUTING OF BONDED PRESTRESSING TENDONS	✖	
☐	10. INSPECT ERECTION OF PRECAST CONCRETE MEMBERS		✖
☐	11. VERIFY IN-SITU CONCRETE STRENGTH, PRIOR TO STRESSING OF TENDONS IN POST-TENSIONED CONCRETE AND PRIOR TO REMOVAL OF SHORES AND FORMS FROM BEAMS AND STRUCTURAL SLABS		✖
☑	12. INSPECT FORMWORK FOR SHAPE, LOCATION, AND DIMENSIONS OF THE CONCRETE MEMBER BEING FORMED		✖

REQUIRED VERIFICATIONS AND SPECIAL INSPECTIONS FOR STEEL CONSTRUCTION (BOLTING)

CHECK IF REQUIRED	VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC
☑	1. INSPECTION PRIOR TO BOLTING (AISC 360-10):		
	A. VERIFY IDENTIFICATION MARKINGS CONFORM TO ASTM STANDARDS SPECIFIED IN THE APPROVED CONSTRUCTION DOCUMENTS.		QC & QA
	B. MANUFACTURER'S CERTIFICATIONS AVAILABLE FOR FASTENER MATERIALS	QA	QC
	C. FASTENERS MARKED IN ACCORDANCE WITH ASTM REQUIREMENTS		QC & QA
	D. PROPER FASTENERS SELECTED FOR THE JOINT DETAIL (GRADE, TYPE, BOLT LENGTH IF THREADS ARE TO BE EXCLUDED FROM SHEAR PLANE)		QC & QA
	E. PROPER BOLTING PROCEDURE SELECTED FOR JOINT DETAIL		QC & QA
	F. CONNECTING ELEMENTS, INCLUDING THE APPROPRIATE FAYING SURFACE CONDITION AND HOLE PREPARATION, IF SPECIFIED, MEET APPLICABLE REQUIREMENTS		QC & QA
	G. PRE-INSTALLATION VERIFICATION TESTING BY INSTALLATION PERSONNEL OBSERVED AND DOCUMENTED FOR FASTENER ASSEMBLIES AND METHODS USED	QC	QA
	H. PROPER STORAGE PROVIDED FOR BOLTS, NUTS, WASHERS, AND OTHER FASTENER COMPONENTS		QC & QA
☑	2. INSPECTION DURING BOLTING (AISC 360-10):		
	A. FASTENER ASSEMBLIES, OF SUITABLE CONDITION, PLACED IN ALL HOLES AND WASHERS (IF REQUIRED) ARE POSITIONED AS REQUIRED		QC & QA
	B. SNUG-TIGHT JOINTS AND JOINTS BROUGHT TO THE SNUG-TIGHT CONDITION PRIOR TO THE PRESTRESSING OPERATION		QC & QA
	C. FASTENER COMPONENT NOT TURNED BY THE WRENCH PREVENTED FROM ROTATING		QC & QA
	D. FASTENERS ARE PRETENSIONED IN ACCORDANCE WITH THE RCSC SPECIFICATION, PROGRESSING SYSTEMATICALLY FROM THE MOST RIGID POINT TOWARD THE FREE EDGES		QC & QA
	E. PRETENSIONED AND SLIP-CRITICAL JOINTS USING TURN-OF-NUT WITH MATCHMARKING, TWIST-OFF BOLT, OR DIRECT TENSION INDICATOR METHODS OF INSTALLATION		QC & QA
	F. PRETENSIONED AND SLIP-CRITICAL JOINTS USING TURN-OF-NUT WITHOUT MATCHMARKING OR CALIBRATED WRENCH METHODS OF INSTALLATION	QC & QA	
☑	3. INSPECTION AFTER BOLTING (AISC 360-10):		
	A. DOCUMENT ACCEPTANCE OR REJECTION OF BOLTED CONNECTIONS	QC & QA	

REQUIRED VERIFICATIONS AND SPECIAL INSPECTIONS FOR STEEL CONSTRUCTION (WELDING)

CHECK IF REQUIRED	VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC
☑	1. INSPECTION PRIOR TO WELDING (AISC 360-10):		
	A. VERIFY IDENTIFICATION MARKINGS OF WELD FILLER MATERIALS CONFORM TO AWS SPECIFICATION IN THE APPROVED CONSTRUCTION DOCUMENTS		✖
	B. WELDING PROCEDURE SPECIFICATIONS ARE AVAILABLE	QC & QA	
	C. MANUFACTURER CERTIFICATIONS FOR WELDING CONSUMABLES AVAILABLE	QC & QA	
	D. MATERIAL IDENTIFICATION (TYPE/GRADE) AND WELDER IDENTIFICATION SYSTEM		QC & QA
	E. FIT-UP OF WELDS INCLUDING BUT NOT LIMITED TO JOINT PREPARATION, DIMENSIONS, CLEANLINESS, TACKING, AND BACKING TYPE AND FIT AS APPLICABLE		QC & QA
	F. CONFIGURATION AND FINISH OF ACCESS HOLES		QC & QA
	G. CHECK WELDING EQUIPMENT		QC
☑	2. INSPECTION DURING WELDING (AISC 360-10):		
	A. USE OF QUALIFIED WELDERS		QC & QA
	B. PACKAGING AND EXPOSURE CONTROL AND HANDLING OF WELDING CONSUMABLES		QC & QA
	C. NO WELDING OVER CRACKED TACK WELDS		QC & QA
	D. ENVIRONMENTAL CONDITIONS INCLUDING BUT NOT LIMITED TO PRECIPITATION, TEMPERATURE, AND WIND SPEEDS WITHIN LIMITS		QC & QA
	E. VERIFY SETTINGS ON EQUIPMENT, TRAVEL SPEEDS, ELECTED MATERIALS, SHIELDING GAS TYPE/FLOW RATE, PREHEATING INTERPASS TEMPERATURES AND PROPER POSITION MEETS WPS STANDARDS		QC & QA
	F. VERIFY WELDING TECHNIQUES FOR INTERPASS, FINAL CLEANING, PROFILE LIMITATIONS, AND QUALITY REQUIREMENTS		QC & QA
☑	3. INSPECTION AFTER WELDING (AISC 360-10):		
	A. WELDS ARE CLEANED AND PAINTED WHERE REQUIRED		QC & QA
	B. VERIFY SIZE, LENGTH, AND LOCATIONS OF WELDS	QC & QA	
	C. VISUALLY VERIFY WELDS FOR CRACK PROHIBITION, WELD/BASE-METAL FUSION, CRATER CROSS SECTION, WELD PROFILES, WELD SIZE, UNDERCUTTING, AND POROSITY	QC & QA	
	D. ARC STRIKES, K-AREA CRACKS WITHIN 3" OF WELD, REMOVAL OF BACKING, AND REPAIR ACTIVITIES AS APPLICABLE	QC & QA	
	E. DOCUMENTATION OF ACCEPTANCE OR REJECTION OF WELDED JOINT OR MEMBER	QC & QA	
☑	4. REQUIREMENTS FOR STRUCTURAL STEEL AND COLD-FORMED STEEL DECK:		
	A. INSPECT COMPLETE AND PARTIAL JOINT PENETRATION GROOVE WELDS	✖	
	B. INSPECT MULTIPASS FILLET WELDS	✖	
	C. INSPECT SINGLE PASS FILLET WELDS > 5/16"	✖	
	D. INSPECT PLUG AND SLOT WELDS	✖	
	E. INSPECT SINGLE-PASS FILLET WELDS ≤ 5/16"		✖
	F. INSPECT FLOOR AND ROOF DECK WELDS		✖
	G. INSPECT WELDED STUDS AND DEFORMED BAR ANCHORS		✖
	H. INSPECT WELDED SHEET STEEL FOR COLD-FORMED STEEL MEMBERS		✖
	I. INSPECT WELDING OF STAIRS AND RAILING SYSTEMS		✖

TABLE 1705.6: REQUIRED SPECIAL INSPECTIONS AND TESTS OF SOIL

CHECK IF REQUIRED	VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC
☑	1. VERIFY MATERIALS BELOW SHALLOW FOUNDATIONS ARE ADEQUATE TO ACHIEVE THE DESIGN BEARING CAPACITY		✖
☑	2. VERIFY EXCAVATIONS ARE EXTENDED TO PROPER DEPTH AND HAVE REACHED PROPER MATERIAL		✖
☑	3. PERFORM CLASSIFICATION AND TESTING OF COMPACTED FILL MATERIALS		✖
☑	4. VERIFY USE OF PROPER MATERIALS, DENSITIES, AND LIFT THICKNESS DURING PLACEMENT AND COMPACTION OF COMPACTED FILL	✖	
☑	5. PRIOR TO PLACEMENT OF COMPACTED FILL, INSPECT SUBGRADE AND VERIFY THAT SITE HAS BEEN PREPARED PROPERLY		✖

REGISTERED PROFESSIONAL ENGINEER
06/30/22
BRANDON WALL
21108
OKLAHOMA

NOTES ON THRUST BLOCKING

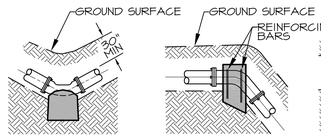
1.) ALL BLOCKING SHALL BE AGAINST UNDISTURBED HAND DUG SOIL AND SHALL BE CONCRETE HAVING A MINIMUM 28 DAY STRENGTH OF 2000 PER SQUARE INCH.

2.) THRUST CALCULATORS TO BE BASED ON THRUST DUE TO WATER PRESSURE AT 100% OF TEST PRESSURE.

THRUST = 2 AP SIN 1/2 Φ

A = AREA OF PIPE
P = WATER PRESSURE
Φ = DEFLECTION ANGLE.

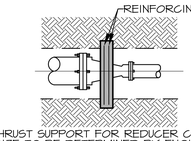
3.) VERTICAL UPLIFT BLOCKS SHALL BE DESIGNED ON THE BASIS OF 150 LBS. PER CU. FT. FOR CONCRETE AND SOIL AT 120 LBS. PER CU. FT. OVER THE AREA OF BLOCK.



4.) VERTICAL DOWN THRUST BLOCKS SHALL BE DESIGNED ON THE BASIS OF 2000 PER SQ. FT. ALLOWABLE SOIL BEARING PRESSURE. DIMENSIONS MAY BE DECREASED WITH APPROVAL OF THE ENGINEER IF MEASURED SOIL CONDITIONS PERMIT. IN POOR SOIL CONDITIONS, BLOCK DIMENSIONS SHALL BE INCREASED IN PROPORTION TO ALLOWABLE BEARING VALUE.

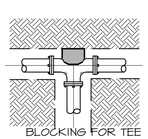
5.) THRUST BLOCKS ON HORIZONTAL BENDS, TEES, CROSSES, AND REDUCERS SHALL BE SIZED BASED ON 24000 LBS. PER SQ. FT. OF BLOCKING SURFACE AREA IN CONTACT WITH UNDISTURBED SOIL, BLOCK DIMENSIONS MAY BE DECREASED WITH APPROVAL OF THE ENGINEER IF MEASURED SOIL CONDITIONS PERMIT. IN POOR SOIL CONDITIONS, BLOCK DIMENSIONS SHALL BE INCREASED IN PROPORTION TO THE ALLOWABLE BEARING VALUE.

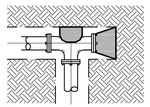
6.) ALL BLOCKING SHALL HAVE A MINIMUM SOIL COVER OF 1 FT.



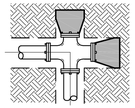
7.) ADDITIONAL REINFORCING MAY BE REQUIRED FOR HORIZONTAL BLOCKING TO HANDLE UNUSUAL SHEAR LOADING CONDITIONS.

8.) ANCHOR COLLARS SHALL BE REINFORCED IN ACCORDANCE WITH REINFORCING BAR SCHEDULE FOR REDUCED BLOCKS SHOWN ABOVE. STEEL ANCHOR RING IN ACCORDANCE WITH DIMENSIONS OF ANCHOR COLLAR.





TYPICAL BLOCKING FOR VERTICAL BENDS



TYPICAL BLOCKING FOR HORIZONTAL BENDS

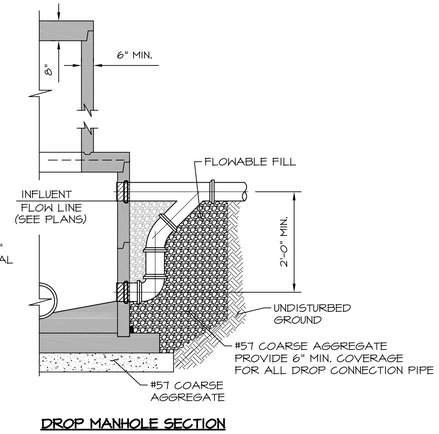
THRUST BLOCKING DETAILS
N.T.S.

MANHOLE NOTES:



1. PRECAST RISERS, CONES, FLOORS, GRADE RINGS, STEPS, AND RINGS AND COVERS SHALL BE MANUFACTURED ACCORDING TO THE MOST RECENT ASTM C-478 SPECIFICATIONS.
2. ALL MANHOLE CONSTRUCTION SHALL BE WATERTIGHT. JOINTS SHALL BE RUBBER GASKET MANHOLE SECTIONS WITH PROFILE JOINT AND FORSHEDA 114 JOINT SEALS.
3. ANY ERECTION HOLES, STEP HOLES, OR OTHER HOLES THROUGH THE WALL OF THE MANHOLE SHALL BE COVERED WITH 3" CONCRETE GROUT. GRADE RINGS SHALL BE FORMED WITH TONGUE AND GROOVE OF LUGS AND NOTCHES.
4. GRADE RINGS SHALL BE SET IN MORTAR OR PLASTIC JOINT COMPOUND.
5. WHEN FIELD CONDITIONS REQUIRE HEIGHT TO BE ADJUSTED, ADDITIONAL GRADE RINGS MAY BE USED AS DIRECTED BY THE ENGINEER.
6. WHENEVER THE SUBGRADE FOR ANY MANHOLE OR DROP MANHOLE IS OF AN UNSATISFACTORY MATERIAL, SAME SHALL BE REMOVED AND REPLACED WITH A CRUSHED ROCK BEDDING AND COMPACTED TO THE SATISFACTION OF THE ENGINEER.
7. ALL CONCRETE ENCASEMENT IN ROCK SHALL BE POURED AGAINST THE FACE OF THE ROCK. NO PAYMENT WILL BE MADE FOR EXTRA CONCRETE USED IN OVER BREAKAGE OF THE DIMENSIONS AS SHOWN ON THE TYPICAL SECTION OF CONCRETE ENCASEMENT.
8. BACKFILL EXCAVATION WITH SELECT FILL COMPACTED IN 8" LAYERS TO 95% OF MAXIMUM DENSITY WITHIN 2% OF OPTIMUM MOISTURE AS DETERMINED BY ASTM D-698.
9. CENTERLINE OF ALL PIPES ENTERING AND LEAVING SHALL PASS THROUGH CENTER OF MANHOLE.
10. CONSTRUCT FLOW CHANNEL FOR ALL PIPES ENTERING MANHOLE, INCLUDING SERVICES. MAINTAIN A CONSTANT GRADE THROUGHOUT EACH INVERT.
11. INVERT MUST HAVE A CHANNEL DEPTH OF EQUAL TO AT LEAST HALF THE LARGEST PIPE DIAMETER.
12. ALL PIPE ENTERING THE MANHOLE MORE THAN 24" ABOVE AN INVERT MUST HAVE A DROP PIPE.
13. WHENEVER SEWER PIPE IS CONNECTED INTO THE WALL OF A MANHOLE WITHOUT A RESILIENT MANHOLE PIPE CONNECTOR THE FIRST JOINT OF THE SEWER PIPE SHALL BE LOCATED A MAXIMUM OF 12" OUTSIDE THE WALL OF THE MANHOLE. CONNECTION INTO MANHOLE WITHOUT A RESILIENT CONNECTOR WILL BE USED ONLY UPON APPROVAL OF THE ENGINEER.
14. FRAME & COVER SHALL BE INSTALLED TO CONCRETE WITH 2 ROWS OF MASTIC.
15. AVERAGE WEIGHT OF CASTING SHALL NOT BE LESS THAN 95% OF: RING 228 LBS; COVER 195 LBS; TOTAL 430 LBS.
16. MANHOLES MAY HAVE EITHER PRECAST OR CAST-IN-PLACE BASES. BASE DIAMETER TO MATCH DETAILS.
17. MANHOLE AND BASE SHALL BE MANUFACTURED IN ACCORDANCE WITH C478.
18. MINIMUM BASE INSIDE DIAMETER SHALL BE BASED ON THE NUMBER AND SIZE OF THE PIPES ENTERING THE MANHOLE, THE ELEVATION OF THE PIPES, AND THE MINIMUM SPACING BETWEEN THE PIPES.

STANDARD MANHOLE PLAN

NOTES
1. INSTALL TRANSMITTER TO MANUFACTURER'S SPECIFICATIONS AND REQUIREMENTS.
2. CONSULT MANUFACTURER'S INSTALLATION MANUAL FOR CORRECT PROBE INSERTION LENGTH.
3. USE 316 SST FITTINGS FOR ALL PROCESS CONNECTIONS.
4. ANCHOR SYSTEM SHALL BE HILTI HY 150 W 316SS MATERIALS.
5. ENSURE THE SENSOR CANNOT MAKE CONTACT WITH THE TANK WALL.
6. ENSURE THAT SENSOR IS FULLY IMMERSED AT ALL TIMES.

EMBEDDMENT DETAIL NOTES

1. MINIMUM TRENCH WIDTH AT SPRINGLINE OF PIPE
   a. PIPES < 4" 18"
   b. PIPES 6" - 18" 12" + O.D.
   c. PIPES > 20" 24" + O.D.
2. EXCAVATION MAY BE WIDENED ABOVE THE EMBEDMENT ZONE AT THE CONTRACTOR'S OPTION AND EXPENSE.
3. EMBEDMENT / BACKFILL LIFT THICKNESS (MAXIMUM)
   a. FINAL BACKFILL 12" LIFTS TYPICAL; 6" LIFTS UNDER PAVING / STRUCTURES
   b. INITIAL BACKFILL 6" LIFTS
   c. HAUNCHING 4" LIFTS
   d. BEDDING 4" LIFTS
4. TRENCH SLOPE, SHORING, BENCHING, ETC TO BE DETERMINED BY THE CONTRACTOR. CONTRACTOR IS SOLELY RESPONSIBLE FOR TRENCH SAFETY AND OSHA COMPLIANCE.
5. EXCAVATION FOR BELL HOLE REQUIRED FOR ALL PIPING <4". CONTRACTOR SHALL SELECT AND UTILIZE CONSTRUCTION METHODS SUCH THAT ALL AREAS UNDER THE PIPE HAUNCHES ARE FILLED WITH THE APPROPRIATE MATERIAL AND COMPACTED.
6. ALL MATERIALS UNDER PAVING / STRUCTURES SHALL BE COMPACTED TO 95% MODIFIED PROCTOR DENSITY AT 4% OPTIMUM MOISTURE CONTENT BY SHEEPSFOOT OR OTHER SUTIABLE MECHANICAL COMPACTION METHODS AT SPECIFIED LIFT THICKNESSES. COMPACTION EQUIPMENT MUST NOT COME IN CONTACT WITH CARRIER PIPE NOR CASING PIPE.
7. IF TRENCH BOTTOM IS OVER-EXCAVATED BELOW INTENDED GRADE, FILL THE OVER-EXCAVATION WITH EMBEDMENT MATERIAL AND COMPACT AT THE DENSITY SPECIFIED FOR THE EMBEDMENT MATERIAL.
8. THE EXISTING NATIVE MATERIAL WITHIN THE LIMITS OF THE EMBEDMENT ZONE IS TO REMAIN UNDISTURBED OR REPLACED WITH SPECIFIED PIPE EMBEDMENT MATERIAL IF OVER-EXCAVATION TAKES PLACE. REPLACEMENT WITH ONSITE MATERIAL WILL NOT BE ACCEPTABLE.
9. IF BEDDING DETAIL CONFLICTS WITH ANY OTHER DETAIL THE MORE STRINGENT SHALL APPLY.

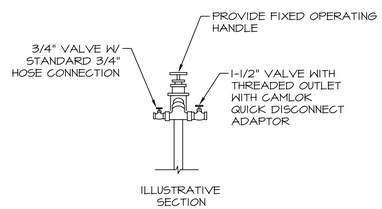
48	118	48	23	18	214	322
54	131	54	26	18	348	344

NOTES:



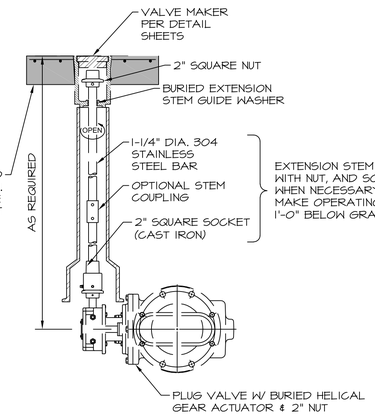
1. RESTRAIN ALL DUCTILE IRON FITTINGS.
2. TABULATED VALUES ARE FOR 100 PSIG TEST PRESSURE. FOR VALUES AT PRESSURES OTHER THAN 100 PSID, MULTIPLY TABLE VALUES BY THE RATIO OF ACTUAL TEST PRESSURE TO 100 PSIG. TEST PRESSURES FOR EACH SERVICE ARE DEFINED IN THE PIPING SCHEDULE.
3. WHERE LISTED VALUES, OR CALCULATED VALUES (SEE ABOVE), ARE LESS THAN ON STANDARD FULL PIPE SEGMENT (18 FEET), RESTRAIN THE FITTING ONLY.
4. RESTRAINT LENGTHS APPLY TO PIPE RUNS ON EACH SIDE OF A CHANGE IN DIRECTION.
5. WHERE THE PIPING LAYOUT HAS RESTRAINED JOINT LENGTHS FOR TWO OR MORE FITTINGS TO OVERLAP, THRUST RESTRAIN ALL PIPING BETWEEN THE OTHER FITTINGS, ASSUME 1/2 OF THE RESTRAINED PIPE LENGTH BETWEEN THE TWO FITTINGS RESTRAINS EACH OF THE FITTINGS AND ADD ADDITIONAL RESTRAINED JOINT LENGTH TO THE OUTER LEGS OF THE OUTER FITTINGS TO EQUAL THE TOTAL REQUIRED FOR ALL FITTINGS.
6. THRUST RESTRAINT TABLE REFERS TO NEW PIPING.

BACKFLOW PREVENTER

N.T.S

NOTES:

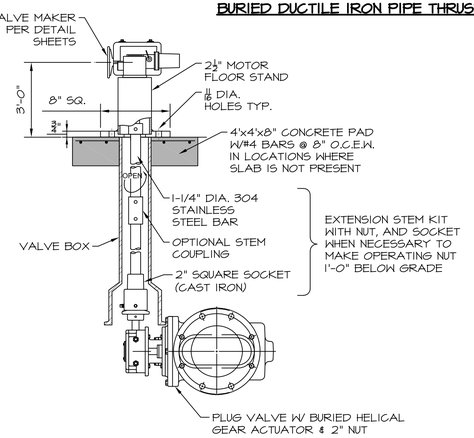
1. INSTALL INSIDE INSULATED FIBERGLASS ENCLOSURE, SUBMITTAL REQUIRED.



HOSE BIB-NON POTABLE

N.T.S

NOTES:



1. ALL HYDRANTS SHALL BE PROVIDED W/ HOSE RACK.
2. SIGN IS ROTATED FOR CLARITY, ORIENTATION SHALL BE VISIBLE FROM FRONT OF HYDRANT.
3. CONTRACTOR SHALL PROVIDE A 3/4" AND 1-1/2" THREADED OUTLET WITH CAMLOK QUICK DISCONNECT ADAPTERS AND VALVE ON EACH YARD HYDRANT IN ADDITION TO THE 2" HYDRANT VALVE. YARD HYDRANT SHALL BE ZURN Z1390 SERIED OR APPROVED EQUAL.
4. YARD HYDRANTS LOCATED NEXT TO STRUCTURES SHALL BE SECURELY MOUNTED TO THE STRUCTURES WITH STAINLESS STEEL FASTENERS.
5. YARD HYDRANTS SHALL BE PROVIDED WITH WHEEL TYPE HANDLE.
6. PROVIDE CASING GUARD AROUND YARD HYDRANT ABOVE GRADE SURFACE.
7. HYDRANT SHALL BE DESIGNATED WITH A "NON-POTABLE WATER" SIGN. SEE DETAIL SHEETS.

BURIED MANUAL PLUG VALVE

RM	ROOM
SE	SERVICE ENTRANCE
SHT	SHEET
SN	SOLID NEUTRAL
SPD	SURGE PROTECTIVE DEVICE
SW	SWITCH
TEL	TELEPHONE
TYP	TYPICAL
TC	TIME CLOCK
UG	UNDER GROUND
UH	UNIT HEATER
VA	VOLT-AMP
VFD	VARIABLE FREQUENCY DRIVE
W	WATT OR WIRE
WH	WATER HEATER
WM	WATT METER
WP	WEATHERPROOF
XMFR	TRANSFORMER

ABBREVIATION OR SYMBOL — DESCRIPTION

SENSORS

- XX — SPECIALTY CEILING MOUNT SENSOR WITH DESIGNATION "XX", REFER TO ABBREVIATION LEGEND BELOW.
- XX — SPECIALTY CORNER MOUNT SENSOR WITH DESIGNATION "XX", REFER TO ABBREVIATION LEGEND BELOW.

COMMUNICATIONS DEVICES

- I — INTERCOM STATION
- I$_M$ — MASTER INTERCOM STATION
- C — CLOCK
- C$_D$ — CLOCK, DUAL SIDED
- C$_{WG}$ — CLOCK, WITH WIREGUARD
- H — HORN SPEAKER
- H$_{WP}$ — HORN SPEAKER - WEATHERPROOF
- P — PAGING SPEAKER
- C — CAMERA WITH PAN, TILT, & ZOOM
- C$_{WP}$ — CAMERA - WEATHERPROOF WITH PAN, TILT, & ZOOM
- J$_V$ J$_A$ — SPECIAL SYSTEMS JUNCTION BOX ABOVE CEILING. ROUTE 1" C WITH PULL STRING TO DATA/ELECTRICAL ROOM. (V) VIDEO, (A) ALARM/ACCESS
- A — ACCESS CONTROL - PROVIDE ACCESS CONTROL ROUGH-IN AT DOOR. REFER TO DETAILS FOR ACCESS CONTROL ROUGH-IN REQUIREMENTS.
- D — MAGNETIC DOOR HOLDER
- F — FIRE ALARM PULL STATION
- F — FIRE ALARM COMBINATION HORN/STROBE DEVICE
- S — FIRE ALARM COMBINATION SPEAKER/STROBE DEVICE
- F — FIRE ALARM STROBE DEVICE
- Z, Z$_C$, Z$_M$ — FIRE ALARM ZAM DEVICE; IAM (I), CONTROL (C), OR MONITOR MODULE (M)
- S — SMOKE DETECTOR
- H — HEAT DETECTOR
- S$_D$ — DUCT SMOKE DETECTOR
- S$_{DA}$ — DUCT SMOKE DETECTOR WITH AUXILIARY CONTACTS
- TS, FS — TAMPER SWITCH / FLOW SWITCH
- ATS — SERVICE ENTRANCE RATED AUTOMATIC TRANSFER SWITCH
- M — MANHOLE, HANDHOLE DESIGNATION REFER TO SCHEDULE.

GENERAL NOTES

1. SOME SYMBOLS OR ABBREVIATIONS MAY APPEAR ON THIS SHEET AND NOT BE UTILIZED ON THE PROJECTS.

WIRE TYPES

- LIGHTING CONTROL CABLING

EQUIPMENT AND CONDUIT LINE TYPES

- FURNISH + INSTALL NEW
- EXISTING
- DEMOLISH
- UNDERGROUND CONNECT TO EXISTING

2 (3#8 + 1#8 + 1#10EG) 3/4" GRS

- CONDUIT TYPE (SEE ABBREVIATIONS) REFER TO SPECIFICATIONS IF NOT SHOWN
- CONDUIT SIZE
- GROUNDED (NEUTRAL) CONDUCTOR, NUMBER AND SIZE
- GROUNDED (NEUTRAL) CONDUCTOR, NUMBER AND SIZE
- PHASE (HOT) CONDUCTOR, NUMBER & SIZE
- NUMBER OF SETS

XX - ## — HOME RUN TO PANEL. LETTER(S) INDICATE NAME OF PANEL, NUMBER(S) INDICATE CIRCUIT NUMBERS.

ONE LINE SYMBOLS

- CIRCUIT BREAKER, TRIP RATING SHOWN, 3-POLE UNLESS NOTED.
- FUSE, CURRENT LIMITING, RATING AS SHOWN.
- 480V / ** kVA / 208V — TRANSFORMER, RATINGS AS SHOWN.
- M 10 HP — ELECTRIC MOTOR, HORSEPOWER SHOWN.
- MOTOR STARTER, SIZE AS SHOWN OR REQUIRED. FVNR UNLESS NOTED.
- SPD — SURGE PROTECTION DEVICE.
- G *KW — GENERATOR
- GROUNDING ROD, 3/4" x 10' MINIMUM, COPPER CLAD.
- VARIABLE FREQUENCY DRIVE.
- ATS-1 200A / 3P /BP — AUTOMATIC TRANSFER SWITCH

MANUFACTURER–DESIGNED EQUIPMENT SYSTEM NOTES:

1. THIS PROJECT INCLUDES THE CONSTRUCTION OF MANUFACTURER–DESIGNED EQUIPMENT SYSTEMS.
2. POWER, SIGNAL AND CONTROL CIRCUITS ARE SHOWN ON THESE DRAWINGS BASED ON SIMILAR MANUFACTURER–DESIGNED EQUIPMENT SYSTEMS.
3. THE FINAL POWER, SIGNAL AND CONTROL CIRCUIT REQUIREMENTS SHALL BE DETERMINED BY THE APPROVED MANUFACTURER.
4. DRAWINGS, SPECIFICATIONS, INSTALLATION MANUALS, AND OTHER REQUIRED DOCUMENTATION SHALL BE PROVIDED BY THE APPROVED MANUFACTURERS AND MAY INCLUDE ADDITIONAL AND/OR ALTERED REQUIREMENTS THAN SHOWN ON THESE DRAWINGS.
5. THE CONTRACTOR SHALL COORDINATE WITH THOSE APPROVED SUBMITTAL DRAWINGS AND PROVIDE ALL REQUIRED LABOR AND MATERIALS NECESSARY FOR A COMPLETE AND ACCEPTED SYSTEM AT NO ADDITIONAL COST TO THE OWNER.

KEYED NOTES:

1. CCTV LOCATION POLE MOUNT. ROUTE (3#12)3/4"C TO 120 VOLT PANEL SCHEDULES.
2. CCTV LOCATION BUILDING MOUNT
3. FURNISH AND INSTALL CIRCUIT 1F20N FROM PANEL IPCL1 TO MAG METER IN VAULT. CONNECT TO 20A/1P CIRCUIT BREAKER. FURNISH AND INSTALL (1ISP16)1"C FROM MAG METER TO PANEL RTU–A.
4. FURNISH AND INSTALL CIRCUIT F20 FROM PANEL HP–1 TO ACTUATED VALVE. CONNECT TO 20A/3P CIRCUIT BREAKER. FURNISH AND INSTALL (8#14)1"C AND (2ISP16)1"C TO PANEL RTU–A.

HAZARDOUS LOCATION NOTES:

1. THIS PROJECT INCLUDES THE INSTALLATION OF ELECTRICAL SYSTEMS IN LOCATIONS DEFINED BY THE NATIONAL FIRE PROTECTION AGENCY (NFPA) AS HAZARDOUS (CLASSIFIED) LOCATIONS. WASTEWATER COLLECTION SYSTEMS AND WASTEWATER TREATMENT PROCESSES ARE FIRE AND EXPLOSION HAZARDS DUE TO THE POSSIBLE IGNITION OF FLAMMABLE GASSES AND FLOATING FLAMMABLE LIQUIDS.
2. WIRING MATERIALS AND METHODS IN HAZARDOUS (CLASSIFIED) LOCATIONS SHALL MEET THE REQUIREMENTS OF THE NATIONAL ELECTRICAL CODE (NEC), ARTICLE 500, HAZARDOUS (CLASSIFIED) LOCATIONS. INSTALLATION SHALL BE DONE BY PERSONS TRAINED AND EXPERIENCED IN HAZARDOUS (CLASSIFIED) LOCATION WORK.
3. CONDUIT SEAL FITTINGS SHALL BE FURNISHED AND INSTALLED AT BOUNDARIES OF HAZARDOUS (CLASSIFIED) LOCATIONS. BOUNDARIES OF HAZARDOUS (CLASSIFIED) LOCATIONS ARE BETWEEN CLASS I AND UNCLASSIFIED LOCATIONS, CLASS I AND CLASS II LOCATIONS, CLASS II AND UNCLASSIFIED LOCATIONS. CONDUIT SEAL FITTINGS SHALL BE LOCATED AS REQUIRED BY THE NATIONAL ELECTRICAL CODE.
4. RIGID CONDUIT IN HAZARDOUS (CLASSIFIED) LOCATIONS SHALL BE RIGID METAL CONDUIT (RMC) OR CONCRETE–ENCASED PVC. FLEXIBLE CONDUIT IN HAZARDOUS (CLASSIFIED) LOCATIONS SHALL BE RATED FOR THE HAZARD CLASSIFICATION IN WHICH IT IS INSTALLED.
5. WASTEWATER LIFT STATION WET WELLS ARE CLASS I, DIVISION I HAZARDOUS LOCATIONS.
6. WASTEWATER LIFT STATION METER VAULTS ARE CLASS I, DIVISION II HAZARDOUS LOCATIONS.

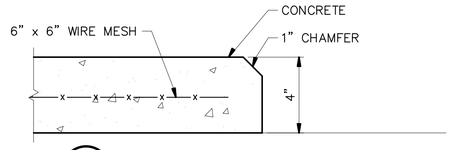
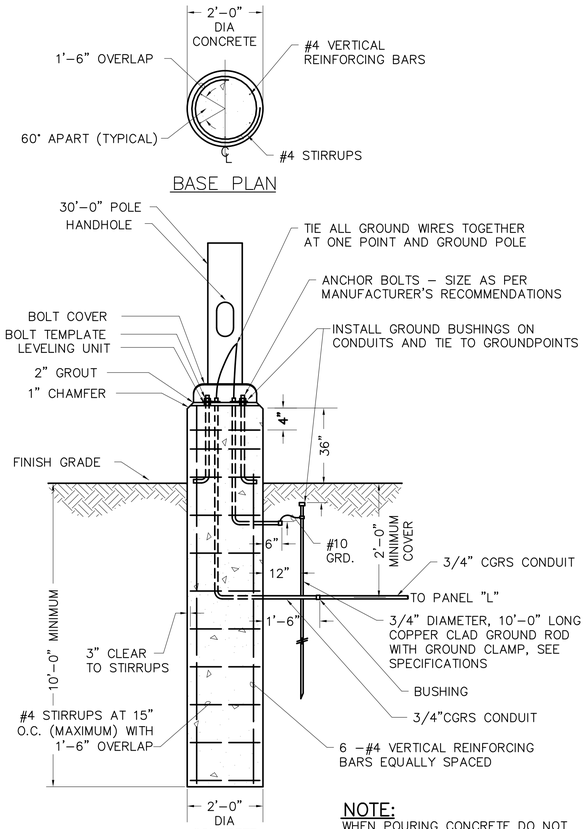
ALL PIPING MUST BE FULLY INSULATED AND WEATHERSEALED

1 — HEAT TRACE DETAIL I
SCALE: NONE



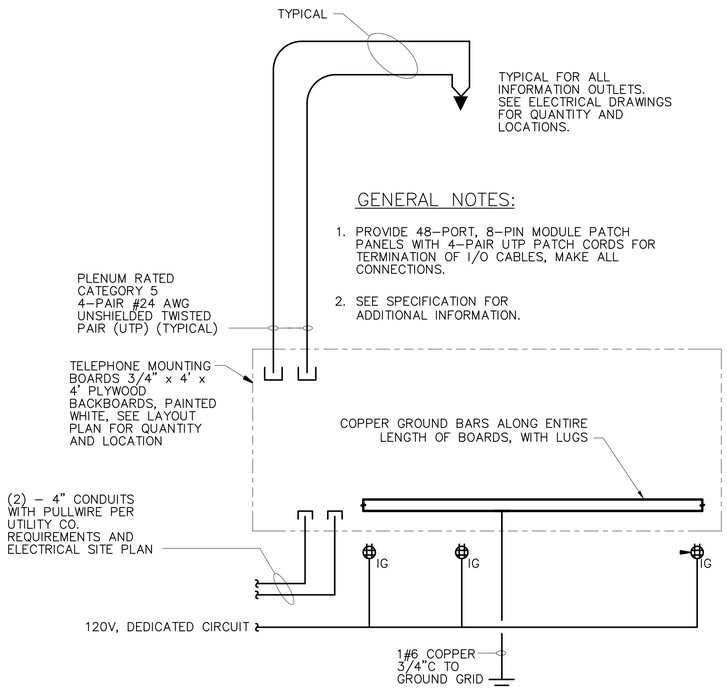
2 — HEAT TRACE DETAIL II
SCALE: NONE



GENERAL NOTES:

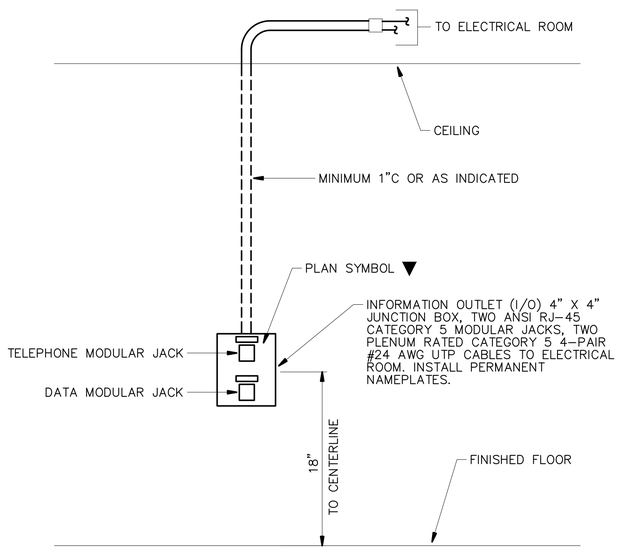
1. POWER MARKING TAPES SHALL BE DETECTABLE TYPE CONSTRUCTION WITH RED BACKGROUND AND BLACK LETTERING.
2. COMMUNICATION MARKING TAPES SHALL BE DETECTABLE TYPE CONSTRUCTION WITH ORANGE BACKGROUND AND BLACK LETTERING, "TELEPHONE LINE" OR "FIBER OPTIC LINE" RESPECTIVELY.
3. TAPE SHALL BE DETECTABLE, DURABLE, HIGHLY VISIBLE, RESISTANT TO ELEMENTS, MEETING AND/OR EXCEEDING ALL INDUSTRY STANDARDS.

3 — UNDERGROUND DETECTABLE WARNING TAPE
SCALE: NONE



4 — HOUSEKEEPING PAD (TYPICAL)
SCALE: NTS

NOTE:
WHEN POURING CONCRETE DO NOT DROP CONCRETE THROUGH WATER IF WATER IS PRESENT IN HOLE.



7 — POLE BASE DETAIL
SCALE: NONE

GENERAL NOTES:

1. PROVIDE 48–PORT, 8–PIN MODULE PATCH PANELS WITH 4–PAIR UTP PATCH CORDS FOR TERMINATION OF I/O CABLES, MAKE ALL CONNECTIONS.
2. SEE SPECIFICATION FOR ADDITIONAL INFORMATION.

5 — TELEPHONE AND DATA RISER DIAGRAM
SCALE: NONE

NOTE:

1. FLUSH MOUNTED INFORMATION OUTLET: 1 BOX, 2 JACKS, 2 CABLES, 1 CONDUIT. ONE FLEXIBLE CONDUIT PER INFORMATION OUTLET. ROUTE UP THROUGH WALL AND STUB ABOVE CEILING. CAP, TAG, AND IDENTIFY ALL CONDUIT. PROVIDE PULLWIRE IN ALL CONDUIT. PULLWIRE TO REMAIN AFTER CABLE INSTALLATION. TWO JACKS AND CABLES UNLESS OTHERWISE NOTED.
2. WHERE UNABLE TO CONCEAL ABOVE CEILING–PROVIDE WIREMOLD TO CONCEAL CIRCUIT

6 — TYPICAL INFORMATION OUTLET
SCALE: NONE

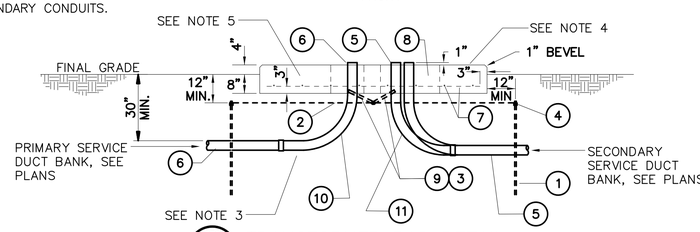
1 — **PREFABRICATED CONCRETE PULL BOX - PLAN SYMBOL H**
SCALE: NONE

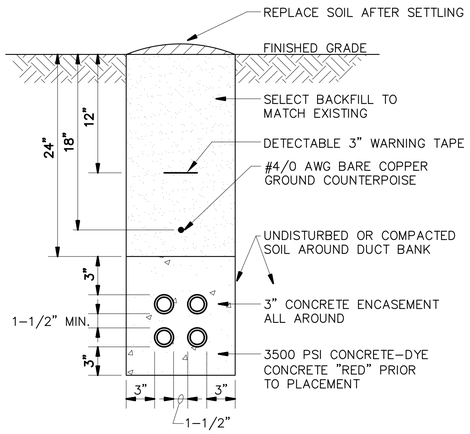


MANHOLE NOTES:

1. SUBMIT LAYOUT OF EACH MANHOLE FOR APPROVAL BY ENGINEER, INDICATING DUCT, CONDUIT AND SPARE STUBOUTS. MANHOLE INTERIOR DIMENSION SIZE SHALL BE AS DETAILED.
2. EXACT LOCATION FOR EACH MANHOLE SHALL BE
3. APPROVED BY THE ENGINEER/OWNER.
4. CABLE BRACKETS SHALL BE A BRACED CHANNEL STRUT WITH INSULATED CABLE CLAMPS.
5. INSTALL CABLE BRACKETS AND PULLING IRONS IN EACH FACE.
6. PROVIDE WATER STOPS AT ALL JOINTS; SPLICE WHERE REQUIRED.
7. PROVIDE 0.006" PLASTIC MEMBRANE VAPOR BARRIER AT BOTTOM; PROVIDE 2 COATS WATERPROOF COATING COLD METHOD. ALLOW TO DRY 24 HOURS BETWEEN EACH COAT AND BACKFILLING.
8. COLOR CODE, TAG, AND IDENTIFY ALL CABLES IN MANHOLE.
9. PROVIDE MINIMUM 5' SLACK CABLE LOOP FOR EACH CABLE.
10. PROVIDE 3' MINIMUM CONDUIT PER CAPPED STUBOUT. PROVIDE CONDUIT BUSHINGS AND WATERTIGHT SEALS FOR
11. ALL DIRECET BURIED CABLES AND COUNTERPOISE ENTERING THE MANHOLE VIA A CONDUIT STUBOUT. PROVIDE SLEEVES FOR 8 WAY EXITS AT MANHOLES.
12. SLEEVES AND STUBOUTS SHALL BE CAPPED WATERTIGHT. BOND AND GROUND COVER AND FRAME TO GROUND ROD
13. USING BRAIDED COPPER GROUND STRAP EQUIVALENT TO #6 AWG COPPER WIRE.

TRANSFORMER PAD KEYED NOTES:

1. INSTALL NEW COPPER CLAD GROUND ROD, 3/4" x 10"-0", TYPICAL OF 4.
2. INSTALL NEW #2/0 BARE COPPER CONDUCTOR (TYPICAL).
3. INSTALL NEW #2 BARE COPPER CONDUCTOR.
4. INSTALL NEW EXOTHERMIC WELD, TYPICAL OF 5.
5. INSTALL NEW SECONDARY CONDUITS, SEE SITE PLAN.
6. INSTALL NEW PRIMARY CONDUITS, SEE SITE PLAN.
7. INSTALL NEW #4 REBAR, 12"O.C. BOTH WAYS.
8. CONSTRUCT NEW PAD USING CONCRETE, 3500 PSI AT 28 DAYS.
9. INSTALL NEW 1" GRSC UNDER PAD FOR GROUND WIRES (TYPICAL).
10. UTILIZE LONG SWEEP 90° BEND PVC CONDUITS ON PRIMARY CONDUITS.
11. UTILIZE LONG SWEEP 90° BEND CONDUITS ON SECONDARY CONDUITS.



2 — **TRANSFORMER PAD DETAIL**
SCALE: NONE

TRANSFORMER PAD NOTES:

1. WHERE POSSIBLE. DO NOT PLACE CONDUIT UNDER THIS SECTION OF FOUNDATION.
2. REINFORCING - #4 BARS 12" O.C. BOTH WAYS.
3. WHEN INSTALLING CONDUIT, DISTURB GROUND IN FOUNDATION AREA AS LITTLE AS POSSIBLE. EXTEND CONDUIT 1" ABOVE FOUNDATION.
4. TOP OF FOUNDATION TO BE SMOOTH AND LEVEL. FINAL GRADE SHALL SLOPE AWAY FROM PAD.
5. CONCRETE SHALL BE 3500 PSI AT 28 DAYS AND 1:2:4 MIXTURE WITH 6 GAL. MAX. WATER CONTENT PER SACK OF CEMENT.
6. CONTRACTOR TO FURNISH 1" CONDUIT UNDER PAD FOR GROUND WIRE.
7. LOCATE CONDUITS UNDER PRIMARY AND SECONDARY BUSHINGS.
8. TRANSFORMER LOCATION TAG SHALL BE ATTACHED TO PAD WITH CONCRETE NAILS OR SHEET METAL SCREWS.
9. TRANSFORMER PAD REQUIRES A MINIMUM 3'-0" CLEARANCE AROUND EACH SIDE AND BACK OF PAD. A 15'-0" CLEARANCE IS REQUIRED ON FRONT SIDE OF PAD.

ELECTRICAL DUCT NOTES:

1. CONTRACTOR SHALL STAKE THE DUCT INSTALLATION IN PLAN AND ELEVATION FOR NEW ELECTRICAL DUCTS TO AVOID EXISTING UTILITIES.
2. CONTRACTOR SHALL ADJUST THE DEPTH OF THE ELECTRICAL DUCTS AS REQUIRED TO MAINTAIN THE MINIMUM COVER REQUIREMENT INDICATED AND AVOID EXISTING UTILITIES.
3. SIMILAR CONSTRUCTION FOR OTHER DUCT SIZES. SEE DUCT BANK SCHEDULE FOR QUANTITY AND SIZES.
4. INSTALL DUCT CONDUIT SUPPORTS AT 5'-0" O.C. MAXIMUM SPACING (TYPICAL ALL DUCTS).
5. OFFSETS AND BENDS OVER 10 DEGREES AND ELBOWS IN PVC CONDUIT RUNS SHALL BE PVC COATED GALVANIZED RIGID STEEL CONDUIT.
6. NO PVC SHALL EMERGE FROM THE GROUND OR CONCRETE SLAB OR ENCASEMENT, PVC SHALL CONVERT TO PVC COATED GALVANIZED RIGID STEEL CONDUIT PRIOR TO ITS EMERGENCE.
7. INSTALL GROUND RODS AT ENDS OF ELECTRICAL DUCT OR CONNECT TO GROUND RING.
8. INSTALL CONDUCTORS AND CABLES AS NOTED ON DRAWING. INSTALL PULLWIRE IN ALL SPARE DUCTS.
9. MINIMUM COVER REQUIREMENT FOR DUCT BANKS UNDER ROADS, DRIVEWAYS AND PARKING LOTS SHALL BE 24".
10. MINIMUM COVER REQUIREMENTS FOR ELECTRICAL SECONDARY SERVICE DUCT BANKS SHALL BE 30".
11. MINIMUM COVER REQUIREMENTS FOR ELECTRICAL PRIMARY SERVICE DUCT BANKS SHALL BE 36".

4 — **CONCRETE ENCASED ELECTRICAL DUCT**
SCALE: NONE

FEEDER SCHEDULE NOTES:

1. "H" SUFFIX INDICATES THAT FEEDER IS TO BE USED ON A 480 VOLT CIRCUIT.
2. "L" SUFFIX INDICATES THAT FEEDER IS TO BE USED ON 208/240 VOLT CIRCUIT.
3. "N" SUFFIX INDICATES THAT FEEDER CONTAINS A FULL SIZE NEUTRAL CONDUCTOR. OTHERWISE PROVIDE ONLY PHASE AND GROUND CONDUCTORS.
4. "1" PREFIX INDICATES A SINGLE PHASE FEEDER (LINE-TO-LINE). OTHERWISE ASSUME 3-PHASE FEEDER.
5. "S" PREFIX INDICATES A SERVICE FEEDER CONSISTING OF PHASE CONDUCTORS PLUS A FULL SIZE GROUNDED SERVICE CONDUCTOR (NEUTRAL).
6. "CO" MEANS PROVIDE CONDUIT ONLY FOR THAT FEEDER SIZE.

Panel Totals

	PHASE A	PHASE B	PHASE C
Total Load:	25.68 kVA	25.25 kVA	24.37 kVA
Total Amps:	215 A	212 A	203 A
Total Conn. Load:	75.31 kVA		
Total Design Current:	328 A		

Notes:

PANELBOARD NOTES

(1) INSTALL LOCKING DEVICE (LOCK-OFF FOR MAINTENANCE)

(2) INSTALL LOCKING DEVICE (LOCK-ON FOR CRITICAL LOAD).

(3) REFER TO SITE LIGHTING PLAN FOR WIRE SIZES.

(4) PROVIDE GFI CIRCUIT BREAKER OR INLINE GFI FOR PERSONNEL PROTECTION (5 mA).

(5) PROVIDE GFI CIRCUIT BREAKER OR INLINE GFI FOR EQUIPMENT PROTECTION (30 mA).

(6) PROVIDE U.L. LISTED OVERCURRENT DEVICE TO COORDINATE AND MAINTAIN MANUFACTURER'S SERIES RATED SYSTEM.

(7) EXISTING CIRCUIT TO REMAIN.

(8) EXISTING CIRCUIT BREAKER TO REMAIN. VERIFY CONDITION OF CIRCUIT BREAKER TO ENSURE THAT IT IS OPERATIONAL AND MEETS ALL U.L. RATINGS.

(9) TRACE EXISTING CIRCUIT, IDENTIFY LOAD AND PROVIDE TYPEWRITTEN PANELBOARD SCHEDULE AND PLACE ON INTERIOR OF PANELBOARD DOOR. IF CIRCUIT IS A "SPARE", REFER TO NOTE (8).

IN IN ADDITION TO CIRCUIT BREAKERS SHOWN IN PANEL SCHEDULES, FURNISH THE FOLLOWING SPARE CIRCUIT BREAKERS AND INCREASE THE SIZE OF THE PANELBOARDS/SWITCHBOARDS TO ACCOMMODATE THE INSTALLATION OF THESE SPARE CIRCUIT BREAKERS:

DP1
(4) 600A/3P
(4) 400A/3P
(4) 200A/3P
(6) 20A/3P

CABLE SCHEDULE NOTES:

1. INSTRUMENT DEVICE SCHEDULE SHOWN ABOVE SPECIFIES THE REQUIRED CIRCUITS AND CIRCUIT ROUTING FOR EACH DEVICE.
2. FURNISH AND INSTALL ANALOG CABLING FROM LOCATION INDICATED IN COLUMN "ANALOG_CABLE" TO LOCATION SHOWN IN COLUMN "I&C_ROUTE_TO".
3. FURNISH AND INSTALL DIGITAL CABLING FROM LOCATION INDICATED IN COLUMN "DIGITAL_CABLE" TO LOCATION SHOWN IN COLUMN "I&C_ROUTE_TO".
4. FURNISH AND INSTALL POWER CABLING FROM DEVICE TO LOCATION SHOWN IN COLUMN "PWR_ROUTE_TO".
5. SIZE POWER CIRCUIT AS REQUIRED OR AS INDICATED IN COLUMN "LOAD/CIRCUIT".
6. REFER TO PLAN SHEETS FOR OTHER CIRCUIT REQUIREMENTS.
7. SUBSCRIPT "a" ON PLAN SHEET CABLE CALL OUT INDICATES THE ANALOG CIRCUIT.
8. SUBSCRIPT "d" ON PLAN SHEET CABLE CALL OUT INDICATES THE DIGITAL CIRCUIT.
9. SUBSCRIPT "p" ON PLAN SHEET CABLE CALL OUT INDICATES THE POWER CIRCUIT.
10. CABLE TYPE "ISP16/P-OS" IS DEFINED AS EQUAL TO OKONITE OKOSEAL-N TYPE P-OS, TC, 600V, 16 AWG, SINGLE PAIR INSTRUMENTATION CABLE WITH OVERALL SHIELD.
11. CABLE TYPE "**-ISP16/SP-OS" IS DEFINED AS EQUAL TO OKONITE OKOSEAL-N TYPE SP-OS, TC, 600V, 16 AWG, **PAIRS, MULTIPLE SHIELDED PAIR INSTRUMENTATION CABLE WITH OVERALL SHIELD.
12. CABLE TYPE "**PR#14/P-OS" IS DEFINED AS EQUAL TO OKONITE OKOSEAL-N TYPE P-OS, TC, 600V, 14 AWG, **PAIRS, MULTIPLE SHIELDED PAIR INSTRUMENTATION CABLE WITH OVERALL SHIELD.
13. CABLE TYPE "THWN" IS DEFINED AS INDIVIDUAL #14 AWG THWN CONDUCTORS.

HVAC LEGEND

ABBREVIATION OR SYMBOL	DESCRIPTION
AHU	AIR HANDLING UNIT
AFF	ABOVE FINISHED FLOOR
AP	ACCESS PANEL
BHP	BRAKE HORSEPOWER
BTUH	BRITISH THERMAL UNIT PER HOUR
CFM	CUBIC FEET PER MINUTE
CRAC	COMPUTER ROOM AIR CONDITIONING UNIT
D	DRAIN
DB	DRY BULB TEMPERATURE
DN	DOWN
EA	EXHAUST AIR
EAT	ENTERING AIR TEMPERATURE OF THE COIL
ESP	EXTERNAL STATIC PRESSURE
EWT	ENTERING WATER TEMPERATURE
FCU	FAN COIL UNIT
FLR	FLOOR
FO	FLAT OVAL
FPM	FEET PER MINUTE (VELOCITY)
GPM	GALLONS PER MINUTE
HP	HORSEPOWER
KW	KILOWATT
LAT	LEAVING AIR TEMPERATURE OF THE COIL
LWT	LEAVING WATER TEMPERATURE
MAU	MAKE-UP AIR UNIT
MAX	MAXIMUM
MIN	MINIMUM
MHP	MOTOR HORSEPOWER
NTS	NOT TO SCALE
OSA	OUTSIDE AIR
PSI	POUNDS PER SQUARE INCH
RA	RETURN AIR
RH	RELATIVE HUMIDITY
RPM	REVOLUTION PER MINUTE
RTU	ROOF TOP (AIR CONDITIONING) UNIT
SA	SUPPLY AIR
SP	STATIC PRESSURE
TYP	TYPICAL
VAV	VARIABLE AIR VOLUME
WB	WET BULB TEMPERATURE
XFR	TRANSFER AIR
'	FEET
"	INCHES
ø	ROUND DUCT
Φ	OVAL DUCT

DETAIL/SECTION NUMBER

2 / M1.1

DETAIL/SECTION DESIGNATION

SHEET NUMBER

T VAV-2 S — THERMOSTAT OR SENSOR. (SUBSCRIPT DESIGNATES CONTROLLED EQUIPMENT)

2 — KEYED NOTE

ABBREVIATION OR SYMBOL	DESCRIPTION
	CEILING SUPPLY DIFFUSER
	CEILING RETURN/EXHAUST GRILLE
	GRILLE OR REGISTER ON BOTTOM OF DUCTWORK
18/12 SA	SIDEWALL SUPPLY (RETURN SIMILAR)
18/12	RECTANGULAR DUCT WITH DUCT SIZE TAG
20ø	ROUND DUCT WITH DUCT SIZE TAG
20/14Φ	OVAL DUCT WITH DUCT SIZE TAG
24/24 SA	SUPPLY DUCT UP
24/24 SA	SUPPLY DUCT DOWN
24/24 RA	RETURN DUCT UP
24/24 RA	RETURN DUCT DOWN
24/24 EA	EXHAUST DUCT UP
24/24 EA	EXHAUST DUCT DOWN
18/18Φ 24/12	RECTANGULAR/OVAL TRANSITION
18ø 24/12	RECTANGULAR/ROUND TRANSITION
	FLEXIBLE DUCT CONNECTION
F(1) M(3) S(2) C(4)	(1) FIRE DAMPER (2) SMOKE DAMPER (3) MOTORIZED DAMPER (4) CONTROL DAMPER
(1) SD (2)	(1) BALANCING DAMPER (2) SMOKE DETECTOR
250	BALANCING DAMPER, SET TO INDICATED CFM

ABBREVIATION OR SYMBOL	DESCRIPTION
	NEW EQUIPMENT
	EXISTING EQUIPMENT TO REMAIN
	EXISTING EQUIPMENT TO BE REMOVED
	NEW DUCT
	EXISTING DUCT TO REMAIN
	DEMOLISH EXISTING DUCT BACK TO POINT.
	CONNECT TO EXISTING DUCT.

C/350 — AIR DEVICE DESIGNATION

AIR DEVICE "MARK" — AIRFLOW CFM

* NOT ALL SYMBOLS MAY APPLY TO THIS PROJECT

MECHANICAL GENERAL NOTES

1. ALL MECHANICAL WORK SHALL COMPLY WITH ALL LOCAL CODES, DRAWINGS, SPECIFICATIONS, AND AUTHORITIES HAVING JURISDICTION. IF DISCREPANCIES ARE FOUND, THE MOST STRINGENT REQUIREMENT SHALL GOVERN WORK. WHERE INSPECTIONS ARE REQUIRED BY AUTHORITIES HAVING JURISDICTION, WORK MUST NOT BE CONCEALED UNTIL INSPECTIONS AND TESTING ARE COMPLETE AND WORK IS ACCEPTED.
2. REFER TO SPECIFICATIONS AND PROJECT MANUAL FOR ADDITIONAL INFORMATION AND REQUIREMENTS.
3. REFER TO ALL PROJECT DRAWINGS FOR DETAILS OF CONSTRUCTION AND INSTALLATION REQUIREMENTS.
4. PRIOR TO BID, CONTRACTOR SHALL BECOME THOROUGHLY FAMILIAR WITH THE REQUIREMENTS OF THESE NOTES AS WELL AS OTHER NOTES SHOWN ON THE CONTRACT DOCUMENTS.
5. THESE DRAWINGS REFLECT A SYSTEM DESIGNED AROUND SPECIFIED REFERENCE PRODUCTS. THE SELECTION OF WHICH HAS INFLUENCED THE DESIGNS OF OTHER TRADES. IF SUBSTITUTE MANUFACTURERS, SIZES, OR MODEL NUMBERS ARE BID OR SUBMITTED, IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO COORDINATE ALL DIFFERENCES PRIOR TO BID. ALL COSTS OF ALL TRADES ASSOCIATED WITH THE SUBSTITUTION SHALL BE INCLUDED IN THE BID
6. COORDINATION OF ALL MODIFICATIONS TO EACH DISCIPLINE WHICH RESULT FROM SUBSTITUTION OF EQUIPMENT OR MATERIALS SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR. SUBSTITUTIONS WHICH ARE INSTALLED AND SUBSEQUENTLY ARE PROVEN UNSATISFACTORY BY OWNER, SHALL BE REMOVED COMPLETELY BY THE CONTRACTOR AND REPLACED WITH THE ORIGINAL DESIGN OR CORRECTED AS DIRECTED BY THE ENGINEER WITHOUT ADDITIONAL COST TO THE OWNER.
7. ALL DRAWINGS ARE DIAGRAMMATIC AND INDICATE THE GENERAL ARRANGEMENTS OR GEOMETRICAL RELATIONSHIPS OF EQUIPMENT AND SERVICES. THEY ARE NOT INTENDED TO SPECIFY OR SHOW EVERY OFFSET, SEQUENCE, DEVICE, OPTION, FITTING, OR COMPONENT.
8. INFORMATION AND COMPONENTS ON DETAILS OR IN SPECIFICATIONS, BUT NOT SHOWN ON PLANS, AND VICE VERSA, SHALL BE PROVIDED AS IF EXPRESSLY REQUIRED BY BOTH.
9. CONTRACTOR SHALL NOT SCALE DRAWINGS. DRAWINGS SPECIFIC TO THIS DISCIPLINE DO NOT LIMIT THE RESPONSIBILITY OF WORK REQUIRED BY THE CONTRACT DOCUMENTS.
10. EXACT LOCATIONS OF ALL EQUIPMENT, ROOF CURBS, DUCTS, DIFFUSERS, AND PIPING SHALL BE COORDINATED WITH OTHER TRADES. CEILING MOUNTED SPRINKLER, LIGHTING, AND ELECTRICAL REQUIREMENTS TAKE PRECEDENCE OVER CEILING MOUNTED MECHANICAL REQUIREMENTS. SEE ARCHITECTURAL REFLECTED CEILING PLANS FOR CEILING GRID AND LIGHTING LAYOUT FOR COORDINATION OF FINAL DIFFUSER LOCATIC NS.
11. SEE ARCHITECTURAL AND STRUCTURAL DRAWINGS FOR BUILDING DETAILS AND DIMENSIONS. COORDINATE PLACEMENT OF MECHANICAL SYSTEMS WITH ARCHITECTURAL AND STRUCTURAL TRADES.
12. CONTRACTOR SHALL BE RESPONSIBLE FOR COORDINATING ALL WORK WITH THAT OF OTHER TRADES. REFER TO ALL CONSTRUCTION DOCUMENTS FOR COMPLETE INFORMATION PRIOR TO BID.
13. ALL MECHANICAL CONSTRUCTION DETAILS SHALL BE AS SHOWN AND AS REQUIRED TO MAINTAIN "UL" ASSEMBLY RATINGS AS SHOWN ON ARCHITECTURAL SHEETS. SEAL AROUND ALL PENETRATIONS THOROUGH UL RATED ASSEMBLIES, FIRE AND SMOKE WALLS. COORDINATE WITH GENERAL CONTRACTOR.
14. NO OTHER TRADES, I.E., ELECTRICAL, CEILING, PLUMBING, OR OTHER SYSTEMS SHALL BE SUSPENDED, HUNG, OR SUPPORTED FROM DUCTWORK OR PIPING.
15. SPECIAL CARE SHALL BE TAKEN O|EXISTING |ROOFS TO PREVENT DAMAGE. ANY DAMAGE SHALL BE PROMPTLY REPAIRED AT NO EXPENSE TO THE OWNER. COMPLY WITH BONDING REQUIREMENTS O|EXISTING |ROOF.
16. CONTRACTOR SHALL BE RESPONSIBLE FOR FLASHING AND SEALING OF ALL ROOF PENETRATIONS AIR AND WATER TIGHT.
17. CLOSELY COORDINATE FINAL LOCATIONS OF INSTALLED EQUIPMENT TO ACHIEVE THE GREATEST ACCESSIBILITY FOR MAINTENANCE PURPOSES.
18. CONTRATCTOR SHALL VISIT THE SITE TO ESTABLISH THE EXISTING CONDITIONS PRIOR TO DUCT, PIPE OR EQUIPMENT FABRICATION. SYSTEMS SHALL BE ERECTED USING FIELD MEASUREMENTS FOR COORDINATION WITH THE EXISTING EQUIPMENT, STRUCTURE, FIRE PROTECTION AND ELECTRICAL IN THE SPACE.
19. MAINTAIN THE SECURITY OF THE BUILDING AT ALL TIMES.
20. CORE DRILL ALL PIPING PENETRATIONS OF CONCRETE WALLS AND FLOORS.
21. ALL HVAC WORK TO BE PER SMACNA AND ALL APPLICABLE CODES. DUCT SIZES REPRESENT FREE AREA.
22. ALL LOW PRESSURE DUCTWORK THAT HAS TO BE OFFSET DUE TO AN OBSTRUCTION SHALL BE OFFSET WITH TWO - 45 DEGREE, 1.5 RADIUS ELBOWS UNLESS OTHERWISE NOTED.
23. PROVIDE ACCESS DOORS IN WALLS, FLOORS, OR CEILINGS FOR ACCESS TO ALL FIRE DAMPERS, SMOKE DAMPERS, EQUIPMENT, COILS, VALVES, AND BALANCING DAMPERS. ACCESS DOORS ARE NOT REQUIRED WHERE DEVICES ARE DIRECTLY ACCESSIBLE THROUGH AIR DEVICES.
24. ALL DUCTWORK UPSTREAM OF VAV BOXES SHALL BE CONSIDERED "MEDIUM-PRESSURE DUCT".
25. DUCT FITTINGS ARE AS FOLLOWS: 1) FLEX DUCT IS ONLY PERMITTED IN LINEAR DUCT RUNS. FLEX DUCT SHALL NOT BE USED WHERE DUCTWORK CHANGES DIRECTION. ALL ELBOWS SHALL BE HARD DUCTED. 2) ALL 90 DEGREE ELBOWS TO HAVE R/D = 1.5, UNLESS OTHERWISE NOTED. 3) ALL MITERED RECTANGULAR ELBOWS GREATER THAN 90 DEGREES NOTED ARE TO HAVE TURNING VANES. 4) SIDE TAKE-OFF FITTINGS SHALL BE EQUAL TO FLEXMASTER STODB03. 5) DAMPERS SHALL BE EQUAL TO FLEXMASTER SLDB03
26. PROVIDE BRANCH TAKEOFF AND DAMPER AT EACH CONNECTION OF ROUND OR RECTANGULAR BRANCH DUCTS TO A RECTANGULAR DUCT, SEE DETAILS.
27. REFER TO ARCHITECTURAL PLANS FOR LOCATION OF FIRE AND SMOKE WALLS.
28. MAINTAIN A MINIMUM OF 10'-0" BETWEEN ALL FRESH AIR INTAKES AND PLUMBING VENTS, EXHAUST FAN DISCHARGE, AND FLUES. MAINTAIN MINIMUM CLEAR DISTANCE OF 5'0" BETWEEN PARAPET WALL AND ALL ROOF MOUNTED MECHANICAL EQUIPMENT.
29. ALL ROOF MOUNTED EQUIPMENT SHALL BE PROVIDED WITH MANUFACTURER'S FABRICATED CURBS WHICH FACILITATE LEVEL MOUNTING OF THE EQUIPMENT (I.E. FACTORY FABRICATED TO COMPENSATE FOR ROOF SLOPE). OBTAIN ROOF SLOPES AND DIRECTION OF SLOPE FROM ARCHITECTURAL AND/OR STRUCTURAL PLANS. ALL ROOF CURBS SHALL BE A MINIMUM OF 8" HIGH. SHIMMING OF CURBS IS NOT ACCEPTABLE.
30. ROOF PENETRATIONS AND FLASHING OR SEALING MUST COMPLY WITH ROOF MANUFACTUF S RECCOMMENDATIONS AND WARRANTY REQUIREMENTS.
31. ALL DUCTS SHALL BE MOUNTED HIGH AS POSSIBLE AGAINST BOTTOM OF STRUCTURE EXCEPT AS REQUIRED TO AVOID CONFLICTS WITH INTERSECTING SYSTEMS. DIAGONALLY OFFSET DUCTS IMMEDIATELY BEFORE AND AFTER PASSING UNDER INTERSECTING SYSTEMS TO MAINTAIN DUCT TIGHT TO STRUCTURE.
32. CONTRACTOR SHALL FIELD VERIFY ALL PIPE ROUTING AND ADJUST ELEVATIONS AS REQUIRED TO AVOID CONFLICTS. FINAL PLACEMENT OF PIPING SHALL BE DETERMINED BY FIELD MEASUREMENT AND VERIFICATION. ELEVATIONS ARE REFERENCED TO PIPE CENTERLINE UNLESS OTHERWISE NOTED.
33. DUCTWORK SHALL CONFORM TO THE FOLLOWING PRESSURE CLASSES: SUPPLY: 2" SP; RETURN/RELIEF/OUTSIDE AIR/EXHAUST: 2" SP. ALL DUCTWORK IS REQUIRED TO BE TESTED IN ACCORDANCE WITH THE SPECIFICATIONS.
34. ALL EQUIPMENT, DEVICES, AND FIXTURES SHALL BE INSTALLED AS PER MANUFACTURER'S RECOMMENDATION.
35. CONTRACTOR SHALL VERIFY CLOSELY AT SITE TRANSPORTATION OF NEW HVAC EQUIPMENT INTO MECHANICAL AREAS BEFORE BIDDING. PROVIDE COMPLETE DISASSEMBLY AND RE-ASSEMBLY OF NEW EQUIPMENT AS REQUIRED FOR A COMPLETE INSTALLATION.
36. PROVIDE FLEXIBLE CONNECTIONS AND TRANSITIONS ON DUCT INLET AND OUTLET CONNECTIONS TO ALL EQUIPMENT WITH MOVING PARTS.
37. DUCTWORK VISIBLE THROUGH RETURN AIR OPENINGS SHALL BE PAINTED FLAT BLACK TO REDUCE VISIBILITY.
38. EXPOSED DUCTWORK AND PIPING SHALL BE FURNISHED SUITABLE FOR PAINTING, AND SHALL BE PAINTED AS REQUIRED BY ARCHITECTURAL SPECIFICATIONS.
39. NOT ALL REQUIRED PIPING, VALVES, OR FITTINGS ARE SHOWN ON DRAWINGS FOR CLARITY. COORDINATE PLAN DETAILS WITH SPECIFICATIONS, SCHEMATICS, FLOW DIAGRAMS, AND OTHER DETAILS TO PROVIDE COMPLETE PIPING SYSTEMS.
40. COORDINATE WORK CLOSELY WITH CONTROL REQUIREMENTS. PROVIDE ALL NECESSARY DUCT TAPS, PIPE TAPS, WELLS, AND OTHER APPURTENANCES REQUIRED BY CONTROL SYSTEM. PROVIDE SPARE PIPE WELL ADJACENT TO EACH TEMPERATURE SENSOR IN PIPING.
41. REFER TO ARCHITECTURAL PLANS FOR CEILING TYPE, AND FOR MOUNTING REQUIREMENTS. CONTRACTOR SHALL PROVIDE AND INSTALL ALL AIR DEVICES WITH MOUNTING SYSTEM DESIGNED FOR MOUNTING SURFACE TYPE.
42. COORDINATE FINAL PLACEMENT OF ALL THERMOSTATS WITH WALL-MOUNTED DEVICES AND OWN S REPRESENTATIVE. MOUNT PER A.D.A. REQUIREMENTS. ANY THERMOSTAT THAT IS REQUIRED TO BE MOUNTED ON AN EXTERIOR WALL SHALL BE MOUNTED ON AN INSULATED PAD.
43. INSTALL SMOKE DETECTOR IN SUPPLY AND RETURN DUCT OF ALL AIR HANDLERS SUPPLYING GREATER THAN 2,000 CFM.
44. PROVIDE CONCRETE PADS FOR ALL GROUND MOUNTED EQUIPMENT.
45. REPLACE ALL ARCHITECTURAL FEATURES REMOVED OR DAMAGED DURING THE COURSE OF THE WORK.
46. CONTRACTOR SHALL PATCH ALL WALLS, FLOORS, AND CEILINGS TO MATCH NEW FOR ALL OPENINGS CREATED BY INSTALLATION OF EQUIPMENT AND HVAC SERVICE PENETRATIONS.
47. ALL SUPPLY, RETURN, RELIEF, AND OUTSIDE AIR DUCTWORK SHALL BE EXTERNALLY INSULATED EXCEPT WHERE LINER, DOUBLE WALL LINED DUCT, OR FABRIC DUCT IS INDICATED. INSULATE TOPS OF SUPPLY AIR DIFFUSERS WITI' THICK FIBERGLASS DUCT WRAP. DO NOT INSULATE EXHAUST DUCTWORK EXCEPT FOR FIRE WRAP ON KITCHEN HOOD EXHAUST AND ON EXHAUST ASSOCIATED WITH DEDICATED OUTSIDE AIR UNITS (DOAS).
48. REFER TO SPECIFICATONS FOR INSULATION AND R-VALUES FOR MECHANICAL PIPING AND DUCTWORK INSULATION.
49. SEE ARCHITECTURAL PLANS FOR ROOF PENETRATION DETAILS.
50. ALL HVAC COMPONENTS WITH ELECTRICAL REQUIREMENTS SHALL BE INSTALLED WITH ELECTRICAL INFRASTRUCTURE NECESSARY TO PROVIDE A FULLY FUNCTIONING SYSTEM. IF NOT SPECIFICALLY SHOWN ON ELECTRICAL SCHEDULE, HVAC FIXTURES REQUIRING ELECTRICAL SERVICE SHALL BE FED FROM BREAKER OF ADEQUATE CAPACITY.
51. ALL CONTROL WIRING SHALL BE INSTALLED IN CONDUIT.
52. PLENUM CABLING SHALL HAVE ITS OWN SYSTEM OF SUPPORT AND BE STRUCTURALLY SOUND. ATTACHMENT TO CEILING GRID AND HANGER WIRES IS PROHIBITED. WHERE NOT INSTALLED IN CONDUIT, CABLING SHALL BE RUN IN CABLE HOOKS. CABLING LAYING ON CEILING TILES IS PROHIBITED.
53. CONTRACTOR SHALL PROVIDE FURR DOWN AND ANY OTHER CEILING MODIFICATIONS NEEDED TO ACCOMMODATE DUCTWORK PENETRATIONS.
54. PROVIDE ALL HVAC UNITS WITH AN EXTRA SET OF MANUFACTURI S RECOMMENDED FILTERS AFTER PROJECT COMPLETION.
55.

HVAC THERMOSTAT SETTINGS:

ALL THERMOSTATS WHICH ARE NOT UNIT–MOUNTED SHALL BE AT APPROXIMATELY 44" PER ADA REQUIREMENTS. SET ALL THERMOSTATS ASSOCIATED WITH HVAC EQUIPMENT PER THE FOLLOWING:

1. EXHAUST FANS WEF–1,2,3 : FAN SHALL ENERGIZE AT 85°F AND DE–ENERGIZE AT 80°F (ADJUSTABLE).
2. UNIT HEATERS EUH–1 THROUGH 12 , WEUH–1,2,3,4 : UNIT HEATER SHALL ENERGIZE AT 55°F AND DE–ENERGIZE AT 60°F (ADJUSTABLE).
3. SPLIT SYSTEM AIR HANDLERS AHU–1,2 : A. COOLING MODE: SETPOINT SHALL BE 75°F (ADJUSTABLE) B. HEATING MODE: SETPOINT SHALL BE 72°F (ADJUSTABLE) C. AHU–1 AND AHU–2 SHALL HAVE THE SAME HEATING AND COOLING SETPOINTS.
4. SPLIT SYSTEM AIR HANDLER AHU–3 : A. COOLING MODE: SETPOINT SHALL BE 80°F (ADJUSTABLE) B. HEATING MODE: SETPOINT SHALL BE 65°F (ADJUSTABLE)

KEYED NOTES:

1. PROVIDE SINGLE TIMER SWITCH ON WALL FOR MANUAL ACTIVATION OF HEATER FANS FOR CIRCULATION. SWITCH SHALL HAVE MAXIMUM DURATION OF 6 HOURS OR MORE.

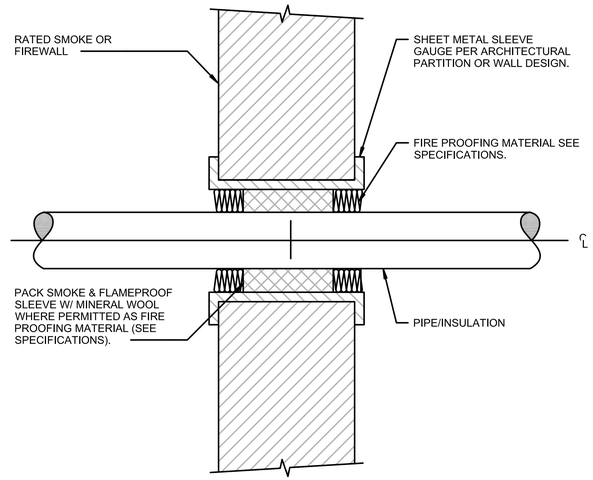
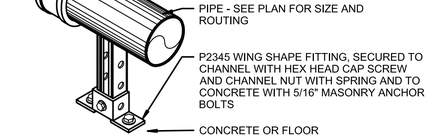
P:\PRODUCTION\PROJECTS\WALL ENGINEERING (WE)\WE-055 SHAWNEE NORTHSIDE WASTEWATER TREATMENT PLANT\DWG\M7.DWG
5/20/2022 1:44 PM

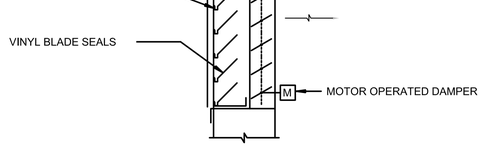


NOTES:

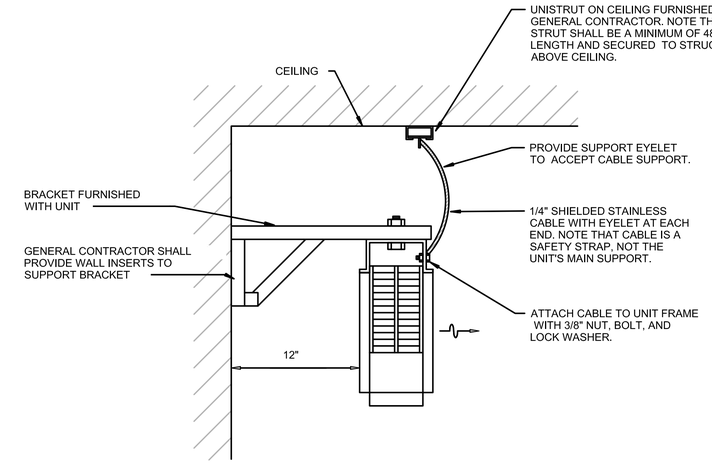
1. RUNNING TRAPS WILL NOT BE ACCEPTED.
2. INSTALL FACTORY FURNISHED TRAP WITH OUTSIDE AIR UNITS.
3. CONDENSATE DISCHARGE LOCATION SHALL MEET REQUIREMENTS OF ALL LOCAL CODES AND AUTHORITIES HAVING JURISDICTION.



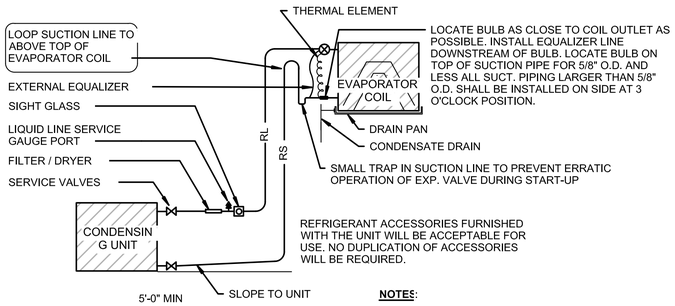
1 CONDENSATE TRAP
SCALE: NONE



2 EXHAUST FAN – WALL – BELT DRIVE
SCALE: NONE



3 PIPE PENETRATION AT SMOKE AND FIREWALL
SCALE: NONE



4 PIPE SUPPORT (REFRIGERANT)
SCALE: NONE

5 INTAKE LOUVER WITH MOTOR DAMPER
SCALE: NONE

6 ELECTRIC UNIT HEATER
SCALE: NONE

NOTES:

1. WRAP EXPANSION VALVE, BULB AND FITTINGS WITH ARMAFLEX INSULATION TAPE AND SECURE WITH BLACK CABLE TIES.
2. TRAP AND LOOP AT EVAPORATOR COIL IS NOT REQUIRED FOR UNITS WITH LIQUID LINE SOLENOID VALVES.
3. SUCTION LINES SHALL BE INSULATED. LIQUID LINES SHALL BE INSULATED ONLY ON DUCTLESS MINI-SPLITS.

7 REFRIGERANT PIPING
SCALE: NONE

1 FAN COIL (V) DUCTED OSA
SCALE: NONE

NOTES:

1. UNIT MUST BE INSTALLED WITH COIL AND FILTER ACCESSIBLE FOR MAINTENANCE FROM BELOW CEILING OR FROM MECHANICAL PLATFORM.
2. DRAINS FROM UNIT SHALL BE SUPPORTED FROM PLATFORM, OR HUNG FROM STRUCTURE.
3. DRAIN LINES SHALL BE SLOPED AT MIN. 1/4" PER FOOT.
4. UNIT SHALL BE FURNISHED AND INSTALLED WITH VIBRATION ISOLATOR, NOT SHOWN FOR CLARITY.
5. UNIT AND PAN SHALL BE SUPPORTED FROM PLATFORM OR STRUCTURE AS PER MANUFACTURER'S RECOMMENDATION.

2 INDOOR UNIT – SPLIT SYSTEM
SCALE: NONE

NOTES:

1. COVER TOP, BOTTOM, AND EXPOSED SIDES WITH 20 GA. SHEET METAL - SEAL JOINTS AIR TIGHT.
2. COVER ALL INTERIOR SURFACES OF PLENUM WITH 1" 3# DENSITY COATED FIBERGLASS LINER.
3. IF THERE ARE MULTIPLE FURNACE PLENUMS IN AN AREA, PROVIDE DIVIDER PIECE FOR EACH PLENUM.

3 FURNACE PLENUM
SCALE: NONE

SIGNAL CONDITIONERS

SYMBOL	DESCRIPTION	SYMBOL	DESCRIPTION
A/D	ANALOG TO DIGITAL	Σ	SUM
D/A	DIGITAL TO ANALOG	Δ	DIFFERENCE
I/P	CURRENT TO PRESSURE	√	SQUARE ROOT
P/I	PRESSURE TO CURRENT	f(x)	CHARACTERIZATION
F/I	FREQUENCY TO CURRENT	∫	INTEGRATION
I/I	CURRENT BOOST/ REPEATER		

I/O INTERFACE

(2)

DIGITAL SYSTEM I/O INTERFACE. DIRECTION OF TRIANGLE DENOTES WHETHER INPUT OR OUTPUT

NOTE:
QUANTITY OF INPUTS AND OUTPUTS IS DEPENDENT UPON THE NUMBER OF DEVICES OR PIECES OF EQUIPMENT THAT ARE BEING CONTROLLED AND/OR MONITORED. NUMBER IN PARENTHESES DENOTES QUANTITY OF MULTIPLE TYPICAL SIGNALS REPRESENTED.

FILLING DENOTES SIGNAL TYPE. THE FILLED TRIANGLE DENOTES AN ANALOG SIGNAL.

PLUMBING GENERAL NOTES:

1. ALL PLUMBING WORK SHALL COMPLY WITH ALL LOCAL CODES, AUTHORITIES HAVING JURISDICTION, DRAWINGS AND SPECIFICATIONS. IF DISCREPANCIES ARE FOUND – THE MOST STRINGENT REQUIREMENT SHALL GOVERN WORK.
2. ALL DRAWINGS ARE DIAGRAMMATIC AND INDICATE THE GENERAL ARRANGEMENTS OR GEOMETRIC RELATIONSHIPS OF EQUIPMENT AND SERVICES. THEY ARE NOT INTENDED TO SPECIFY OR SHOW EVERY OFFSET, FITTING, OR COMPONENT. CONTRACTOR SHALL NOT SCALE DRAWINGS. EQUIPMENT SCHEDULES SHALL TAKE PRECEDENCE OVER CONFLICTING DRAWING INFORMATION. DRAWINGS SPECIFIC TO THIS DISCIPLINE DO NOT LIMIT THE RESPONSIBILITY OF WORK REQUIRED BY CONTRACT DOCUMENTS. REFER TO COMPLETE PROJECT DOCUMENTS FOR COORDINATION WITH OTHER DISCIPLINES.
3. EXCEPT WHERE MODIFIED BY SPECIFIC NOTATION TO THE CONTRARY, IT SHALL BE UNDERSTOOD THAT THE INDICATION AND/OR DESCRIPTION OF ANY ITEM IN THE DRAWINGS OR SPECIFICATIONS CARRIES WITH IT THE INSTRUCTION TO PROVIDE THE ITEM, REGARDLESS OF WHETHER OR NOT THIS INSTRUCTION IS EXPLICITLY STATED AS PART OF THE INDICATION OR DESCRIPTION.
4. REFER TO PLUMBING SCHEDULES AND SPECIFICATIONS FOR BASIS OF DESIGN, ACCEPTABLE MANUFACTURERS, AND MODELS OF PLUMBING FIXTURES AND EQUIPMENT.
5. PROVIDE CLEANOUTS IN ALL SANITARY LINES, WHETHER SHOWN OR NOT, AT INTERVALS NOT TO EXCEED 100' AND AT EACH CHANGE IN DIRECTION GREATER THAN 45 DEGREES.
6. PROVIDE A TWO–WAY CLEANOUT AT THE JUNCTION OF ALL BUILDING DRAINS AND BUILDING SEWERS.
7. REFER TO SPECIFICATIONS FOR INSULATION REQUIREMENTS.
8. ALL SANITARY LINES 2 1/2" AND SMALLER SHALL HAVE A MINIMUM SLOPE OF 1/4" PER FOOT. ALL SANITARY LINES 3" AND LARGER SHALL HAVE A MINIMUM SLOPE OF 1/8" PER FOOT. VERIFY EXISTING SANITARY LINE ELEVATIONS AND COORDINATE INSTALLATION TO ASSURE PROPER FLOW.
9. SEAL ALL PIPE PENETRATIONS THROUGH WALLS, ROOF, AND FLOOR AIR AND WATER TIGHT.
10. ALL FLOOR DRAINS SHALL HAVE DEEP SEAL TRAPS, 4" DEEP SEAL MINIMUM UNLESS NOTED OTHERWISE. PROVIDE A TRAP GUARD EQUAL TO PROSET OR SURE SEAL SIZED ACCORDING TO MANUFACTURER'S RECOMMENDATIONS FOR ALL FLOOR DRAINS.
11. ALL PIPE DROPS FROM CEILING PLENUM TO BELOW FLOOR SHALL BE MADE IN FURR–OUTS AT COLUMNS, IN WEBB OF BEAMS AT COLUMNS, OR IN WALLS UNLESS SHOWN OTHERWISE.
12. ALL EXPOSED OR ACCESSIBLE P–TRAPS SHALL BE CHROME PLATED AND PROVIDED WITH BOTTOM CLEANOUT PLUGS. ALL EXPOSED PLUMBING TRIM SHALL BE CHROME PLATED.
13. PROVIDE TIGHT–FITTED MOLDED PLASTIC INSULATION AT ALL EXPOSED WATER AND DRAIN PIPING FOR ADA FIXTURES PER ANSI A117.1 AND ADA REQUIREMENTS. FINISH SHALL BE WHITE.
14. ALL DOMESTIC WATER SHALL BE ROUTED ABOVE CEILING. ALL DOMESTIC WATER ROUTED IN EXTERIOR WALLS SHALL BE INSTALLED ON CONDITIONED SIDE OF ROOM INSULATION.
15. MAINTAIN A MINIMUM OF 10 ' BETWEEN ALL HVAC FRESH AIR INTAKES AND PLUMBING VENTS. COORDINATE WITH MECHANICAL BEFORE INSTALLATION OF VTRs.
16. CONTRACTOR SHALL VISIT SITE AND VERIFY CONDITIONS PRIOR TO BIDDING.
17. CONTRACTOR SHALL VERIFY EXACT LOCATIONS OF UTILITIES AND INVERTS PRIOR TO ROUTING SERVICES. CONTRACTOR SHALL COORDINATE ALL SANITARY SEWER, FIRE, GAS AND DOMESTIC WATER LINES WITH CIVIL DRAWINGS. SEE CIVIL DRAWINGS FOR CONTINUATION OF ALL UTILITY LINES.
18. CONTRACTOR SHALL PAY ALL UTILITY FEES AND CHARGES IN THE CONTRACT.
19. PROVIDE ALL FITTINGS, TRANSITIONS, COUPLINGS, ADAPTORS, UNIONS, AND OTHER ACCESSORIES NEEDED TO COMPLETE CONNECTIONS AND PROVIDE FOR PROPER OPERATION OF PLUMBING FIXTURES AND PLUMBING EQUIPMENT.
20. FIRE STOP ALL PIPE PENETRATIONS THROUGH RATED WALLS. REFER TO SPECIFICATIONS.
21. PIPING SHALL NOT BE ROUTED OVER ELECTRICAL ROOMS, COMPUTER ROOMS, ELECTRICAL PANELS, OR ELECTRICAL EQUIPMENT UNLESS OTHERWISE NOTED.
22. PROVIDE LEAD–FREE PRESSURE REDUCING VALVE AT DOMESTIC ENTRANCE TO PROVIDE ADEQUATE PRESSURE AT ALL OUTLETS IN ACCORDANCE WITH THE SYSTEM REQUIREMENTS.
23. EACH FIXTURE GROUP OR BATTERY OF FIXTURES SHALL BE PROVIDED WITH A SHUTOFF VALVE IN THE DOMESTIC HOT AND COLD WATER SUPPLY LINES ABOVE CEILING. VALVES SHALL BE ACCESSIBLE FROM ROOM BELOW.
24. PAINT EXPOSED PIPING AND PIPE INSULATION. COORDINATE WITH OWNER FOR FINAL COLOR.
25. ALL UNDER FLOOR WATER PIPING SHALL BE PROVIDED WITH A POLYETHYLENE SLEEVE. EXTEND SLEEVE UP THROUGH FLOOR SLAB AND SEAL AIR AND WATER TIGHT.
26. PIPING THROUGH FOUNDATION WALLS AND FOOTINGS SHALL BE SLEEVED AS PER STRUCTURAL DETAILS.
27. ALL PIPE CONNECTIONS BETWEEN DISSIMILAR METALS SHALL BE MADE THROUGH DIELECTRIC UNIONS.
28. ALL PLUMBING COMPONENTS WITH ELECTRICAL REQUIREMENTS SHALL BE INSTALLED WITH THE ELECTRICAL INFRASTRUCTURE NECESSARY TO PROVIDE A FULLY FUNCTIONING SYSTEM. IF NOT SPECIFICALLY SHOWN ON ELECTRICAL SCHEDULE, PLUMBING FIXTURES REQUIRING ELECTRICAL SERVICE SHALL BE FED FROM BREAKER OF ADEQUATE CAPACITY.
29. REFER TO PLUMBING SPECIFICATIONS FOR PIPE MATERIAL AND INSULATION REQUIREMENTS.
30. EXACT LOCATION OF ALL EQUIPMENT AND PIPING SHALL BE COORDINATED WITH OTHER TRADES. CEILING MOUNTED SPRINKLER AND LIGHTING SHALL TAKE PRECEDENCE OVER CEILING MOUNTED MECHANICAL REQUIREMENTS.
31. PROVIDE FABRICATED EXPANSION LOOP OR MANUFACTURED EXPANSION DEVICE ON ALL PIPING SYSTEMS CROSSING BUILDING EXPANSION JOINTS.

DOMESTIC WATER GENERAL NOTES:

1. PROVIDE LEAD–FREE ISOLATION VALVE FOR EACH RESTROOM MAIN AND EACH BRANCH MAIN SERVING A BATTERY OF FIXTURES.
2. PERMANENTLY LABEL ALL VALVES TO INDICATED AREA THAT VALVE SERVES.
3. PROVIDE WATER HAMMER ARRESTOR AT END OF ALL DCW AND DHW BRANCH LINES BEFORE LAST FIXTURE. REFER TO DETAILS FOR WATER HAMMER ARRESTOR SCHEDULE.
4. ROUTE ALL DOMESTIC WATER LINES IN ADMIN/LAB SPACES CONCEALED ABOVE CEILING. WHERE DOMESTIC WATER LINES MUST BE ROUTED EXPOSED, PAINT EXPOSED PIPE AND COORDINATE WITH ARCHITECT FOR COLOR.

(#) KEYED NOTES:

1. RPZAs FOR FILTER PRESS SYSTEM AND DOMESTIC WATER SYSTEM AT THIS LOCATION. REFER TO CIVIL FOR SPECIFICATION OF RPZA SERVING FILTER PRESS WATER SYSTEM.
2. UTILITY WASH STATION. REFER TO CIVIL FOR SPECIFICATION AND DETAILING OF ALL WATER PIPING IN CHEMICAL ROOM AND FILTER PRESS ROOM NOT EXPLICITLY NOTED AS IN PLUMBING SCOPE.
3. ROUTE DOMESTIC WATER PIPING FROM RPZA HIGH AT PERIMETER AROUND CHEMICAL ROOM. COORDINATE LOCATION WITH CHEMICAL ROOM WATER SUPPLY PIPING. ALL PIPING WITHIN CHEMICAL ROOM AND BELT PRESS ROOM SHALL BE STAINLESS STEEL.
4. SLEEVE WATER PIPING ACROSS ELECTRICAL ROOM. SLEEVE SHALL BE HIGH AND TIGHT TO STRUCTURE AND LABELED ON EXTERIOR. FIRE CAULK BETWEEN SLEEVE AND PIPING AT BELT PRESS WALL TO MATCH WALL FIRE RATING.

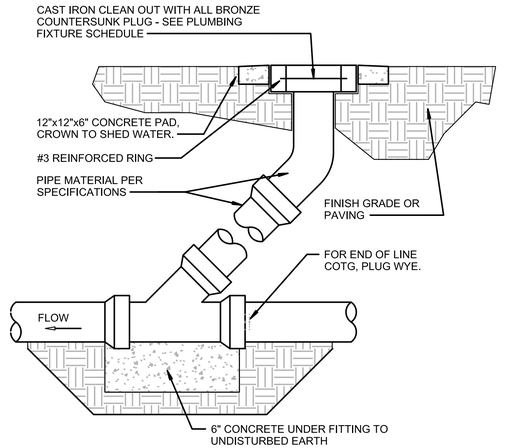
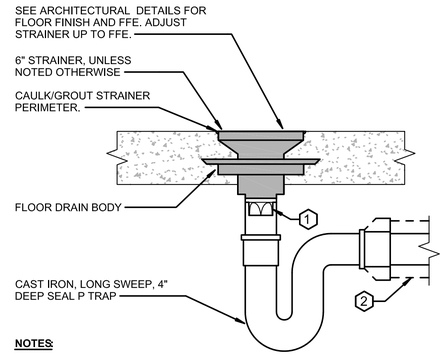
GENERAL NOTE WHERE POSSIBLE, OFFSET COTG FITTINGS AWAY FROM BUILDING PERIMETER TO AVOID SIDEWALKS. ALL DCOTG LOCATIONS SHALL BE ACCESSIBLE FOR USE.

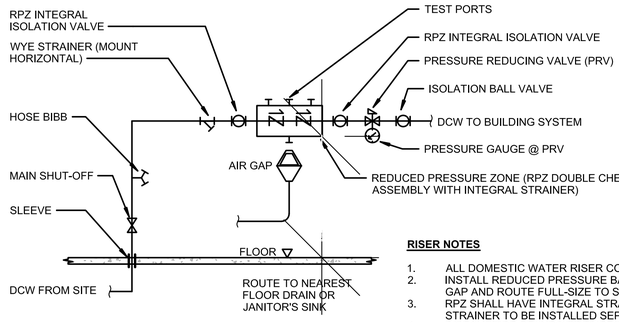


1 DOUBLE CLEANOUT TO GRADE
SCALE: NONE



COMBINED DOUBLE CLEANOUT FITTING OPTION.

MATCH DCOTG STYLE SHOWN ON PLANS



2 CLEANOUT TO GRADE
SCALE: NONE

NOTES

1. PROVIDE TRAP SEAL PROTECTION DEVICE.
2. FOR COMBINATION WASTE AND VENT, UPSIZE PIPE BY TWO NOMINAL SIZES.

3 FLOOR DRAIN
SCALE: NONE

RPZ SIZE	MAKE	MODEL
1/4" - 2"	WATTS	ULF009QTS
2 1/2" - 3"	WATTS	LF009QT-FDA
4" - 10"	WATTS	LF909OSYS-FDA

RISER NOTES

1. ALL DOMESTIC WATER RISER COMPONENTS SHALL BE LEAD-FREE.
2. INSTALL REDUCED PRESSURE BACKFLOW PREVENTER WITH MANUFACTURER'S AIR GAP AND ROUTE FULL-SIZE TO SANITARY.
3. RPZ SHALL HAVE INTEGRAL STRAINER UNLESS SPATIAL CONSTRAINTS REQUIRE STRAINER TO BE INSTALLED SEPARATELY.
4. INSTALL PIPE STANDS TO SUPPORT THE COMPONENTS. DO NOT SUPPORT ASSEMBLIES FROM PIPING. INSTALL BEARING PLATES ON CONCRETE FLOOR UNDEF EACH SUPPORT.
5. COORDINATE FINAL LOCATION OF DOMESTIC RISER WITH ALL OTHER SYSTEMS AND EQUIPMENT IN ASSOCIATED ROOM. RISER SHALL NOT INTERFERE WITH OR IMPEDE OPERATIONS OF OTHER SYSTEMS OR FACILITY PERSONNEL.
6. INSTALL ALL VALVES SO THAT VALVE HANDLES ARE NOT IMPEDED IN ANY MANNER AND ARE EASILY OPERATED FROM INTERIOR OF ROOM.

PRV NOTES

1. IF INCOMING PRESSURE IS 70PSI OR GREATER, PROVIDE PRV EQUAL TO WATTS LF223 FOR 2 1/2" AND BELOW. PRV SHALL BE EQUAL TO WATTS LFN223B FOR 3".
2. SIZE PRV PER PLANS OR MATCH RPZ SIZE, DO NOT SIZE BASED ON DISTRIBUTION PIPE SIZE.
3. ENGINEER SHALL BE INFORMED IF INCOMING PRESSURE AT BUILDING IS 150PSI OR GREATER.

4 RPZ DOMESTIC WATER RISER
SCALE: NONE

KEYED NOTES

1. TAP HOT WATER SUPPLY AT SINK FOR DISHWASHER. PROVIDE BRASS INLINE ISOLATION VALVE FOR DISHWASHER SUPPLY LINE.
2. ROUTE DISHWASHER DRAIN THROUGH HIGH LOOP SECURED TO BOTTOM OF COUNTERTOP WITH NON-METALLIC FASTENER OR CONNECT TO SINK-TOP AIR GAP FITTING BEFORE CONNECTING TO SINK DRAIN.
3. CONNECT DISHWASHER DRAIN TO GARBAGE DISPOSAL INLET PORT. FOR SINKS WITHOUT GARBAGE DISPOSAL, CONNECT DRAIN TO WYE FITTING IN VERTICAL PIPE UPSTREAM OF P-TRAP. TRIM DISHWASHER DRAIN HOSE TO ELIMINATE EXCESS LENGTH. DRAIN SHALL BE SLOPED TO DRAIN DOWNSTREAM OF HIGH LOOP OR AIR GAP.

5 RESIDENTIAL STYLE DISHWASHER PLUMBING

PRELIMINARY

THIS DOCUMENT IS PRELIMINARY IN NATURE AND IS NOT A FINAL, SIGNED AND SEALED DOCUMENT

SHEET OF

ABBREVIATIONS AND SYMBOLS

XG1-02

GENERAL

G1. SCOPE
THE NOTES ON THIS SHEET AND THE STANDARD STRUCTURAL DETAILS ARE GENERAL AND APPLY TO THE ENTIRE PROJECT WHETHER SPECIFICALLY CALLED OUT OR NOT, EXCEPT WHERE THERE ARE SPECIFIC INDICATIONS TO THE CONTRARY ON STRUCTURAL SHEETS. IF THERE ARE QUESTIONS, THEY SHALL BE SUBMITTED TO THE STRUCTURAL ENGINEER AND ANSWERED IN WRITING PRIOR TO CONSTRUCTION.

G2. APPLICABLE SPECIFICATIONS AND CODES
A. INTERNATIONAL BUILDING CODE (IBC) 2012 WITH APPLICABLE EDITIONS OF THE CODE REFERENCED STANDARDS.
B. ACI 350-{01},{06}
C. ASCE 7-16
D. AISC 14th EDITION
E. LOCAL JURISDICTION AMENDMENTS

G3. DESIGN CRITERIA
1. APPLIES TO ALL STRUCTURES
A. DEAD LOAD:
1. ACTUAL TRIBUTARY STRUCTURE WEIGHT
2. SUPERIMPOSED DEAD LOAD:
B. LIVE LOAD:

1. ELEVATED FLOORS:	40 PSF
2. WALKWAYS, STAIRS, GRATING:	100 PSF
3. SLAB ON GRADE:	250 PSF
4. ROOF:	20 PSF (NOT REDUCIBLE)

C. WIND:
1. BASIC WIND SPEED: 120 MPH
2. EXPOSURE: C
3. RISK CATEGORY: III
4. ALL STRUCTURES ARE ENCLOSED EXCEPT AS FOLLOWS: OVERHEAD CRANE
D. SNOW LOAD:
1. GROUND SNOW LOAD = 10 PSF

G4. GEOTECH
THE FOLLOWING NON-CONTRACTUAL GEOTECHNICAL REPORT DEVELOPED FOR THIS PROJECT AND IS THE BASIS OF THIS STRUCTURAL DESIGN:
CONTRACTOR IS TO READ AND BECOME FAMILIAR WITH THE GEOTECHNICAL REPORT.
GEOTECHNICAL FIRM NAME: HINDERLIGHTER GEOTECHNICAL ENGINEERING
ADDRESS: 4071 NW 3rd St., OKLAHOMA CITY, OK
PROJECT NUMBER: WE-20-03
REPORT DATE: JUNE 2020
ALLOWABLE [NET] SOIL BEARING = 2000 / 5000 PSF
PRIOR TO REACHING THE EXCAVATIONS DEPTHS OF 15 FEET TO 50 FEET, EXCAVATIONS ARE EXPECTED TO ENCOUNTER HARD SHALEY CLAYS, WEATHERED SHALE AND/OR WEATHERED SANDSTONE. BEDROCK REFLECTING AN SPT "N" VALUE OF 50 BLOWS PER 4 INCHES OR MORE OF PENETRATION CAN BE SUCCESSFULLY REMOVED USING EXCAVATION EQUIPMENT OUTFITTED WITH ROCK-RIPPING TEETH. BEDROCK DISPLAYING N-VALUES OF 50 BLOWS PER 3 INCHES OR LESS OF PENETRATION COULD REQUIRE PNEUMATIC HAMMERS OR BLASTING FOR REMOVAL.

G5. SAFETY
SAFETY AND STRUCTURE STABILITY DURING CONSTRUCTION ARE THE SOLE RESPONSIBILITY OF THE CONTRACTOR. STRUCTURES HAVE BEEN DESIGNED TO RESIST THE DESIGN LIVE LOADS ONLY AS A COMPLETED STRUCTURE.

G6. OPENINGS
OPENINGS FOR PIPES, DUCTS, CONDUITS, ETC. ARE NOT ALL SHOWN ON THE STRUCTURAL DRAWINGS. COORDINATE AND PROVIDE OPENINGS AS REQUIRED TO ACCOMMODATE ALL WORK SHOWN OR SPECIFIED IN THE CONTRACT DOCUMENTS AND OTHERWISE REQUIRED FOR THE FURNISHING OF A FUNCTIONALLY COMPLETE PROJECT. REINFORCE AROUND OPENINGS PER STANDARD STRUCTURAL DETAILS UNLESS OTHERWISE SHOWN.

G7. STANDARD DETAILS
THE STANDARD DETAILS DEPICT TYPICAL DETAILING TO BE USED ON THIS PROJECT. IF CONDITIONS ARE NOT EXPLICITLY SHOWN ON THE DRAWINGS THEY SHALL BE MADE SIMILAR TO THE STANDARD DETAILS. OBTAIN APPROVAL OF ENGINEER IN WRITING FOR SIMILAR CONDITIONS PRIOR TO CONSTRUCTION.

G8. THE CONTRACTOR SHALL FIELD VERIFY ALL DIMENSIONS AND ELEVATIONS OF EXISTING CONSTRUCTION AS REQUIRED TO COORDINATE NEW CONSTRUCTION. SUBMIT REQUIRED CHANGES FOR APPROVAL.

G9. CONTRACTOR TO SUBMIT FOR REVIEW ALL EQUIPMENT SIZES, OPERATING WEIGHTS, VIBRATION FORCES, SUPPORT LOCATIONS, ALONG WITH ANY FLOOR OPENINGS, NOTCHES, AND RECESSES REQUIRED BY SUCH EQUIPMENT. CONCRETE SUPPORT PADS AND/OR FRAMING REQUIRED TO SUPPORT SAID EQUIPMENT SHALL NOT BE FABRICATED AND PLACED UNTIL THE CONCRETE SUPPORT PADS AND/OR FRAMING IS APPROVED TO SUPPORT THE EQUIPMENT.

G10 SPECIAL INSPECTIONS
SPECIAL INSPECTIONS ARE REQUIRED IN ACCORDANCE WITH CHAPTER 1 AND CHAPTER 17 OF THE CONTRACTOR SHALL PROVIDE FOR FULL ACCESS TO THE WORK BY THE SPECIAL INSPECTOR & SHALL PROVIDE FOR THESE INSPECTIONS IN HIS CONSTRUCTION SCHEDULE IN ACCORDANCE WITH THE SPECIFICATIONS. A SPECIAL INSPECTION PLAN WILL BE SUBMITTED UNDER SEPARATE COVER WITH THE PERMIT APPLICATION.

G11 UNLESS SPECIFICALLY NOTED, THERE ARE NOT PROVISIONS MADE FOR FUTURE FLOORS, ROOFS, OR OTHER LOADS.

CONCRETE

C1. DESIGN STRENGTHS: (28 DAY COMPRESSIVE STRENGTH)

NORMAL WEIGHT CONCRETE FILL, UTILITY ENCASEMENT CONCRETE:	3000 PSI
NORMAL WEIGHT CONCRETE TOPPING:	4000 PSI
NORMAL WEIGHT CONCRETE INTEGRAL WEARING COURSE:	6000 PSI
NORMAL WEIGHT CONCRETE W/ POWER TROWEL FINISH:	4000 PSI
NORMAL WEIGHT WATER-BEARING CONCRETE:	4500 PSI

C2. CONCRETE COVER
UNLESS OTHERWISE NOTED, PROVIDE CONCRETE COVER FOR REINFORCING AS FOLLOWS:

CONCRETE DEPOSITED AGAINST EARTH:	3"
ALL OTHER:	2"

SEE DRAWINGS FOR EXCEPTIONS

C3. SEE SPECIFICATIONS FOR REINFORCING PLACEMENT REQUIREMENTS.

C4. REFER TO OTHER DISCIPLINE DRAWINGS PRIOR TO CONSTRUCTION FOR EMBEDDED ITEMS AND PENETRATIONS NOT SHOWN ON STRUCTURAL DRAWINGS. AS REQUIRED TO ACCOMMODATE ALL WORK SHOWN OR SPECIFIED IN THE CONTRACT DOCUMENTS AND OTHERWISE REQUIRED FOR THE FURNISHING OF A FUNCTIONALLY COMPLETE PROJECT. REINFORCE AROUND OPENINGS PER STANDARD STRUCTURAL DETAILS UNLESS OTHERWISE SHOWN.

C5. PROVIDE 3/4" CHAMFERS AT ALL EXPOSED EDGES {AND 1/2" CHAMFERS AT JOINTS AS SHOWN.} NOT ALL CHAMFERS MAY BE SHOWN ON DRAWINGS.

C6. FIELD ADJUST REINFORCING AT OPENINGS AND EMBEDDED ITEMS AS INDICATED.

C7. ANCHOR BOLTS NOT SPECIFIED BY ENGINEER SHALL BE DESIGNED AND CERTIFIED BY A REGISTERED PROFESSIONAL ENGINEER, RETAINED BY THE CONTRACTOR, IN ACCORDANCE WITH APPLICABLE PROJECT AND CODE REQUIREMENTS. SUBMIT AS A SHOP DRAWING FOR REVIEW AND APPROVAL BY THE ENGINEER. COORDINATE LOCATION, SIZE AND EMBEDMENT PRIOR TO CASTING CONCRETE.

C8. CONTINUOUS WATERSTOP SHALL BE INSTALLED IN JOINTS SUBJECT TO STATIC WATER PRESSURE AND IN LOCATIONS SHOWN ON THE DRAWINGS.

C9. ABSOLUTELY NO WELDING OF REINFORCING BARS OR TORCHING TO BEND REINFORCING BARS SHALL BE ALLOWED WITHOUT SPECIFIC APPROVAL FROM THE STRUCTURAL ENGINEER.

C10. CONTRACTOR SHALL SUBMIT A CONCRETE PLACEMENT PLAN IDENTIFYING JOINT TYPES, JOINT LOCATIONS AND CONCRETE PLACEMENT SEQUENCE.

C11. ALL CAST IN PLACE AND POST-INSTALLED ANCHORS INDICATED IN THE STRUCTURAL DOCUMENTS SHALL COMPLY WITH APPENDIX D OF ACI 318 AND CHAPTER 19 OF THE IBC. ALL EXPANSION AND ADHESIVE ANCHORS SHALL HAVE THE ICC REPORT SHOWING EQUIVALENT LOAD CAPACITY. SUBMIT AND INSTALL PER THE ICC EVALUATION REPORT.

C12. PROVIDE ACI STANDARD HOOKS WHERE INDICATED ON DRAWINGS.

C13. FORMED CONSTRUCTION JOINTS SHALL BE KEYED. CONSTRUCTION JOINTS AT UNFORMED SURFACE SHALL BE ROUGHENED.

C14. A MINIMUM OF 48 HOURS SHALL ELAPSE BETWEEN PLACEMENT OF ADJACENT CONCRETE CONSTRUCTION AT JOINTS WHERE PLACEMENT IS INTERRUPTED.

C15. SEE SPECIFICATIONS FOR REQUIREMENTS RELATED TO MASS CONCRETE, INCLUDING MIX DESIGN, JOINING AND TEMPERATURE CONTROL.

C16. ALL CONCRETE SHALL BE WSI CURED FOR A MINIMUM 7 DAYS. SEE SPECIFICATIONS.

C17. UNLESS OTHERWISE NOTED, LAPS FOR REINFORCING SHALL BE 40 BAR DIAMETERS OR 1'-8" WHICHEVER IS GREATER.

C18. ALL GROUTED AREAS OVER 8" THICK SHALL BE REINFORCED WITH WELDED WIER MESH, 6x6-W2.0xW2.0 MATTS AT 8'-0" CIRS MAX.

MASONRY

M1. DESIGN STRENGTHS:
F'm= 1500 PSI
Fy= 60,000 PSI

M2. GROUT FOR FILLING MASONRY CAVITIES TO BE COARSE GROUT UNO, MAXIMUM COARSE AGGREGATE SIZE IS 3/8 INCH.

M3. GROUT POURS SHALL NOT EXCEED 4 FEET IN HEIGHT UNLESS CLEANOUTS ARE PROVIDED IN THE BOTTOM COURSE OF THE CELL(S) TO BE GROUTED, AND WRITTEN PERMISSION IS OBTAINED FOR HIGH LIFT GROUTING.

M4. RESTRICTED BAR ANCHORAGE:
IN CASES WHERE REINFORCING BARS CANNOT BE EXTENDED AS FAR AS REQUIRED, THE BARS SHALL EXTEND AS FAR AS POSSIBLE AND END IN STANDARD HOOK. SHOW ON SHOP DRAWINGS AND HIGHLIGHT WITH A BOX TO BRING TO ENGINEER'S ATTENTION.

M5. ANCHOR BOLTS:
ALL EXPANSION AND ADHESIVE ANCHORS SHALL HAVE THE ICC REPORT SHOWING EQUIVALENT LOAD CAPACITY. SUBMIT AND INSTALL PER THE ICC EVALUATION REPORT.

M6. IF BOND BEAMS AT INTERSECTING WALLS ARE SHOWN ON THE DRAWINGS TO MEET AT DIFFERENT ELEVATIONS, EXTEND REINFORCING OF BOTH BOND BEAMS AROUND INTERSECTING CORNER NOT LESS THAN 4 FEET IN EACH DIRECTION.

M7. LINTEL BLOCKS SHALL NOT BE USED AS BOND BEAM BLOCKS EXCEPT AT OPENINGS WHERE BOND BEAMS AND LINTELS COINCIDE.

STEEL

S1. DESIGN STRENGTHS:

WIDE FLANGE AND TEES:	Fy=50 KSI
PIPES:	Fy=35 KSI
STAINLESS STEEL	Fy=33 KSI
HSS SECTIONS	Fy=46 KSI
ALL OTHER PLATES AND SHAPES:	Fy=36 KSI

S2. DIMENSIONS:
TO CENTERLINES OF COLUMNS AND BEAMS, TOP SURFACES OF BEAMS AND TUBES AND BACKS OF CHANNELS AND ANGLES UNO.

S3. ELEVATIONS:
TOP OF STEEL REFERS TO TOP SURFACE OF MEMBER OR FLANGE UNO.

S4. WHEN FILLET WELD SIZE IS NOT INDICATED, PROVIDE MAXIMUM WELD SIZE BASED ON MATERIAL THICKNESS IN ACCORDANCE WITH AISC SPECIFICATIONS.

S5. ALL BOLTED STRUCTURAL CONNECTIONS ARE BEARING TYPE CONNECTIONS UNLESS OTHERWISE SPECIFIED TO BE SLIP-CRITICAL. PROVIDE LOAD INDICATING WASHERS AT SLIP-CRITICAL CONNECTIONS.

S6. CONFORM TO AISC 360, STEEL CONSTRUCTION MANUAL AND AISC 341, SEISMIC DESIGN MANUAL.

S7. ALL STEEL BEAMS SHALL RECEIVE STANDARD CAMBER PER THE SPECIFICATIONS UNLESS NOTED OTHERWISE ON THE PLANS. BEAMS REQUIRING SPECIAL CAMBER ARE DENOTED ON THE BEAMS SHOWN ON THE FRAMING PLANS. EXAMPLE: (+1/2") INDICATES ½".

S8. WELD ALL STRUCTURAL STEEL CONNECTIONS OR BOLT WITH ASTM A325-N BOLTS. BEAM CONNECTIONS SHALL BE EQUIVALENT TO "FRAMED BEAM CONNECTIONS" (AISC). WELDING SHALL CONFORM TO AWS "WELDING IN BUILDING CONSTRUCTION".

ALUMINUM

A1. STRUCTURAL ALUMINUM YIELD STRENGTHS
STRUCTURAL ALUMINUM: Fy=35 KSI
STRUCTURAL ALUMINUM IS ALLOY 6061-T6 UNO

A2. DIMENSIONS:
TO CENTERLINES OF COLUMNS AND BEAMS, TOP SURFACES OF BEAMS AND TUBES AND BACKS OF CHANNELS AND ANGLES UNO.

A3. ELEVATIONS:
TOP OF ALUMINUM REFERS TO TOP SURFACE OR FLANGE OF MEMBER UNO.

A4. WHEN FILLET WELD SIZE IS NOT INDICATED, PROVIDE MAXIMUM WELD SIZE FOR THE MATERIAL THICKNESS IN ACCORDANCE WITH THE LATEST EDITION OF THE "ALUMINUM DESIGN MANUAL" BY THE ALUMINUM ASSOCIATION.

A5. ALUMINUM IN CONTACT WITH DISSIMILAR MATERIALS OR CONCRETE:
CONTACT SURFACES SHALL BE PROVIDED WITH GALVANIC SEPARATION PER SPECIFICATIONS.

A6. ALUMINUM GRATING:
5.1 SIZE: 2" x 3/16" BEARING BARS AT 1 3/16" ON CENTER, UNO.
5.2 CLIPS AND BOLTS: STAINLESS STEEL, UNO.
5.3 OPENINGS THROUGH GRATING: REINFORCED AND BANDED AS REQUIRED TO MAINTAIN 200 PSF SUPERIMPOSED LIVE LOAD CAPACITY.
5.4 REQUIRED LIVE LOAD CAPACITY 200 PSF, W/ MAX DEFLECTION OF 1/4" WHEN SUPPORTING 100 PSF LIVE LOAD.

A7. ALL OPENINGS AND EDGES OF ALUMINUM GRATING SHALL BE SANDED.

A8. TO FACILITATE PIPE PLACEMENT, ALL CHECKERED PLATE SURROUNDING PIPE SHALL BE SUPPLIED IN TWO PIECES WITH STIFFENERS FOR ATTACHMENT.

PLAN NOTES

P1. SEE PROCESS/MECHANICAL DOCUMENTS FOR ALL PIPE SIZES, LOCATIONS AND PENETRATION DETAILS. SEE PROCESS/MECHANICAL DRAWINGS FOR FLOOR DRAIN LOCATIONS AND DETAILS.

P2. SEE PROCESS/MECHANICAL DRAWINGS FOR EQUIPMENT DETAILS. INCLUDING CONCRETE PAD LOCATIONS AND DIMENSIONS. SEE STRUCTURAL DETAILS FOR CONCRETE DETAILS.

P3. SEE PROCESS/ARCHITECTURAL FOR CONCRETE OPENING DIMENSIONS AND LOCATIONS. INCLUDING LOUVERS AND OTHER WALL PENETRATIONS.

P4. SEE CIVIL DRAWINGS FOR ALL EXTERIOR PAVING AND EARTHWORK.

P5. ALL GRATING AND WALKWAY PLATFORM FRAMING SHALL BE ALUMINUM EXCEPT IN LOCATIONS NOTED IN THE MEMBRANE BUILDING WHERE GRATING AND PLATFORM FRAMING IS FRP. GRATING DEPTH SHALL BE 2" UNLESS OTHERWISE NOTED.

P6. ALL PLATFORM FRAMING AND GRATING, FRAMING CONNECTIONS, AND CONNECTIONS TO CONCRETE SHALL BE PER STANDARD DETAILS.

P7. REFER PROCESS/MECHANICAL DRAWING FOR ALL GUARDRAIL LOCATIONS. REFER STANDARD DETAILS FOR GUARDRAIL DETAILS.

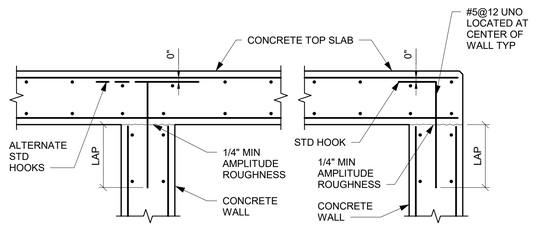
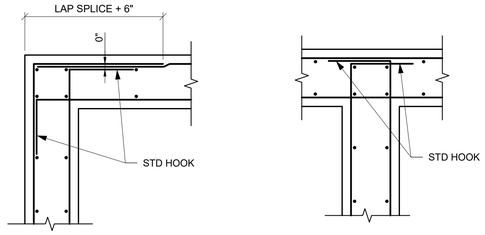
RECTANGULAR OPENING DETAIL



CIRCULAR OPENING DETAIL

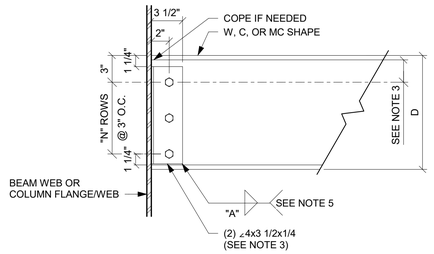
NOTES:

1. PROVIDE ADDITIONAL REINFORCING THE SAME SIZE AS DISCONTINUOUS REINFORCEMENT AT OPENING. QUANTITY OF REINFORCING IN EACH DIRECTION SHALL BE EQUAL TO OR ONE GREATER THAN THE NUMBER OF DISCONTINUOUS BARS. PLACE 1/2 OF ADDITIONAL REINFORCING BARS EACH SIDE OF OPENING, PLACE ADDITIONAL REINFORCEMENT AT 3" OC (TYPICAL BOTH DIRECTIONS AND ALL LAYERS OF REINFORCEMENT). START FIRST BAR 2" CLEAR TO OPENING.
2. EXTEND ADDITIONAL REINFORCING BEYOND EDGE OF OPENING AS SHOWN ABOVE. ADDITIONAL BARS MAY TERMINATE AT THE END OF THE WALL WITH A STANDARD HOOK WHERE THE LENGTH OF THE WALL WILL NOT PERMIT BARS TO EXTEND AS SHOWN ABOVE.
3. TYPICAL WALL OR SLAB REINFORCING NOT SHOWN FOR CLARITY. TERMINATE TYPICAL REINFORCING 2" CLEAR TO OPENING.
4. OPENINGS 12" OR LESS IN SLABS AND WALLS, NO EXTRA REBARS ARE REQUIRED UNLESS SHOWN OTHERWISE. TYPICAL REINFORCING SHALL BE RESPACED (NOT CUT) TO ALLOW FOR OPENINGS TO BE MADE.
5. UNLESS SHOWN OTHERWISE ON DRAWINGS, PROVIDE EXTRA REINFORCING AROUND OPENINGS AS SHOWN AND INDICATED ABOVE.
6. PROVIDE ADDITIONAL DOWELS PER NOTE 1 ABOVE FOR ALL OPENINGS NEAR THE FLOOR SLAB, BASE SLAB, OR CORNERS.



1 EXTRA REINFORCING AROUND OPENINGS

12" = 1'-0"

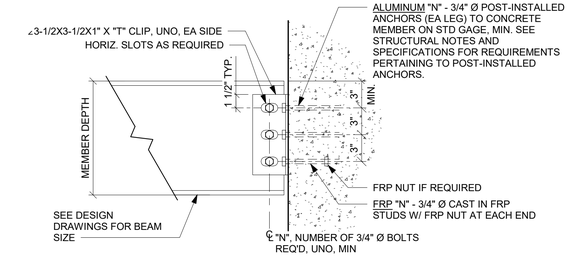


NOTE:

1. ALL HOOKS SHALL BE STD 90 DEGREE HOOKS.

NOTES:

1. ALL HOOKS SHALL BE STD 90 DEGREE HOOKS.
2. SEE DRAWINGS FOR ADDITIONAL HORIZONTAL BARS. STAGGER BETWEEN TYPICAL REINF SPACING, EXTEND TO 1/5 OF DISTANCE TO NEAREST ADJACENT WALL IN EACH DIRECTION, UNO.
3. OPTIONAL LAP LOCATION. APPLIES TO BOTH DOUBLE AND SINGLE LAYER CONDITIONS TYP.



STANDARD BOLTED CONNECTION SCHEDULE		
NOMINAL BEAM SIZE "D"	NUMBER OF BOLT ROWS	WELD SIZE

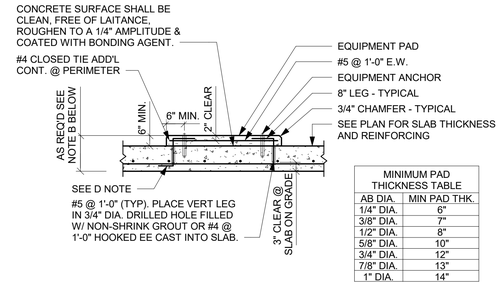
1 STAGGERED REINFORCING AT CONSTRUCTION JOINT
12" = 1'-0"

6 RAIL CRANE FRAME - BASEPLATE DETAIL
1 1/2" = 1'-0"



2 WALL VERTICAL REINFORCING AT CONSTRUCTION JOINT
12" = 1'-0"

NOTE:

1. FOR FTG EL, DEPTH AND REINF, SEE PLANS AND TYP FTG DET.

3 TYPICAL BOTTOM STEP FOOTING
3/4" = 1'-0"

MINIMUM PAD THICKNESS TABLE	
AB DIA.	MIN PAD THK.
1/4" DIA.	6"
3/8" DIA.	7"
1/2" DIA.	8"
5/8" DIA.	10"
3/4" DIA.	12"
7/8" DIA.	13"
1" DIA.	14"

NOTES:

A. PROVIDE ABOVE PAD UNDER ALL ELECTRICAL AND MECHANICAL EQUIPMENT SUPPORTED ON STRUCTURAL SLABS. ALSO PROVIDE FOR EQUIPMENT WEGHING LESS THAN 5000 POUNDS WHICH ARE SUPPORTED ON GRADE OR WHERE SPECIFICALLY NOTED ON PLANS.
B. PAD THICKNESS SHALL BE THE LARGER OF 6" OR MINIMUM PAD THICKNESS FROM TABLE. PROVIDE AN ADDITIONAL LAYER OF #5 @ 1'-0" EACH WAY WITH 1-1/2" CLEAR TOP AND BOTTOM FOR EACH 4" ADDITIONAL PAD THICKNESS EXCEEDING THE 6" MIN. THICKNESS.
C. THIS DETAIL SHOULD BE USED FOR PADS UP TO 14" HIGH. ANCHOR SIZES TO FOLLOW THE RECOMMENDATION OF THE EQUIPMENT MANUFACTURERE, IF NO SIZES ARE GIVEN, USE SIZES SHOWN ON THE DETAIL.
D. FOR EQUIPMENT BASES ON NEW SLABS PROVIDE #5 DOWELS HAVING TWO HOOKED ENDS AT 1'-0" CENTERS AROUND PERIMETER OF EQUIPMENT BASE, UNLESS APPROVED OTHERWISE.
E. BEFORE EQUIPMENT SUPPORT PADS ARE CAST, THE PAD SIZES AND REINFORCING SHALL BE APPROVED BY THE ENGINEER AS BEING CAPABLE OF SUPPORTING EQUIPMENT TO BE PLACED THEREON. EQUIPMENT BASE DIMENSIONS SHALL BE THE LARGER OF:
   a. AS DETERMINED BY THE EQUIPMENT MANUFACTURER OR
   b. AS INDICATED ON THE DRAWINGS. CONTRACTOR SHALL COORDINATE EQUIPMENT PADS WITH EQUIPMENT SUPPLIED. THE SIZE, NUMBER, TYPE, LOCATION, AND THREAD PROJECTION OF THE ANCHORS SHALL BE AS DETERMINED BY THE EQUIPMENT MANUFACTURER. SUBMIT DATA TO ENGINEER FOR RECORD PURPOSES ONLY. ANCHORS SHALL BE HELD IN POSITION WITH A TEMPLATE WHILE EQUIPMENT PAD IS CAST.

SHEET
S1-1

GENERAL

1. ALL NOTES LISTED ON THIS SHEET APPLY TO ALL SHEETS OF THE DRAWINGS AS IF THEY WERE WRITTEN ON EACH SHEET.
2. NOTIFY OWNER 48 HOURS PRIOR TO CONSTRUCTION.
3. VERIFY ALL EXISTING CONDITIONS AND OBSTRUCTIONS INCLUDING LOCATION AND DIMENSIONS BEFORE STARTING WORK AND SHALL NOTIFY THE ENGINEER OF ANY DISCREPANCIES.
4. PRIOR TO INSTALLATION OF RELEVANT FACILITIES CONTRACTOR SHALL, AT HIS OWN EXPENSE, UNCOVER AND OTHERWISE DETERMINE THE DEPTH OF UTILITIES WHICH, IN HIS OPINION, COULD INTERFERE WITH CONSTRUCTION.
5. ALL DIMENSIONS SHOWN WITH ± SHALL BE CONFIRMED BY THE CONTRACTOR ACCORDING TO ACTUAL FIELD CONDITIONS OR EQUIPMENT/STRUCTURE REQUIREMENTS.
6. ALL MISCELLANEOUS REMOVAL ITEMS REQUIRED FOR CONSTRUCTION SHALL BE FIELD LOCATED BY THE CONTRACTOR PRIOR TO BIDDING. THESE ITEMS WILL NOT BE MEASURED FOR PAYMENT AND SHALL BE INCLUDED IN THE PRICE BID FOR ASSOCIATED ITEMS OF WORK.
7. TRAFFIC CONTROL DEVICES SHALL BE FURNISHED AND MAINTAINED BY THE CONTRACTOR THROUGHOUT THIS PROJECT IN ACCORDANCE WITH THE LATEST VERSION OF THE MANUAL OF UNIFORM TRAFFIC CONTROL DEVICES AND/OR AS REQUIRED BY THE DEPARTMENT OF TRANSPORTATION OR COUNTY PERMITS FOR CONSTRUCTION IN RIGHT-OF-WAY.
8. SUBMIT AN EROSION CONTROL PLAN (SWPPP) PRIOR TO CONSTRUCTION AND SHALL MAINTAIN SWPPP THROUGHOUT DURATION OF CONSTRUCTION IN ACCORDANCE WITH SPECIFICATIONS.
9. EXISTING FACILITY AND UTILITY INFORMATION SHOWN ON THE DRAWINGS WAS OBTAINED FROM AVAILABLE RECORDS, LOCATES, AND AVAILABLE FILES. NEITHER THE OWNER NOR THE ENGINEER ASSUMES ANY RESPONSIBILITY FOR FACILITIES AND UTILITIES NOT SHOWN OR NOT IN THE LOCATION SHOWN. THE CONTRACTOR SHALL FIELD VERIFY ALL LOCATIONS, SIZES, MATERIALS, TYPES, AND ELEVATIONS SHOWN AROUND OR NEAR AREAS OF CONSTRUCTION PRIOR TO THE START OF CONSTRUCTION.
10. PERFORM ALL WORK WITHIN DESIGNATED EASEMENTS. CONTRACTOR SHALL NOT ENCROACH OR TRESPASS INTO PRIVATE PROPERTY WITHOUT WRITTEN APPROVAL FROM THE PROPERTY OWNER.
11. MAINTAIN LOCAL AND THROUGH TRAFFIC FOR ALL STREETS AT ALL TIMES WITHOUT CLOSURES OR RESTRICTIONS EXCEPT AS PART OF THE TRAFFIC CONTROL PLAN.
12. MAINTAIN REASONABLE ACCESS TO ALL PROPERTIES AT ALL TIMES. DO NOT RESTRICT DRIVEWAY ACCESS WITHOUT OWNER'S APPROVAL. RESTORE DRIVEWAY ACCESS AT THE END OF EACH DAY. PROVIDE TEMPORARY MEASURES AS NEEDED (SUCH AS GRAVEL) TO MAINTAIN DRIVEWAY ACCESS.
13. KEEP ACCURATE RECORDS OF ALL CONSTRUCTION THAT DEVIATES FROM THE DRAWINGS. THE CONTRACTOR SHALL FURNISH TO THE ENGINEER ACCURATE "AS-BUILT" RED LINE DRAWINGS FOLLOWING COMPLETION OF CONSTRUCTION.
14. TAKE SPEIAL PRECAUTIONS IN THE VICINITY OF ANY OVERHEAD AND UNDERGROUND ELECTRIC LINES. CONTRACTOR SHALL ABIDE BY THE MOST RECENT NATIONAL ELECTRIC CODE FOR WORKING AROUND OVERHEAD ELECTRIC LINES AS WELL AS OTHER LOCAL, STATE OR FEDERALS LAWS / REQUIREMENTS.
15. CONFORM TO ALL APPLICABLE FEDERAL, STATE AND LOCAL LAWS GOVERNING EXCAVATION. TRENCH SIDE SLOPES SHALL MEET OSHA REQUIREMENTS THAT ARE IN EFFECT AT THE TIME OF CONSTRUCTION. CONTRACTOR SHALL SUBMIT A TRENCH SAFETY PLAN PRIOR TO CONSTRUCTION.
16. THIS PROJECT IS SUBJECT TO AMERICAN IRON AND STEEL (AIS) REQUIREMENTS. ALL IRON AND STEEL PRODUCTS FOR CONSTRUCTION, ALTERATION, MAINTENANCE, OR REPAIRS INCORPORATED MUST BE PRODUCED IN THE UNITED STATES.
17. PROVIDE DUST CONTROL AT ALL TIMES DURING CONSTRUCTION.
18. ANY WORK PERFORMED WITHOUT THE KNOWLEDGE OF THE ENGINEER, INSPECTOR OR OWNER'S REPRESENTATIVE IS SUBJECT TO REMOVAL AND REPLACEMENT AT THE CONTRACTOR'S EXPENSE.

EARTHWORK

1. ALL COMPACTED SUBGRADE AND BASE NOT ACCESSIBLE TO MECHANICAL COMPACTION EQUIPMENT SHALL BE HAND COMPACTED USING WHACKER PACKERS.
2. SUBGRADE PREPARATION FOR ALL STRUCTURES AND BUILDINGS ON DRAWINGS SHALL BE AS FOLLOWS: OVER-EXCAVATE 30 INCHES BELOW BASE OF CONCRETE, SCARIFY AND COMPACT TOP 12", COMPACT TO 95% STANDARD PROCTOR DENSITY, INSTALL NON-WOVEN NEEDLE PUNCHED GEOTEXTILE FABRIC, INSTALL 30 INCHES OF CRUSHER RUN AGGREGATE BASE IN 10" LIFTS, COMPACT TO 95% MODIFIED PROCTOR DENSITY. BASE OF CONCRETE SHALL BE CONSIDERED THE BOTTOM OF SLAB AND NOT THE BASE OF FOOTINGS/STEM WALLS. OVER EXCAVATION MAY BE DELETED WHERE ROCK IS PRESENT. #57 ROCK SHALL BE SUBSTITUTED FOR AGG BASE WHERE GROUNDWATER IS PRESENT. ALL FILL MATERIAL REQUIRED TO ACHIEVE FINAL GRADE BELOW THE 30" ROCK LAYER SHALL BE CONSTRUCTED WITH ONSITE OR IMPORTED FILL MATERIAL COMPACTED TO 95% STANDARD PROCTOR DENSITY.
3. ELEVATIONS GIVEN ARE FINISHED GRADE UNLESS OTHERWISE NOTED.
4. NO FIRES WILL BE ALLOWED UNLESS OTHERWISE NOTED. TREES AND BRUSH SHALL BE REMOVED AND DISPOSED OF OFF SITE.
5. NO BLASTING WILL BE ALLOWED.
6. ALL SURFACE DRAINAGE IMPACTED SHALL BE RESTORED TO AS GOOD OR BETTER CONDITION.
7. ALL DISTURBED AREAS SHALL BE LEFT FREE OF RUTS AND TRACKS AND SHALL BE FULLY GRADED TO DRAIN.

GRASSING

1. ANY AND ALL DISTURBED AREAS OUTSIDE OF PLANT FENCING SHALL BE TOPSOILED, HYDROMULCHED, AND WATERED UNTIL ESTABLISHED. ANY AND ALL DISTURBED AREAS INSIDE PLANT FENCING SHALL BE SOLID SLAB SODDED PER SPECIFICATIONS & WATERED UNTIL ESTABLISHED.
2. FOR PIPELINE CONSTRUCTION EXTERNAL TO THE TREATMENT PLANT, ANY AND ALL DISTURBED AREAS SHALL BE TOPSOILED, HYDROMULCHED, AND FERTILIZED, WITH THE EXCEPTION OF RESIDENTIAL YARDS WHICH SHALL RECEIVE SOLID SLAB SOD IN LIEU OF HYDROMULCHING PER SPECIFICATIONS. THIS WORK WILL NOT BE MEASURED FOR PAYMENT. COST SHALL BE INCLUDED IN THE PRICE BID FOR ASSOCIATED ITEMS OF WORK.

DUCTILE IRON PIPE & FITTINGS

1. ALL BURIED DUCTILE IRON PIPE AND FITTINGS SHALL BE PROTECTED IN ACCORDANCE WITH ANSI/AWWA C105/A21.5 "POLYETHYLENE ENCASEMENT FOR GRAY AND DUCTILE IRON PIPE FOR WATER AND OTHER LIQUIDS." THIS ITEM SHALL NOT BE MEASURED FOR PAYMENT AND SHALL BE INCLUDED IN THE PRICE BID FOR ASSOCIATED ITEMS OF WORK.
2. ALL DUCTILE IRON AIR PIPING SHALL BE UNLINED WITH EPDM GASKETS RATED FOR COMPRESSED AIR USAGE (PRESSURE & TEMPERATURE.)
3. ALL DUCTILE IRON PIPING SHALL BE RESTRAINED JOINT.
4. ALL DUCTILE IRON PIPE CONNECTIONS TO P.V.C. SHALL BE MADE WITH A BOLTED CAST TRANSITION COUPLING.
5. ALL EXPOSED FITTINGS SHALL BE FLANGED FITTINGS W/ XYLAN COATED BOLTS AND APPURTENANCES.
6. ALL MECHANICAL JOINT, FLANGE & MISC. FITTINGS TO HAVE XYLAN COATED BOLTS, NUTS & WASHERS.
7. ALL BURIED FITTINGS SHALL BE D.I. MECHANICAL JOINT (M.J) RESTRAINED (MEGALUG.)
8. WALL PIPES SHALL BE USED WHEREVER PIPING PASSES FROM A STRUCTURE TO EARTHEN BACKFILL.
9. PROVIDE 1/4" ANTI-SEEPAGE RINGS A MINIMUM OF 2" WIDE WELDED TO ALL PIPES PIERCING WATER HOLDING TANKS TO PREVENT SEEPAGE OF WATER BETWEEN PIPE AND CONCRETE. WALL PIPES MAY BE USED IN LIEU OF WELDED RINGS.
10. ALL DUCTILE IRON PIPING LARGER THAN 10" DIAMETER SHALL HAVE CONCRETE SUPPORTS UNLESS OTHERWISE DETAILED. SMALLER PIPING MAY HAVE METAL STAND TYPE SUPPORTS.

CONCRETE

1. CONSTRUCTION JOINTS TO FACILITATE CONSTRUCTION SHALL BE LOCATED AND DETAILED ON THE SHOP DRAWINGS FOR REVIEW. UNLESS INDICATED OTHERWISE, ALL CONSTRUCTION JOINTS SHALL BE KEYED. HORIZONTAL CONSTRUCTION JOINTS SHALL NOT BE PERMITTED IN WALLS AND BEAMS, UNLESS SHOWN ON THE DRAWINGS OR APPROVED BY THE ENGINEER.
2. ALL EXPOSED CORNERS OF CONCRETE STRUCTURES REGARDLESS OF LOCATION SHALL HAVE A 3/4 INCH MINIMUM CHAMFER.
3. ALL EXPOSED EXTERIOR CONCRETE SHALL BE COATED WITH THEROSEAL OR TNEMEC ENVIROCRETE (8MIL THICKNESS). SURFACE PREPARATION AND COATING TO BE PER MANUFACTURER'S REQUIREMENTS.
4. ALL GROUTED AREAS OVER 8" THICK SHALL BE REINFORCED WITH WELDED WIRE MESH, 6x6-W2.0xW2.0 MATTS AT 8'-0" CTRS MAX.
5. ANCHOR BOLTS NOT SPECIFIED BY ENGINEER SHALL BE DESIGNED AND STAMPED BY A REGISTERED PROFESSIONAL ENGINEER, RETAINED BY THE CONTRACTOR IN ACCORDANCE WITH APPLICABLE PROJECT AND CODE REQUIREMENTS. SUBMIT AS A SHOP DRAWING FOR REVIEW AND APPROVAL BY THE ENGINEER. COORDINATE LOCATION, SIZE AND EMBEDMENT PRIOR TO CASTING CONCRETE.
6. EXPANSION JOINTS SHALL BE USED WHERE EXTERIOR OF ALL EXISTING AND PROPOSED STRUCTURES AND BUILDINGS ABUT CONCRETE PAVING WHETHER SHOWN ON THE DRAWINGS OR NOT.
7. NO FLY ASH SHALL BE PERMITTED IN CONCRETE MIX DESIGN.
8. TREMIES REQUIRED ON ALL POURS DEEPER THAN 10 FEET.
9. VAPOR BARRIER (10 MIL) REQUIRED BENEATH ALL SLABS.
10. WALKWAYS AND SIDEWALKS SHALL BE POURED WITH SLIGHT SLOPE AND NO LOW SPOTS SO THEY WILL DRAIN FREELY.
11. ALL STRUCTURAL JOINTS SHALL RECEIVE 6" RUBBER CENTER BULB PVC WATERSTOP PLACED AT ALL WATERTIGHT JOINTS.
12. VERTICAL WATERSTOP SHALL BE FULLY EMBEDDED IN SLAB POUR AND WELDED TO ALL ADJACENT WATERSTOP.
13. WHEN WATERSTOP IS PLACED HORIZONTALLY IN SLABS, THE CONTRACTOR SHALL TEMPORARILY TIE UP OR STAND UP THE WATERSTOP UNTIL THE CONCRETE IS PLACED TO SLIGHTLY ABOVE THE DEPTH OF THE WATERSTOP.
14. ALL CONCRETE SHALL HAVE XYPEX ADMIXTURE PER MANUFACTURE'S SPECIFICATIONS.

BUILDING

1. ALL EXTERIOR DOORS ON ALL BUILDINGS SHALL HAVE R-PANEL AWNING SUPPLIED INTEGRAL WITH METAL BUILDING. AWNING ROOF PANELS SHALL MATCH MAIN BUILDING ROOF. AWNINGS SHALL INCLUDE FULL WIDTH GUTTER WITH DOWNSPOUTS.
2. ALL EXTERIOR EXPOSED CMU SHALL BE SPLIT FACE ARCHITECTURAL BLOCK UNLESS OTHERWISE NOTED.
3. ANY R-PANEL USED IN THE BUILDING CONSTRUCTION WHERE NO GAUGE IS SPECIFIED SHALL BE 24 GA. MINIMUM.

PIPING & APPURTENANCES

1. MANHOLES SHALL BE GROUTED INSIDE AND OUT AT ALL JOINTS.
2. ALL NON-POTABLE WATER LINES SHALL BE IN PURPLE COLORED PIPE AND LABELED "DO NOT DRINK". THE WARNING LABEL SHALL BE LOCATED ON OPPOSITE SIDES OF ALL PIPES AND REPEATED EVERY THREE (3) FEET OR LESS.
3. ALL PIPING THAT CROSS VERTICALLY SHALL HAVE AT LEAST 6" SEPARATION.
4. ALL UNDERGROUND FITTINGS SHALL BE DUCTILE IRON MECHANICAL JOINTS (MEGALUG), UNLESS OTHERWISE NOTED.
5. ALL VALVE ASSEMBLIES, VAULTS, PULLS BOXES AND MANHOLES CONSTRUCTED SHALL BE ADJUSTED TO BE FLUSH WITH FINISHED GRADE UNLESS OTHERWISE NOTED. MANHOLES SET IN OPEN FIELDS SHALL BE SET TWELVE INCHES ABOVE FINISHED GRADE AND VAULTS SHALL BE SET 6 INCHES ABOUT FINISHED GRADE.
6. ALL VALVE ASSEMBLIES, VAULTS, PULLS BOXES AND MANHOLES CONSTRUCTED SHALL BE ADJUSTED TO BE FLUSH WITH FINISHED GRADE UNLESS OTHERWISE NOTED.
7. ANY BY-PASS PUMPING AND/OR BY-PASS PIPING INSTALLED SHALL BE OPERATED AND MAINTAINED BY THE CONTRACTOR AT CONTRACTOR'S EXPENSE. THE CONTRACTOR IS RESPONSIBLE FOR ANY UNAUTHORIZED DISCHARGES.
8. CONNECTIONS TO EXISTING UTILITIES SHALL BE MADE IN A TIME AND UNDER CONDITIONS WHICH WILL LEAST INTERFERE WITH SERVICE OF THE OWNER, AND AS AUTHORIZED BY THE ENGINEER AND OWNER. FACILITIES SHALL BE PROVIDED FOR PROPER DEWATERING AND FOR DISPOSAL OF ALL WATER/WASTEWATER REMOVED TO ADJACENT PROPERTY FROM DEWATERED LINES WITHOUT DAMAGE.
9. MAINTAIN THE REQUIRED 10 FOOT HORIZONTAL AND 2 FOOT VERTICAL SEPARATION BETWEEN SANITARY SEWER AND POTABLE WATER MAINS. ALL OTHER PIPING SHALL MAINTAIN A MINIMUM OF 5' SEPARATION.
10. ORDER MANHOLES IN PAVEMENT LOWER THAN PROPOSED GRADE AND BRING THEM TO EXACT GRADE WITH LEVEL RINGS.
11. PROVIDE FREEZE PROTECTION FOR ANY EXPOSED PIPING. FREEZE PROTECTION SHALL CONSIST OF WRAPPED PIPE W/ RIGID ALUMINUM COVERS. FREEZE PROTECTION/INSULATION WILL NOT BE REQUIRED FOR PIPING INSIDE BUILDING, AIR PIPING OR SCADA INSTRUMENTATION CONDUIT.
12. CONTRACTOR SHALL SCHEDULE AND CONDUCT OPERATIONS TO LIMIT AMOUNT OF TRENCH OPENED TO INCLUDE ONLY THAT WHICH MAY BE COVERED IN 2 (TWO) DAYS TIME TO A MAXIMUM OF 200'. ANY TRENCH LEFT OPEN OVERNIGHT SHALL BE BARRICADED AND PROTECTED AS DETAILED IN THE MOST CURRENT EDITION OF THE MANUAL OF UNIFORM TRAFFIC CONTROL DEVICES.
13. SEWER MAINS SHALL BE CONSTRUCTED UTILIZING A LASER WITH GRADE ESTABLISHED THROUGH SEWER PIPE.
14. WHEN TIE-INS TO EXISTING MANHOLES ARE TO BE MADE, CONTRACTOR SHALL VERIFY MANHOLE FLOW LINE AT AN INTERVAL PRIOR TO MANHOLE TO ENSURE ADEQUATE DEPTH OF NEW LINE. WHEN CONSTRUCTING A MANHOLE OVER AN EXISTING LINE, CONTRACTOR SHALL VERIFY EXISTING LINE DEPTHS PRIOR TO MANHOLE CONSTRUCTION.
15. MATERIAL EXCAVATED FROM TRENCH & PIPE BEDDING MATERIALS SHALL NOT BE PLACED ON ADJACENT ASPHALT OR CONCRETE PAVING.
16. A SILT AND VARMINT CAP AND/OR PLUG SHALL BE IN PLACE ON THE OPEN END OF PIPES AT ALL TIMES.
17. DO NOT EXCEED 75% OF MANUFACTURE'S RECOMMENDED MAXIMUM DEFLECTION FOR PIPE JOINTS UNLESS OTHERWISE NOTED.
18. INSTALL TEMPORARY FENCES TO PROTECT HORSES AND LIVESTOCK WHEN NECESSARY.
19. REMOVAL AND REPLACEMENT OF STREET TRAFFIC SIGNS, MAIL BOXES AND OTHER STRUCTURES BY THE CONTRACTOR TO FACILITATE CONSTRUCTION SHALL BE CONSIDERED INCIDENTAL AND BE INCLUDED IN THE PRICE BID.
20. ALL EXISTING PAYMENT TO REMAIN SHALL BE SAWCUT TO ENSURE A STRAIGHT SMOOTH SURFACE. ALL CUTS MADE IN DRIVEWAYS OR OTHER PAVEMENTS SHALL BE MADE IN STRAIGHT PERPENDICULAR LINES. COST TO BE CONSIDERED SUBSIDIARY TO CONTRACTOR'S BID.
21. INSTALL METAL TRACER WIRE AND TAPE ON ALL PIPING INSTALLED IN ACCORDANCE WITH SPECIFICATIONS.

TREATMENT PLANT

1. ALL EXPOSED COMPONENTS REGARDLESS OF LOCATION TO BE CORROSION RESISTANT (GALVANIZED, ALUMINUM, SST, FRP, ETC).
2. PROPERLY INSULATE, GASKET AND PROTECT TRANSITIONS TO DISSIMILAR METALS (DUCTILE-STAINLESS).
3. ALL EXPOSED VALVES SHALL HAVE HANDWHEELS OR LEVERS. CHAINWHEELS TO BE PROVIDED ON ALL ELEVATED VALVING.
4. ALL PLANT PIPING, CONDUIT, DRAINS, EQUIPMENT, PIPING, ELECTRICAL, COMPONENTS, ETC., SHALL BE PROVIDED WITH PIPE AND EQUIPMENT SUPPORTS. PIPE AND EQUIPMENT HANGERS FOR ALL BRACING AND STABILIZATION FOR A COMPLETE SYSTEM AND PROVIDE WALKING ACCESS AREAS FREE AND CLEAR. ALL PIPE SHALL BE PROPERLY PAINTED OR COATED WITH APPROVED PAINT. CONTRACTOR SHALL LABEL UNITS, PIPING, VALVES, TANKS, ETC., WITH PROPER FLOW DIRECTION AND TYPE. LOCATION AND NUMBER OF PIPE HANGERS AND PIPE SUPPORTS SHOWN IN ONLY APPROX. CONTRACTOR SHALL DESIGN SUPPORTS AS SPECIFIED.
5. ALL PVC/CPVC VALVES AND COMPONENTS FOR USE IN CHEMICAL FEED AND AIR PIPING SHALL HAVE VITON SEALS AND SHALL BE RATED FOR PRODUCT BEING CARRIED.
6. ALL SUSPENDED PIPING SHALL BE SUPPORTED AT NOT LESS THAN EVERY 10 FEET. ALL PIPING LARGER THAN 6" DIAMETER MAY REQUIRE ADDITIONAL SUPPORTS PER SUPPORT SUPPLIERS RECOMMENDATIONS AND/OR SPECIFICATION REQUIREMENTS.
7. ALL WATERTIGHT STRUCTURES CONCRETE SHALL HAVE 72 HOUR WATER TEST FOR LEAKAGE ON STRUCTURE BEFORE BACKFILL.
8. DISSIMILAR METALS IN CONTACT SHALL BE PROVIDED WITH GALVANIC SEPARATION.
9. CONTRACTOR TO COORDINATE WITH SUPPLIERS AND PROVIDE DRAIN CONDUIT (2" MINIMUM) FOR ANY/ALL ANALYZERS, RPZ, AIR/VAC VALVES, SAMPLERS OR ANY OTHER ITEM INSIDE BUILDING WHICH DISCHARGES INTERMITTENT WATER AND ROUTE TO DRAIN. NO SURFACE DRAINAGE WILL BE PERMITTED.
10. SUPPLY ONE SPARE WASHWATER PUMP.
11. SUBMIT FOR REVIEW ALL EQUIPMENT SIZES, OPERATING WEIGHTS, VIBRATION FORCES, SUPPORT LOCATIONS, ALONG WITH ANY FLOOR OPENINGS, NOTCHES, AND RECESSES REQUIRED BY SUCH EQUIPMENT. CONCRETE SUPPORT PADS AND/OR FRAMING REQUIRED TO SUPPORT SAID EQUIPMENT SHALL NOT BE FABRICATED AND PLACED UNTIL THE CONCRETE SUPPORT PADS AND/OR FRAMING IS APPROVED TO SUPPORT THE EQUIPMENT.
12. PROCESS EQUIPMENT DELIVERIES SHALL BE COORDINATED SO THAT EQUIPMENT COMES TO SITE NO MORE THAN 30 DAYS PRIOR TO INSTALLATION, UNLESS STORED INDOORS WITH CLIMATE CONTROL.
13. AT ALL POINTS UNDERGROUND WHERE PIPING EXITS STRUCTURES AND TRANSITIONS TO NATURAL GROUND OR OTHER AREAS SUBJECT TO GROUND SETTLING OR OTHER POTENTIAL INTRODUCED STRESSES AFTER INSTALLATION, A BELL-FLANGE WALL PIPE W/SEEP RING AND RESTRAINED MECHANICAL JOINT SHALL BE PROVIDED TO ALLOW FOR DEFLECTION WHETHER BEING SHOWN ON DRAWINGS OR NOT.
14. ALL PIPING 18" AND LARGER SHALL HAVE A MINIMUM COVER OF 48"; AND PIPE SMALLER THAN 18" SHALL HAVE A MINIMUM COVER OF 36" UNLESS OTHERWISE NOTED. PIPE SHALL BE ROUTED AS SHOWN UNLESS MINOR REVISIONS ARE NECESSARY TO AVOID EXISTING PIPES, STRUCTURES, ETC. CONTRACTOR SHALL BE RESPONSIBLE FOR FURNISHING ALL FITTINGS AND ADAPTERS REQUIRED TO MAKE THE ROUTING CHANGES. CONTRACTOR SHALL INCLUDE COST IN PRICE BID.
15. WHERE CONFLICTS OCCUR BETWEEN CIVIL AND MEP DRAWINGS SHALL GOVERN. ELECTRICAL CONTRACTOR IS RESPONSIBLE FOR VERIFICATION AND ANY MINOR MODIFICATIONS REQUIRED TO FACILITATE INSTALLATION AS OUTLINED ON CIVIL DRAWINGS.
16. REVIEW OF ANY/ALL SCOPE AND PROPOSALS FURNISHED BY EQUIPMENT SUPPLIERS AND SHALL VERIFY ALL REQUIREMENTS OUTLINED IN PROPOSED EQUIPMENT SCOPE/PROPOSAL HAVE VERIFIED AGAINST THE DRAWINGS PRIOR TO BID. ANY ADJUSTMENTS AND/OR ADDITIONAL WORK/MATERIALS REQUIRED ARE THE RESPONSIBILITY OF THE CONTRACTOR AND NO ADDITIONAL COMPENSATION WILL BE PROVIDED.
17. MAKE CONNECTIONS TO EXISTING PIPE, EQUIPMENT, ETC. AS REQUIRED AND SHALL PROVIDE ALL FITTINGS, ADAPTERS AND APPURTENANCES REQUIRED TO MAKE THE CONNECTIONS. PROVIDE SUPPORTS REQUIRED FOR A RIGIDLY SUPPORTED SYSTEM.
18. TEMPORARILY RELOCATE PIPING AS REQUIRED TO MAINTAIN SERVICE TO THE EXISTING PLANT.
19. MECHANICAL AND ELECTRICAL EQUIPMENT SUPPORTS, ANCHORAGES, OPENINGS, RECESSES, AND REVEALS NOT SHOWN ON THE STRUCTURAL DRAWINGS THAT ARE REQUIRED BY OTHER CONTRACT DRAWINGS SHALL BE PROVIDED PRIOR TO CASTING CONCRETE.
20. PRIOR TO FABRICATION OF NEW PIPING, INCLUDING SPECIAL FITTINGS AND EXCAVATIONS FOR NEW STRUCTURES, ELECTRICAL CONDUIT AND/OR OTHER PROPOSED UTILITIES, CONTRACTOR SHALL BE RESPONSIBLE TO VERIFY/TIME THE LOCATION OF ALL EXISTING PIPING AND UTILITIES IN THE CONSTRUCTION AREA. AT TIE-IN LOCATIONS, VERIFY THE SIZING OF EXISTING PIPING BEFORE FABRICATION OF NEW PIPING AND FITTINGS. THE CONTRACTOR SHALL INCLUDE THE COST IN HIS BID FOR TEMPORARILY RELOCATING AND REINSTALLING EXISTING UTILITIES AS REQUIRED FOR CONSTRUCTION OF PROPOSED ITEMS.
21. ANY PLANT UTILITY, PIPING, CONDUIT, COMMUNICATION SYSTEM, ELECTRICAL OR INSTRUMENTATION WIRING DAMAGED DURING CONSTRUCTION SHALL BE REPAIRED AND PLACED BACK IN SERVICE BY THE CONTRACTOR ON THE SAME DAY THAT THE DAMAGE OCCURRED. AFTER 24 HOURS OUT OF SERVICE, OWNER WILL HAVE THE OPTION OF HAVING THE REPAIRS MADE BY A SEPARATE CONTRACTOR AND DEDUCTING THE COST OF SAID REPAIRS FROM THE CONTRACT AMOUNT.
22. GALVANIZED STEEL PRODUCTS SHALL NOT BE USED FOR ANY TREATMENT PLANT STRUCTURE / EQUIPMENT CONSTRUCTION UNLESS SPECIFICALLY CALLED OUT / APPROVED.
23. ALL NEW UNISTRUT, ANCHORS, SUPPORT SYSTEMS AND FASTENING HARDWARE TO BE 316 STAINLESS STEEL.
24. BACKFILLING AGAINST STRUCTURES WHICH HAVE A TOP SLAB SHALL BE DONE ONLY AFTER THE TOP SLAB IS IN PLACE AND THE CONCRETE HAS CURED TO 2/3 OF ITS DESIGN STRENGTH, BUT IN NO CASE LESS THAT 4 DAYS.
25. STAGING AREA WILL ONLY BE USED FOR CONSTRUCTION EQUIPMENT AND MATERIALS USED IN THE CONSTRUCTION OF THE PROJECT. CONSTRUCTION DEBRIS SHOULD NOT BE ALLOWED TO ACCUMULATE AND SHOULD BE REMOVED ON A WEEKLY BASIS.
26. INSTALL METAL TRACER WIRE AND COLOR CODE FOR ALL PIPE INSTALLED.
27. IN ACCORDANCE WITH OAC 252:656-5-4(G)(1), SANITARY SEWER MUST BE AT LEAST 10-FEET FROM AN EXISTING OR PROPOSED WATERMAIN AND AT LEAST 5-FEET ELECTRICAL OR PETROLEUM LINES. SANITARY SEWERS MUST CROSS AT LEAST 24 INCHES ABOVE OR BELOW WATERMAINS.
28. THE CONTRACTOR SHALL NOT OPEN OR CLOSE ANY VALVES AT THE TREATMENT PLANT AND SHALL ASK FOR THE OWNER'S ASSISTANCE.

ELECTRICAL/CONTROLS/SCADA

1. ALL ELECTRICAL CONSTRUCTION SHALL BE IN STRICT ACCORDANCE WITH ALL N.E.C. AND LOCAL ELECTRICAL CODES.
2. ALL MECHANICAL EQUIPMENT (INCLUDING MCC & PANELS) SHALL RECEIVE HOUSEKEEPING PADS WITH #4 BARS @ 12" O.C.E.W. MINIMUM THICKNESS SHALL BE 6" OR AS REQUIRED FOR ANCHOR BOLT CLEARANCE. ANCHOR BOLTS SLEEVES MAY BE USED PROVIDED THE SLEEVES ARE NON-SHRINK GROUT FILLED WITH 1-1/2" GROUT UNDER EQUIPMENT BASE. ALL PADS SHALL BE ANCHORED TO CONCRETE SLABS WITH J BARS (#3 @ 12" O.C.) OR EPOXY ANCHORS.
3. ALL SCADA SYSTEM WIRING SHALL BE CONDUIT ENCASED AND IS NOT SHOW FOR CLARITY. CONTRACTOR TO PROVIDE PROPOSED CONDUIT LAYOUT WITH SCHEDULE TO ENGINEER FOR APPROVAL PRIOR TO CONSTRUCTION.
4. ALL SURFACE MOUNTED PANELS AND PANEL BOARDS ON THE INTERIOR OF EXTERIOR WALLS OR IN OTHER LOCATIONS CONSIDERED DAMP OR WET AND SHALL BE MOUNTED SO AS TO MAINTAIN A 1/4" MINIMUM AIR SPACE BETWEEN THE ENCLOSURE AND THE WALL.
5. ALL EXTERNAL DISPLAYS SHALL BE PROVIDED WITH A WEATHER SHIELD.
6. REVIEW OF ANY/ALL SCOPE AND PROPOSALS FURNISHED BY EQUIPMENT SUPPLIERS AND SHALL VERIFY ALL ELECTRICAL REQUIREMENTS OUTLINED IN PROPOSED EQUIPMENT SCOPE/PROPOSAL HAVE BEEN ACCOMMODATED BY ELECTRICAL CONTRACTOR.
7. THE WIRING DIAGRAMS, QUANTITY AND SIZE OF WIRES AND CONDUITS REPRESENT A SUGGESTED ARRANGEMENT BASED UPON SELECTED STANDARD COMPONENTS OF ELECTRICAL EQUIPMENT. IF EQUIPMENT SUPPLIED BY THE MANUFACTURER HAS A LARGER LOAD THAN THE VALUE SHOWN OR INDICATED, THE CABLE, CONDUIT AND ELECTRICAL EQUIPMENT SHALL BE ENLARGED AS REQUIRED TO ACCOMMODATE THE HIGHER LOADING. HOWEVER, THE BASIC SEQUENCE AND METHOD OF CONTROL MUST BE MAINTAINED AS INDICATED ON THE DRAWINGS AND/OR SPECIFICATIONS. CONTRACTOR TO PROVIDE PROPOSED CONDUIT LAYOUT WITH SCHEDULE TO ENGINEER FOR APPROVAL PRIOR TO CONSTRUCTION.

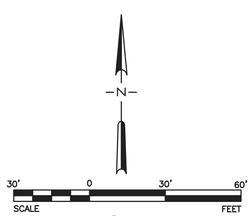
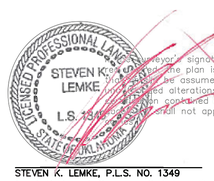
"HARD SURVEY LOCATIONS" REQUESTS:
All information was collected as shown in the drawings excepting:
– Existing Plant Headworks ~ Could not determine size and material of some piping.
– Chlorine Contact Basin ~ Could not determine size and material of piping.
– Treated Flow and Wet Weather Flow Screw Pumps ~ Could not determine size and material of piping.

NOTICE:
All invert elevation, pipe size, and pipe material information was collected in unfavorable conditions. This information was difficult to obtain with absolute certainty of its accuracy.

LOCATION MAP



UTILITY WARNING:
The underground utilities shown have been located from record documents or field locations by the operator. The surveyor makes no guarantee that the underground utilities shown comprise all such utilities in the area either in service or abandoned. The surveyor further does not warrant that the underground utilities shown are in the exact location indicated although the surveyor does certify that they are located as accurately as possible from the information available. The surveyor has not physically located the underground utilities.



Utility elevations and sizes may have been measured under adverse field conditions. Upon exposing the utility, elevations and line sizes should be verified by the contractor prior to construction. Contractor should verify critical elevations using the benchmark provided by the surveyor or engineer. Any discrepancies should be immediately brought to the engineer's and surveyor's attention.

SECTION A-A

LEGEND

INITIAL DEMOLITION W/ SLUDGE REMOVAL/DISPOSAL

DEMOLITION SCOPE OF WORK (PRIOR TO PRIMARY CONSTRUCTION)

1. DEWATER & REMOVE SLUDGE FROM DRYING BEDS.
2. DEMOLISH DRYING BEDS TO A 981' ELEVATION.

NOTES:

1. SLUDGE TO BE REMOVED AND DISPOSED OF BY A SLUDGE REMOVAL CONTRACTOR WITH EXPERIENCE REMOVING & DISPOSING OF MUNICIPAL WASTEWATER TREATMENT PLANT SLUDGE. SEE 02_41_00 DEMOLITION.
2. CUT/PLUG EXISTING MAINS AT LIMITS OF DEMOLITION.
3. DEMOLITION OF EXISTING 30" SEWERMAIN TO FOLLOW INSTALLATION OF TMPI. SEE PRIMARY PIPING PLAN.

LEGEND

FINAL DEMOLITION WITH SLUDGE REMOVAL/DISPOSAL

DEMOLITION SCOPE OF WORK (AFTER STARTUP ON PROPOSED EQUIPMENT)

1. COMPLETE CONSTRUCTION, STARTUP, TESTING AND INITIAL OPERATION.
2. CLOSE ALL EXISTING VALVES AND RAW WASTEWATER LINES. VERIFY POSITIVE CLOSURE ON VALVES.
3. DISCONNECT ALL INCOMING ELECTRICAL W/POSITIVE VERIFICATION FROM POWER COMPANY. OFFICE/SHOP ELECTRICAL TO REMAIN.
4. CUT AND PLUG W/ CONCRETE EXISTING WATER/WASTEWATER LINES.
5. DEWATER AND DEMOLISH EXISTING STRUCTURES TO A DEPTH OF 4' BELOW FINAL GRADE.
6. BACKFILL STRUCTURES WITH SELECT FILL AND COMPACT. GRADE TO DRAIN.
7. DISPOSE OF DEMOLISHED MATERIALS OFF SITE IN A LOCATION PROVIDED BY THE CONTRACTOR PER STATE AND FEDERAL REGULATIONS. DISPOSAL INSIDE EXISTING BASINS WILL BE ACCEPTABLE PROVIDED 4' SOIL COVER REQUIREMENTS ARE MET.
8. TOPSOIL AND HYDROMULCH DISTURBED AREAS & WATER UNTIL ESTABILISHED.

NOTES:

1. SLUDGE TO BE REMOVED AND DISPOSED OF BY A SLUDGE REMOVAL CONTRACTOR WITH EXPERIENCE REMOVING & DISPOSING OF MUNICIPAL WASTEWATER TREATMENT PLANT SLUDGE. SEE 02_41_00 DEMOLITION.

2. ALL STRUCTURES AND BUILDINGS SCHEDULED TO REMAIN ARE TO HAVE MISCELLANEOUS EQUIPMENT, PUMPS, ETC. REMOVED & DISPOSED OF.

3. CUT/PLUG EXISTING MAINS AT LIMITS OF CONSTRUCTION.

INDEX
FE: EMBEDDED FRAME
HC: HAND CRANK
GS: GALVANIZED STEEL
CW: CHANNEL WALL
SQN: SQUARE NUT

NOTES:
1. ALL ABOVE GRADE PIPING AND FITTINGS 4" AND SMALLER SHALL BE 316 SST (GR).
2. USE VICTAULIC FITTINGS AS REQUIRED.
3. GATE WIDTHS LISTED ARE NOMINAL
4. CONTRACTOR SHALL ADJUST LOCATION OF GRIT WASHER CONVEYER TO ALLOW FOR USE OF ONE DUMPSTER.
5. THERE SHALL NOT BE ANY GRATING OVER GATES WHICH WOULD INTERFERE WITH OPERATION.
6. ALL EXPOSED PIPING SHALL BE FREEZE PROTECTED BY HEAT TRACE AND INSULATED.
7. GRIT PUMPS SHALL BE EQUIPPED WITH CASE HEATING AND FREEZE PROTECTION PER MANUFACTURERS RECOMMENDATIONS.
8. PW WATER CONNECTION TO EQUIPMENT SHALL BE INSTALLED WITH CONNECTION SOLENOID VALVE SUPPLIED BY MANUFACTURER. FIELD ROUTE ELECTRICAL/CONTROLS PER MANUFACTURERS RECOMMENDATIONS.
9. CONTRACTOR SHALL VERIFY WITH OWNER DUMPSTER DIMENSIONING PRIOR TO PLACEMENT OF CLASSIFIER/COMPACTOR DISCHARGE OUTLETS.
10. ALL PIPING AND CONNECTIONS SHALL BE PER MANUFACTURERS RECOMMENDATIONS.
11. ALL ELECTRONICALLY ACTUATED VALVES TO ALSO BE EQUIPPED WHANDWHEEL OPERATORS.
12. SLIDE GATES TO BE MOUNTED PER MANUFACTURERS RECOMMENDATIONS.
13. CONTRACTOR TO INSTALL A 2" RADIUS FILLET BEFORE AND AFTER THE SCREENS TO PREVENT SEDIMENTATION OF SOLIDS. CONTRACTOR SHALL VERIFY WITH MFR. THAT APPROPRIATE CHANNEL VELOCITY WILL BE MAINTAINED.
14. ACTUATED SLIDE GATE EMERGENCY FLOAT TO AUTOMATICALLY CLOSE GATE IN THE EVENT WATER RISES TO HEADWORKS FLOOR.
15. AT CONTRACTORS OPTION, FLOOR OF HEADWORKS MAY BE POURED LEVEL AT ELEVATION GROUTED TO PROPOSED FLOW LINE ELEVATION.
16. COORDINATE LOCATIONS FOR REQUIRED WASH WATER NON POTABLE WATER MAINS WITH HEADWORKS EQUIPMENT SUPPLIER PRIOR TO INSTALLATION.
17. ELECTRONICALLY OPERATED GATE SHALL BE 480 VOLTS/3 PHASE.
18. CONTRACTOR SHALL SUBMIT A COMPLETE PIPING PLAN FOR APPROVAL.
19. CONTRACTOR SHALL PROVIDE PIPING SUPPORTS AS NEEDED REGARDLESS OF BEING SHOWN ON DRAWINGS.
20. ALL OPEN AREAS OF HEADWORKS STRUCTURE ARE TO RECEIVE GRATING. SOME GRATING IS NOT SHOWN FOR CLARITY.
21. COORDINATE WITH EQUIPMENT SUPPLIER FOR EXACT REQUIREMENTS OF INLET WATER PIPING PRIOR TO BID.
22. EQUIPMENT DRAINS NOT SHOWN IN PIPING SHALL BE FIELD ROUTED TO HEADWORKS CHANNELS PER MANUFACTURER RECOMMENDATIONS.
23. ENTIRE SUSTEM SHALL BE EQUIPPED WITH A FACTORY DESIGNED FREEZE PROTECTION SYSTEM CONSISTING OF HEAT TAPE, CASE HEATERS AND INSULATION. FREEZE PROTECTION SYSTEM SHALL BE DESIGNED TO ENSURE PROPER OPERATION INDEFINITELY AT -15 DEGREES FAHRENHEIT. PROVIDE INFORMATION ON FREEZE PROTECTION SYSTEM WITH THE EQUIPMENT SUBMITTAL.
24. ALL EXPOSED PIPING IN HEADWORKS AREA 6" AND SMALLER TO BE GROOVED 316 STAINLESS STEEL. COMPLETE SYSTEM TO BE DESIGNED AND PROVIDED BY VICTAULIC.

JIB CRANE FOUNDATION
N.T.S.

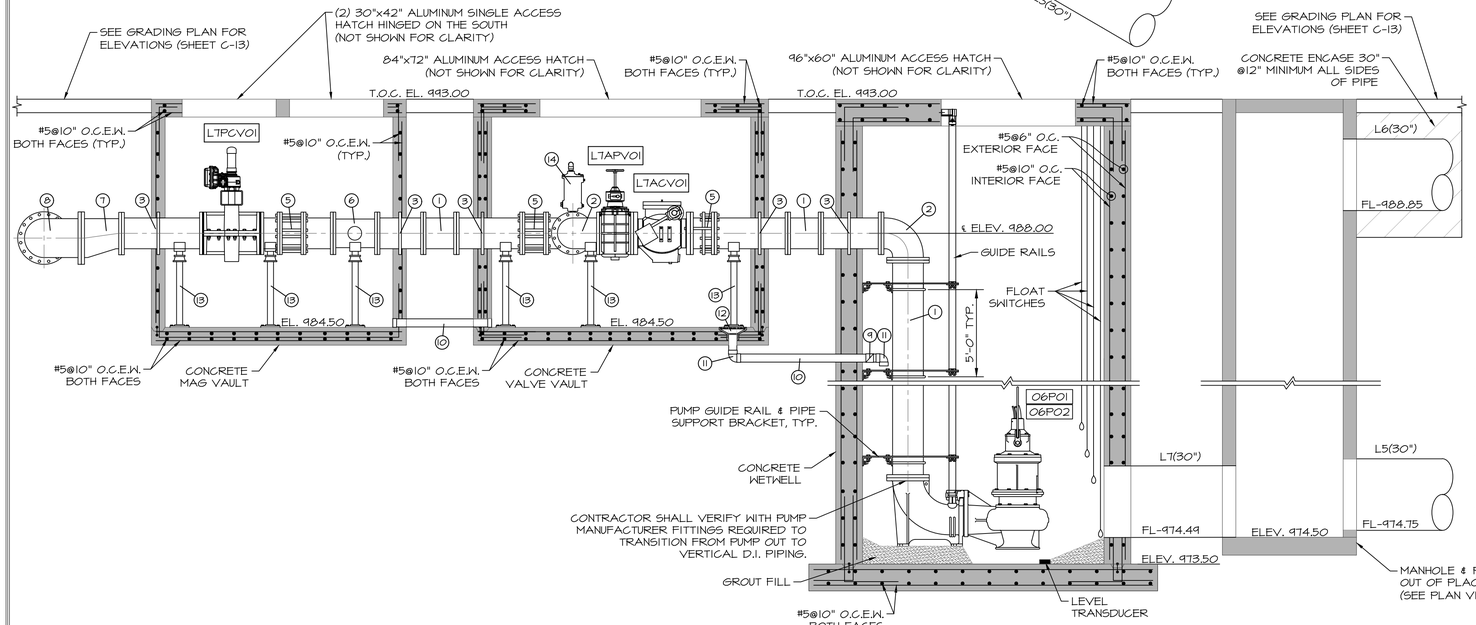
JIB CRANE NOTES:

1. JIB CRANE SHALL BE SPANCO MODEL 100 FREESTANDING JIB CRANE.
2. SPAN LENGTH SHALL BE 15'.
3. FURNISH 2 TON ELECTRIC MONORAIL HOIST W/ PUSH TROLLEY WITH WATERPROOF COVER.
4. CONTRACTOR TO PROVIDE AND INSTALL MECHANISM IN CONCRETE TO PREVENT CRANE FROM FREE ROTATING IF NOT SUPPLIED BY MANUFACTURER.
5. FOOTING DIMENSIONS ARE FOR REFERENCE ONLY AND SHALL BE PER MANUFACTURER REQUIREMENTS/RECOMMENDATIONS.
6. PROVIDE MOTORIZED TROLLEY HOIST CAPABLE OF LIFTING SUBMERSIBLE PUMPS FROM WET WELL FOR MAINTENANCE AND REPAIR.
7. HOIST SUPPLIER SHALL INSPECT AND CERTIFY HOIST INSTALLATION MEETS MINIMUM STANDARDS AND IS APPROPRIATE FOR THIS APPLICATION.
8. FURNISH "J" BOLTS PER MANUFACTURER RECOMMENDATIONS.

VALVE SCHEDULE STRUCTURE #6 & #7

VALVE I.D.	VALVE TYPE	VALVE SIZE	MOTORIZED
L7APV01	PLUG	12"	YES
L7ACV01	CHECK	12"	NA
L7BPV01	PLUG	12"	YES
L7BCV01	CHECK	12"	NA
L7PCV01	PINCH VALVE	12"	YES

NOTES:



1. ROUTE AIR/VAC DRAINS TO FLOOR DRAIN IN PVC.
2. AIR RELEASE VALVES TO BE SUPPLIED WITH ISOLATION BALL VALVE & ½" SAMPLE COCK.

PUMP SCHEDULE STRUCTURE #6

NO.	FLOW	TDH-DES	FUNCTION	CONTROL	HP	EFFICIENCY MIN.
06P01-06P02	3,200 GPM	16'	STORMWATER	VFD	20	65%

PUMP NOTES:

1. PUMPS SHALL PENTAIR OR APPROVED EQUAL.
2. PUMPS SHALL BE PROVIDED WITH BASE ELBOWS, S.S. RAILS, AND S.S. LIFTING CHAINS.
3. PROVIDE FITTINGS AS REQUIRED TO CONNECT BASE ELBOWS TO LIFT STATION PIPING.
4. EACH PUMP SHALL BE EQUIPPED WITH A VARIABLE FREQUENCY DRIVE.
5. HOLD CONDUIT TIGHT TO BOTTOM OF WET WELL SLAB. ONE CONDUIT FOR EACH POWER CABLE, ONE FOR FLOAT SWITCHES.
6. SEAL CONDUITS TO KEEP WET WELL GASSES OUT OF CONTROL PANEL.
7. LOCATED FLOATS AND CABLE HOLDER AWAY FROM INLET PIPE.
8. ALL COMPONENTS SUBJECT TO CONTACT WITH WASTEWATER SHALL BE DUCTILE IRON OR STAINLESS STEEL.
9. PIPE SUPPORT LOCATIONS ARE FOR REFERENCE ONLY & MORE MAY BE REQUIRED PRE SPECIFICATIONS AND/OR INDUSTRY STANDARD.
10. WETWELL TO BE EQUIPPED WITH A LEVEL TRANSDUCER AND 3 BACKUP FLOATS (LOW LEVEL, ALARM, INFLUENT CLOSE).
11. LIFT STATION VAULTS TO RECEIVE AN EXTERIOR COATING OF INDURON RS-2100 APPLIED TO ACHIEVE 12-16 DRY MILLS (COLOR = BLACK) AND AN INTERIOR COATING OF INDURON PERMA-SAFE 100 APPLIED TO ACHIEVE 40 DRY MILLS (COLOR = RED).

D1	6'-0" X 7'-0" STEEL INSULATED DOUBLE DOOR AND STEEL FRAME, DRIP LEDGE, AND THRESHOLD	HARDWARE SET #1

FINISH SCHEDULE	
FIN. NO.	DESCRIPTION
F1	WALL SHALL BE PAINTED PER SPECIFICATIONS. FLOORS SHALL HAVE TWO (2) COATS OF TNEMEC TNEME-GLAZE SERIES 280 WITH ONE (1) FINISH COAT OF TNEMEC CRU SERIES 290.

BUILDING NOTES:

1. ROOF TRUSSES INCLUDING ANCHOR BOLTS, AND CONNECTION FROM CMU TO ROOF SHALL BE PRE-ENGINEERED W/ SUBMITTAL STAMPED BY AN ENGINEER REGISTERED IN THE STATE OF OKLAHOMA. IT IS INTENDED THAT A COMPLETE STRUCTURAL DESIGN SHALL BE SUBMITTED.
2. ALL PRIMARY AND SECONDARY METALS SHALL BE GALVANIZED TO PREVENT CORROSION AND CERTIFIED FOR USE WITH WASTEWATER.
3. CONCRETE SLABS & WALLS SHALL BE 8" MIN., UNLESS OTHERWISE NOTED.
4. ALL FOOTINGS SHALL BE EXCAVATED AND CONCRETE SHALL BE PLACED THE SAME DAY OR THE FOOTING IS TO BE RE-EXCAVATED.
5. SAWCUTS IN CONCRETE SLABS SHALL BE MADE AS SOON AS THE CONCRETE IS OF SUFFICIENT STRENGTH TO SAW WITHOUT RAVELING THE AGGREGATE. ANY TIME LAPSE GREATER THAN 8 HOURS AFTER PLACING THE CONCRETE SHALL BE PERMITTED ONLY IF APPROVED BY THE ENGINEER. FILL ALL JOINTS WITH MM-80 JOINT COMPOUND.
6. ADHESIVE ANCHORS WITH REBAR OR THREADED RODS, SHALL BE HILTI-HIT HY 200. INSTALL ACCORDING TO THE MANUFACTURE'S RECOMMENDATIONS, WHICH INCLUDED CLEANING THE HOLE WITH AIR AND USING A MANUFACTURER APPROVED DISPENSING TOOL WITH MIXING NOZZLE.
7. ALL DOWELS, ANCHOR BOLTS, EMBEDDED STEEL, ELECTRICAL CONDUITS, PIPE SLEEVES, PIPING, WATER STOPS, INSERTS, GROUNDS, AND ALL OTHER EMBEDDED ITEMS AND FORMED DETAILS SHALL BE IN PLACE BEFORE START OF CONCRETE PLACEMENT. VERIFY SIZE AND LOCATION OF ALL OPENINGS.
8. 10 MIL VAPOR RETARDED SHALL BE INSTALLED UNDER ALL FLOOR SLABS AND BE EITHER STEGO 10 MIL CLASS A VAPOR RETARDER OR VAPOR BLOCK 10 BY RAVEN INDUSTRIES. USE STEGO OR RAVEN TAPOE ON ALL LAPS AND AROUND ALL PENETRATIONS.
9. ENTIRETY OF FLOOR SHALL SLOPE TO A FLOOR DRAIN SUCH THAT NO SURFACE REMAINS FLAT. REFER EB-4 FOR CMU DETAILS.
10. FOUNDATION PREPARATION PER GENERAL NOTES.
11. SEE NORTHSIDE FOR ADDITIONAL CMU STANDARD DETAILS.

NOTE:

NOTES ON THRUST BLOCKING

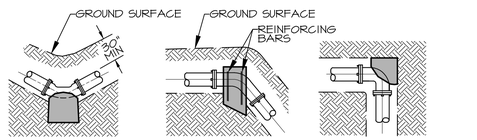
1.) ALL BLOCKING SHALL BE AGAINST UNDISTURBED HAND DUG SOIL AND SHALL BE CONCRETE HAVING A MINIMUM 28 DAY STRENGTH OF 2000 PER SQUARE INCH.

2.) THRUST CALCULATORS TO BE BASED ON THRUST DUE TO WATER PRESSURE AT 100% OF TEST PRESSURE.

THRUST = 2 AP SIN 1/2 Φ

A = AREA OF PIPE
P = WATER PRESSURE
Φ = DEFLECTION ANGLE.

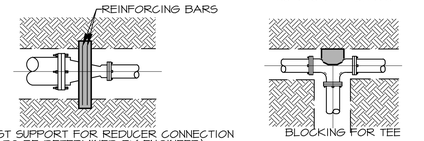
3.) VERTICAL UPLIFT BLOCKS SHALL BE DESIGNED ON THE BASIS OF 150 LBS. PER CU. FT. FOR CONCRETE AND SOIL AT 120 LBS. PER CU. FT. OVER THE AREA OF BLOCK.



4.) VERTICAL DOWN THRUST BLOCKS SHALL BE DESIGNED ON THE BASIS OF 2000 PER SQ. FT. ALLOWABLE SOIL BEARING PRESSURE. DIMENSIONS MAY BE DECREASED WITH APPROVAL OF THE ENGINEER IF MEASURED SOIL CONDITIONS PERMIT. IN POOR SOIL CONDITIONS, BLOCK DIMENSIONS SHALL BE INCREASED IN PROPORTION TO ALLOWABLE BEARING VALUE.

5.) THRUST BLOCKS ON HORIZONTAL BENDS, TEES, CROSSES, AND REDUCERS SHALL BE SIZED BASED ON 24000 LBS. PER SQ. FT. OF BLOCKING SURFACE AREA IN CONTACT WITH UNDISTURBED SOIL, BLOCK DIMENSIONS MAY BE DECREASED WITH APPROVAL OF THE ENGINEER IF MEASURED SOIL CONDITIONS PERMIT. IN POOR SOIL CONDITIONS, BLOCK DIMENSIONS SHALL BE INCREASED IN PROPORTION TO THE ALLOWABLE BEARING VALUE.

6.) ALL BLOCKING SHALL HAVE A MINIMUM SOIL COVER OF 1 FT.



7.) ADDITIONAL REINFORCING MAY BE REQUIRED FOR HORIZONTAL BLOCKING TO HANDLE UNUSUAL SHEAR LOADING CONDITIONS.

8.) ANCHOR COLLARS SHALL BE REINFORCED IN ACCORDANCE WITH REINFORCING BAR SCHEDULE FOR REDUCED BLOCKS SHOWN ABOVE. STEEL ANCHOR RING IN ACCORDANCE WITH DIMENSIONS OF ANCHOR COLLAR.

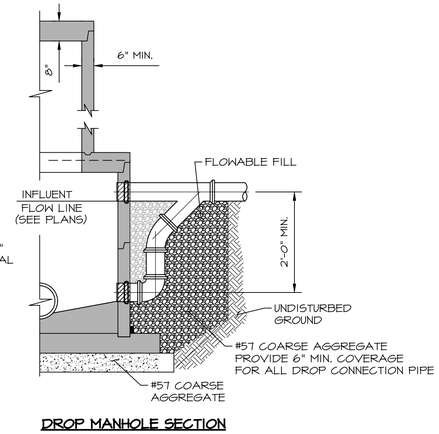
THRUST BLOCKING DETAILS
N.T.S.

MANHOLE NOTES:



1. PRECAST RISERS, CONES, FLOORS, GRADE RINGS, STEPS, AND RINGS AND COVERS SHALL BE MANUFACTURED ACCORDING TO THE MOST RECENT ASTM C-478 SPECIFICATIONS.
2. ALL MANHOLE CONSTRUCTION SHALL BE WATERTIGHT. JOINTS SHALL BE RUBBER GASKET MANHOLE SECTIONS WITH PROFILE JOINT AND FORSHEDA 114 JOINT SEALS.
3. ANY ERECTION HOLES, STEP HOLES, OR OTHER HOLES THROUGH THE WALL OF THE MANHOLE SHALL BE COVERED WITH 3" CONCRETE GROUT. GRADE RINGS SHALL BE FORMED WITH TONGUE AND GROOVE OF LUGS AND NOTCHES.
4. GRADE RINGS SHALL BE SET IN MORTAR OR PLASTIC JOINT COMPOUND.
5. WHEN FIELD CONDITIONS REQUIRE HEIGHT TO BE ADJUSTED, ADDITIONAL GRADE RINGS MAY BE USED AS DIRECTED BY THE ENGINEER.
6. WHENEVER THE SUBGRADE FOR ANY MANHOLE OR DROP MANHOLE IS OF AN UNSATISFACTORY MATERIAL, SAME SHALL BE REMOVED AND REPLACED WITH A CRUSHED ROCK BEDDING AND COMPACTED TO THE SATISFACTION OF THE ENGINEER.
7. ALL CONCRETE ENCASEMENT IN ROCK SHALL BE POURED AGAINST THE FACE OF THE ROCK. NO PAYMENT WILL BE MADE FOR EXTRA CONCRETE USED IN OVER BREAKAGE OF THE DIMENSIONS AS SHOWN ON THE TYPICAL SECTION OF CONCRETE ENCASEMENT.
8. BACKFILL EXCAVATION WITH SELECT FILL COMPACTED IN 8" LAYERS TO 95% OF MAXIMUM DENSITY WITHIN 2% OF OPTIMUM MOISTURE AS DETERMINED BY ASTM D-698.
9. CENTERLINE OF ALL PIPES ENTERING AND LEAVING SHALL PASS THROUGH CENTER OF MANHOLE.
10. CONSTRUCT FLOW CHANNEL FOR ALL PIPES ENTERING MANHOLE, INCLUDING SERVICES. MAINTAIN A CONSTANT GRADE THROUGHOUT EACH INVERT.
11. INVERT MUST HAVE A CHANNEL DEPTH OF EQUAL TO AT LEAST HALF THE LARGEST PIPE DIAMETER.
12. ALL PIPE ENTERING THE MANHOLE MORE THAN 24" ABOVE AN INVERT MUST HAVE A DROP PIPE.
13. WHENEVER SEWER PIPE IS CONNECTED INTO THE WALL OF A MANHOLE WITHOUT A RESILIENT MANHOLE PIPE CONNECTOR THE FIRST JOINT OF THE SEWER PIPE SHALL BE LOCATED A MAXIMUM OF 12" OUTSIDE THE WALL OF THE MANHOLE. CONNECTION INTO MANHOLE WITHOUT A RESILIENT CONNECTOR WILL BE USED ONLY UPON APPROVAL OF THE ENGINEER.
14. FRAME & COVER SHALL BE INSTALLED TO CONCRETE WITH 2 ROWS OF MASTIC.
15. AVERAGE WEIGHT OF CASTING SHALL NOT BE LESS THAN 95% OF: RING 228 LBS; COVER 195 LBS; TOTAL 430 LBS.
16. MANHOLES MAY HAVE EITHER PRECAST OR CAST-IN-PLACE BASES. BASE DIAMETER TO MATCH DETAILS.
17. MANHOLE AND BASE SHALL BE MANUFACTURED IN ACCORDANCE WITH C478.
18. MINIMUM BASE INSIDE DIAMETER SHALL BE BASED ON THE NUMBER AND SIZE OF THE PIPES ENTERING THE MANHOLE, THE ELEVATION OF THE PIPES, AND THE MINIMUM SPACING BETWEEN THE PIPES.

STANDARD MANHOLE PLAN

NOTES
1. INSTALL TRANSMITTER TO MANUFACTURER'S SPECIFICATIONS AND REQUIREMENTS.
2. CONSULT MANUFACTURER'S INSTALLATION MANUAL FOR CORRECT PROBE INSERTION LENGTH.
3. USE 316 SST FITTINGS FOR ALL PROCESS CONNECTIONS.
4. ANCHOR SYSTEM SHALL BE HILTI HY 150 W 316SS MATERIALS.
5. ENSURE THE SENSOR CANNOT MAKE CONTACT WITH THE TANK WALL.
6. ENSURE THAT SENSOR IS FULLY IMMERSED AT ALL TIMES.

EMBEDDMENT DETAIL NOTES

1. MINIMUM TRENCH WIDTH AT SPRINGLINE OF PIPE
   a. PIPES < 4" — 18"
   b. PIPES 6" - 18" — 12" + O.D.
   c. PIPES > 20" — 24" + O.D.
2. EXCAVATION MAY BE WIDENED ABOVE THE EMBEDMENT ZONE AT THE CONTRACTOR'S OPTION AND EXPENSE.
3. EMBEDMENT / BACKFILL LIFT THICKNESS (MAXIMUM)
   a. FINAL BACKFILL — 12" LIFTS TYPICAL; 6" LIFTS UNDER PAVING / STRUCTURES
   b. INITIAL BACKFILL — 6" LIFTS
   c. HAUNCHING — 4" LIFTS
   d. BEDDING — 4" LIFTS
4. TRENCH SLOPE, SHORING, BENCHING, ETC TO BE DETERMINED BY THE CONTRACTOR. CONTRACTOR IS SOLELY RESPONSIBLE FOR TRENCH SAFETY AND OSHA COMPLIANCE.
5. EXCAVATION FOR BELL HOLE REQUIRED FOR ALL PIPING <4". CONTRACTOR SHALL SELECT AND UTILIZE CONSTRUCTION METHODS SUCH THAT ALL AREAS UNDER THE PIPE HAUNCHES ARE FILLED WITH THE APPROPRIATE MATERIAL AND COMPACTED.
6. ALL MATERIALS UNDER PAVING / STRUCTURES SHALL BE COMPACTED TO 95% MODIFIED PROCTOR DENSITY AT 4% OPTIMUM MOISTURE CONTENT BY SHEEPSFOOT OR OTHER SUITABLE MECHANICAL COMPACTION METHODS AT SPECIFIED LIFT THICKNESSES. COMPACTION EQUIPMENT MUST NOT COME IN CONTACT WITH CARRIER PIPE NOR CASING PIPE.
7. IF TRENCH BOTTOM IS OVER-EXCAVATED BELOW INTENDED GRADE, FILL THE OVER-EXCAVATION WITH EMBEDMENT MATERIAL AND COMPACT AT THE DENSITY SPECIFIED FOR THE EMBEDMENT MATERIAL.
8. THE EXISTING NATIVE MATERIAL WITHIN THE LIMITS OF THE EMBEDMENT ZONE IS TO REMAIN UNDISTURBED OR REPLACED WITH SPECIFIED PIPE EMBEDMENT MATERIAL IF OVER-EXCAVATION TAKES PLACE. REPLACEMENT WITH ONSITE MATERIAL WILL NOT BE ACCEPTABLE.
9. IF BEDDING DETAIL CONFLICTS WITH ANY OTHER DETAIL THE MORE STRINGENT SHALL APPLY.

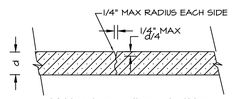
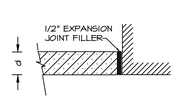
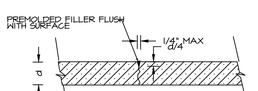
LONGITUDINAL CONTROL JOINT: SAWED, HAND-FORMED, OR PREMOLDED FILLER
TRANSVERSE CONTROL JOINT: SAWED, HAND-FORMED, OR PREMOLDED FILLER



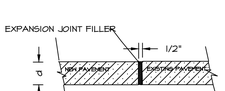
ISOLATION JOINT



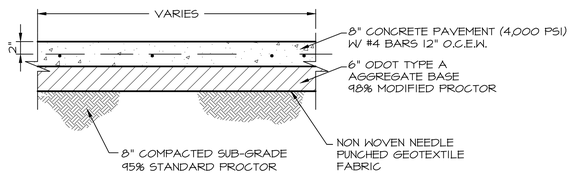
SAWED JOINT
N.T.S.



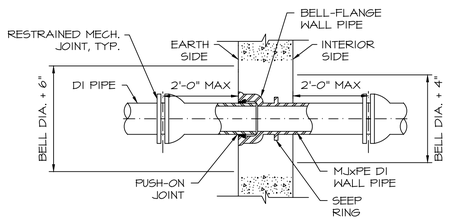
NOTE: USE ONLY AROUND NON-TELESCOPING CASTINGS IN THE PAVED AREA



HAND-FORMED JOINT
N.T.S.

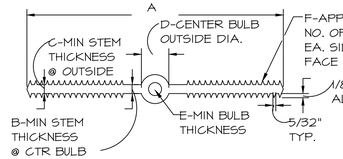


NOTE: USE ONLY AT BUILDINGS OR OBJECTS ABUTTING THE PAVED AREA



PREMOLDED FILLER JOINT
N.T.S.

NOTE: USE ONLY AT JUNCTION OF NEW AND EXISTING PAVEMENT. THICKEN SLAB WHENEVER PRACTICAL.



NEW CONCRETE PAVING SECTION
N.T.S.

NOTE:
1. COAT WALL PIPE WITH SPECIFIED PAINT SYSTEM PRIOR TO CONCRETE PLACEMENT.
2. TYPICAL FOR ALL PIPE PENETRATIONS THROUGH CONCRETE WALLS, REGARDLESS OF BEING SHOWN ON DRAWINGS OR NOT.

N.T.S.

WALL PIPE

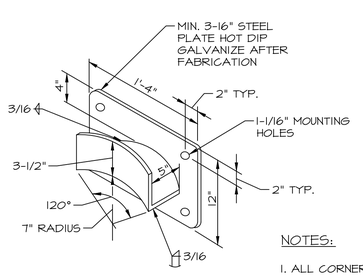
WALL MOUNTED UTILITY STATION
N.T.S

CMU PIPE OPENING REINFORCEMENT
N.T.S

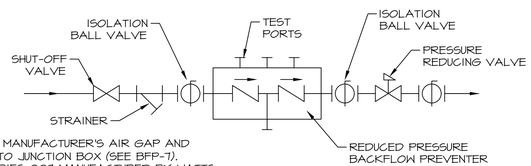
NOTES:



1. AT ADJACENT OPENING WITH LESS THAN 8'-0" WALL BETWEEN, CONTINUE HORIZONTAL REINFORCING TO 2'-8" BEYOND FURTHEST OPENING.
2. LOCATE VERTICAL BARS CENTERED IN 2 ADJACENT CELLS IN 8" WALLS AND EACH FACE IN SINGLE CELL IN 12" WALLS. LAP 48 BAR DIAMETERS WITH MATCHING FOUNDATION DOWELS.
3. LOCATE #4 ARCH BARS CENTERES IN 8" WALLS, AND EACH FACE IN 12" WALLS.

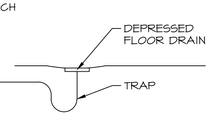
ADDITIONAL REINFORCEMENT @ OPENINGS IN WALLS
N.T.S

NOTES:



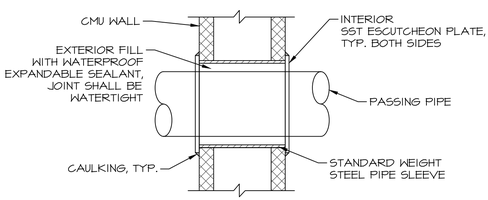
1. NUMBER OF ADDITIONAL REINF. BARS AT EACH SIDE OF OPENING SHALL EQUAL HALF THE NUMBER OF INTERRUPTED BARS IN EACH LAYER OF REINF.
2. SIZE OF ADDITIONAL REINF. BARS TO EQUAL SIZE OF INTERRUPTED REINF. BARS.
3. PROVIDE STD HOOKS FOR BARS IF LAP LENGTH EXTENSION CANNOT BE OBTAINED AT JOINTS OR OTHER OBSTRUCTIONS. PLACE ADDITIONAL BARS IN SAME PLANES AS INTERRUPTED REINF.
4. UNLESS NOTED OTHERWISE, SIZE OF DIAGONAL BARS SHALL BE THE SAME SIZE AS THE INTERRUPTED NORMAL REINF. LOCATE DIAGONALS IN EACH LAYER OF REINF.
5. PLACE DIAGONAL BARS INSIDE NORMAL REINF
6. PROVIDE 2 DIAGONAL BARS EACH LAYER OR FACE, EACH WAY AS SHOWN.
7. ALL REINF. TO CLEAR OPENING OR FLANGE COLLARS BY 2".

NOTES:



1. ALL CORNERS SHALL HAVE A 3/4" RADIUS
2. HOSE RACKS TO BE PLACED AT ALL HYDRANTS ADJACENT TO BUILDING/STRUCTURES.
3. LOCATION TO BE FIELD DETERMINED.

HOSE RACK
N.T.S



NOTES

1. INSTALL RPZ WITH MANUFACTURER'S AIR GAP AND ROUTE FULL-SIZE TO JUNCTION BOX (SEE BFP-7).
2. RPZ SHALL BE SERIES 009 MANUFACTURED BY WATTS
3. INSTALL PIPE STANDS TO SUPPORT THE COMPONENTS. DO NOT SUPPORT ASSEMBLIES FROM PIPING. INSTALL BEARING PLATES ON CONCRETE FLOOR UNDER EACH SUPPORT.
4. ALL COMPONENTS TO BE CORROSION RESISTANT.
5. DRAIN MAY NOT BE OUTLINED ON DRAWINGS FOR CLARITY. FIELD ROUTE TO DRAIN.

RPZ DOMESTIC WATER RISER (INTERIOR)

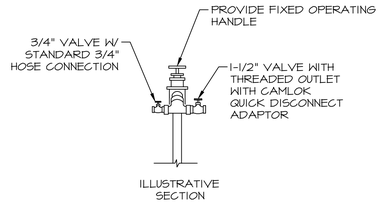
SIDE VIEW

END VIEW

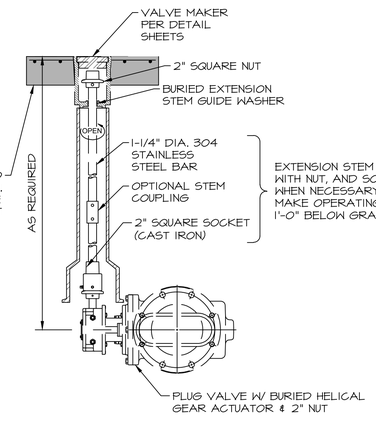
MINIMUM RESTRAINED LENGTH (FT) FOR A TEST PRESSURE OF 100 PSIG

NOMINAL PIPE SIZE	90 DEGREE	WYE OR 45 DEGREE	22-1/2 DEGREE	11-1/4 DEGREE	TEE BRANCH	TERMINAL PLUG
6	23	18	18	18	39	59
8	30	18	18	18	51	6'-4"
10	36	18	18	18	61	92
12	41	18	18	18	71	107
20	62	26	18	18	110	164
24	72	30	18	18	128	192
30	85	35	18	18	152	228
36	96	40	18	18	175	262
48	118	48	23	18	214	322
54	131	54	26	18	348	344

NOTES:



1. RESTRAIN ALL DUCTILE IRON FITTINGS.
2. TABULATED VALUES ARE FOR 100 PSIG TEST PRESSURE. FOR VALUES AT PRESSURES OTHER THAN 100 PSID, MULTIPLY TABLE VALUES BY THE RATIO OF ACTUAL TEST PRESSURE TO 100 PSIG. TEST PRESSURES FOR EACH SERVICE ARE DEFINED IN THE PIPING SCHEDULE.
3. WHERE LISTED VALUES, OR CALCULATED VALUES (SEE ABOVE), ARE LESS THAN ON STANDARD FULL PIPE SEGMENT (18 FEET), RESTRAIN THE FITTING ONLY.
4. RESTRAINT LENGTHS APPLY TO PIPE RUNS ON EACH SIDE OF A CHANGE IN DIRECTION.
5. WHERE THE PIPING LAYOUT HAS RESTRAINED JOINT LENGTHS FOR TWO OR MORE FITTINGS TO OVERLAP, THRUST RESTRAIN ALL PIPING BETWEEN THE OTHER FITTINGS. ASSUME 1/2 OF THE RESTRAINED PIPE LENGTH BETWEEN THE TWO FITTINGS RESTRAINS EACH OF THE FITTINGS AND ADD ADDITIONAL RESTRAINED JOINT LENGTH TO THE OUTER LEGS OF THE OUTER FITTINGS TO EQUAL THE TOTAL REQUIRED FOR ALL FITTINGS.
6. THRUST RESTRAINT TABLE REFERS TO NEW PIPING.



BACKFLOW PREVENTER

N.T.S

NOTES:

1. INSTALL INSIDE INSULATED FIBERGLASS ENCLOSURE, SUBMITTAL REQUIRED.

HOSE BIB-NON POTABLE

N.T.S

NOTES:

1. ALL HYDRANTS SHALL BE PROVIDED W/ HOSE RACK.
2. SIGN IS ROTATED FOR CLARITY, ORIENTATION SHALL BE VISIBLE FROM FRONT OF HYDRANT.
3. CONTRACTOR SHALL PROVIDE A 3/4" AND 1-1/2" THREADED OUTLET WITH CAMLOK QUICK DISCONNECT ADAPTERS AND VALVE ON EACH YARD HYDRANT IN ADDITION TO THE 2" HYDRANT VALVE. YARD HYDRANT SHALL BE ZURN Z1390 SERIED OR APPROVED EQUAL.
4. YARD HYDRANTS LOCATED NEXT TO STRUCTURES SHALL BE SECURELY MOUNTED TO THE STRUCTURES WITH STAINLESS STEEL FASTENERS.
5. YARD HYDRANTS SHALL BE PROVIDED WITH WHEEL TYPE HANDLE.
6. PROVIDE CASING GUARD AROUND YARD HYDRANT ABOVE GRADE SURFACE.
7. HYDRANT SHALL BE DESIGNATED WITH A "NON-POTABLE WATER" SIGN. SEE DETAIL SHEETS.

AIR VACUUM & RELEASE VALVE (3" & SMALLER)

N.T.S

NOTES:

1. VALVE SIZE SHALL BE AS INDICATED ON THE DRAWINGS.
2. SERVICE TAP & PLUG VALVE SHALL MATCH VALVE INLET SIZE.
3. FIELD ROUTE DISCHARGE PIPE TO DRAIN/DAYLIGHT.

GENERAL NOTES:

1. THE ASSET SCHEDULE INCLUDES MAJOR EQUIPMENT AND SYSTEMS TO BE INSTALLED, REMOVED OR ALTERED BY THIS PROJECT. ASSETS ARE INDICATED ON THESE DRAWINGS BY THE ASSET ID. REFER TO THE LEGEND AND ABBREVIATIONS FOR THE ASSET SYMBOL. NOT ALL EQUIPMENT REQUIRED BY THIS PROJECT IS SHOWN ON THE ASSET SCHEDULE.
2. THE CIRCUIT SCHEDULE DEFINES THE CABLE, WIRE AND CONDUIT REQUIRED FOR POWER AND CONTROL CIRCUITS. CIRCUITS ARE INDICATED ON THESE DRAWINGS BY THE CIRCUIT ID. REFER TO THE LEGEND AND ABBREVIATIONS FOR THE CIRCUIT SYMBOL. THE CONDUIT SIZE SHOWN IN THE "CIRCUIT" COLUMN IS FOR ABOVE-GRADE CONDUIT. CONDUIT INSTALLED UNDERGROUND SHALL BE 1" MINIMUM SIZE.
3. THE PANEL SCHEDULES INDICATE THE REQUIRED CHARACTERISTICS OF SWITCHBOARDS, MOTOR CONTROL CENTERS, DISTRIBUTION PANELS, POWER PANELS, AND LIGHTING PANELS. REFER TO THE ASSET SCHEDULE AND THE CIRCUIT SCHEDULE FOR ADDITIONAL INFORMATION.
4. THE POWER SYSTEM ONE-LINE DIAGRAM(S) SHOW MAJOR ASSETS ONLY. REFER TO THE PANEL SCHEDULES FOR ADDITIONAL REQUIREMENTS.
5. THE CONTROL SYSTEM ONE-LINE DIAGRAM(S) INDICATE THE GENERAL ARRANGEMENT OF ASSETS AND THE CONTROL AND SIGNAL CIRCUITS REQUIRED. REFER TO THE ASSET SCHEDULE, CIRCUIT SCHEDULE, SIGNAL SCHEDULE, AND WIRING DIAGRAMS FOR ADDITIONAL REQUIREMENTS.
6. THE CONTRACTOR SHALL FURNISH AND INSTALL ALL REQUIRED EQUIPMENT AND LABOR TO PROVIDE NEW AND ALTER EXISTING ELECTRICAL SERVICE(S) AS INDICATED. THE CONTRACTOR SHALL PAY ALL COSTS IMPOSED BY THE ELECTRIC UTILITY FOR EACH NEW ELECTRICAL SERVICE. THE CONTRACTOR SHALL COORDINATE ALL REQUIREMENTS AND THE LOCATION OF EACH NEW ELECTRICAL SERVICE WITH THE ELECTRIC UTILITY AND THE OWNER.
7. THE CONTRACTOR SHALL PROVIDE AND INSTALL POWER AND CONTROL CIRCUITS IN CONDUIT TO ALL ELECTRICAL EQUIPMENT INSTALLED OR ALTERED DURING THIS PROJECT AT NO ADDITIONAL COST TO THE OWNER.
8. THE CONTRACTOR SHALL TEST ALL INSTALLED AND ALTERED EQUIPMENT, DEMONSTRATE PROPER OPERATION OF ALL EQUIPMENT TO THE OWNER, AND TRAIN THE OWNER IN OPERATION AND MAINTENANCE PROCEDURES.

MANUFACTURER-DESIGNED EQUIPMENT SYSTEM NOTES:

1. THIS PROJECT INCLUDES THE CONSTRUCTION OF MANUFACTURER-DESIGNED EQUIPMENT SYSTEMS.
2. POWER, SIGNAL AND CONTROL CIRCUITS ARE SHOWN ON THESE DRAWINGS BASED ON SIMILAR MANUFACTURER-DESIGNED EQUIPMENT SYSTEMS.
3. THE FINAL POWER, SIGNAL AND CONTROL CIRCUIT REQUIREMENTS SHALL BE DETERMINED BY THE APPROVED MANUFACTURER.
4. DRAWINGS, SPECIFICATIONS, INSTALLATION MANUALS, AND OTHER REQUIRED DOCUMENTATION SHALL BE PROVIDED BY THE APPROVED MANUFACTURERS AND MAY INCLUDE ADDITIONAL AND/OR ALTERED REQUIREMENTS THAN SHOWN ON THESE DRAWINGS.
5. THE CONTRACTOR SHALL COORDINATE WITH THOSE APPROVED SUBMITTAL DRAWINGS AND PROVIDE ALL REQUIRED LABOR AND MATERIALS NECESSARY FOR A COMPLETE AND ACCEPTED SYSTEM AT NO ADDITIONAL COST TO THE OWNER.

HAZARDOUS LOCATION NOTES:

1. THIS PROJECT INCLUDES THE INSTALLATION OF ELECTRICAL SYSTEMS IN LOCATIONS DEFINED BY THE NATIONAL FIRE PROTECTION AGENCY (NFPA) AS HAZARDOUS (CLASSIFIED) LOCATIONS. WASTEWATER COLLECTION SYSTEMS AND WASTEWATER TREATMENT PROCESSES ARE FIRE AND EXPLOSION HAZARDS DUE TO THE POSSIBLE IGNITION OF FLAMMABLE GASSES AND FLOATING FLAMMABLE LIQUIDS.
2. WIRING MATERIALS AND METHODS IN HAZARDOUS (CLASSIFIED) LOCATIONS SHALL MEET THE REQUIREMENTS OF THE NATIONAL ELECTRICAL CODE (NEC), ARTICLE 500, HAZARDOUS (CLASSIFIED) LOCATIONS. INSTALLATION SHALL BE DONE BY PERSONS TRAINED AND EXPERIENCED IN HAZARDOUS (CLASSIFIED) LOCATION WORK.
3. CONDUIT SEAL FITTINGS SHALL BE FURNISHED AND INSTALLED AT BOUNDARIES OF HAZARDOUS (CLASSIFIED) LOCATIONS. BOUNDARIES OF HAZARDOUS (CLASSIFIED) LOCATIONS ARE BETWEEN CLASS I AND UNCLASSIFIED LOCATIONS, CLASS I AND CLASS II LOCATIONS, CLASS II AND UNCLASSIFIED LOCATIONS. CONDUIT SEAL FITTINGS SHALL BE LOCATED AS REQUIRED BY THE NATIONAL ELECTRICAL CODE.
4. RIGID CONDUIT IN HAZARDOUS (CLASSIFIED) LOCATIONS SHALL BE RIGID METAL CONDUIT (RMC) OR CONCRETE-ENCASED PVC. FLEXIBLE CONDUIT IN HAZARDOUS (CLASSIFIED) LOCATIONS SHALL BE RATED FOR THE HAZARD CLASSIFICATION IN WHICH IT IS INSTALLED.
5. WASTEWATER LIFT STATION WET WELLS ARE CLASS I, DIVISION I HAZARDOUS LOCATIONS.
6. WASTEWATER LIFT STATION METER VAULTS ARE CLASS I, DIVISION II HAZARDOUS LOCATIONS.

KEYED NOTES:

1. CONTRACT WITH SERVING UTILITY TO INSTALL NEW 480Y/277 VOLT, 3 PHASE, 4 WIRE ELECTRICAL SERVICE. CONSTRUCT NEW CONCRETE TRANSFORMER PAD FOR SERVING UTILITY–FURNISHED TRANSFORMER "ES–T". COORDINATE WITH SERVING UTILITY AND PROVIDE ALL MATERIALS AND LABOR TO MEET ALL SERVING UTILITY REQUIREMENTS. PAY ALL SERVING UTILITY–IMPOSED FEES. CONSTRUCT NEW PRIMARY FEEDER DUCTS AS REQUIRED BY SERVING UTILITY.
2. CONSTRUCT NEW CONCRETE PAD AND INSTALL NEW GENERATOR "G" AND AUTOMATIC TRANSFER SWITCH "ATS".
3. CONSTRUCT NEW ELECTRICAL BUILDING "EB".
4. CONSTRUCT NEW INFLUENT LIFT STATION "ILS" AND INFLUENT LIFT STATION FLOW METER STRUCTURE "ILS–FMS."
5. CONSTRUCT NEW HEADWORKS "HW". INCLUDING BAR SCREENS AND GRIT CLASSIFIERS.
6. CONSTRUCT NEW FLOW EQUALIZATION BASIN LIFT STATION "FEBLS" AND FLOW EQUALIZATION BASIN LIFT STATION FLOW METER STRUCTURE "FEBLS–FMS".
7. CONSTRUCT NEW PRIMARY FLOW EQUALIZATION BASIN IMPROVEMENTS. INSTALL LEVEL MEASUREMENT SYSTEM.

1/– **POWER SYSTEM PAD – ELEVATION**
SCALE: NONE

3/– **TRANSFORMER PAD DETAIL**
SCALE: NONE

GENERATOR DIMENSIONS – APPROXIMATE				
ASSET ID	KW	LENGTH	WIDTH	NOTE
G	600	19'-1"	6'-2"	–
ATS	–	5'-9"	3'	–

NOTES:

1. APPROXIMATE DIMENSIONS SHOWN. COORDINATE ACTUAL DIMENSIONS WITH APPROVED SUBMITTAL DRAWINGS.

2/– **POWER SYSTEM PAD – PLAN**
SCALE: NONE

TRANSFORMER PAD KEYED NOTES:

1. INSTALL NEW COPPER CLAD GROUND ROD, 3/4" x 10"–0", TYPICAL OF 4.
2. INSTALL NEW #2/0 BARE COPPER CONDUCTOR (TYPICAL).
3. INSTALL NEW #2 BARE COPPER CONDUCTOR.
4. INSTALL NEW EXOTHERMIC WELD, TYPICAL OF 5.
5. INSTALL NEW SECONDARY CONDUITS, SEE SITE PLAN.
6. INSTALL NEW PRIMARY CONDUITS, SEE SITE PLAN.
7. INSTALL NEW #4 REBAR, 12"O.C. BOTH WAYS.
8. CONSTRUCT NEW PAD USING CONCRETE, 3500 PSI AT 28 DAYS.
9. INSTALL NEW 1" GRSC UNDER PAD FOR GROUND WIRES (TYPICAL).
10. UTILIZE LONG SWEEP 90° BEND PVC CONDUITS ON PRIMARY CONDUITS.
11. UTILIZE LONG SWEEP 90° BEND CONDUITS ON SECONDARY CONDUITS.

TRANSFORMER PAD NOTES:

1. WHERE POSSIBLE. DO NOT PLACE CONDUIT UNDER THIS SECTION OF FOUNDATION.
2. REINFORCING – #4 BARS 12" O.C. BOTH WAYS.
3. WHEN INSTALLING CONDUIT, DISTURB GROUND IN FOUNDATION AREA AS LITTLE AS POSSIBLE. EXTEND CONDUIT 1" ABOVE FOUNDATION.
4. TOP OF FOUNDATION TO BE SMOOTH AND LEVEL. FINAL GRADE SHALL SLOPE AWAY FROM PAD.
5. CONCRETE SHALL BE 3500 PSI AT 28 DAYS AND 1:2:4 MIXTURE WITH 6 GAL. MAX. WATER CONTENT PER SACK OF CEMENT.
6. CONTRACTOR TO FURNISH 1" CONDUIT UNDER PAD FOR GROUND WIRE.
7. LOCATE CONDUITS UNDER PRIMARY AND SECONDARY BUSHINGS.
8. TRANSFORMER LOCATION TAG SHALL BE ATTACHED TO PAD WITH CONCRETE NAILS OR SHEET METAL SCREWS.
9. TRANSFORMER PAD REQUIRES A MINIMUM 3'–0" CLEARANCE AROUND EACH SIDE AND BACK OF PAD. A 15'–0" CLEARANCE IS REQUIRED ON FRONT SIDE OF PAD.

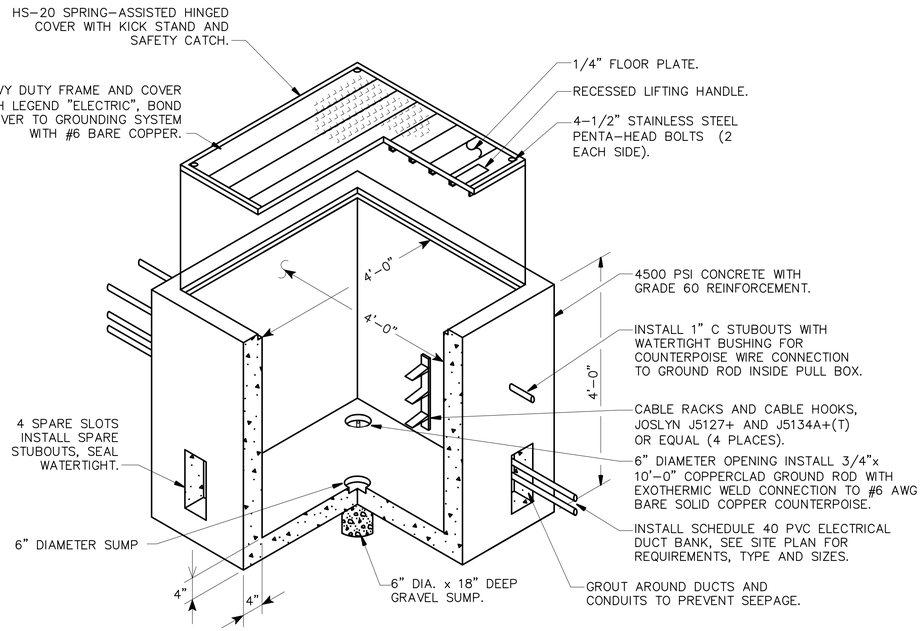
1 — **ELECTRICAL DUCT DETAIL**
SCALE: NONE

ELECTRICAL DUCT NOTES:

1. CONTRACTOR SHALL STAKE THE DUCT INSTALLATION IN PLAN AND ELEVATION FOR NEW ELECTRICAL DUCTS TO AVOID EXISTING UTILITIES.
2. CONTRACTOR SHALL ADJUST THE DEPTH OF THE ELECTRICAL DUCTS AS REQUIRED TO MAINTAIN THE MINIMUM COVER REQUIREMENT INDICATED AND AVOID EXISTING UTILITIES.
3. SIMILAR CONSTRUCTION FOR OTHER DUCT SIZES. SEE DUCT BANK SCHEDULE FOR QUANTITY AND SIZES.
4. INSTALL DUCT CONDUIT SUPPORTS AT 5'–0" O.C. MAXIMUM SPACING (TYPICAL ALL DUCTS).
5. OFFSETS AND BENDS OVER 10 DEGREES AND ELBOWS IN PVC CONDUIT RUNS SHALL BE CGRS CONDUIT.
6. NO PVC SHALL EMERGE FROM THE GROUND OR CONCRETE SLAB OR ENCASEMENT, PVC SHALL CONVERT TO CGRS CONDUIT PRIOR TO ITS EMERGENCE.
7. INSTALL GROUND RODS AT ENDS OF ELECTRICAL DUCT OR CONNECT TO GROUND RING.
8. INSTALL CONDUCTORS AND CABLES AS NOTED ON DRAWING. INSTALL PULLWIRE IN ALL SPARE DUCTS.
9. MINIMUM COVER REQUIREMENT FOR DUCT BANKS UNDER ROADS, DRIVEWAYS AND PARKING LOTS SHALL BE 24".
10. MINIMUM COVER REQUIREMENTS FOR ELECTRICAL SECONDARY SERVICE DUCT BANKS SHALL BE 30".
11. MINIMUM COVER REQUIREMENTS FOR ELECTRICAL PRIMARY SERVICE DUCT BANKS SHALL BE 36".



BASE PLAN

NOTE:
WHEN POURING CONCRETE DO NOT DROP CONCRETE THROUGH WATER IF WATER IS PRESENT IN HOLE.

BASE ELEVATION

3 — **LIGHT POLE BASE DETAILS**
SCALE: NONE

1. VERIFY BOLT CIRCLE AND MOUNTING WITH MANUFACTURER

2 — **PREFABRICATED CONCRETE PULL BOX**
SCALE: NONE

NOTES:

1. EACH CABLE SHALL BE IDENTIFIED WITH BRADY WIRE MARKER GIVING CIRCUIT NUMBER (#PWC–PK–6 OR APPROVED EQUAL).
2. ALL CABLE THROUGH BOX SHALL HAVE SUFFICIENT SLACK SO CABLE CAN BE BROUGHT TO SURFACE FOR SPLICING, MINIMUM 5' SLACK CABLE LOOP.
3. COVER AND PULL BOX SHALL BE DESIGNED FOR A 60 KIPS CONCENTRATED WHEEL LOAD OVER A 12" x 24" AREA.
4. GROUND ROD INSIDE OF PULL BOX SHALL BE DRIVEN PRIOR TO PLACEMENT OF BOX AND CAST IN BOTTOM OF BOX. IT WILL NOT BE CONNECTED TO ANY CIRCUIT.
5. PROVIDE HANDHOLES WITH 2–4"C SCHEDULE 40 PVC SPARE STUBOUTS IN EACH FACE, EXTENDED 3' MINIMUM BEYOND HANDHOLE, CAPPED WATERTIGHT.
6. EXCAVATION AND BACKFILL NECESSARY FOR THE CONSTRUCTION OF THE HANDHOLE SHALL BE PERFORMED IN ACCORDANCE WITH THE SPECIFICATION REQUIREMENTS.
7. PROVIDE WATERTIGHT CONDUIT BUSHING AND WATERTIGHT SEALS FOR ALL DIRECT BURIED COUNTERPOISE ENTERING THE HANDHOLE VIA A CONDUIT STUBOUT.
8. HANDHOLE COVER SHALL BE 1" MAXIMUM ABOVE FINISHED GRADE. AREA SURROUNDING HANDHOLE SHALL BE GRADED TO DRAIN AWAY FROM HANDHOLE.
9. BOND AND GROUND COVER AND FRAME TO ROD USING BRAIDED COPPER GROUND STRAP EQUIVALENT AMPACITY TO #6 AWG COPPER WIRE.
10. GRADE THE AREA AROUND THE HANDHOLE 10' IN ALL DIRECTIONS SUCH TO PREVENT WATER AND DIRT ACCUMULATION ACROSS THE TOP OF THE COVER AND ALLOW WATER TO DRAIN AWAY FROM THE HANDHOLE.

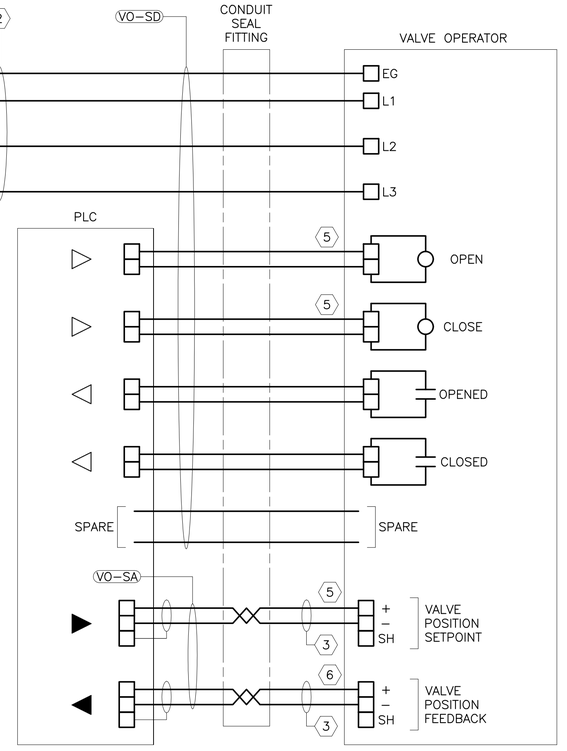
1 — VFD MOTOR CONTROLLER WIRING
SCALE: NONE



VFD MOTOR CONTROLLER NOTES:

1. COORDINATE WIRING AND TERMINATIONS WITH APPROVED EQUIPMENT.
2. SEE PANELBOARD SCHEDULE FOR CIRCUIT IDENTIFICATION.
3. MOTOR SIGNAL WIRING MAY BE IN A SEPARATE CONTROL CABLE OR COMBINED WITH POWER CABLE.
4. SEE CONTROL SYSTEM – ONE–LINE DIAGRAM FOR CIRCUIT.
5. TERMINAL BOX AND SEAL FITTING ARE REQUIRED FOR ALL MOTORS IN HAZARDOUS (CLASSIFIED) LOCATIONS.
6. OVER TEMPERATURE AND SEAL FAILURE WIRING REQUIRED FOR SUBMERSIBLE PUMPS ONLY.

2 — ANALOG INSTRUMENT WIRING
SCALE: NONE

ANALOG INSTRUMENT WIRING NOTES:

1. COORDINATE WIRING AND TERMINATIONS WITH APPROVED EQUIPMENT.
2. SEE PANELBOARD SCHEDULE FOR CIRCUIT IDENTIFICATION. LOOP POWERED ANALOG INSTRUMENTS DO NOT NEED 120 VAC WIRING FROM PANELBOARD.
3. CONNECT ANALOG SIGNAL SHIELD AT PLC END ONLY. INSULATE SHIELD AT FIELD INSTRUMENTS TO PREVENT GROUND LOOP. CALIBRATE ALL ANALOG SIGNALS.
4. SEAL FITTING IS REQUIRED FOR ALL INSTRUMENTS IN HAZARDOUS (CLASSIFIED) LOCATIONS.
5. TYPICAL FOR "FM–SA" AND "LT–SA".

3 — VALVE OPERATOR WIRING
SCALE: NONE

VALVE OPERATOR WIRING NOTES:

1. COORDINATE WIRING AND TERMINATIONS WITH APPROVED EQUIPMENT.
2. SEE PANELBOARD SCHEDULE FOR CIRCUIT IDENTIFICATION.
3. CONNECT ANALOG SIGNAL SHIELD AT PLC END ONLY. INSULATE SHIELD AT FIELD INSTRUMENTS TO PREVENT GROUND LOOP. CALIBRATE ALL ANALOG SIGNALS.
4. SEAL FITTING IS REQUIRED FOR ALL INSTRUMENTS IN HAZARDOUS (CLASSIFIED) LOCATIONS.
5. ANALOG VALVES HAVE SETPOINT SIGNAL, DIGITAL VALVES HAVE OPEN AND CLOSE SIGNALS.
6. ALL VALVES MAY NOT HAVE POSITION FEEDBACK.

REGISTERED PROFESSIONAL ENGINEER
DAVID BRANDON WALL
21108
OKLAHOMA

GENERAL

1. ALL NOTES LISTED ON THIS SHEET APPLY TO ALL SHEETS OF THE DRAWINGS AS IF THEY WERE WRITTEN ON EACH SHEET.
2. CONTRACTOR SHALL NOTIFY OWNER 48 HOURS PRIOR TO CONSTRUCTION.
3. CONTRACTOR SHALL VERIFY ALL EXISTING CONDITIONS AND OBSTRUCTIONS INCLUDING LOCATION AND DIMENSIONS BEFORE STARTING WORK AND SHALL NOTIFY THE ENGINEER OF ANY DISCREPANCIES.
4. PRIOR TO INSTALLATION OF RELEVANT FACILITIES CONTRACTOR SHALL, AT HIS OWN EXPENSE, UNCOVER AND OTHERWISE DETERMINE THE DEPTH OF UTILITIES WHICH, IN HIS OPINION, COULD INTERFERE WITH CONSTRUCTION.
5. ALL DIMENSIONS SHOWN WITH ± SHALL BE CONFIRMED BY THE CONTRACTOR ACCORDING TO ACTUAL FIELD CONDITIONS OR EQUIPMENT/STRUCTURE REQUIREMENTS.
6. ALL MISCELLANEOUS REMOVAL ITEMS REQUIRED FOR CONSTRUCTION SHALL BE FIELD LOCATED BY THE CONTRACTOR PRIOR TO BIDDING. THESE ITEMS WILL NOT BE MEASURED FOR PAYMENT AND SHALL BE INCLUDED IN THE PRICE BID FOR ASSOCIATED ITEMS OF WORK.
7. TRAFFIC CONTROL DEVICES SHALL BE FURNISHED AND MAINTAINED BY THE CONTRACTOR THROUGHOUT THIS PROJECT IN ACCORDANCE WITH THE LATEST VERSION OF THE MANUAL OF UNIFORM TRAFFIC CONTROL DEVICES AND/OR AS REQUIRED BY THE DEPARTMENT OF TRANSPORTATION OR COUNTY PERMITS FOR CONSTRUCTION IN RIGHT-OF-WAY.
8. THE CONTRACTOR SHALL SUBMIT AN EROSION CONTROL PLAN (SWPPP) PRIOR TO CONSTRUCTION AND SHALL MAINTAIN SWPPP THROUGHOUT DURATION OF CONSTRUCTION IN ACCORDANCE WITH SPECIFICATIONS.
9. EXISTING FACILITY AND UTILITY INFORMATION SHOWN ON THE DRAWINGS WAS OBTAINED FROM AVAILABLE RECORDS, LOCATES, AND AVAILABLE FILES. NEITHER THE OWNER NOR THE ENGINEER ASSUMES ANY RESPONSIBILITY FOR FACILITIES AND UTILITIES NOT SHOWN OR NOT IN THE LOCATION SHOWN. THE CONTRACTOR SHALL FIELD VERIFY ALL LOCATIONS, SIZES, MATERIALS, TYPES, AND ELEVATIONS SHOWN AROUND OR NEAR AREAS OF CONSTRUCTION PRIOR TO THE START OF CONSTRUCTION.
10. CONTRACTOR SHALL PERFORM ALL WORK WITHIN DESIGNATED EASEMENTS. CONTRACTOR SHALL NOT ENCROACH OR TRESPASS INTO PRIVATE PROPERTY WITHOUT WRITTEN APPROVAL FROM THE PROPERTY OWNER.
11. MAINTAIN LOCAL AND THROUGH TRAFFIC FOR ALL STREETS AT ALL TIMES WITHOUT CLOSURES OR RESTRICTIONS EXCEPT AS PART OF THE TRAFFIC CONTROL PLAN.
12. MAINTAIN REASONABLE ACCESS TO ALL PROPERTIES AT ALL TIMES. DO NOT RESTRICT DRIVEWAY ACCESS WITHOUT OWNER'S APPROVAL. RESTORE DRIVEWAY ACCESS AT THE END OF EACH DAY. PROVIDE TEMPORARY MEASURES AS NEEDED (SUCH AS GRAVEL) TO MAINTAIN DRIVEWAY ACCESS.
13. CONTRACTOR SHALL KEEP ACCURATE RECORDS OF ALL CONSTRUCTION THAT DEVIATES FROM THE DRAWINGS. THE CONTRACTOR SHALL FURNISH TO THE ENGINEER ACCURATE "AS-BUILT" RED LINE DRAWINGS FOLLOWING COMPLETION OF CONSTRUCTION.
14. CONTRACTOR SHALL TAKE SPECIAL PRECAUTIONS IN THE VICINITY OF ANY OVERHEAD AND UNDERGROUND ELECTRIC LINES. CONTRACTOR SHALL ABIDE BY THE MOST RECENT NATIONAL ELECTRIC CODE FOR WORKING AROUND OVERHEAD ELECTRIC LINES AS WELL AS OTHER LOCAL, STATE OR FEDERALS LAWS / REQUIREMENTS.
15. CONTRACTOR SHALL CONFORM TO ALL APPLICABLE FEDERAL, STATE AND LOCAL LAWS GOVERNING EXCAVATION. TRENCH SIDE SLOPES SHALL MEET OSHA REQUIREMENTS THAT ARE IN EFFECT AT THE TIME OF CONSTRUCTION. CONTRACTOR SHALL SUBMIT A TRENCH SAFETY PLAN PRIOR TO CONSTRUCTION.
16. THIS PROJECT IS SUBJECT TO AMERICAN IRON AND STEEL (AIS) REQUIREMENTS. ALL IRON AND STEEL PRODUCTS FOR CONSTRUCTION, ALTERATION, MAINTENANCE, OR REPAIRS INCORPORATED MUST BE PRODUCED IN THE UNITED STATES.
17. CONTRACTOR TO PROVIDE DUST CONTROL AT ALL TIMES DURING CONSTRUCTION.
18. ANY WORK PERFORMED WITHOUT THE KNOWLEDGE OF THE ENGINEER, INSPECTOR OR OWNER'S REPRESENTATIVE IS SUBJECT TO REMOVAL AND REPLACEMENT AT THE CONTRACTOR'S EXPENSE.

EARTHWORK

1. ALL COMPACTED SUBGRADE AND BASE NOT ACCESSIBLE TO MECHANICAL COMPACTION EQUIPMENT SHALL BE HAND COMPACTED USING WHACKER PACKERS.
2. SUBGRADE PREPARATION FOR ALL STRUCTURES AND BUILDINGS ON DRAWINGS SHALL BE AS FOLLOWS: OVER-EXCAVATE 30 INCHES BELOW BASE OF CONCRETE, SCARIFY AND COMPACT TOP 12", COMPACT TO 95% STANDARD PROCTOR DENSITY, INSTALL NON-WOVEN NEEDLE PUNCHED GEOTEXTILE FABRIC, INSTALL 30 INCHES OF CRUSHER RUN AGGREGATE BASE IN 10" LIFTS, COMPACT TO 95% MODIFIED PROCTOR DENSITY. BASE OF CONCRETE SHALL BE CONSIDERED THE BOTTOM OF SLAB AND NOT THE BASE OF FOOTINGS/STEM WALLS. OVER EXCAVATION MAY BE DELETED WHERE ROCK IS PRESENT. #57 ROCK SHALL BE SUBSTITUTED FOR AGG BASE WHERE GROUNDWATER IS PRESENT. ALL FILL MATERIAL REQUIRED TO ACHIEVE FINAL GRADE BELOW THE 30" ROCK LAYER SHALL BE CONSTRUCTED WITH ONSITE OR IMPORTED FILL MATERIAL COMPACTED TO 95% STANDARD PROCTOR DENSITY.
3. ELEVATIONS GIVEN ARE FINISHED GRADE UNLESS OTHERWISE NOTED.
4. NO FIRES WILL BE ALLOWED UNLESS OTHERWISE NOTED. TREES AND BRUSH SHALL BE REMOVED AND DISPOSED OF OFF SITE.
5. NO BLASTING WILL BE ALLOWED.
6. ALL SURFACE DRAINAGE IMPACTED SHALL BE RESTORED TO AS GOOD OR BETTER CONDITION.
7. ALL DISTURBED AREAS SHALL BE LEFT FREE OF RUTS AND TRACKS AND SHALL BE FULLY GRADED TO DRAIN.

GRASSING

1. ANY AND ALL DISTURBED AREAS SHALL BE TOPSOILED, HYDROMULCHED, AND WATERED. ANY AND ALL DISTURBED IMPROVE/RESIDENTIAL AREAS SHALL BE SOLID SLAB SODDED PER SPECIFICATIONS & WATERED UNTIL ESTABLISHED.

PIPING & APPURTENANCES

1. ALL PIPING THAT CROSS VERTICALLY SHALL HAVE AT LEAST 6" SEPARATION.
2. CONTRACTOR SHALL BE RESPONSIBLE FOR MAINTAINING THE REQUIRED 10 FOOT HORIZONTAL AND 2 FOOT VERTICAL SEPARATION BETWEEN SANITARY SEWER AND POTABLE WATER MAINS. ALL OTHER PIPING SHALL MAINTAIN A MINIMUM OF 5' SEPARATION.
3. CONTRACTOR SHALL SCHEDULE AND CONDUCT OPERATIONS TO LIMIT AMOUNT OF TRENCH OPENED TO INCLUDE ONLY THAT WHICH MAY BE COVERED IN 2 (TWO) DAYS TIME TO A MAXIMUM OF 200'. ANY TRENCH LEFT OPEN OVERNIGHT SHALL BE BARRICADED AND PROTECTED AS DETAILED IN THE MOST CURRENT EDITION OF THE MANUAL OF UNIFORM TRAFFIC CONTROL DEVICES.
4. MATERIAL EXCAVATED FROM TRENCH & PIPE BEDDING MATERIALS SHALL NOT BE PLACED ON ADJACENT ASPHALT OR CONCRETE PAVING.
5. A SILT AND VARMINT CAP AND/OR PLUG SHALL BE IN PLACE ON THE OPEN END OF PIPES AT ALL TIMES.
6. DO NOT EXCEED 75% OF MANUFACTURE'S RECOMMENDED MAXIMUM DEFLECTION FOR PIPE JOINTS UNLESS OTHERWISE NOTED.
7. THE CONTRACTOR SHALL INSTALL TEMPORARY FENCES TO PROTECT HORSES AND LIVESTOCK WHEN NECESSARY.
8. REMOVAL AND REPLACEMENT OF STREET TRAFFIC SIGNS, MAIL BOXES AND OTHER STRUCTURES BY THE CONTRACTOR TO FACILITATE CONSTRUCTION SHALL BE CONSIDERED INCIDENTAL AND BE INCLUDED IN THE PRICE BID.
9. ALL EXISTING PAVMENT TO REMAIN SHALL BE SAWCUT TO ENSURE A STRAIGHT SMOOTH SURFACE. ALL CUTS MADE IN DRIVEWAYS OR OTHER PAVEMENTS SHALL BE MADE IN STRAIGHT PERPENDICULAR LINES. COST TO BE CONSIDERED SUBSIDIARY TO CONTRACTOR'S BID.
10. INSTALL TRACER TAPE ON ALL PIPING INSTALLED IN ACCORDANCE WITH SPECIFICATIONS.
11. BONE EXTENTS ARE APPROXIMATE ONLY. FIELD VERIFY ACTUAL REQUIRED FOOTAGES & ASSOCIATED ITEMS PRIOR TO BID.
12. CONTRACTOR MAY ELECT TO BORE ANY AREAS SCHEDULES FOR OPEN CUT. SURFACE REPAIR MAY BE REMOVED WHEN/IF BORING IS USED.
13. CONTRACTOR MAY ELECT TO OPEN CUT ANY AREAS SCHEDULED FOR BORING WITH THE EXCEPTION ON RAILROAD & ROADWAY CROSSINGS WHERE BORING IS CALLED OUT.

ASPHALT

1. ALL ASPHALT SHALL CONFORM WITH OKLAHOMA DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS FOR HIGHWAY CONSTRUCTION, 2019 EDITION.

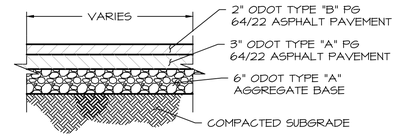
NOTE:



1. FLOWABLE FILL SHALL BE PROTECTED WITH BRIDGE PLATES OR A TEMPORARY SURFACE SEAL OF COLD MIX ASPHALT CONCRETE UNTIL FINAL SURFACE IS INSTALLED. COLD MIX ASPHALT IS NOT ACCEPTABLE FOR FINAL REPAIR.
2. FLOWABLE FILL SHALL BE ALLOWED TO CURE FOR A PERIOD OF NOT LESS THAN 24 HOURS PRIOR TO PLACEMENT OF SURFACE.
3. FLOWABLE FILL SHALL BE PROTECTED FROM FREEZING OR TOO RAPID CURING.
4. CONCRETE REPAIR SURFACE SHALL BE FINISHED WITH A ROUGH BROOM TEXTURE, OR MATCHING EXISTING ADJACENT SURFACES.
5. CONCRETE REPAIRS SHALL NOT BE OPENED FOR TRAFFIC FOR A PERIOD OF NOT LESS THAN 72 HOURS FOLLOWING PLACEMENT. BRIDGE PLATES SHALL BE USED TO PROTECT CONCRETE ON ANY LANES REQUIRED TO BE OPENED.
6. BEDDING, BACKFILL INCLUDING SELECT/FLOWABLE FILL IS CONSIDERED INCIDENTAL TO THE PIPE INSTALLATION AND/OR INCLUDED IN PIPE RESTORATION ITEM.
7. FOR DEEP TRENCHES, DEPTH OF FLOWABLE FILL SHALL BE A MAXIMUM OF 4' DEEP, AS MEASURED DOWN FROM THE SUBGRADE. GRANULAR BACKFILL MATERIAL SHALL BE USED FROM BOTTOM OF FLOWABLE FILL TO THE TOP OF PIPE ZONE.
8. PATCH SHALL EXTEND A MINIMUM OF 18" OUTSIDE EDGE OF EXCAVATION. FOR CONCRETE PAVEMENT AND APRONS, SAWCUTS WITHIN 5 FEET OF AN EXISTING JOINT SHALL BE REMOVED AND REPLACED TO THE EXISTING JOINT. FOR ALL ASPHALT STREETS, SAWCUTS WITH 3 FEET OF THE EXISTING ASPAHLT EDGE, ASPHALT SHALL BE REMOVED TO THAT EDGE AND THE ENTIRE SECTION REPLACED. LONGITUDINAL SAWCUTS SHALL NOT FALL WITHIN 36 INCHES OF THE TIRE PATH. EXACT QUANTITY/COST OF EXTENDED PAVING TO BE VERIFIED BY CONTRACTOR PRIOR TO BID.
9. FOR DRIVEWAY CROSSINGS, SELECT FILL OR AGGREGATE BASE MAY BE SUBSTITUTED FOR FLOWABLE FILL. FLOWABLE FILL WILL ONLY BE REQUIRED FOR STREET CROSSINGS.
10. ALL AGGREGATE BASE MATERIAL SHALL BE COMPACTED TO THE SPECIFIED DENSITY IN 6" LAYERS MAXIMUM.
11. FOR ASPHALT PAVEMENT REPAIRS THE TOP 3" OF CONCRETE SURFACE SHALL BE SUBSTITUTED WITH 3" OF HMAC ODOT TYPE "A" MEETING THE REQUIREMENTS OF ODOT STANDARD SPECIFICATIONS FOR HIGHWAY CONSTRUCTION, LATEST EDITION.
12. SURFACE REPAIR SHALL MATCH SLOPE & CURB TYPE OF ADJOINING PAVEMENT.
13. CONSTRUCT CONCRETE JOINT TO MATCH EXISTING.

GRAVEL SURFACE

ASPHALT/CONCRETE PAVEMENT

BRANGUS ROAD ASPHALT REPAIR/REPLACEMENT
N.T.S.

NOTES
1. WHEN OPTIONAL BORE IS ELECTED TO BE USED ASPHALT REPAIR NET REQUIRED.

SEQUENCE OF CONSTRUCTION
1. PERFORM EXISTING ROADWAY SURVEY TO ESTABLISH GRADE.
2. REMOVE PAVEMENT & BASE 11" BELOW EXISTING SURFACE.
3. SCARIFY, COMPACT & PROOF ROLL.
4. REMOVE/REPLACE SOFT/FAILING AREAS.
5. GRADE TO DRAIN.
6. INSTALL ASPHALT SECTION AND GRADE TO MATCH EXISTING GRADE PRIOR TO REMOVAL.

1. #57 CRUSHED ROCK
2. #67 CRUSHED ROCK
3. FINE CRUSHED ROCK
4. FLOWABLE FILL
5. SELECT BACKFILL MATERIAL
6. PEA GRAVEL
7. SAND
8. TOPSOIL (NO STONES OR ROCKS)
9. SELECT FILL
10. AGGREGATE BASE OR CONTROLLED LOW STRENGTH MATERIAL
11. PAVEMENT MATCHING OR AS SPECIFIED IN DRAWINGS
12. SELECT EXCAVATED MATERIAL (NO STONES LARGER THAN 1")
13. SELECT EXCAVATION MATERIAL (NO STONES LARGER THAN 4")

* LINES SMALLER THAN 18" SHALL BE #67 BEDDING.
LINES 18" AND LARGER SHALL BE #57 BEDDING.
SAND MAY BE SUBSTITUTED FOR PVC/HDPE LINES 8" & SMALLER.

UTILITY BEDDING DETAIL
N.T.S.

EMBEDDMENT DETAIL NOTES

1. MINIMUM TRENCH WIDTH AT SPRINGLINE OF PIPE
   a. PIPES < 4" — 18"
   b. PIPES 6" - 18" — 12" + O.D.
   c. PIPES > 20" — 24" + O.D.
2. EXCAVATION MAY BE WIDENED ABOVE THE EMBEDMENT ZONE AT THE CONTRACTOR'S OPTION AND EXPENSE.
3. EMBEDMENT / BACKFILL LIFT THICKNESS (MAXIMUM)
   a. FINAL BACKFILL — 12" LIFTS TYPICAL; 6" LIFTS UNDER PAVING / STRUCTURES
   b. INITIAL BACKFILL — 6" LIFTS
   c. HAUNCHING — 4" LIFTS
   d. BEDDING — 4" LIFTS
4. TRENCH SLOPE, SHORING, BENCHING, ETC TO BE DETERMINED BY THE CONTRACTOR. CONTRACTOR IS SOLELY RESPONSIBLE FOR TRENCH SAFETY AND OSHA COMPLIANCE.
5. EXCAVATION FOR BELL HOLE REQUIRED FOR ALL PIPING <4". CONTRACTOR SHALL SELECT AND UTILIZE CONSTRUCTION METHODS SUCH THAT ALL AREAS UNDER THE PIPE HAUNCHES ARE FILLED WITH THE APPROPRIATE MATERIAL AND COMPACTED.
6. ALL MATERIALS UNDER PAVING / STRUCTURES SHALL BE COMPACTED TO 95% MODIFIED PROCTOR DENSITY AT 4% OPTIMUM MOISTURE CONTENT BY SHEEPSFOOT OR OTHER SUTIABLE MECHANICAL COMPACTION METHODS AT SPECIFIED LIFT THICKNESSES. COMPACTION EQUIPMENT MUST NOT COME IN CONTACT WITH CARRIER PIPE NOR CASING PIPE.
7. IF TRENCH BOTTOM IS OVER-EXCAVATED BELOW INTENDED GRADE, FILL THE OVER-EXCAVATION WITH EMBEDMENT MATERIAL AND COMPACT AT THE DENSITY SPECIFIED FOR THE EMBEDMENT MATERIAL.
8. THE EXISTING NATIVE MATERIAL WITHIN THE LIMITS OF THE EMBEDMENT ZONE IS TO REMAIN UNDISTURBED OR REPLACED WITH SPECIFIED PIPE EMBEDMENT MATERIAL IF OVER-EXCAVATION TAKES PLACE. REPLACEMENT WITH ONSITE MATERIAL WILL NOT BE ACCEPTABLE.
9. IF BEDDING DETAIL CONFLICTS WITH ANY OTHER DETAIL THE MORE STRINGENT SHALL APPLY.

NOTES:

1. SPOOL LENGTH TO BE ADJUSTED SUCH THAT RISER PIPE IS IMMEDIATELY ADJACENT TO MANHOLE WALL.
2. MANHOLE HEIGHT TO BE ADJUSTED BASED ON BURY DEPTH & EXACT EQUIPMENT DIMENSIONS TO MAINTAIN 6" TO 12" CLEARANCE ABOVE 90 DEGREE BEND AS SHOWN.
3. DEPTH OF CARRIER PIPE TO BE FIELD MODIFIED FOR EXACT APPURTENANCE HEIGHT.
4. PROVIDE CORE HOLE FOR VENT PIPE. SEAL PENETRATION WITH RAM NECK, SYNCHOFLEX OR EQUAL.
5. SECURE PIPE STRAPS TO WALL USING STAINLESS ANCHOR BOLTS & HILTI ANCHORING SYSTEM SUBMITTAL REQUIRED.
6. AIR VAC SHALL BE CONNECTED TO GATE VALVE AND VENT PIPING BY FLANGE CONNECTION.
7. VALVE EXTENSION SHALL BE POSITIONED WHERE IT CAN BE OPERATED ABOVE GROUND WITHIN 4" OF MANHOLE TOP. PROVIDE CORE HOLE & SEAL WITH RAM NECK, SYNCHOFLEX OR EQUAL.
8. VENT PIPE TO BE PAINTED SILVER IN COLOR.
9. MANHOLE LIDS SHALL BE MANUFACTURED WITH THE WORDS "CITY OF SHAWNEE" & "WASTEWATER" INCLUDED.

SCHEDULE

NO.	DESCRIPTION
1	24"x12" HDPE FLG TEE
2	HDPE FLG OUTLET (12"x4")

ADDENDUM NO. 1

TO: ALL PLAN HOLDERS

RE: Shawnee Wastewater System Improvements

DATE: 07/08/22

The Plans, Specifications and Contract Documents for the above referenced project are hereby modified / clarified as follows.

Please note that changes made to the plans/specs added by addendum will only contain a summary of changes in the addendum verbiage and may not contain all modifications. It is the Contractor's responsibility to thoroughly review the revised sheets/specs.

General (applying to all project sections)

A1 – 1 **Information:** Q&A provided in CivCast are made a part of this addendum by reference.

A1 – 2 **Information:** There are numerous locations where a structural engineer is required to verify/certify miscellaneous items during construction. The selection of the structural engineer is by the Contractor, but it would be our preference that the project Structural Engineer be utilized for this purpose (BKL, Inc, Tulsa, OK (918) 835-9588.)

A1 – 3 **Clarification:** There are areas withing the drawings where underground fittings are drawn as what could be interpreted as flanged. It is the intent the ALL underground fittings be mechanical joint unless specifically detailed otherwise (regardless of how they are drawn.)

A1 – 4 **Clarification:** Refer to Civil Drawings for correct location and number of electrically actuated gates, electronically actuated valves, hoists & cranes. Provide power and controls to all and coordinate with Electrical Drawings.

A1 – 5 **Clarification:** Provide power to all cranes and hoists called out on Civil Drawings. Furnish per like kind on Electrical Drawings if not detailed.

A1 – 6 **Clarification:** All hydrants shown on drawings will include a hose mount. It will be wall mounted if adjacent to a structure and free standing if not. See detail sheets.

A1 – 7 **Clarification:** Concrete joints in roadway/paving shall have a maximum spacing of 10' for sawed joints and 30' for expansion joints.

A1 – 8 Clarification: Foundation prep under ALL structures (even minor structures) shall be per C-2 Earthwork Note 2. No exceptions.

A1 – 9 Specification: All hoses for hydrants to be reinforced rubber commercial hose with a 300psi working pressure rating and a minimum burst pressure of 1200psi. Underhill UltraMax Blue or equal. Underhill PowerBlast Nozzle or equal.

A1 – 10 Addition: All internal hose mounts to be supplied with 1" x 25' hose.

A1 – 11 Addition: Supply the following hoses w/ spray nozzles to be field located:
1. 6ea – 50'
2. 4ea – 100'
3. 4ea – 200'

A1 – 12 Addition: Provide auto-openers and manual chain wheel operators for all overhead doors. Field locate auto-opener adjacent to door.

A1 – 13 Addition: Trolley hoists to be inspected by the supplier to certify installation meets minimum standards and is appropriate for application.

A1 – 14 Addition: All pipe supports to be anchored to slabs per manufacturer's recommendations.

A1 – 15 Modification: 00_41_16 List of Manufacturers – Revised

A1 – 16 Modification: 03_30_00 Cast in Place Concrete – Revised

A1 – 17 Modification: 33_01_33 Wastewater Liquid & Solids Removal – Revised

Northside WWTP

A1 – 18 Clarification: Floor drains to be Neenah 4937-A unless otherwise noted.

A1 – 19 Addition: EN7 Electrical Details - Added

A1 – 20 Addition: Level measurement will be required and reported back to SCADA in all basins. This includes all wetwell, pre-EQ, SBR, post-EQ and Aerobic Digesters.

A1 – 21 Modification: The following sheets have been modified as follows:
1. C-2: Notes have been modified.
2. C-13: Added flowline elevations to sludge piping
3. C-14A: Notes
4. HW-2, HW-7: Notes; Gate Schedule; Valve Schedule
5. PEQ-1, PEQ-2, AD-1, AD-2, AD-3: Notes; Valve Schedule; Piping Schedule
6. SBR-1, SBR-2 - Notes; Valve Schedule; Piping Schedule

7. UV-1, UV-2: Piping Schedule; Added Wall Mount Utility Stations; Gate Schedule
8. LS-1, LS-2: Piping Schedule; Low Profile Cascade Aerator (LPCA) narrowed and will be grouted between LPCA and wall to height to LPCA
9. WAS-1: Piping schedule; Added door to enclosure; Notes
10. Belt Filter Press Sheets: Revised. Complete new sheets. These sheets govern all other sheets pertaining to belt press area (electrical, architectural and structural.)
11. DT-5: Wall Mounted Utility Station; RPZ Riser (Interior)
12. DT-7: Backflow Preventer
13. DT-9: Detail Drawing; Notes; Piping Schedule

A1 – 22 Modification: CMU wall in belt press room shall be 11' in height and extend to an elevation of 976.33 (supersedes architectural drawings)

A1 – 23 Miscellaneous: Headworks electrical equipment to be staggered between columns for ease of access.

Southside

A1 – 24 Modification: The following sheets have been modified as follows:

1. C-1: Notes
2. HW-1: Gate schedule; Notes
3. ILS-2, ILS-2A & ILS-2B: Gate Schedule; Valve Schedule; Notes
4. MM-1: Piping/Piping schedule
5. SW-2, SW-3: Gate Schedule; Notes
6. DT-7: Backflow Preventor Detail

Should you have any additional questions about the above modifications and their intent, please post to the CivCast website.

List of manufacturers / suppliers above must represent either the specified manufacturer / supplier or an alternate that has been approved and ADDED BY ADDENDUM. Listing an unapproved manufacturer / supplier may deem the bid non-responsive since the basis of bid would be with unapproved equipment.

SECTION 03_30_00

CAST-IN-PLACE CONCRETE (ADDENDUM #1)

PART 1 GENERAL

1.1 SUMMARY

A. Cast-in-place concrete work, as indicated on the drawings and specified herein.

B. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 03_11_00 Concrete Formwork

D. Section 03_20_00 Concrete Reinforcement

E. Section 03_15_20 Concrete Joints & Embedded Items

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections if included.

B. Submit mix designs for each specified concrete and grout type. Design data shall include the name of the concrete supplier; manufacturer/supplier and type of cement used; size and type of aggregate; proportional weights of cement, aggregate, and water per cubic yard of concrete; name and quantity of admixture used.

C. Concrete Mix Design
   1. Concrete mix design.
      a. Mixture Identification and intended use.
      b. Minimum 28-day compressive strength.
   2. Constituent quantities per cubic yard.
   3. Sources of all concrete mix components including coarse aggregate, fine aggregate, cement, water, admixtures, and pozzolans where included.
   4. Cement type and manufacturer, include chemical analysis (mill test report) for each cement type to be used.

5. Pozzolan type and source; include chemical analysis for each pozzolan type to be used.
6. Water/cement ratio, by weight.
7. Air content
8. Mix design slump.
9. Nominal maximum aggregate size.
10. Average compressive strengths conforming to the requirements of ACI 318 at 28 days.
11. Provide both average strengths and sample standard deviation. Provide results at 7 and 14 days if available.
12. Laboratory shrinkage test results for concrete mix designs, where specified.

D. Aggregate for Mix Design:
1. Laboratory sieve analysis, conforming to ASTM C33.
2. Verification that aggregate is not "deleterious," or "potentially deleterious." Provide documentation or other certification that aggregate does not contain deleterious substances and has been used without issues on previous projects.

E. Admixtures.
1. Submit Manufacturer's data brochures on all admixtures proposed for use and provide certification of compliance with specified ASTM standards for each admixture.

F. Submit Manufacturer's data sheets and product specifications for curing compounds and items specified in other Sections including form release agents, bonding agents, etc. Identify the locations where each will be used in the Work as a part of the submittal.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

6. ACI 302.1: Guide for Concrete Floor and Slab Construction
7. ACI 304: Guide for Measuring, Mixing, Transporting & Placing Concrete
8. ACI 304.2R: Placing Concrete by Pumping Methods
9. ACI 305R: Guide to Hot Weather Concreting
10. ACI 305.1: Specification for Hot Weather Concreting
11. ACI 306R: Guide to Cold Weather Concreting
12. ACI 306.1: Standard Specification for Cold Weather Concreting
13. ACI 308: Guide to Curing Concrete
14. ACI 308.1: Specification for Curing Concrete
15. ACI 309: Guide for Consolidation of Concrete
16. ACI 318: Building Code Requirements for Structural Concrete.
17. ACI 350: Code Requirements for Environmental Engineering Concrete Structures

1.5 QUALITY ASSURANCE

A. Conform to ACI 305R when concreting during hot weather.

B. Conform to ACI 306R when concreting during cold weather.

C. Manufacturer's Qualifications:
1. Manufacturer must be certified by the National Ready Mix Concrete Association's Certification of Ready Mixed Concrete Production Facilities.

D. Concrete Consistency
1. Test for slump shall be performed at the job site immediately prior to placing in accordance with ASTM C143. Slump tests shall be performed for each batch of concrete to indicate workability and consistency from batch to batch.
2. If the slump is outside the allowed limits, the concrete shall be rejected. Concrete showing either poor cohesion or poor coating of the coarse aggregate with paste shall be remixed or rejected.
3. If the slump is within the allowable limit, but excessive bleeding, poor workability, or poor finishability are observed, the concrete shall be rejected and changes in the concrete mix shall be made only by an adjustment of one or more of the following:
   a. The gradation of aggregate.
   b. The proportion of fine and coarse aggregate.

c. The percentage of entrained air, within the allowable limits.

E. Concrete Temperature
1. Comply with ACI 301, ACI 306.1 and ACI 305.1
2. Concrete temperature shall be taken immediately before placement with the point of measurement being in the chute or bucket.
3. Perform temperature test for each batch and record result on batch ticket.
4. If fresh concrete temperature does not meet requirements in this section the concrete shall be rejected.

F. Concrete Air Content
1. Test for air content shall be made on a fresh concrete sample for each batch prior to placing in forms.
2. Air content for concrete made of ordinary aggregates having low absorption shall be made in accordance with either ASTM C231, or ASTM C173. If light weight aggregates or aggregates with high absorptions are used, use ASTM C173.
3. If air content of fresh concrete does not meet requirements specified in this Section, the concrete shall be rejected. Do not place concrete that does not meet the air entrainment requirements of this Section.

G. Compressive Strength
1. Compression test specimens shall be made, cured and tested in accordance with ASTM C31 and ASTM C39.
2. Compressive strength tests shall be made on cylinders at 7 and 28 days. The value of each test result shall be the average compressive strength of a minimum of 2 cylinders taken at the same time from the same batch of concrete.
3. Compressive test specimens shall be 6” x 12” cylinders; 4” x 8” cylinders are not permitted.
4. Sets of concrete test cylinders shall be cast for each concrete pour as follows.
   a. A "set" of test cylinders consists of a minimum of six cylinders, two to be broken and strengths averaged at seven days; and two broken and strengths averaged at 28 days. Two hold cylinders will remain unbroken so that they will be available to be broken upon unforeseen circumstances or upon the option of the Engineer to break cylinders at different times.
   b. A minimum of one “set” of cylinders will be made for each concrete pour up to 25 CY in volume. For pours larger than 25 CY, additional “sets” of cylinders will be made for each additional 25 CY of concrete poured.
5. Evaluation of compressive strength for compliance with design requirements will be conducted by the Engineer per ACI 318 – Section 26.12 based on the results of the 28 day test.

H. Failure to Meet Requirements
1. The Owner may withhold payment for any section of concrete which does not meet the requirements of the Plans and Specifications. Withheld payment shall be based upon unit prices established for concrete, if available. Payment shall be withheld until the unacceptable concrete has been repaired or removed and replaced or otherwise brought into conformance with the Plans and Specifications.
2. Concrete Strength
   a. If the 28 day strength test results fall below required values, additional curing may be performed and test cores may be obtained in accordance with ASTM C42 with approval of the Engineer. Additional curing, core

removal and testing, if allowed by the Engineer, shall be at the Contractor's expense.

b. If the strength results from test cores do not exhibit the required strength, the Engineer or Owner's Representative reserves the right to require strengthening, replacement of substandard materials and/or additional testing at the Contractor's expense. The choice of remedy is at the sole discretion of the Engineer or Owner's Representative.

3. Other Concrete Properties

a. If concrete properties besides strength do not meet required values, the Engineer may require concrete samples to be obtained in accordance with ASTM C42 and evaluated in accordance with ASTM C856 at the Contractor's expense.

b. If concrete properties besides strength do not meet required values, and the results of additional examination per ASTM C856 are deemed unsatisfactory at the sole discretion of the Engineer, the Owner reserves the right to require strengthening, replacement of substandard materials and/or additional testing at the Contractor's expense.

1.6 DESCRIPTION/DESIGN REQUIREMENTS

A. All concrete shall be 4,000 psi unless otherwise noted. See Section 2.4 for additional requirements.

B. Concrete shall not be placed in any form until formwork has been inspected by the Engineer and permission is given to start placing.

C. Notify Engineer a minimum of 48 hours prior to concrete placement.

D. Fly ash will not be accepted for use in mix designs

E. Provide PVC waterstop at all submerged joints and as outlined in the plans and other specification sections.

F. Retempering by adding water to concrete at the jobsite will not be permitted unless prior approval is obtained from the Engineer.

G. All slabs to receive 10ml vapor barrier prior to concrete placement

H. All cracks greater than 0.05" wide not located in control joints shall be sealed by cutting a bevel groove on the water side of the crack 1/2" to 3/4" wide and caulking with epoxy sealant. Crack widths shall be measured at the concrete surface.

PART 2 PRODUCTS

2.1 CONCRETE MATERIALS

A. Cement: ASTM C150, Type I/II, Type I – Only type of one brand of cement shall be used.

B. Coarse Aggregates: Shall consist of gravel, crushed gravel, crushed stone, air-cooled blast furnace slag, or a combination thereof, conforming to ASTM C-33 with a maximum size of

1½-inches. Where required due to minimum spacing of reinforcing steel, maximum size of coarse aggregate shall be reduced to 1-inch with prior written approvalof the Engineer.

C. Fine Aggregate: Shall conform to ASTM C-33 and shall be washed river sand composed of clean, uncoated grains of strong materials.

D. Abrasive aggregates shall be equal to fine (c.f.) "Alumdum" aggregate as manufactured by Norton Company, Worcester, Mass. or "Frictex NS" as manufactured by Sonneborn - Contech. Use only as approved by Engineer.

E. Water: Potable water free from detrimental chemicals and solids that will decrease the strength of the concrete.

F. Embedded Items: Embedded items shall be of the size and type shown or as needed for the application.

G. Curing Materials: Curing materials shall be burlap, impervious sheets, or membrane-forming compounds.

H. Dowels: Plain carbon steel bars, minimum yield point of 60,000 psi for use in slabs on grade.

I. Expansion Joint Filler Strips: Premolded nonextruding, resilient bituminous or non-bituminous type for use in concrete paving or construction, thickness as shown.

J. Form Materials: Wood, metal or other Engineer approved materials that will produce the specified finishes without adversely affecting the concrete surfaces in accordance with Section 03_11_00 Concrete Formwork.

K. Form Coating: Nonstaining form oil or form-release agent that will not deleteriously affect concrete surfaces nor impair subsequent applications.

L. Form Ties: Metal, factory-fabricated removable snap-off type, that will not leave holes less than 1/4 inch nor more than 1 inch deep and not more than 1 inch in diameter.

M. Joint Sealant: As approved by Engineer for sealing joints in concrete against moisture infiltration for specific application.

N. Reinforcement: Bar reinforcement shall be deformed, Grade 60 conforming to ASTM A615. Mesh reinforcement shall be welded wire fabric with wires at right angles to eachother. See Section 03_20_00 Concrete Reinforcement.

O. Bonding Agent: As approved by Engineer.

P. Admixtures: Air-entraining, retarders, and other admixtures as approved by Engineer
1. Air-entraining admixture: ASTM C260.
2. Water-Reducing Admixture: ASTM C494/C494M, Type A.
3. Retarding Admixture: ASTM C494/C494M, Type B.
4. Water-Reducing and -Retarding Admixture: ASTM C494/C494M, Type D.
5. High-Range, Water-Reducing Admixture: ASTM C494/C494M, Type F.

6. High-Range, Water-Reducing and -Retarding Admixture: ASTM C494/C494M, Type G.
7. Plasticizing and Retarding Admixture: ASTM C1017/C1017M, Type II.
8. Antimicrobial, Crystalline Waterproofing Admixture
    a. Manufacturer(s): Xypex Admix C500 Bio San or engineer approved equal
    b. Dosage rate shall be minimum 1% by weight of cementitious content. No exceptions.
    c. Locations: All primary treatment unit concrete structures that are subject to direct or indirect exposure to wastewater. Units (Northside & Southside)
        1) Headworks
        2) Influent Lift Station
    d. Performance Requirements:
        1) Product shall demonstrate a minimum of 99% reduction in bacterial count formation after 10 years of exposure in wastewater service.
9. Crystalline Waterproofing Admixture
    a. Manufacturer(s): Xypex Admix C500 or engineer approved equal
    b. Dosage rate shall be minimum 2% by weight of cementitious content. No exceptions.
    c. Locations: All concrete structures that are subject to direct or indirect exposure to wastewater, excluding primary treatment units.
    d. Performance Requirements:
        1) Permeability: Independent testing shall be performed according to U.S. Army Corps of Engineers CRD-C48 - Mod Permeability of Concrete. Under CRD-C48 treated concrete samples that are no greater than 2 inches thick shall be pressure tested to 150 psi (350 foot head of water). The treated samples shall exhibit no measurable leakage against control samples which shall exhibit full saturation and measurable leakage. In all case cases treated and untreated samples shall have the same mix design.
        2) DIN 1048/ EN 12390 "Water Impermeability of Concrete"/Requirement: Treated and untreated samples that are 120mm thick shall be subjected to hydrostatic pressure for 3 days (Minimum of 3 samples of each). Control samples shall have a minimum of 100mm of penetration (average of samples). Treated samples shall show a minimum of 90% reduction in depth of water penetration when compared to the control sample (average of samples). In all case cases treated and untreated samples shall have the same mix design.
        3) Crack Bridging Capability: Requirement: Crack sealing effect shall be evidenced by the following when comparing treated and untreated samples:
            a) Cracks shall be minimum 0.4mm wide.
            b) Cracks for treated and untreated samples shall both leak initially.
            c) Cracks for treated samples shall be completely sealed against the passage of water after 21 days or less.
            d) Cracks for untreated samples shall continue to leak after 21 days or more."

2.2 ADMIXTURES

A. A retarding admixture, conforming to ASTM C-494, pre-tested with job materials under job conditions, may be used if approved by Engineer, whenever necessary to prevent cold joints due to the quantity of concrete placed, to permit revibration of the concrete, to offset the effects of high concrete temperature rise.

2.3 ACCESSORIES

A. Curing Compound: Concrete curing compound shall be of a nature and composition not deleterious to concrete and shall be of a standard and uniform quality ready for use as shipped by the manufacturer. At the time of use, the curing compound shall be in a thoroughly stirred condition. Curing compounds shall not be diluted by the addition of solvent or thinners, or be altered in any manner without the specific approval of and ina manner prescribed by the manufacturer. Curing compound shall conform to the requirements of ASTM C-309 Type 1.

1. The curing compound shall be sufficiently transparent and free from color so that there will be no permanent change in the color of the concrete. The compound shall contain, however, a temporary dye of sufficient color to make the membrane clearly visible for a period of at least four hours after application.

2.4 CONCRETE MIX QUALITY AND CONTROL

A. No fly ash will be permitted in mix designs.

B. Design: Concrete shall be composed of Portland cement, fine aggregate, coarse aggregate and water. All concrete shall be designed by an approved testing laboratory in accordance with the ACI Standard Recommended Practice for Selecting Proportions for Concrete (ACI-211) to produce the strength for each class of concrete specified, and with slumps and maximum sizes of coarse aggregate in accordance with the requirements outlined below.

C. Prior to placing any concrete, the Contractor shall submit for review mix designs for each specified concrete and grout type.

D. Concrete Classifications

Class	Min. 28-Day Compressive Strength (psi)	Coarse Aggregate Size (in.)	Max. Water Cement Ratio	Max. Slump (in.)	Min. Cement Content (lb. per CY)
A	4000	1.5 (No. 467)	0.45	5	517
B	3000	1.5 (No. 467)	0.50	4	470
C	4000	1.0 (No. 57)	0.45	4	564
D	5000	0.75 (No. 67)	0.45	5	611

E	1500	1.5 (No. 467)	0.70	4	376
F	4000	0.375 (No. 8)	0.45	8	611

E. Concrete Usage

Class	Usage
A	All reinforced concrete unless otherwise specified
B	Concrete Encasement; Sidewalks
C	Drilled Shafts; Pumped Concrete; Thin Wall Sections
D	Precast Concrete and Panels
E	Lean Concrete Backfill; Foundation Seal; Blocking/Cradling
F	Underground Duct Banks

F. In not specifically noted in the table above, concrete shall be 4,000 psi.

G. The slump shall not exceed the maximum specified above for the type of construction for which it is to be used. The 28-day compressive strength determined in accordance with current ASTM Specifications C-39 and C-31 and with specimens cured in accordance with C-31 shall not be less than that shown above for the specified class of concrete. No water will be added after the amount specified by the mix design.

H. If admixtures are used, slump shall be as approved by Engineer.

I. Production of Concrete: All ready-mixed concrete shall be batched, mixed and transported in accordance with "Specifications for Ready-Mixed Concrete (ASTM C-94)". Plant equipment and facilities shall conform to the "Check List for Certification of Ready-Mixed Concrete Production Facilities" of the National Ready-Mixed Concrete Association.

J. Laboratory Testing: The Owner shall engage an independent testing laboratory to conduct concrete tests. Unless otherwise informed the Contractor will be responsible for sampling concrete for test cylinders, recording, providing all materials required, and for making all slump tests in the field directed by the Engineer. All costs in connection with work performed by the laboratory shall be paid by the Owner. When cylinder reports indicate concrete does not meet strength requirements delineated in the Contract Documents, the Contractor shall be responsible for the costs of developing a redesign of the concrete mix.

K. At least one test shall be made on fresh concrete for each 60 cubic yards of each class of concrete (or fraction thereof) placed on any one day and in any event, not less than one test for each class of concrete each day it is used. Testing shall be done in accordance with the following ASTM Specifications, latest edition:
   1. C-172 - Standard Method of Sampling Fresh concrete
   2. C-31 - Standard Method of Making and Curing Concrete Compression & Flexure Test Specimens in the Field

3. C-39 - Standard Method of Test of Compressive Strength of Molded concrete Cylinders
4. C-143 - Standard Method of Slump Test for Consistency of Portland Cement Concrete

L. Before any concrete is poured, the Contractor shall construct a storage box in accordance with ASTM Specification C-31. Each set of tests shall consist of one slump test and three compression test cylinders. All cylinders shall be kept in the storage box for the first 24 hours. The three cylinders shall be laboratory cured and tested for adequacy of the design for strength of the concrete in accordance with ASTM Specification C-31. One cylinder shall be tested at seven days and two at twenty-eight days.

M. Failure of Concrete to Meet Strength Requirements: The concrete shall be considered acceptable if, for any one class of concrete, the average of all tests or any five consecutive tests is equal to or greater than the specified strength, provided that no more than one test of the five falls between 90 percent and 100 percent of the specified strength. The only cylinders to be used for determination of concrete acceptability will be those laboratory cured and tested at twenty-eight days. When it appears the tests of laboratory-cured cylinders will fail to meet these requirements, the Engineer may require changes in the proportions of concrete for the remainder of the work in order to meet the strength requirements. In addition, the Engineer may also require additional curing not to exceed a total of twenty-one days on portions of the concrete already poured.

N. The Engineer may also require tests in accordance with Methods of Securing, Preparing and Testing Specimen from Hardened Concrete for Compressive and Flexural Strengths (ASTM Specifications C-42) when the concrete cylinder tests fail to meet strength requirements. In the event there still is question as the quality of the concrete in the structure, the Engineer may require load tests for that portion where the questionable concrete has been placed. Such load tests will be made as outlined in Chapter 20 of American Concrete Institute Building Code. (ACI 318-71), and shall be at the expense of the Contractor.

O. Removal of Under Strength Concrete: If the above tests indicate that a particular batch of previously placed concrete is under strength, the Engineer may direct that the under strength batch be removed and replaced. The removal of the under strength concrete shall also include the removal of concrete that has obtained the required strength if the Engineer deems this necessary to obtain structural or visible continuity when the concrete is replaced.

P. The removal, and replacement of any under strength concrete, shall be made at no additional cost to the Owner. This shall include any new formwork required or any reinforcing steel that may be required. The Owner shall not be charged any additional costs for any extra work that is required because of the failure of any concrete to meet the minimum test requirements.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify requirements for concrete cover over reinforcement as referenced in Section 03_20_00 are met.

B. Verify that anchors, seats, plates, reinforcement and other items to be cast into concrete are accurately placed, positioned securely, and will not cause hardship in placing concrete.

3.2 PREPARATION

A. All items, including lines and grades, forms, waterstops, reinforcing, inserts, piping, electrical, plumbing and the Contractor's concreting materials and equipment shall be complete and in compliance with the plans and specifications before proceeding with concrete placement.

B. Concrete finishing shall be completed in daylight hours. When this is not possible, brilliantly light the work site so that all operations are plainly visible.

C. Water shall be removed from excavations before concrete is deposited. Hardened concrete, wood chips, shavings, and other debris shall be removed from interior of forms and inner surfaces of mixing and conveying equipment. Wood forms shall be oiled or, except in freezing weather, wetted with water in advance of pouring. Contractor shall verify that all reinforcement is properly place, aligned, and secured prior to pouring concrete and shall coordinate with Resident Project Representative.

D. Soil at bottom of foundation systems is subject to testing for soil bearing value by the testing laboratory. Place concrete immediately after approval of foundation excavations. Excavate and backfill as necessary to complete the concrete work. Place concrete on sub-grades that are well compacted to level and true grade. Before concrete is poured in areas between slabs on grade previously poured, recheck compaction of subgrades and if necessary, recompact to avoid settlement of slabs at joints. Seal extremely porous subgrades. Remove all ice, debris and excess water from subgrades. After completion of the concrete work, backfill all excavations.

E. Mix concrete only in quantities for immediate use. Discard concrete which has set; re-tempering is not permitted. **Completely discharge concrete at the site within one hour and 30 minutes after adding cement to aggregate. In hot weather, reduce this time to one hour or less to prevent stiffening of concrete before it is placed.**

F. If concrete arrives at the project with slump below that specified, water may be added only if the addition of water does not exceed either the maximum permissible water-cement ratio or maximum slump. Mix adjustments to obtain specified slump must be approved by the Engineer.

G. Protection from Adverse Weather
1. If adverse weather is imminent, no concrete placement is permitted. Do not permit rainwater to increase mixing water or to damage the surface finish. If rainfall occurs after placing operations begin, provide adequate covering to protect the work.

3.3 CONVEYING

A. Concrete shall be conveyed from mixer to forms as rapidly as practicable and by methods which will prevent segregation and loss of ingredients. It shall be deposited as nearly as practicable in its final position. Chutes used shall be such that concrete slides in them and does not flow. Chutes, if permitted, shall have a slope of less than 1 on 2. Where a vertical

drop greater than 5 feet is necessary, placement shall be through elephant trunks or similar devices to prevent segregation.

3.4 PLACING

A. Completely discharge concrete at the site within one hour and 30 minutes after adding cement to aggregate. In hot weather, reduce this time to one hour or less to prevent stiffening of concrete before it is placed.

B. Unless otherwise specified, all concrete shall be placed upon clean, damp surfaces free from running water, or upon properly consolidated fills, but never upon soft mud or dry, porous earth. The concrete shall be compacted and worked in an approved manner into all corners and angles of the forms and around reinforcement and embedded fixtures as to prevent segregation of the coarse aggregate. Construction of forms for the lifts of vertical.

C. Deposit concrete continuously in one layer or in horizontal layers of such thickness that no new concrete is placed on concrete that has hardened enough to cause seams or planes of weakness.
   1. If a section cannot be placed continuously, provide construction joints as indicated.
   2. Deposit concrete to avoid segregation.
   3. Deposit concrete in horizontal layers of depth not to exceed formwork design pressures and in a manner to avoid inclined construction joints.
   4. Consolidate placed concrete with mechanical vibrating equipment in accordance with ACI 301.
      a. Do not use vibrators to transport concrete inside forms.
      b. Insert and withdraw vibrators vertically at uniformly spaced locations to rapidly penetrate placed layer and at least 6 inches into preceding layer.
      c. Do not insert vibrators into lower layers of concrete that have begun to lose plasticity.
      d. At each insertion, limit duration of vibration to time necessary to consolidate concrete, and complete embedment of reinforcement and other embedded items without causing mixture constituents to segregate.

D. Deposit and consolidate concrete for floors and slabs in a continuous operation, within limits of construction joints, until placement of a panel or section is complete.
   1. Do not place concrete floors and slabs in a checkerboard sequence.
   2. Consolidate concrete during placement operations, so concrete is thoroughly worked around reinforcement and other embedded items and into corners.
   3. Maintain reinforcement in position on chairs during concrete placement.
   4. Screed slab surfaces with a straightedge and strike off to correct elevations.
   5. Level concrete, cut high areas, and fill low areas.
   6. Slope surfaces uniformly to drains where required.
   7. Begin initial floating using bull floats or darbies to form a uniform and open-textured surface plane, before excess bleedwater appears on the surface.
   8. Do not further disturb slab surfaces before starting finishing operations.

3.5 VIBRATION

A. Consolidate concrete, including floor slabs on grade, by internal concrete vibrators supplemented by hand-spading, rodding, or tamping so that the concrete is thoroughly

worked around reinforcement and embedded items and into the corners of forms. Consolidate each layer of concrete with previously placed layers in a manner that will eliminate all air or stone pockets which may cause honeycombing, pitting, or planes of weakness. Internal vibrators shall produce a minimum frequency of 7000 impulses per minute when submerged in concrete. Do not use vibrators to transport concrete. Insert and withdraw vibrators at uniformly spaced points not farther apart than the visible effectiveness of the machine. Duration of vibration shall be limited to time necessary to produce satisfactory consolidation without causing objectionable segregation. The vibrating equipment shall at all times be adequate in number of units and power to properly consolidate all concrete. Spare units shall be on hand as necessary to ensure such adequacy.

3.6 CONSTRUCTION JOINTS

A. Construction joints shall be in accordance with Section 03_15_20 – Concrete Joints & Embedded Items. Waterstops shall be installed in all construction joints below grade or in liquid containing structures as noted on the plans.

3.7 BONDING

A. Roughen surfaces of set concrete at all joints, except where bonding is obtained by use of a concrete bonding agent, and clean surfaces of laitance, coatings, loose particles, and foreign matter. Roughen surfaces in a manner to expose bonded aggregate uniformly and to not leave laitance, loose particles of aggregate, or damaged concrete at the surface.

B. Prepare for bonding of fresh concrete to new concrete that has set but is not fully cured, as follows:

1. At joints between footings and walls and between walls and beams or slabs they support, and elsewhere unless otherwise specified herein, dampen, but do not saturate, the roughened and cleaned surface of set concrete immediately before placing fresh concrete.
2. At joints in exposed work; at vertical joints in walls; at joints in girders, beams, supported slabs, and other structural members; and at joints designed to contain liquids; dampen, but do not saturate, the roughened and cleaned surface of set concrete and apply either a liberal coating of neat cement grout or a commercial bonding agent.
3. Use neat cement grout consisting of equal parts Portland cement and fine aggregate by weight and not more than 6 gallons of water per sack of cement. Apply with a stiff broom or brush to a minimum thickness of 1/16". Deposit fresh concrete before cement grout has attained its initial set.

3.8 PATCHING

A. Any concrete which is not formed as shown on the Plans, or for any reason is out of alignment or level or shows a defective surface shall be considered as not conforming with the intent of these Specifications and shall be removed from job by Contractor at his expense, unless the Engineer grants permission to patch defective area, which shall be done in accordance with the following procedures.

B. Permission to patch any such area shall not be considered a waiver of the right of the Engineer to require complete removal of defective work if patching does not, in the opinion

of the Engineer, satisfactorily restore quality and appearance of surface. Suitable non-shrink, latex or epoxy mortar shall be used for patching and repairing defective surface if directed by the Engineer.

C. After removing forms, all concrete surfaces shall be inspected and any poor joints, void, stone pockets, all tie holes, or other defective areas shall be patched, if permitted by the Engineer. Where necessary, defective areas shall be chipped away to a depth of not less than 1" with edges perpendicular to the surface. Area to be patched and a space at least 6" wide entirely surrounding it shall be wetted to prevent absorption of water from the patching mortar. A grout of equal parts Portland cement and sand, with sufficient water to produce a brushing consistency, shall then be well brushed into the surface followed immediately by the patching mortar. The patch shall be made of the same material and of approximately the same proportions and shall not be richer than one part cement to three parts sand. White Portland cement shall be substituted for a part of the gray Portland cement to match color of the surrounding concrete. The proportion of white and gray cements shall be determined by making a trial patch. The amount of mixing water shall be as little as consistent with the requirements of handling and placing. The mortar shall be retempered without the addition of water by allowing it to stand for a period of one hour during which time it shall be mixed occasionally with a trowel to prevent setting.

D. The mortar shall be thoroughly compacted into place and screeded off so as to leave patch slightly higher than surrounding surface. It shall then be left undisturbed for a period of one to two hours to permit initial shrinkage before being finally finished. The patch shall be finished in such a manner as to match the adjoining surface. On exposed surfaces where unlined forms have been used, the final finish shall be obtained by striking off the surface with a straightedge spanning the patch and held parallel to the direction of the form marks.

E. Tie holes left by withdrawal of rods or the holes left by removal of ends of ties shall be filled solid with mortar after first being thoroughly wetted.

3.9 SLABS ON GRADE

A. The Contractor shall insure that subgrade has been thoroughly compacted and leveled prior to concrete placement. Sprinkle all sub-grades with water no more than half an hour prior to placing concrete.
   1. Place vapor barrier below interior slabs unless noted otherwise. Sprinkling of fill is not necessary when using vapor barrier. Lap vapor barrier 6" in direction of pour, and seal laps with specified mastic. Repair all ruptures of the vapor barrier that might occur before or during concrete pour.
   2. The Contractor shall insure that all reinforcing steel is located properly prior to pour, and that steel will not be vertically displaced during the pour.

3.10 EDGING

A. Edges exposed to view on the outside of structures, footings, pads and slabs, and all those in the inside of structures shall be chamfered, unless otherwise approved by the Engineer. Chamfer shall be at an angle of 45 degrees, as shown on the Plans. If so required by the Engineer, however, the Contractor shall provide square edges for any portion of the work.

3.11 SLAB FINISHES

A. Exterior Walks: The top surface shall be "slip-resistant" as follows:
   1. The surface shall be steel troweled as noted in Paragraph C below, and have a final finish applied by brushing lightly with a soft bristle brush to form a slightly roughed surface.

B. Interior slabs that are to receive a finish floor covering (this does not include ceramic tile covering) shall be finished by tamping the concrete with special tools to force the coarse aggregate below the surface, then screeding and floating with straightedges to bring the surface to the required finish level. While the concrete is still green but sufficiently hardened to bear a man's weight without deep imprint, it shall be wood floated to a true and even plane with no coarse aggregate visible. Sufficient pressure shall be used on the wood floats to bring moisture to the surface. After surface moisture has disappeared, surfaces shall be steel-trowelled to a smooth, even, impervious finish, free from trowel marks. After cement has set enough to ring the trowel, surface of all slabs shall be given a second steel trowelling to a burnished finish.

C. Interior slabs to receive fill or mortar setting bed shall be finished by tamping concrete with special tools to force coarse aggregate below the surface, and screeded with straightedges to bring surface to required finish plane. Surface shall be left roughened sufficiently to produce good bond with topping material.

D. Top and bottom slabs of all structures and water carrying conduits except as noted otherwise on the Plans shall be finished as follows: The top of the slab shall be screeded to grade and cross section; lightly tamped as required to bring up a good bed of mortar for finishing and re-screeded as necessary. The surface shall then be finished with a wood float and leveling darby. No further finish will be required on top slabs of structures or conduits which are to be buried. In the case of all exposed top slabs of structures and conduits, they shall be given a final wood float and a light broomed, slip resistant finish to a uniform surface which conforms with accuracy to required shape, slope and grade. Slabs shall be edged as appropriate.

E. All interior floor slabs shall be "slip resistant finish", unless called out otherwise, as follows: The top surface shall be steel trowelled as noted in Paragraph B above and have a final finish applied by brushing lightly with a soft bristle brush to form a slightly roughed surface.

F. The floor surfaces of basins in which raking mechanisms are to be installed shall be finished, as indicated on the Plans, by sweeping in cement grout with the mechanism. The cement grout to be used shall be composed of one part Portland cement and two parts sand by weight.

G. The sweeping-in process shall be performed in the presence of the Engineer or the Engineer’s Representative or, if necessary, under the supervision of a factory representative of the equipment manufacturer.

H. The slab upon which the grout is to be applied shall be finished in accordance with the provisions of Paragraph D above except that after leveling and floating, it shall be raked in such a manner as to provide a good bond for the grout. Before grout is deposited on the slab, it shall be thoroughly cleaned, wet down with clean water, and lightly dusted with neat cement immediately prior to placement of the grout.

I. Concrete Hardener shall be applied to the floors where scheduled to be exposed concrete. Concrete surfaces to be treated must be thoroughly set and dry, clean and free of dust. Three applications of "lapidolith", "saniseal", "hornolith", "vitrox", or Engineer approved equal liquid are required, using one gallon per 100 square feet for the complete treatment. Apply hardener strictly according to the manufacturer's printed instructions. Any substitution for the specified hardeners must be of the magnesium fluosilicate or zinc fluosilicate types.

3.12 FINISH OTHER THAN FLOORS

A. All top surfaces, other than slabs, not covered by forms, and which are not to be covered by additional concrete or fill shall receive a wood float finish without additional mortar. Care shall be taken that no excess water is present when the finish is made. Other surfaces shall be brought to finished elevations and left true and regular. All exposed interior concrete shall be grouted smooth and give a cement wash of one part light colored Portland cement and two parts fine aggregate mixed with water to consistency of thick paint. Grout shall be cork or wood floated to fill all pits, air bubbles, and surface holes.

B. Excess grout shall be scraped off with a trowel and rubbed with burlap to remove any visible grout film. Surface shall be kept damp during setting period. The finish for any area shall be completed in same day and the limits of a finished area shall be made at natural breaks in finished surface.

C. Rubbed Finish: Unless otherwise indicated, all faces (except top surfaces of slabs) exposed to view, such as walls, grade beams, columns, beams, canopy soffits and fascias, etc. shall be finished as follows:
1. Forms shall be removed and all fins removed, off-sets leveled, damaged places and depressions resulting from the removal of metal ties or other causes shall be carefully pointed with a mortar of sand and cement in the proportion which has been employed for the particular class of concrete treated.
2. The surface film of all such pointed places shall be carefully removed before setting occurs.
3. After the point has set sufficiently to permit it, all exposed surfaces shall be dampened and rubbed with a No. 16 carborundum stone, to a smooth even plane. Final rubbing shall be done with a No. 30 carborundum stone, or an abrasive of equal quality, to obtain an entire surface of a smooth texture and uniformity in color.
4. Mortar or grout worked up during rubbing shall be promptly removed by sacking with burlap or other suitable means so that no visible grout film or paste will remain. A cement wash or plaster coat shall not be used.
5. All surfaces shall be finished uniformly smooth and washed clean. The rubbed finish for any area shall be completed in the same day and the limits of a finished area shall be made at natural breaks in the finished surface.
6. If the Contractor does not provide suitable surface finish using carborundum stones specified above the Engineer, without additional cost to the Owner, may require to use of a power operated grinding machine to produce the desired finish.

3.13 CURING

A. Unformed concrete surfaces shall be water cured to prevent check of the fresh concrete surface. Where drying conditions are severe, as determined by the Engineer, fog sprays

shall be employed to prevent checking of the fresh concrete surface. Fog spraying shall be continued as specified until the finished surface has attained sufficient strength to permit flooding or covering with burlap mats. Where drying conditions are not severe, as determined by the Engineer, unformed concrete surfaces shall be covered with wet burlap mats as soon as the concrete has sufficiently set, and shall thereafter be kept under wet burlap. Comply with ACI 308.1.

B. Formed surfaces, both interior and exterior, shall be water cured by water sprays or under burlap mats beginning as soon as the forms are stripped. Prior to stripping of forms, the concrete and forms shall be kept moist by the water sprays. Comply with ACI 308.1.

C. Unless otherwise specified, surfaces shall be water cured for seven days after the concrete is placed.

D. After 48 hours of water cure, and with the acceptance of the Engineer, the curing of concrete surfaces may be completed by the curing compound method. Curing compounds shall be applied in strict conformance with the manufacturer's instructions. If the compound is applied to a surface which is later to be painted, the Contractor shall thoroughly sandblast the surface to remove all vestiges of the compound prior to concrete finishing. Curing compound shall not be used on any surfaces against which additional concrete or other finishing materials are to be bonded.

E. In all concrete structures, concrete made with normal Portland cement shall be prevented from drying for at least the first seven days after placing. Whenever the temperature of the surrounding air is between 40ºF and 60ºF, adequate provision shall be made for maintaining the temperature of concrete above 60ºF or the moist curing period shall be extended to ensure a compressive strength corresponding to that which would be secured under provisions of the previous part of this paragraph.

F. Whenever the temperature of surrounding air is below 40ºF, all concrete shall be maintained at a temperature of not less than 50ºF for at least 72 hours for normal concrete or for as much more time as is necessary to insure proper rate of curing of the concrete. The housing, covering or other protection used in connection with curing shall remain in place and intact at least 24 hours after the artificial heating is discontinued. No salt or other chlorides shall be used for prevention of freezing.

G. Protection from the Sun: All concrete shall be adequately protected from injurious action of sun in a manner satisfactory to the Engineer.

H. Temperature Control: During and at the conclusion of the specified curing period, means shall be provided to ensure that the temperature of the air immediately adjacent to the concrete does not fall more than 3ºF in any one hour nor more than 30ºF in any 24 hours.

3.14 CONCRETING IN COLD WEATHER

A. When the atmospheric temperature may be expected to drop below 40ºF at the time concrete is delivered to the work site, during placement, or at any time during the curing period, the following provisions also shall apply:
   1. Prevent damage to concrete due to early age freezing and limit rapid changes in temperature at early ages consistent with the requirements of ACI 306R, ACI 306.1 and the requirements in this Section.

2. If the air temperature is at or below 40 degrees F, cold weather concreting shall be performed in accordance with ACI 306R and ACI 306.1. This includes cases where the temperature drops below 40 degrees F after concrete operations have been started. The temperature shall be taken in shade away from artificial heat.
3. When air temperatures are at or below 40 degrees F, heated mixing water or a combination of heated mixing water and heated aggregates shall be used, if required, to raise the concrete temperature at placement to the minimum values (or greater) listed in ACI 306R – Chapter 5. The temperature of the heated water or aggregates shall not exceed 150 degrees F when entering the mixer.
4. Concrete placement is not permitted when the air temperature is at or below 35 degrees F. The temperature shall be taken in shade away from artificial heat.
5. Do not place concrete against a frozen subgrade or formwork that is at or below 35 F.
6. Salts, chlorides, chemicals or other foreign materials shall not be mixed with the concrete to prevent freezing or act as an accelerator.
7. When temperatures at or below 35 F may be expected during the curing period, the concrete shall be maintained at a temperature of at least 50 degrees F for five days or 70 degrees F for three days after placement. Rapid cooling or heating of concrete shall not be permitted.

B. Hot Weather Concreting.
1. Hot weather concreting shall comply with ACI 305R and ACI 305.1. At air temperatures of 90 degrees F or above, concrete placement shall be in accordance with Hot Weather Concreting requirements in ACI 305R, ACI 305.1 and requirements in this Section.
2. The temperature of the concrete when placed in the work shall not exceed 90 degrees F. Use chilled water or ice or other approved methods to reduce the temperature of the concrete as required.
3. Concrete shall be placed in the forms without the addition of any more water than is required by design. No excess water may be added to the concrete surface to aid in finishing. Control of the initial set and extending the time for finishing may be accomplished through the use of admixtures in accordance with these Specifications.
4. Plastic shrinkage cracking, due to rapid evaporation of moisture, shall be prevented. Concrete shall not be placed when the evaporation rate (actual or anticipated) equals or exceeds 0.2 pound per square foot per hour, as determined by Figure 4.2 in ACI 305R.

3.15 CONCRETING IN HOT WEATHER

A. When climatic or other conditions are such that the temperature of the concrete may reasonably be expected to exceed 90ºF at the time of delivery at the work site, during placement, or during the first 24 hours after placement, the following provisions also shall apply:
1. The Contractor shall maintain the temperature of the concrete below 90ºF during mixing, conveying, and placing. Methods used shall conform to "Recommended Practice for Hot Weather Concreting," ACI Standard 305.
2. The concrete shall be placed in the work immediately after mixing. Truck mixing shall be delayed until only time enough remains to accomplish it before the concrete is placed.

3. Exposed concrete surfaces, which tend to dry or set too rapidly, shall be continuously moistened by means of fog sprays or otherwise protected from drying during the time between placement and finishing, and after finishing.
4. Finishing of slabs and other exposed surfaces shall be started as soon as the condition of the concrete allows and shall be completed without delay.
5. Concrete surfaces exposed to the air shall be covered as soon as the concrete has hardened sufficiently and shall be kept continuously wet for at least the first 48 hours of the curing period, and for the entire curing period unless curing compound is applied as specified.
6. Formed surfaces shall be kept completely and continuously wet for the duration of curing period (prior to, during, and after form removal) or until curing compound is applied as specified.

3.16 EMBEDDED ITEMS, JOINTS & WATERSTOP

A. See Section 03_15_20 Concrete Joint & Embedded Items

3.17 DRY PACK MORTAR

A. Where surfaces are required to be built up with mortar, such surfaces shall be thoroughly roughened by brushing, completely cleaned, and coated with appropriate bonding compound before the application of the required mortar. The mortar shall be applied immediately following the application of the bonding compound in bands or strips to form a compact durable covering of the required thickness and shall be free from lumps and depression. Construction joints in the mortar shall be sloped to thin edges and, before application is resumed, the joint shall be thoroughly cleaned. Dry pack mortar shall be used for built-up surfaces, setting miscellaneous metal items, and correcting minor repairs and imperfections.

B. No mortar shall be applied during freezing weather unless adequate protection is provided.

C. The mortar shall be cured as specified for concrete.

3.18 MODIFICATION OF EXISTING CONCRETE

A. Where the work indicated on the Plans requires modification of existing concrete structures or concrete poured over six months previously to be removed or modified, the existing concrete shall be cut accurately to the lines required in the presence of the Engineer or the Engineer's Representative. Concrete faces exposed to view shall be cut with a concrete saw. The cutting shall be accomplished in a manner that preserves, free from cracks or other injuries, those parts of the existing structure that are to remain. Where the cut surface is to be left exposed, it shall be cleaned and faced with non-shrink grout and finished to match adjacent surface. Where new concrete or mortar is to be placed against existing concrete surfaces or surfaces that have been cut, such surfaces shall be thoroughly cleaned by sandblasting, and coated with bonding compound just prior to the placement of the new concrete. Bonding compounds shall be as specified herein. Depth of saw cut should be ¾" minimum. Unless otherwise indicated on the Plans or specified, continuity of reinforcing steel shall be obtained by either exposing bars to provide sufficient laps with new bars or by welding existing bars with new bars as specified. Where indicated, existing bars shall be exposed and fully developed by; embedding in new concrete.

3.19 PROTECTION OF CONCRETE

A. All surfaces shall be protected against injury. During the first 72 hours after placing the concrete, any wheeling, working or walking on the concrete shall not be permitted. All slabs subject to wear shall be covered with a layer of sand or other suitable material as soon as the concrete has set. Sisalcraft paper or other similar tough waterproof paper may also be used, provided all joints between adjacent strips of paper are carefully sealed. This does not alter the requirements for proper curing as specified herein.

B. No concrete slabs or top surfaces or walls shall be placed during rain unless acceptable protective shelter is provided, and during such weather, all concrete placed within the preceding 12 hours shall be protected with waterproof canvas or other suitable coverings. These shall be provided and kept ready at hand.

3.20 SURFACE REPAIRS

A. Patching Defective Areas:
   1. Repair and patch defective areas with cement mortar immediately after removal of forms. Use epoxy-based mortar for structural repairs.
   2. Before patching is performed, the Engineer shall be notified and provided sufficient time to observe extent of repairs required.
   3. Cut out honeycomb and rock pockets, down to solid concrete but, in no case, to a depth of less than 1". Where defective concrete extends to the depth of reinforcing steel or where reinforcing steel is exposed during concrete chipping, concrete shall be removed to a minimum depth of 3/4 inch clear beyond depth of reinforcing steel. Saw-cut perimeter or area to be patched to provide edges cut perpendicular to the concrete surface.
   4. For exposed-to-view surfaces, blend white Portland cement and standard Portland cement so that, when dry, the patching mortar will match the color of the surrounding concrete. Provide test areas at inconspicuous location to verify mixture and color match before proceeding with the patching. Compact mortar in place and strike off slightly higher than the surrounding surface.
   5. Fill holes extending through concrete by means of a plunger-type gun or other suitable device from the least exposed face, using a flush stop held at the exposed face to ensure complete filling.

B. Repair of Formed Surfaces:
   1. Repair exposed-to-view formed concrete surfaces, where possible, that contain defects which adversely affect the appearance of the finish. Remove and replace the concrete having defective surfaces if the defects cannot be repaired to the satisfaction of the Engineer. Surface defects, as such, include color and texture irregularities, crack, spalls, air bubbles, honeycomb, rock pockets, and holes left by the rods and bolts; fins and other projections on the surface; and stain and other discolorations that cannot be removed by cleaning.
   2. Repair concealed formed' concrete surfaces, where possible, that contain defects that adversely affect the durability of the concrete. If defects cannot be repaired, remove and replace the concrete having defective surfaces. Surface defects, as such, include cracks in excess of 0.01" wide, cracks of any width through nonreinforced sections, honeycomb, rock pockets, holes left by tie rods and bolts, and spalls except minor breakage at corner.

C. Repair of Uniformed Surfaces:

1. Test unformed surfaces, such as monolithic slabs, for smoothness and to verify surface plane to the tolerances specified for each surface and finish. Correct low and high areas as herein specified.
2. Test unformed surfaces sloped to drain for trueness of slop, in addition to smoothness, using a template having the required slope. Correct high and low areas as herein specified.
3. Repair finished unformed surfaces that contain defects which adversely affect the durability of the concrete. Surface defects, as such, include crazing, cracks in excess of 0.01" wide or which penetrate to the reinforcement or completely through nonreinforced sections regardless of width, spalling, popouts, honeycomb, rock pockets, and other objectionable conditions.
4. Correct high areas in unformed surfaces by grinding, after the concrete has cured sufficiently so that repairs can be made without damage to adjacent areas.
5. Correct low areas in unformed surfaces during or immediately after completion of surface finishing operations by cutting out the low areas and replacing with fresh concrete. Finish repaired areas to blend into adjacent concrete.
6. Repair defective areas, except random cracks and single holes not exceeding 1" diameter, by cutting out and replacing with fresh concrete. Remove defective areas to sound concrete with clean, square cuts and expose reinforcing steel with at least 3/4" clearance all around. Dampen all concrete surfaces in contact with patching concrete and brush with a neat cement grout coating, or use concrete bonding. agent. Place patching concrete before grout takes its initial set. Mix patching concrete of the same materials to provide concrete of the same type or class as the original adjacent concrete. Place, compact, and finish as required to blend with adjacent finished concrete. Cure in the same manner as adjacent concrete.
7. Repair isolated random cracks and single holes not over 1" in diameter by the dry-pack method. Groove the top of cracks, and cut out holes to sound concrete and clean of dust, dirt, and loose particles. Dampen all cleaned concrete surfaces and brush with a neat.cement grout coating. Place dry-pack before the cement grout takes its initial set. Mix dry-pack consisting of one part Portland cement to 2-1/2 parts fine aggregate passing a No. 16 mesh sieve, using only enough water as required for handling and placing. Compact dry-pack mixture in place and finish to match adjacent concrete. Keep patched areas continuously moist for not less than 72 hours.

SECTION 33_01_33

WASTEWATER LIQUID & SOLIDS REMOVAL & DISPOSAL

PART 1 GENERAL

1.1 SUMMARY

A. Removal and disposal of wastewater liquids and solids from the wastewater treatment facilities.

B. Waste sludge handling & disposal to be removed from the following locations:
   1. Southside Drying Beds prior to beginning initial demolition for Southside Improvements (to be included in bid item for "Demolition (Initial)")
   2. Northside Drying Beds prior to beginning initial demolition for Southside Improvements (to be included in bid item for "Demolition (Initial)")
   3. Southside Stormwater Pond prior to beginning stormwater pond improvements (to be included in the price bid for "Secondary FEB Concrete Lining & Sludge Disposal")
   4. Northside existing treatment units prior to beginning final demolition (to be paid from bid item "Waste Sludge Handling & Disposal from Existing Treatment Units Prior to Final Demolition (Northisde & Southside).")
   5. Southside existing treatment units prior to beginning demolition (to be paid from bid item "Waste Sludge Handling & Disposal from Existing Treatment Units Prior to Final Demolition (Northisde & Southside).")

C. Quantity and character of sludge will vary from location to location and bid price should per for waste sludge handling should be an average price for overall quantity.

D. It is the contractor's responsibility to verify the total amounts in each basin prior to bid.

E. No adjustment in price or unit price will be made based on actual quantities.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 02_41_00 Demolition

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 DEFINITIONS

A. Process Sludge: This material is the liquid volume of existing tankage and mixture of process water, mixed liquor, organic settled solids and sludge that will be transferred by the Contractor to another treatment basin as approved by the Owner. **The transfer of process sludge will be required prior to complete construction activities (demolition and rehabilitation of Southside stormwater pond.)**

B. Waste Sludge: This material includes an undetermined volume and mixture of grit, inorganic settled solids and sludge that will be removed and disposed by the Contractor. **The disposal of waste sludge will be required to complete construction activities (demolition and rehabilitation of Southside stormwater pond.)**

C. Sludge Management Plan (SMP): A plan for removing, processing, treating, storing, transporting, and disposing of mixed liquor, settled solids, partially digested sludge, and sludge in addition to soils intermixed with the various types of sludge.

D. Sludge Disposal / Disposition Plan (SDP): A plan for sludge removed from the treatment facility and disposed of in a landfill.

E. Added Water: This water is added by the Contractor to aide in the removal of, cleaning of, and transport of the existing solids to be removed from the wastewater facilities and disposed of off-site. The added water is the sole responsibility of the Contractor. The volume of added water is not included in the specified volumes of the bid quantities of material to be removed from the wastewater facilities. The Contractor is responsible for all effort and costs required to provide, use, transport, and dispose of added water used in the tasks associated with liquid and solids removal. The Contractor shall include all costs for added water in the base bid quantity prices and the Bid Form Unit Prices for Sludge Removal. The Contractor's use of added water shall not be grounds for a scope change nor a contract change.

F. Sludge Removal: Construction activities to remove mixed liquor, settled solids, partially digested sludge, and sludge from any wastewater treatment facility in an effort to gain access for subsequent construction activities and/or cleaning of a facility to facilitate inspection, repair, demolition, and/or other construction activities as required by the Contract Documents.

G. Treatment Basin: Structures, both existing and new, whose primary function is to hold, treat and/or process wastewater, wastewater solids, and sludge.

H. Project Locations: Facilities from which sludge is to be removed.

1.5 SCHEDULING & SEQUENCING

A. Conduct sludge removal only after schedule has been approved by the Owner and the Contractor has submitted SMP or SDP and received written approval of same from ODEQ Contractor, with Owner's approval, may make use of existing SMP/SDP in place. Coordinate with Owner prior to bid. Sludge removal schedule and sequencing must allow for continued operation of the facilities. If land application is used for disposal, apply sludge only after adequate erosion and sediment controls are in place.

1.6 MEASUREMENT & PAYMENT

A. Process Sludge Handling:
   1. Measurement: Will not be measured. It is considered to the be the full volume of any tankage that is required to be drained to execute construction activities
   2. Payment is subsidiary to Demolition. Payment shall be full compensation for the following: equipment, labor, any added water, gas/fuel, sludge and soil testing, spill clean-up, and temporary pumping and piping. Contractor is responsible for all efforts and costs associated with procuring, transport, and final disposal of any added water.

B. Waste Sludge Handling and Disposal for Initial Demolition:
   1. Will not be measured for payment and shall be included in the price bid for demolition.

C. Waste Sludge Handling and Disposal for Final Demolition:
   1. Measurement: The units scheduled for demolition or rehabilitation will be drained of Process Sludge to the minimum level practical. Prior to removal of any Waste Sludge, the Owner, Engineer, and Contractor will agree on that the remaining sludge is of a nature that cannot be processed by the treatment plant. Upon agreement the sludge depth will be measured at each corner and at least one point in the center of the basin. The depth measurements along with the basin plan view area will used to calculate cubic yards of Waste Sludge to be disposed of. No payment will be made for Added Water.
   2. Payment: Payment for sludge disposal will be by the cubic yard of sludge disposed at the Bid Price listed in the Bid Proposal. The Bid Item will be full compensation for removal of waste sludge, dewatering, hauling, landfill tipping fees, permitting, tools, labor and any other incidentals required to complete the work.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 GENERAL

A. The Contractor with coordination from the Owner will be responsible for transferring Process Sludge from one basin to another.

B. Contractor is responsible for removal, handling and disposal of all Waste Sludge, including the material resulting from the tanks' cleaning.

C. Remove Waste Sludge from the existing basins within the limits shown or specified and dispose of the Waste Sludge in accordance with a ODEQ approved SMP or SDP. The Contractor shall also be responsible for removing and handling any waste sludge from the new basins in accordance with an ODEQ approved SMP or SDP as required for his construction activities within these new basins.

D. Contractor is responsible for all expenses related to Process Sludge removal and transfer, which shall be covered under the base bid.

E. Contractor is responsible for maintaining and protecting all roads, drives, dikes, equipment, structures, etc during sludge removal, processing, land application, hauling, and disposal and shall repair any damaged as a result of their work.

F. The Contractor will be required to keep a Daily Record and a Project Record, of the volume of liquid biosolids land-applied each day. The Daily Record will need to be provided to the Project Manager, or his designee, at the end of each workday. The Project Record will need to be provided to the Owner, or designee, at the end of the project.

G. The Contractor will communicate daily with the Engineer to determine which land application site will be used. This discussion is also designed to ensure that the Contractor does not over apply biosolids to any approved application site.

H. The Contractor will be responsible for biosolids sampling, sample preservation, sample delivery, and storage in accordance with methods developed by the City of Shawnee Wastewater Treatment Plant Laboratory Staff or standard practice is no methods have been developed.

I. The Contractor is required to maintain a cooperative and courteous relationship with the landowner while delivering and land-applying sludge, grit, and biosolids. Care shall be taken to leave the fields and roadway in reasonable condition upon project completion.

3.2 PROJECT LOCATION

A. As follows, but not to extend beyond Project limits.
   1. Northside
      a. All existing units
      b. All piping that requires wastewater and sludge removal
      c. All other treatment plant facilities that require dewatering and cleaning to perform the work.
   2. Southside
      a. All existing units
      b. Existing stormwater pond
      c. All piping that requires wastewater and sludge removal
      d. All other treatment plant facilities that require dewatering and cleaning to perform the work.

3.3 TREATMENT BASIN CLEANING

A. Transfer Process Sludge to another basin designated by the Owner and take measurements of Waste Sludge In-Situ prior to commencing cleaning activities.

B. Remove sludge from the Treatment Basins within limits or as specified or directed.

3.4 EQUIPMENT

A. Provide necessary equipment for Process Sludge transfer from on basin to another Owner designated basin.

B. Provide necessary equipment for Waste Sludge removal, transport from the facility to the disposallocation, and final application or disposal.

C. Provide necessary equipment for added water, procurement, transport from the facility to thedisposal location, and final application or disposal.

3.5 DISPOSAL PERMITTING

A. Contractor will be responsible for registration, authorization, and/or permitting of the land application with the appropriate regulatory agencies and shall pay the related regulatory fees.

B. Contractor will maintain all chain of custody forms and provide documentation of all sludgevolumes land applied and the application sites.

3.6 TESTING

A. Contractor will be responsible for obtaining all sludge and soil samples and their required labanalyses for permitting.

B. Contractor will pay for the lab analysis and will include such lab analysis expenses with as part ofthe Work.

3.7 DISPOSAL

A. Apply the sludge and/or added water for beneficial use as fertilizer/soil amendment or dispose ofthe material using a disposal method approved by the appropriate permitting agency.

B. When sludge application is via the subsoil injection method, such application shall be accordingto sound agronomic rates.

C. Contractor is responsible for determining application rates based on cover crops and analyticaltesting of the sludge.

D. Contractor may remove and separately dispose of oil/grease from the sludge prior to land application.

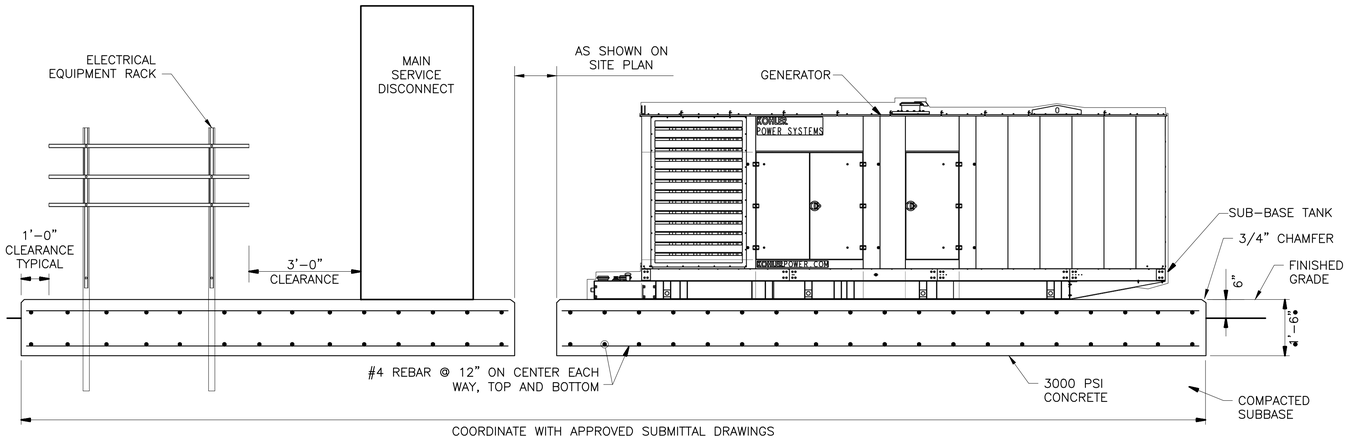
E. Contractor is responsible for providing commercially reasonable handling of sludge once it hasbeen collected, including cleanup of any spills.

F. Contractor is responsible for meeting the dewatering requirements of landfill disposal.

3.8 RECORD KEEPING

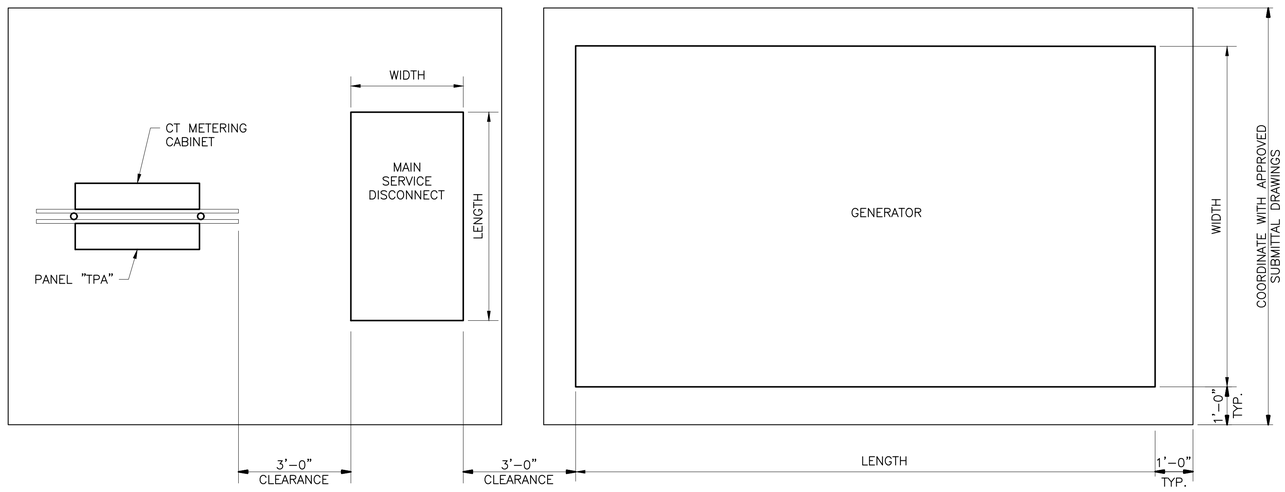
A. Maintain records of sludge application and submit records to Engineer, Owner, and regulatingagencies, as required by this specification and any related permits.

3.9 BIDDING QUANTITIES



A. Process Sludge Removal
   1. Will not be measured for payment and will be included in the price bid for demolition.

B. Waste Sludge (initial demolition)
   1. Will not be measure for payment and will be included in the price bid for demolition.



C. Waste Sludge Removal (final demolition)
   1. Contractor is responsible to remove and dispose of the waste sludge volumes listed in the bid proposal from the designated structures to be demolished.
   2. The volume listed is for reference only, payment will be based on the total quantity of Waste Sludge removed from all facilities. No additional payment will be made if quantities removed exceed the estimated quantity listed for any individual facility unless the total quantity is exceeded (both facilities.) If the total quantity removed meets the total estimated, sludge removal will stop until the Owner and Contractor agree to contract modification to handle the remaining Waste Sludge.

GENERAL

1. ALL NOTES LISTED ON THIS SHEET APPLY TO ALL SHEETS OF THE DRAWINGS AS IF THEY WERE WRITTEN ON EACH SHEET.
2. NOTIFY OWNER 48 HOURS PRIOR TO CONSTRUCTION.
3. VERIFY ALL EXISTING CONDITIONS AND OBSTRUCTIONS INCLUDING LOCATION AND DIMENSIONS BEFORE STARTING WORK AND SHALL NOTIFY THE ENGINEER OF ANY DISCREPANCIES.
4. PRIOR TO INSTALLATION OF RELEVANT FACILITIES CONTRACTOR SHALL, AT HIS OWN EXPENSE, UNCOVER AND OTHERWISE DETERMINE THE DEPTH OF UTILITIES WHICH, IN HIS OPINION, COULD INTERFERE WITH CONSTRUCTION.
5. ALL DIMENSIONS SHALL BE CONFIRMED BY THE CONTRACTOR ACCORDING TO ACTUAL FIELD CONDITIONS OR EQUIPMENT/STRUCTURE REQUIREMENTS.
6. ALL MISCELLANEOUS REMOVAL ITEMS REQUIRED FOR CONSTRUCTION SHALL BE FIELD LOCATED BY THE CONTRACTOR PRIOR TO BIDDING. THESE ITEMS WILL NOT BE MEASURED FOR PAYMENT AND SHALL BE INCLUDED IN THE PRICE BID FOR ASSOCIATED ITEMS OF WORK.
7. TRAFFIC CONTROL DEVICES SHALL BE FURNISHED AND MAINTAINED BY THE CONTRACTOR THROUGHOUT THIS PROJECT IN ACCORDANCE WITH THE LATEST VERSION OF THE MANUAL OF UNIFORM TRAFFIC CONTROL DEVICES AND/OR AS REQUIRED BY THE DEPARTMENT OF TRANSPORTATION OR COUNTY PERMITS FOR CONSTRUCTION IN RIGHT-OF-WAY.
8. SUBMIT AN EROSION CONTROL PLAN (SWPPP) PRIOR TO CONSTRUCTION AND SHALL MAINTAIN SWPPP THROUGHOUT DURATION OF CONSTRUCTION IN ACCORDANCE WITH SPECIFICATIONS.
9. EXISTING FACILITY AND UTILITY INFORMATION SHOWN ON THE DRAWINGS WAS OBTAINED FROM AVAILABLE RECORDS, LOCATES, AND AVAILABLE FILES. NEITHER THE OWNER NOR THE ENGINEER ASSUMES ANY RESPONSIBILITY FOR FACILITIES AND UTILITIES NOT SHOWN OR NOT IN THE LOCATION SHOWN. THE CONTRACTOR SHALL FIELD VERIFY ALL LOCATIONS, SIZES, MATERIALS, TYPES, AND ELEVATIONS SHOWN AROUND OR NEAR AREAS OF CONSTRUCTION PRIOR TO THE START OF CONSTRUCTION.
10. PERFORM ALL WORK WITHIN DESIGNATED EASEMENTS. CONTRACTOR SHALL NOT ENCROACH OR TRESPASS INTO PRIVATE PROPERTY WITHOUT WRITTEN APPROVAL FROM THE PROPERTY OWNER.
11. MAINTAIN LOCAL AND THROUGH TRAFFIC FOR ALL STREETS AT ALL TIMES WITHOUT CLOSURES OR RESTRICTIONS EXCEPT AS PART OF THE TRAFFIC CONTROL PLAN.
12. MAINTAIN REASONABLE ACCESS TO ALL PROPERTIES AT ALL TIMES. DO NOT RESTRICT DRIVEWAY ACCESS WITHOUT OWNER'S APPROVAL. RESTORE DRIVEWAY ACCESS AT THE END OF EACH DAY. PROVIDE TEMPORARY MEASURES AS NEEDED (SUCH AS GRAVEL) TO MAINTAIN DRIVEWAY ACCESS.
13. KEEP ACCURATE RECORDS OF ALL CONSTRUCTION THAT DEVIATES FROM THE DRAWINGS. THE CONTRACTOR SHALL FURNISH TO THE ENGINEER ACCURATE "AS-BUILT" RED LINE DRAWINGS FOLLOWING COMPLETION OF CONSTRUCTION.
14. TAKE SPECIAL PRECAUTIONS IN VICINITY OF ANY OVERHEAD AND UNDERGROUND ELECTRIC LINES. CONTRACTOR SHALL ABIDE BY THE MOST RECENT NATIONAL ELECTRIC CODE FOR WORKING AROUND OVERHEAD ELECTRIC LINES AS WELL AS OTHER LOCAL, STATE OR FEDERALS LAWS / REQUIREMENTS.
15. CONFORM TO ALL APPLICABLE FEDERAL, STATE AND LOCAL LAWS GOVERNING EXCAVATION. TRENCH SIDE SLOPES SHALL MEET OSHA REQUIREMENTS THAT ARE IN EFFECT AT THE TIME OF CONSTRUCTION. CONTRACTOR SHALL SUBMIT A TRENCH SAFETY PLAN PRIOR TO CONSTRUCTION.
16. THIS PROJECT IS SUBJECT TO AMERICAN IRON AND STEEL (AIS) REQUIREMENTS. ALL IRON AND STEEL PRODUCTS FOR CONSTRUCTION, ALTERATION, MAINTENANCE, OR REPAIRS INCORPORATED MUST BE PRODUCED IN THE UNITED STATES.
17. PROVIDE DUST CONTROL AT ALL TIMES DURING CONSTRUCTION.
18. ANY WORK PERFORMED WITHOUT THE KNOWLEDGE OF THE ENGINEER, INSPECTOR OR OWNER'S REPRESENTATIVE IS SUBJECT TO REMOVAL AND REPLACEMENT AT THE CONTRACTOR'S EXPENSE.

EARTHWORK

1. ALL COMPACTED SUBGRADE AND BASE NOT ACCESSIBLE TO MECHANICAL COMPACTION EQUIPMENT SHALL BE HAND COMPACTED USING WHACKER PACKERS.
2. SUBGRADE PREPARATION FOR ALL STRUCTURES AND BUILDINGS ON DRAWINGS SHALL BE AS FOLLOWS: OVER-EXCAVATE 30 INCHES BELOW BASE OF CONCRETE, SCARIFY AND COMPACT TOP 12", COMPACT TO 95% STANDARD PROCTOR DENSITY, INSTALL NON-WOVEN NEEDLE PUNCHED GEOTEXTILE FABRIC, INSTALL 30 INCHES OF CRUSHER RUN AGGREGATE BASE IN 10" LIFTS, COMPACT TO 95% MODIFIED PROCTOR DENSITY. BASE OF CONCRETE SHALL BE CONSIDERED THE BOTTOM OF SLAB AND NOT THE BASE OF FOOTINGS/STEM WALLS. OVER EXCAVATION MAY BE DELETED WHERE ROCK IS PRESENT. #57 ROCK SHALL BE SUBSTITUTED FOR AGG BASE WHERE GROUNDWATER IS PRESENT. ALL FILL MATERIAL REQUIRED TO ACHIEVE FINAL GRADE BELOW THE 30" ROCK LAYER SHALL BE CONSTRUCTED WITH ONSITE OR IMPORTED FILL MATERIAL COMPACTED TO 95% STANDARD PROCTOR DENSITY.
3. ELEVATIONS GIVEN ARE FINISHED GRADE UNLESS OTHERWISE NOTED.
4. NO FIRES WILL BE ALLOWED UNLESS OTHERWISE NOTED. TREES AND BRUSH SHALL BE REMOVED AND DISPOSED OF OFF SITE.
5. NO BLASTING WILL BE ALLOWED.
6. ALL SURFACE DRAINAGE IMPACTED SHALL BE RESTORED TO AS GOOD OR BETTER CONDITION.
7. ALL DISTURBED AREAS SHALL BE LEFT FREE OF RUTS AND TRACKS AND SHALL BE FULLY GRADED TO DRAIN.

GRASSING

1. ANY AND ALL DISTURBED AREAS OUTSIDE OF PLANT FENCING SHALL BE TOPSOILED, HYDROMULCHED, AND WATERED UNTIL ESTABLISHED. ANY AND ALL DISTURBED AREAS INSIDE PLANT FENCING SHALL BE SOLID SLAB SODDED PER SPECIFICATIONS & WATERED UNTIL ESTABLISHED.
2. FOR PIPELINE CONSTRUCTION EXTERNAL TO THE TREATMENT PLANT, ANY AND ALL DISTURBED AREAS SHALL BE TOPSOILED, HYDROMULCHED, AND FERTILIZED, WITH THE EXCEPTION OF RESIDENTIAL YARDS AND IMPROVED GRASS AREAS WHICH SHALL RECEIVE SOLID SLAB SOD IN LIEU OF HYDROMULCHING PER SPECIFICATIONS. THIS WORK WILL NOT BE MEASURED FOR PAYMENT. COST SHALL BE INCLUDED IN THE PRICE BID FOR ASSOCIATED ITEMS OF WORK.

DUCTILE IRON PIPE & FITTINGS

1. ALL BURIED DUCTILE IRON PIPE AND FITTINGS SHALL BE PROTECTED IN ACCORDANCE WITH ANSI/AWWA C105/A21.5 "POLYETHYLENE ENCASEMENT FOR GRAY AND DUCTILE IRON PIPE FOR WATER AND OTHER LIQUIDS." THIS ITEM SHALL NOT BE MEASURED FOR PAYMENT AND SHALL BE INCLUDED IN THE PRICE BID FOR ASSOCIATED ITEMS OF WORK.
2. ALL AIR PIPING SHALL BE UNLINED WITH EPDM GASKETS RATED FOR COMPRESSED AIR USAGE (PRESSURE & TEMPERATURE.)
3. ALL DUCTILE IRON PIPING SHALL BE RESTRAINED JOINT.
4. ALL DUCTILE IRON PIPE CONNECTIONS TO P.V.C. SHALL BE MADE WITH A BOLTED CAST TRANSITION COUPLING.
5. ALL EXPOSED FITTINGS SHALL BE FLANGED FITTINGS W/ STAINLESS STEEL BOLTS AND APPURTENANCES.
6. ALL MECHANICAL JOINT, FLANGE & MISC. FITTINGS TO HAVE STAINLESS STEEL BOLTS, NUTS & WASHERS.
7. ALL BURIED FITTINGS SHALL BE D.I. MECHANICAL JOINT (M.J) RESTRAINED (MEGALUG.)
8. WALL PIPES SHALL BE USED WHEREVER PIPING PASSES FROM A STRUCTURE TO EARTHEN BACKFILL.
9. PROVIDE 1/4" ANTI-SEEPAGE RINGS A MINIMUM OF 2" WIDE WELDED TO ALL PIPES PIERCING WATER HOLDING TANKS TO PREVENT SEEPAGE OF WATER BETWEEN PIPE AND CONCRETE. WALL PIPES MAY BE USED IN LIEU OF WELDED RINGS.
10. ALL DUCTILE IRON PIPING LARGER THAN 10" DIAMETER SHALL HAVE CONCRETE SUPPORTS UNLESS OTHERWISE DETAILED. SMALLER PIPING MAY HAVE METAL STAND TYPE SUPPORTS.

CONCRETE

1. CONSTRUCTION JOINTS TO FACILITATE CONSTRUCTION SHALL BE LOCATED AND DETAILED ON THE SHOP DRAWINGS FOR REVIEW. UNLESS INDICATED OTHERWISE, ALL CONSTRUCTION JOINTS SHALL BE KEYED. HORIZONTAL CONSTRUCTION JOINTS SHALL NOT BE PERMITTED IN WALLS AND BEAMS, UNLESS SHOWN ON THE DRAWINGS OR APPROVED BY THE ENGINEER.
2. ALL EXPOSED CORNERS OF CONCRETE STRUCTURES REGARDLESS OF LOCATION SHALL HAVE A 3/4 INCH MINIMUM CHAMFER.
3. NOT USED.
4. ALL GROUTED AREAS OVER 8" THICK SHALL BE REINFORCED WITH WELDED WIRE MESH, 6x6-W12.0xW2.0 MATTS AT 5'-0" CTRS MAX.
5. ANCHOR BOLTS NOT SPECIFIED BY ENGINEER SHALL BE DESIGNED AND STAMPED BY A REGISTERED PROFESSIONAL ENGINEER, RETAINED BY THE CONTRACTOR IN ACCORDANCE WITH APPLICABLE PROJECT AND CODE REQUIREMENTS. SUBMIT AS A SHOP DRAWING FOR REVIEW AND APPROVAL BY THE ENGINEER. COORDINATE LOCATION, SIZE AND EMBEDMENT PRIOR TO CASTING CONCRETE.
6. EXPANSION JOINTS SHALL BE USED WHERE EXTERIOR OF ALL EXISTING AND PROPOSED STRUCTURES AND BUILDINGS ABUT CONCRETE PAVING WHETHER SHOWN ON THE DRAWINGS OR NOT.
7. NO FLY ASH SHALL BE PERMITTED IN CONCRETE MIX DESIGN.
8. TREMIES REQUIRED ON ALL POURS DEEPER THAN 10 FEET.
9. VAPOR BARRIER (10 MIL) REQUIRED BENEATH ALL SLABS.
10. WALKWAYS AND SIDEWALKS SHALL BE POURED WITH SLIGHT SLOPE AND NO LOW SPOTS SO THEY WILL DRAIN FREELY.
11. ALL STRUCTURAL JOINTS SHALL RECEIVE 6" RUBBER CENTER BULB PVC WATERSTOP PLACED AT ALL WATERTIGHT JOINTS.
12. VERTICAL WATERSTOP SHALL BE FULLY EMBEDDED IN SLAB POUR AND WELDED TO ALL ADJACENT WATERSTOP.
13. WHEN WATERSTOP IS PLACED HORIZONTALLY IN SLABS, THE CONTRACTOR SHALL TEMPORARILY TIE UP OR CLAMP UP THE WATERSTOP UNTIL THE CONCRETE IS PLACED TO SLIGHTLY ABOVE THE DEPTH OF THE WATERSTOP.
14. ALL CONCRETE SHALL HAVE XYPEX ADMIXTURE PER SECTION 03_30_00 AND MANUFACTURE'S SPECIFICATIONS.

BUILDING

1. ALL EXTERIOR DOORS ON ALL BUILDINGS SHALL HAVE R-PANEL AWNING SUPPLIED INTEGRAL WITH METAL BUILDING. AWNING ROOF PANELS SHALL MATCH MAIN BUILDING ROOF. AWNINGS SHALL INCLUDE FULL WIDTH GUTTER WITH DOWNSPOUTS.
2. ALL EXTERIOR EXPOSED CMU SHALL BE SPLIT FACE ARCHITECTURAL BLOCK UNLESS OTHERWISE NOTED.
3. ANY R-PANEL USED IN THE BUILDING CONSTRUCTION WHERE NO GAUGE IS SPECIFIED SHALL BE 24 GA. MINIMUM.

PIPING & APPURTENANCES

1. MANHOLES SHALL BE GROUTED INSIDE AND OUT AT ALL JOINTS.
2. ALL NON-POTABLE WATER LINES SHALL BE IN PURPLE COLORED PIPE AND LABELED "DO NOT DRINK". THE WARNING LABEL SHALL BE LOCATED ON OPPOSITE SIDES OF ALL PIPES AND REPEATED EVERY THREE (3) FEET OR LESS.
3. ALL PIPING THAT CROSS VERTICALLY SHALL HAVE AT LEAST 6" SEPARATION.
4. ALL UNDERGROUND FITTINGS SHALL BE DUCTILE IRON MECHANICAL JOINTS (MEGALUG), UNLESS OTHERWISE NOTED.
5. ALL VALVE ASSEMBLIES, VAULTS, PULLS BOXES AND MANHOLES CONSTRUCTED SHALL BE ADJUSTED TO BE FLUSH WITH FINISHED GRADE UNLESS OTHERWISE NOTED. MANHOLES SET IN OPEN FIELDS SHALL BE SET TWELVE INCHES ABOVE FINISHED GRADE AND VAULTS SHALL BE SET 6 INCHES ABOUT FINISHED GRADE.
6. NOT USED.
7. ANY BY-PASS PUMPING AND/OR BY-PASS PIPING INSTALLED SHALL BE OPERATED AND MAINTAINED BY THE CONTRACTOR AT CONTRACTOR'S EXPENSE. THE CONTRACTOR IS RESPONSIBLE FOR ANY UNAUTHORIZED DISCHARGES.
8. CONNECTIONS TO EXISTING UTILITIES SHALL BE MADE IN A TIME AND UNDER CONDITIONS WHICH WILL LEAST INTERFERE WITH SERVICE OF THE OWNER, AND AS AUTHORIZED BY THE ENGINEER AND OWNER. FACILITIES SHALL BE PROVIDED FOR PROPER DEWATERING AND FOR DISPOSAL OF ALL WATER/WASTEWATER REMOVED TO ADJACENT PROPERTY FROM DEWATERED LINES WITHOUT DAMAGE.
9. MAINTAIN THE REQUIRED 10 FOOT HORIZONTAL AND 2 FOOT VERTICAL SEPARATION BETWEEN SANITARY SEWER AND POTABLE WATER MAINS. ALL OTHER PIPING SHALL MAINTAIN A MINIMUM OF 5' SEPARATION.
10. ORDER MANHOLES IN PAVEMENT LOWER THAN PROPOSED GRADE AND BRING THEM TO EXACT GRADE WITH LEVEL RINGS.
11. PROVIDE FREEZE PROTECTION FOR ANY EXPOSED PIPING. FREEZE PROTECTION SHALL CONSIST OF WRAPPED PIPE W/ RIGID ALUMINUM COVERS UNLESS OTHERWISE SPECIFIED. FREEZE PROTECTION/INSULATION WILL NOT BE REQUIRED FOR PIPING INSIDE BUILDING, AIR PIPING OR SCADA INSTRUMENTATION CONDUIT.
12. CONTRACTOR SHALL SCHEDULE AND CONDUCT OPERATIONS TO LIMIT AMOUNT OF TRENCH OPENED TO INCLUDE ONLY THAT WHICH MAY BE COVERED IN 2 (TWO) DAYS TIME TO A MAXIMUM OF 200'. ANY TRENCH LEFT OPEN OVERNIGHT SHALL BE BARRICADED AND PROTECTED AS DETAILED IN THE MOST CURRENT EDITION OF THE MANUAL OF UNIFORM TRAFFIC CONTROL DEVICES.
13. SEWER MAINS SHALL BE CONSTRUCTED UTILIZING A LASER WITH GRADE ESTABLISHED THROUGH SEWER PIPE.
14. WHEN TIE-INS TO EXISTING MANHOLES ARE TO BE MADE, CONTRACTOR SHALL VERIFY MANHOLE FLOW LINE AT AN INTERVAL PRIOR TO MANHOLE TO ENSURE ADEQUATE DEPTH OF NEW LINE. WHEN CONSTRUCTING A MANHOLE OVER AN EXISTING LINE, CONTRACTOR SHALL VERIFY EXISTING LINE DEPTHS PRIOR TO MANHOLE CONSTRUCTION.
15. MATERIAL EXCAVATED FROM TRENCH & PIPE BEDDING MATERIALS SHALL NOT BE PLACED ON ADJACENT ASPHALT OR CONCRETE PAVING.
16. A SILT AND VARMINT CAP AND/OR PLUG SHALL BE IN PLACE ON THE OPEN END OF PIPES AT ALL TIMES.
17. DO NOT EXCEED 75% OF MANUFACTURE'S RECOMMENDED MAXIMUM DEFLECTION FOR PIPE JOINTS UNLESS OTHERWISE NOTED.
18. INSTALL TEMPORARY FENCES TO PROTECT HORSES AND LIVESTOCK WHEN NECESSARY.
19. REMOVAL AND REPLACEMENT OF STREET TRAFFIC SIGNS, MAIL BOXES AND OTHER STRUCTURES BY THE CONTRACTOR TO FACILITATE CONSTRUCTION SHALL BE CONSIDERED INCIDENTAL AND BE INCLUDED IN THE PRICE BID.
20. ALL EXISTING PAYMENT TO REMAIN SHALL BE SAWCUT TO ENSURE A STRAIGHT SMOOTH SURFACE. ALL CUTS MADE IN DRIVEWAYS OR OTHER PAVEMENTS SHALL BE MADE IN STRAIGHT PERPENDICULAR LINES. COST TO BE CONSIDERED SUBSIDIARY TO CONTRACTOR'S BID.

TREATMENT PLANT

1. ALL EXPOSED COMPONENTS REGARDLESS OF LOCATION TO BE CORROSION RESISTANT. (GALVANIZED, ALUMINUM, SST, FRP, ETC).
2. PROPERLY INSULATE, GASKET AND PROTECT TRANSITIONS TO DISSIMILAR METALS (DUCTILE-STAINLESS).
3. ALL EXPOSED VALVES SHALL HAVE HANDWHEELS OR LEVERS. CHAINWHEELS TO BE PROVIDED ON ALL ELEVATED VALVING.
4. ALL PLANT PIPING, CONDUIT, DRAINS, EQUIPMENT, PIPING, ELECTRICAL, COMPONENTS, ETC., SHALL BE PROVIDED WITH PIPE AND EQUIPMENT SUPPORTS, PIPE AND EQUIPMENT HANGERS FOR ALL BRACING AND STABILIZATION FOR A COMPLETE SYSTEM AND PROVIDE WALKING ACCESS AREAS FREE AND CLEAR. ALL PIPE SHALL BE PROPERLY PAINTED OR COATED WITH APPROVED PAINT. CONTRACTOR SHALL LABEL UNITS, PIPING, VALVES, TANKS, ETC., WITH PROPER FLOW DIRECTION AND TYPE. LOCATION AND NUMBER OF PIPE HANGERS AND PIPE SUPPORTS SHOWN IN ONLY APPROX. CONTRACTOR SHALL DESIGN SUPPORTS AS SPECIFIED.
5. ALL PVC/CPVC VALVES AND COMPONENTS FOR USE IN CHEMICAL FEED AND AIR PIPING SHALL HAVE VITON SEALS AND SHALL BE RATED FOR PRODUCT BEING CARRIED.
6. ALL SUSPENDED PIPING SHALL BE SUPPORTED AT NOT LESS THAN EVERY 10 FEET. ALL PIPING LARGER THAN 6" DIAMETER MAY REQUIRE ADDITIONAL SUPPORTS PER SUPPORT SUPPLIERS RECOMMENDATIONS AND/OR SPECIFICATION REQUIREMENTS.
7. ALL WATERTIGHT STRUCTURES CONCRETE SHALL HAVE 72 HOUR WATER TEST FOR LEAKAGE ON STRUCTURE BEFORE BACKFILL.
8. DISSIMILAR METALS IN CONTACT SHALL BE PROVIDED WITH GALVANIC SEPARATION.
9. CONTRACTOR SHALL COORDINATE WITH SUPPLIERS AND PROVIDE DRAIN CONDUIT (2" MINIMUM) FOR ANY/ALL ANALYZERS, RPZ, AIR/VAC VALVES, SAMPLERS OR ANY OTHER ITEM INSIDE BUILDING WHICH DISCHARGES INTERMITTENT WATER AND ROUTE TO DRAIN. NO SURFACE DRAINAGE WILL BE PERMITTED.
10. NOT USED.
11. SUBMIT FOR REVIEW ALL EQUIPMENT SIZES, OPERATING WEIGHTS, VIBRATION FORCES, SUPPORT LOCATIONS, ALONG WITH ANY FLOOR OPENINGS, NOTCHES, AND RECESSES REQUIRED BY SUCH EQUIPMENT. CONCRETE SUPPORT PADS AND/OR FRAMING REQUIRED TO SUPPORT SAID EQUIPMENT SHALL NOT BE FABRICATED AND PLACED UNTIL THE CONCRETE SUPPORT PADS AND/OR FRAMING IS APPROVED TO SUPPORT THE EQUIPMENT.
12. PROCESS EQUIPMENT DELIVERIES SHALL BE COORDINATED SO THAT EQUIPMENT COMES TO SITE NO MORE THAN 60 DAYS PRIOR TO INSTALLATION, UNLESS STORED INDOORS WITH CLIMATE CONTROL.
13. AT ALL POINTS UNDERGROUND WHERE PIPING EXITS STRUCTURES AND TRANSITIONS TO NATURAL GROUND OR OTHER AREAS SUBJECT TO GROUND SETTLING OR OTHER POTENTIAL INTRODUCED STRESSES AFTER INSTALLATION, A BELL-FLANGE WALL PIPE W/SEEP RING AND RESTRAINED MECHANICAL JOINT SHALL BE PROVIDED TO ALLOW FOR DEFLECTION WHETHER BEING SHOWN ON DRAWINGS OR NOT. NO EXCEPTIONS.
14. ALL PIPING 18" AND LARGER SHALL HAVE A MINIMUM COVER OF 48"; AND PIPE SMALLER THAN 18" SHALL HAVE A MINIMUM COVER OF 36" UNLESS OTHERWISE NOTED. PIPE SHALL BE ROUTED AS SHOWN UNLESS MINOR REVISIONS ARE NECESSARY TO AVOID EXISTING PIPES, STRUCTURES, ETC. CONTRACTOR SHALL BE RESPONSIBLE FOR FURNISHING ALL FITTINGS AND ADAPTERS REQUIRED TO MAKE THE ROUTING CHANGES. CONTRACTOR SHALL INCLUDE COST IN PRICE BID.
15. WHERE CONFLICTS OCCUR BETWEEN CIVIL AND MEP DRAWINGS CIVIL DRAWINGS SHALL GOVERN. ELECTRICAL CONTRACTOR IS RESPONSIBLE FOR VERIFICATION AND ANY MINOR MODIFICATIONS REQUIRED TO FACILITATE INSTALLATION AS OUTLINED ON CIVIL DRAWINGS.
16. REVIEW OF ANY/ALL SCOPE AND PROPOSALS FURNISHED BY EQUIPMENT SUPPLIERS AND SHALL VERIFY ALL REQUIREMENTS OUTLINED IN PROPOSED EQUIPMENT SCOPE/PROPOSAL HAVE VERIFIED AGAINST THE DRAWINGS PRIOR TO BID. ANY ADJUSTMENTS AND/OR ADDITIONAL WORK/MATERIALS REQUIRED ARE THE RESPONSIBILITY OF THE CONTRACTOR AND NO ADDITIONAL COMPENSATION WILL BE PROVIDED.
17. MAKE CONNECTIONS TO EXISTING PIPE, EQUIPMENT, ETC. AS REQUIRED AND SHALL PROVIDE ALL FITTINGS, ADAPTERS AND APPURTENANCES REQUIRED TO MAKE THE CONNECTIONS. PROVIDE SUPPORTS REQUIRED FOR A RIGIDLY SUPPORTED SYSTEM.
18. TEMPORARILY RELOCATE PIPING AS REQUIRED TO MAINTAIN SERVICE TO THE EXISTING PLANT.
19. MECHANICAL AND ELECTRICAL EQUIPMENT SUPPORTS, ANCHORAGES, OPENINGS, RECESSES, AND REVEALS NOT SHOWN ON THE STRUCTURAL DRAWINGS THAT ARE REQUIRED BY OTHER CONTRACT DRAWINGS SHALL BE PROVIDED PRIOR TO CASTING CONCRETE.
20. PRIOR TO FABRICATION OF NEW PIPING, INCLUDING SPECIAL FITTINGS AND EXCAVATIONS FOR NEW STRUCTURES, ELECTRICAL CONDUIT AND/OR OTHER PROPOSED UTILITIES, CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING THE LOCATION OF ALL EXISTING PIPING AND UTILITIES IN THE CONSTRUCTION AREA. AT TIE-IN LOCATIONS, VERIFY THE SIZING OF EXISTING PIPING BEFORE FABRICATION OF NEW PIPING AND FITTINGS. THE CONTRACTOR SHALL INCLUDE THE COST IN HIS BID FOR TEMPORARILY RELOCATING AND REINSTALLING EXISTING UTILITIES AS REQUIRED FOR CONSTRUCTION OF PROPOSED ITEMS.
21. ANY PLANT UTILITY, PIPING, CONDUIT, COMMUNICATION SYSTEM, ELECTRICAL OR INSTRUMENTATION WIRING DAMAGED DURING CONSTRUCTION SHALL BE REPAIRED AND PLACED BACK IN SERVICE BY THE CONTRACTOR ON THE SAME DAY THAT THE DAMAGE OCCURRED. AFTER 24 HOURS OUT OF SERVICE, OWNER WILL HAVE THE OPTION OF HAVING THE REPAIRS MADE BY A SEPARATE CONTRACTOR AND DEDUCTING THE COST OF SAID REPAIRS FROM THE CONTRACT AMOUNT.
22. GALVANIZED STEEL PRODUCTS SHALL NOT BE USED FOR ANY TREATMENT PLANT STRUCTURE / EQUIPMENT CONSTRUCTION UNLESS SPECIFICALLY CALLED OUT / APPROVED.
23. ALL NEW UNISTRUT, ANCHORS, SUPPORT SYSTEMS AND FASTENING HARDWARE TO BE 316 STAINLESS STEEL.
24. BACKFILLING AGAINST STRUCTURES WHICH HAVE A TOP SLAB SHALL BE DONE ONLY AFTER THE TOP SLAB IS IN PLACE AND THE CONCRETE HAS CURED TO 2/3 OF ITS DESIGN STRENGTH, BUT IN NO CASE LESS THAT 4 DAYS.
25. STAGING AREA WILL ONLY BE USED FOR CONSTRUCTION EQUIPMENT AND MATERIALS USED IN THE CONSTRUCTION OF THE PROJECT. CONSTRUCTION DEBRIS SHOULD NOT BE ALLOWED TO ACCUMULATE AND SHOULD BE REMOVED ON A WEEKLY BASIS.
26. INSTALL METAL TRACER WIRE AND COLOR CODE FOR ALL PIPE INSTALLED.
27. IN ACCORDANCE WITH OAC 252:656-5-4(C)(1), SANITARY SEWER MUST BE AT LEAST 10-FEET FROM AN EXISTING OR PROPOSED WATERMAIN AND AT LEAST 5-FEET ELECTRICAL OR PETROLEUM LINES. SANITARY SEWERS MUST CROSS AT LEAST 24 INCHES ABOVE OR BELOW WATERMAINS.
28. THE CONTRACTOR SHALL NOT OPEN OR CLOSE ANY VALVES AT THE TREATMENT PLANT AND SHALL ASK FOR THE OWNER'S ASSISTANCE.

ELECTRICAL/CONTROLS/SCADA

1. ALL ELECTRICAL CONSTRUCTION SHALL BE IN STRICT ACCORDANCE WITH ALL N.E.C. AND LOCAL ELECTRICAL CODES.
2. ALL EQUIPMENT (INCLUDING MCC & PANELS) SHALL RECEIVE HOUSEKEEPING PADS WITH #4 BARS @ 12" O.C.E.W. MINIMUM THICKNESS SHALL BE 6" OR AS REQUIRED FOR ANCHOR BOLT CLEARANCE. ANCHOR BOLTS SLEEVES MAY BE USED PROVIDED THE SLEEVES ARE NON-SHRINK GROUT FILLED WITH 1-1/2" GROUT UNDER EQUIPMENT BASE. ALL PADS SHALL BE ANCHORED TO CONCRETE SLABS WITH J BARS (#3 @ 12" O.C.) OR EPOXY ANCHORS.
3. ALL SCADA SYSTEM WIRING SHALL BE CONDUIT ENCASED AND IS NOT SHOWN FOR CLARITY. CONTRACTOR TO PROVIDE PROPOSED CONDUIT LAYOUT WITH SCHEDULE TO ENGINEER FOR APPROVAL PRIOR TO CONSTRUCTION.
4. ALL SURFACE MOUNTED PANELS AND PANEL BOARDS ON THE INTERIOR OF EXTERIOR WALLS OR IN OTHER LOCATIONS CONSIDERED DAMP OR WET AND SHALL BE MOUNTED SO AS TO MAINTAIN A 1/4" MINIMUM AIR SPACE BETWEEN THE ENCLOSURE AND THE WALL.
5. ALL EXTERNAL DISPLAYS SHALL BE PROVIDED WITH A WEATHER SHIELD.
6. REVIEW ANY/ALL SCOPE AND PROPOSALS FURNISHED BY EQUIPMENT SUPPLIERS. VERIFY ALL ELECTRICAL REQUIREMENTS OUTLINED IN PROPOSED EQUIPMENT SCOPE/PROPOSAL HAVE BEEN ACCOMMODATED FOR BY ELECTRICAL CONTRACTOR.
7. THE WIRING DIAGRAMS, QUANTITY AND SIZE OF WIRES AND CONDUITS REPRESENT A SUGGESTED ARRANGEMENT BASED UPON SELECTED STANDARD COMPONENTS OF ELECTRICAL EQUIPMENT. IF EQUIPMENT SUPPLIED BY THE MANUFACTURER HAS A LARGER LOAD THAN THE VALUE SHOWN OR INDICATED, THE CABLE, CONDUIT AND ELECTRICAL EQUIPMENT SHALL BE ENLARGED AS REQUIRED TO ACCOMMODATE THE HIGHER LOADING. HOWEVER, THE BASIC SEQUENCE AND METHOD OF CONTROL MUST BE MAINTAINED AS INDICATED ON THE DRAWINGS AND/OR SPECIFICATIONS. CONTRACTOR TO PROVIDE PROPOSED CONDUIT LAYOUT WITH SCHEDULE TO ENGINEER FOR APPROVAL PRIOR TO CONSTRUCTION.

NOTES:
1. NOT USED.
2. NOT USED.
3. GATE WIDTHS LISTED ARE NOMINAL.
4. CONTRACTOR SHALL ADJUST LOCATION OF GRIT WASHER CONVEYER TO ALLOW FOR USE OF ONE DUMPSTER.
5. THERE SHALL NOT BE ANY GRATING OVER GATES WHICH WOULD INTERFERE WITH OPERATION.
6. NOT USED.
7. GRIT PUMPS SHALL BE EQUIPPED WITH CASE HEATING AND FREEZE PROTECTION PER MANUFACTURERS RECOMMENDATIONS.
8. PW WATER CONNECTION TO EQUIPMENT SHALL BE INSTALLED WITH CONNECTION SOLENOID VALVE SUPPLIED BY MANUFACTURER. FIELD ROUTE ELECTRICAL/CONTROLS PER MANUFACTURERS RECOMMENDATIONS.
9. CONTRACTOR SHALL VERIFY WITH OWNER DUMPSTER DIMENSIONING PRIOR TO PLACEMENT OF CLASSIFIER/COMPACTOR DISCHARGE OUTLETS.
10. ALL PIPING AND CONNECTIONS SHALL BE PER MANUFACTURERS RECOMMENDATIONS.
11. ALL ELECTRONICALLY ACTUATED VALVES TO ALSO BE EQUIPPED WHANDWHEEL OPERATORS.
12. SLIDE GATES TO BE MOUNTED PER MANUFACTURERS RECOMMENDATIONS.
13. CONTRACTOR TO INSTALL A 2" RADIUS FILLET BEFORE AND AFTER THE SCREENS TO PREVENT SEDIMENTATION OF SOLIDS. CONTRACTOR SHALL VERIFY WITH MFR. THAT APPROPRIATE CHANNEL VELOCITY WILL BE MAINTAINED.
14. ACTUATED SLIDE GATE EMERGENCY FLOAT TO AUTOMATICALLY CLOSE GATE IN THE EVENT WATER RISES TO HEADWORKS FLOOR.
15. AT CONTRACTORS OPTION, FLOOR OF HEADWORKS MAY BE POURED LEVEL AT ELEVATION GROUTED TO PROPOSED FLOW LINE ELEVATION.
16. COORDINATE LOCATIONS FOR REQUIRED WASH WATER NON POTABLE WATER MAINS WITH HEADWORKS EQUIPMENT SUPPLIER PRIOR TO INSTALLATION.
17. ELECTRONICALLY OPERATED GATE SHALL BE 480 VOLTS/3 PHASE.
18. CONTRACTOR SHALL SUBMIT A COMPLETE PIPING PLAN FOR APPROVAL.
19. CONTRACTOR SHALL PROVIDE PIPING SUPPORTS AS NEEDED REGARDLESS OF BEING SHOWN ON DRAWINGS.
20. 1.5% SLOPE TOWARD CHANNELS MAY BE GROUTED OR CONSTRUCTED WITH THICKENED SLAB. SLOPE TO START AT TOP OF WALL (T.O.W.) ELEVATION & EXTEND OUTWARD.
21. ALL OPEN AREAS OF HEADWORKS STRUCTURE ARE TO RECEIVE GRATING. SOME GRATING IS NOT SHOWN FOR CLARITY.
22. COORDINATE WITH EQUIPMENT SUPPLIER FOR EXACT REQUIREMENTS OF INLET WATER PIPING PRIOR TO BID.
23. EQUIPMENT DRAINS NOT SHOWN IN PIPING SHALL BE FIELD ROUTED TO HEADWORKS CHANNELS PER MANUFACTURER RECOMMENDATIONS.
24. COMPLETE SYSTEM TO BE EQUIPPED WITH A FACTORY DESIGNED FREEZE PROTECTION SYSTEM CONSISTING OF HEAT TAPE, CASE HEATERS AND INSULATION. FREEZE PROTECTION SYSTEM SHALL BE DESIGNED TO ENSURE PROPER OPERATION INDEFENITELY AT -15° FAHRENHEIT. PROVIDE INFORMATION ON FREEZE PROTECTION SYSTEM WITH THE EQUIPMENT SUBMITTAL.
25. ALL EXPOSED PIPING IN HEADWORKS AREA 6" AND SMALLER SHALL BE GROOVED 316 STAINLESS STEEL. COMPLETE SYSTEM TO BE FURNISHED AND DESIGNED BY VICTAULIC.
26. ALL HYDRANTS TO BE FURNISHED WITH STAINLESS STEEL SELF SUPPORTING HOSE RACK AND 50' OF HEAVY DUTY COMMERCIAL HOSE (1").

HANDRAIL/WALKWAY NOTES:

1. COMPLETE HANDRAIL SYSTEM (INCLUDING STAIRS AND PUMP MAINTENANCE PLATFORM) TO BE FURNISHED AS A SYSTEM (INCLUDING PRE-EQ BASIN) FROM A SINGLE SUPPLIER. COMPLETE SYSTEM TO BE STAMPED BY AND OKLAHOMA STRUCTURAL ENGINEER (S.E.).
2. HANDRAIL/WALKWAY SUPPLIER TO COORDINATE STAIRS/STEPS OF ADEQUATE CLEARANCE FOR LOCATIONS WHERE AIR/SLUDGE/MISC. PIPING EXTENDS OVER TOP OF WALL. SUBMITTAL REQUIRED.

NOTES:

1. ALL COMPONENTS SHALL BE DUCTILE IRON OR STAINLESS STEEL.
2. ALL ELECTRONICALLY ACTUATED VALVES TO ALSO BE EQUIPPED WITH HAND WHEEL OPERATORS.
3. PIPE SUPPORT LOCATIONS ARE FOR REFERENCE ONLY & MORE MAY BE REQUIRED PER SPECIFICATION REQUIREMENTS AND/OR INDUSTRY STANDARD.
4. ALL AERATION COMPONENTS INTERNAL TO BASINS TO BE STAINLESS STEEL. SYSTEM TO BE DESIGNED AND FURNISHED BY SUPPLIER. COORDINATE WITH SUPPLIER FOR INSTALLATION DETAILS AND CONSTRUCTION INFORMATION.
5. MUD VALVES SHALL BE FURNISHED WITH STEM, WALL ANCHORS, AND HANDWHEEL OPERATOR IN A COMPLETE SYSTEM FOR WALL MOUNTING WITH WHEEL OPERATOR AT WALKWAY LEVEL. SUBMITTAL REQUIRED.
6. GLOBE VALVES TO BE USED TO FILL SBR DECANTER TO RELEASE AIR.
7. AIR PIPING TO BE SUPPORTED TO PREVENT SLIPPAGE AND TO BE LOOSELY ATTACHED TO ALLOW PIPE MOVEMENT.

NOTES:

1. CONTRACTOR NEEDS TO PROVIDE A ¾" NIPPLE AND GLOBE VALVE BETWEEN OUTSIDE OF DECANTER SPOOL PENETRATION AND EFFLUENT CONTROL VALVE TO SERVE AS A FILL PORT TO SINK DECANTER AT START-UP.
2. DECANTER OUTLET PIPING MUST BE DESIGNED WITH A SUBMERGED OUTLET OR TRAPS TO PREVENT AIR FROM ENTERING THE DECANTER.
3. ALL PIPE ELEVATIONS SHOWN ARE CENTER OF PIPE UNLESS OTHERWISE INDICATED.
4. ALL FRP PIPE AND FITTINGS SHALL BE 75 PSI MIN. PRESSURE RATING.
5. ALL FLANGES FURNISHED BY SUPPLIER SHALL MEET OUTSIDE DIAMETER, BOLT CIRCLE DIAMETER, NUMBER AND SIZE OF HOLES PER ANSI B.16.1 125 LB. CAST IRON, AND ANSI B16.5 150 LB. STEEL FLANGE SPECIFICATIONS.
6. GASKETS PROVIDED BY SUPPLIER SHALL BE 3/16" THICK, FULL FACE BUNA-N RUBBER, WITH A DUROMETER HARDNESS OF 40-50 ON THE SHORE-A SCALE.

NOTES:

1. ALL COMPONENTS SHALL BE DUCTILE IRON OR STAINLESS STEEL.
2. ALL ELECTRONICALLY ACTUATED VALVES TO ALSO BE EQUIPPED WITH HAND WHEEL OPERATORS.
3. PIPE SUPPORT LOCATIONS ARE FOR REFERENCE ONLY & MORE MAY BE REQUIRED PER SPECIFICATION REQUIREMENTS AND/OR INDUSTRY STANDARD.
4. ALL AERATION COMPONENTS INTERNAL TO BASINS TO BE STAINLESS STEEL. SYSTEM TO BE DESIGNED AND FURNISHED BY SUPPLIER. COORDINATE WITH SUPPLIER FOR INSTALLATION DETAILS AND CONSTRUCTION INFORMATION.
5. MUD VALVES SHALL BE FURNISHED WITH STEM, WALL ANCHORS, AND HANDWHEEL OPERATOR IN A COMPLETE SYSTEM FOR WALL MOUNTING WITH WHEEL OPERATOR AT WALKWAY LEVEL. SUBMITTAL REQUIRED.
6. GLOBE VALVES TO BE USED TO FILL SBR DECANTER TO RELEASE AIR.
7. AIR PIPING TO BE SUPPORTED TO PREVENT SLIPPAGE AND TO BE LOOSELY ATTACHED TO ALLOW PIPE MOVEMENT.

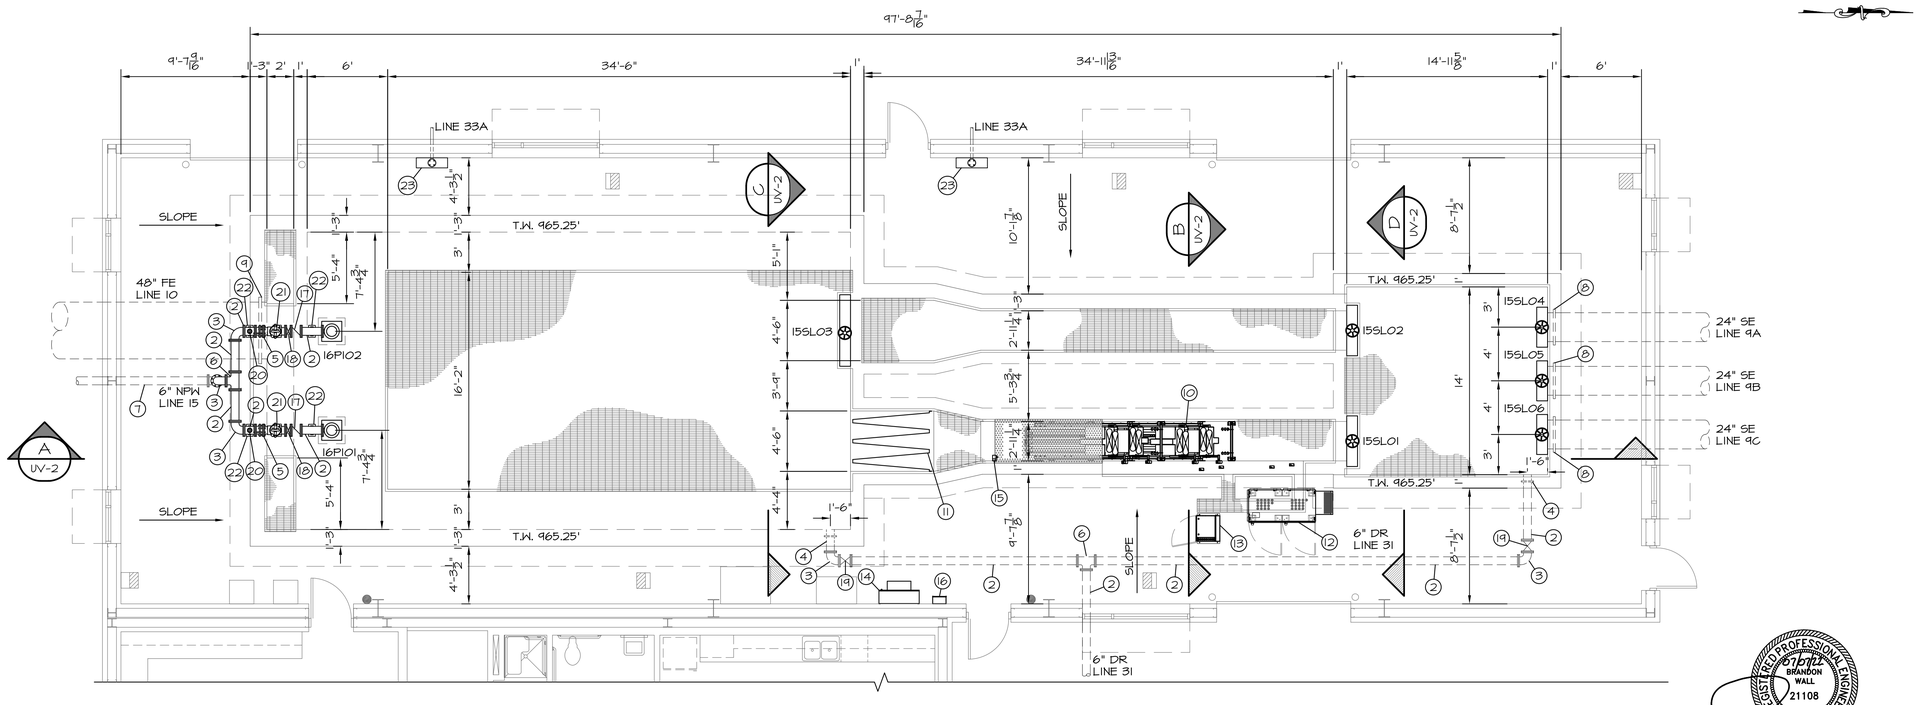
1. ALL GATES ARE UPWARD OPENING UNLESS OTHERWISE SPECIFIED.
2. ELECTRICALLY OPERATED GATE: 460 VOLTS/3 PHASE.
3. SEE HW-5 FOR GATE DETAIL AND COORDINATE W/MANUFACTURER FOR ADDITIONAL INFORMATION.

NON-POTABLE WATER PUMP SCHEDULE - STRUCTURE #16



NO.	FLOW	TDH-DES	FUNCTION	CONTROL	HP
16P101-16P102	400 GPM	235'	PRIMARY	VFD	±40

PUMP NOTES:

1. PUMP SHALL BE GORMAN RUPP T3AS-E5 SELF PRIMING PUMP.
2. 4" SIMPLEX STRAINER SHALL BE EATON MODEL 72 OR APPROVED EQUAL AND SHALL HAVE PIPE SUPPORTS UNDER THE PROCESS PIPING NEAR THE INLET AND OUTLET CONNECTIONS (SEE PIPE SUPPORT DETAIL SHEET DT-03).
3. STRAINER DRAIN SHALL BE FIELD ROUTED INTO BASIN THROUGH APPROPRIATELY SIZED SCH. 80 PVC CONDUIT PER MANUFACTURES REQUIREMENTS.
4. GRATING OVER UV CHANNELS SHALL BE SIZED TO BE EASILY REMOVED BY ONE PERSON.
5. INVERT MOUNTING PER GATE MANUFACTURER REQUIREMENTS/RECOMMENDATIONS SUBMITTAL REQUIRED.
6. COORDINATE WITH PUMP SUPPLIER FOR CONCRETE PENETRATION REQUIREMENTS.

UV NOTES:

1. UV CHANNEL TO HAVE HIGH LEVEL ALARM.
2. SUBMIT WIRING PLAN TO ENGINEER FOR APPROVAL PRIOR TO STARTING WORK.
3. COORDINATE WITH UV SUPPLIER FOR EXACT WIRING AND EQUIPMENT REQUIREMENTS PRIOR TO BID.
4. EQUIPMENT LOCATION IS FOR REFERENCE ONLY. PROVIDE EQUIPMENT LAYOUT TO ENGINEER FOR APPROVAL PRIOR TO CONSTRUCTION.
5. DO NOT SLOPE CHANNEL FLOOR.
6. CHANNEL WIDTH MUST BE KEPT WITHIN A TOLERANCE OF ± 1-1/2" AT UV BANK FRAME AND ±¼" FOR REST OF CHANNEL.
7. ALL CHANNEL ELEVATIONS MUST BE KEPT WITHIN A TOLERANCE OF ± ¼".
8. REMOVABLE GRATING SECTIONS SHALL BE EASILY REMOVED BY ONE PERSON. MAXIMUM WEIGHT OF THE SECTIONS SHALL BE IN ACCORDANCE WITH REQUIREMENTS OF THE APPLICABLE JURISDICTION.
9. CONTRACTOR TO REVIEW ALL TROJAN TECHNOLOGIES INSTALLATION INSTRUCTIONS PRIOR TO EQUIPMENT INSTALLATION.
10. HYDRAULIC HOSE ELEVATIONS NOT TO EXCEED 12" ABOVE HSC MOUNTING ELEVATION.
11. SOLID GRATING REQUIRED TO BLOCK ULTRAVIOLET (UV) LIGHT. IN AREAS SPECIFIED.
12. COORDINATE EXACT DIMENSIONS WITH SUBMITTAL DRAWING.
13. HOUSE KEEPING PADS REQUIRED FOR ALL EQUIPMENT.
14. DURING NORMAL OPERATIONS IF HIGH LEVEL ALARM IS INDICATED, INFLUENT GATES SHOULD CLOSE AND/OR BYPASS GATES OPEN.

NOTE:
CONCRETE TO SLOPE CONTINUOUS FROM EXTERIOR FINISH FLOOR ELEVATION OF 965.33 TO TOP OF WALL ELEVATION OF 965.25 TO FACILITATE DRAINAGE.

LOW PROFILE AERATION SYSTEM NOTES:

1. MATERIALS OF CONSTRUCTION TO BE T-304 STAINLESS STEEL.
2. SLOPE OF CONCRETE FLOOR AND LEVEL OF CONCRETE FLOOR ACROSS WIDTH OF BASIN IS CRITICAL TO PROPER SYSTEM PERFORMANCE.
3. CONCRETE SURFACE TO BE FLAT AND SMOOTH (¼" IN 10' IN ALL DIRECTIONS), AND IS CRITICAL FOR PROPER SEALING.
4. PLACE SEAL MATERIAL BETWEEN MATING STEEL AND CONCRETE SURFACES BEFORE ANCHORAGE. COORDINATE WITH MANUFACTURER.
5. PROVIDE SEALING AND EQUIPMENT INSTALLATION PLAN TO ENGINEER AND MANUFACTURER FOR APPROVAL PRIOR TO CONSTRUCTION.
6. AREA BETWEEN PLCA AND WALL WILL BE GROUTED TO ACTUAL SUPPLIED WIDTH. COORDINATE WITH MANUFACTURER.

HOIST NOTES:

1. PROVIDE MOTORIZED TROLLEY HOIST CAPABLE OF LIFTING SUBMERSIBLE PUMPS FROM WET WELL FOR MAINTENANCE AND REPAIR.
2. HOIST SUPPLIER SHALL INSPECT AND CERTIFY HOIST INSTALLATION MEETS MINIMUM STANDARDS AND IS APPROPRIATE FOR THIS APPLICATION.

VALVE SCHEDULE STRUCTURE #24

NO.	FLOW	TDH-DES	FUNCTION	CONTROL	HP	EFFICIENCY MIN.
24P101-24104	6000 GPM	30'	PRIMARY	VFD	75	77%

PUMP NOTES:

1. PUMPS SHALL FENTAIR OR APPROVED EQUAL.
2. PUMPS SHALL BE PROVIDED WITH BASE ELBOWS, S.S. RAILS, AND S.S. LIFTING CHAINS.
3. PROVIDE FITTINGS AS REQUIRED TO CONNECT BASE ELBOWS TO LIFT STATION PIPING.
4. EACH PUMP SHALL BE EQUIPPED WITH A VARIABLE FREQUENCY DRIVE.
5. HOLD CONDUIT TIGHT TO BOTTOM OF WET WELL SLAB. ONE CONDUIT FOR EACH POWER CABLE, ONE FOR FLOAT SWITCHES.
6. SEAL CONDUITS TO KEEP WET WELL GASSES OUT OF CONTROL PANEL.
7. LOCATED FLOATS AND CABLE HOLDER AWAY FROM INLET PIPE.
8. ALL COMPONENTS SUBJECT TO CONTACT WITH WASTEWATER SHALL BE DUCTILE IRON OR STAINLESS STEEL.
9. SEE SHEET HW-5 FOR GATE DETAIL.
10. PIPE SUPPORT LOCATIONS ARE FOR REFERENCE ONLY & MORE MAY BE REQUIRED PRE SPECIFICATIONS AND/OR INDUSTRY STANDARD.
11. WETWELL TO BE EQUIPPED WITH A LEVEL TRANSDUCER AND 3 BACKUP FLOATS (LOW LEVEL, ALARM, INFLUENT CLOSE).

APPURTENANCE SCHEDULE STRUCTURES #18, #20, #21&#22	
APP. NO	DESCRIPTION
A	POLYMER TOTES WITH POLYMER TRANSFER PUMP AND TOTE MIXER
B	2 METER BELT FILTER PRESS
C	NOT USED
D	POLYMER FEED PUMPS AND CONTROLLERS (SEE SHEET SHF-10 FOR DETAILS)
E	NOT USED
F	6" POLYMER INJECTION RING W/MIXING VALVE (BY BFP MANUFACTURER)
G	WALL MOUNTED UTILITY STATION (SEE NOTE 6) (SEE DETAIL SHEETS)
H	CONVEYOR
J	WALKWAY (SEE SHF-9 FOR DETAILS)
K	BACKFLOW PREVENTER (SEE DT-5 FOR DETAIL) (2" WATTS LF009)
L	FLOOR DRAIN (SIZE TO MATCH PIPE DIAMETER)
M	WALL MOUNTED EYE/FACE WASH (SEE NOTE 5)
N	ELECTRICAL/CONTROL PANEL

NOTES:

1. SEE ARCHITECTURAL SHEETS FOR BUILDING INFORMATION/DETAILS. SLOPE FLOORING TO DRAINS PER SHF-4 (NOT SHOWN ON ARCHITECTURAL/ARCHITECTURAL STRUCTURAL).
2. CONTRACTOR TO VERIFY EQUIPMENT DIMENSIONS WITH EQUIPMENT SUPPLIER PRIOR TO INSTALLATION.
3. EYE WASH TO BE BRADLEY MODEL S19-220T. FIELD ROUTE DRAIN LINE TO ADJACENT TRENCH DRAIN.
4. CONTRACTOR TO US BELT FILTER PRESS SUBMITTAL DRAWINGS TO SIZE AND LAYOUT FOOTING SUPPORTS. DIMENSIONS SHOWN ON THESE DRAWINGS ARE FOR REFERENCE ONLY.
5. ALL WALL MOUNTED UTILITY STATIONS TO BE FURNISHED WITH 30' INDUSTRIAL 1" HOSES WITH HAND HELD SPRAY NOZZLES (1 TOTAL).
6. COORDINATE ALL COMPONENTS SHOWN IN SHF SHEETS WITH ELECTRICAL AND CONTROLS. NOT ALL COMPONENTS ARE OUTLINED IN ELECTRICAL DRAWINGS (METERS, SOLENOID VALVES, SCALES, ECT.). IT IS THE CONTRACTORS RESPONSIBILITY THAT ADEQUATE CONDUIT, WIRE, SCADA INTERACTION, ECT. IS INCLUDED.
7. CHEMICAL SCALE OUTPUT TO BE ROUTED UNDERGROUND TO NEAREST WALL. LOCATION TO BE APPROVED BY ENGINEER.
8. ANY CONFLICT BETWEEN SHF SHEETS & ARCHITECTURAL, STRUCTURAL OR ELECTRICAL SHEETS, SHF SHEETS GOVERN.
9. INTEGRATE POLYMER CONTROLS TO BELT PRESS CONTROL PANEL SUCH THAT POLYMER CAN BE STARTED/STOPPED/CONTROLLED REMOTELY FROM BFP CONTROL PANEL.

SECTION THRU ELEVATED WALKWAY

N.T.S.

NOTES:

1. ALL FRAMING MEMBERS SHALL BE FRP CHANNELS ALL COLUMNS SHALL BE 3" FRP TUBES (MIN).
2. SUPPLIER OF FRP WALKWAY SHALL DESIGN ALL MEMBER SIZES AND DETAIL ALL CONNECTIONS.
3. DESIGN LOADS: (GRATING AND FRAME)
   A. 100 PSF UNIFORM OR 300# CONCENTRATED LOAD PER LINEAL FOOT AT MIDSPAN (MAXIMUM).
   B. MAXIMUM DEFLECTION = 0.25 INCHES.
   C. FACTOR OF SAFETY:
      BENDING = 3.0
      SHEAR = 4.0
      COMPRESSION = 3.0
      CONNECTIONS = 4.0
4. ALL FASTENERS SHALL BE GALVANIZED STEEL.
5. WALKWAY GRATING TO BE REMOVABLE IN 6 FOOT NOMINAL LENGTH SECTIONS. REMAINING STRUCTURE TO BE STABLE AND USABLE UNDER FULL LIVE LOAD.
6. WALKWAY SUBMITTAL SHALL BE STAMPED BY A STRUCTURAL ENGINEER (S.E.) LICENSED IN OKLAHOMA.
7. SIZING IS FOR REFERENCE ONLY & MAY BE MODIFIED DURING STRUCTURAL DESIGN.
8. SUBMITTAL TO INCLUDE FULL STRUCTURAL DESIGN (INCLUDING ANCHORING) AND CLEARLY SHOW RELATIONSHIP BETWEEN PRESS AND WALKWAY IN BOTH PLAN & SECTION VIEWS.
9. COORDINATE HEIGHT OF FOOTING SUPPORTS/PADS SUCH THAT THEY INTERACT PROPERLY AND EVENLY WITH STEPS.
10. COORDINATE EXACT HEIGHT AND LAYOUT OF PLATFORM WITH BELT FILTER PRESS SUPPLIER/MANUFACTURER.

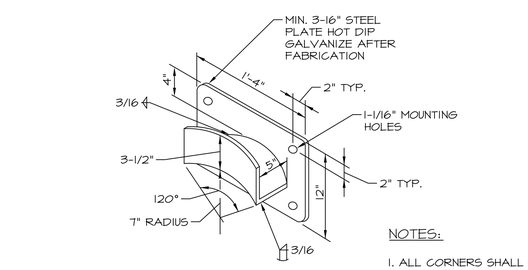
CMU PIPE OPENING REINFORCEMENT
N.T.S

NOTES:



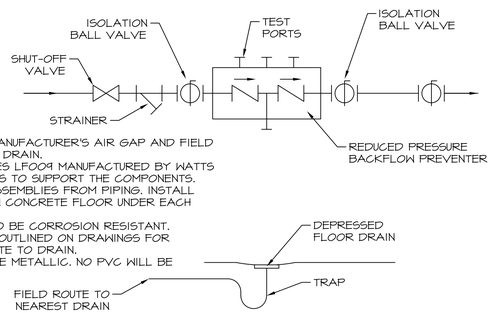
1. AT ADJACENT OPENING WITH LESS THAN 8'-0" WALL BETWEEN, CONTINUE HORIZONTAL REINFORCING TO 2'-8" BEYOND FURTHEST OPENING.
2. LOCATE VERTICAL BARS CENTERED IN 2 ADJACENT CELLS IN 8" WALLS AND EACH FACE IN SINGLE CELL IN 12" WALLS. LAP 48 BAR DIAMETERS WITH MATCHING FOUNDATION DOWELS.
3. LOCATE #4 ARCH BARS CENTERES IN 8" WALLS, AND EACH FACE IN 12" WALLS.

NOTES:

1. NUMBER OF ADDITIONAL REINF. BARS AT EACH SIDE OF OPENING SHALL EQUAL HALF THE NUMBER OF INTERRUPTED BARS IN EACH LAYER OF REINF.
2. SIZE OF ADDITIONAL REINF. BARS TO EQUAL SIZE OF INTERRUPTED REINF. BARS.
3. PROVIDE STD HOOKS FOR BARS IF LAP LENGTH EXTENSION CANNOT BE OBTAINED AT JOINTS OR OTHER OBSTRUCTIONS. PLACE ADDITIONAL BARS IN SAME PLANES AS INTERRUPTED REINF.
4. UNLESS NOTED OTHERWISE, SIZE OF DIAGONAL BARS SHALL BE THE SAME SIZE AS THE INTERRUPTED NORMAL REINF. LOCATE DIAGONALS IN EACH LAYER OF REINF.
5. PLACE DIAGONAL BARS INSIDE NORMAL REINF
6. PROVIDE 2 DIAGONAL BARS EACH LAYER OR FACE, EACH WAY AS SHOWN.
7. ALL REINF. TO CLEAR OPENING OR FLANGE COLLARS BY 2".

ADDITIONAL REINFORCEMENT @ OPENINGS IN WALLS
N.T.S

NOTES:

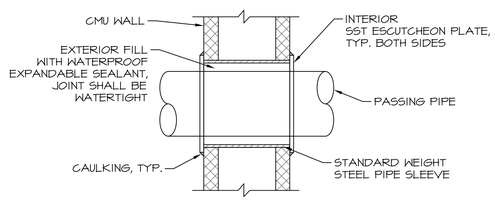


1. PROVIDE 1", 25' COMMERCIAL HOSE WITH SST SPRAYER AT ALL LOCATIONS UNLESS OTHERWISE NOTED.

WALL MOUNTED UTILITY STATION
N.T.S

NOTES:

1. ALL CORNERS SHALL HAVE A 3/4" RADIUS
2. HOSE RACKS TO BE MOUNTED AT ALL HYDRANTS ADJACENT TO BUILDING/STRUCTURES.
3. LOCATION TO BE FIELD DETERMINED.



HOSE RACK
N.T.S

NOTES

1. INSTALL RPZ WITH MANUFACTURER'S AIR GAP AND FIELD ROUTE FULL-SIZE TO DRAIN.
2. RPZ SHALL BE SERIES LF009 MANUFACTURED BY WATTS
3. INSTALL PIPE STANDS TO SUPPORT THE COMPONENTS. DO NOT SUPPORT ASSEMBLIES FROM PIPING. INSTALL BEARING PLATES ON CONCRETE FLOOR UNDER EACH SUPPORT.
4. ALL COMPONENTS TO BE CORROSION RESISTANT.
5. DRAIN MAY NOT BE OUTLINED ON DRAWINGS FOR CLARITY. FIELD ROUTE TO DRAIN.
6. ALL PIPING SHALL BE METALLIC. NO PVC WILL BE PERMITTED.

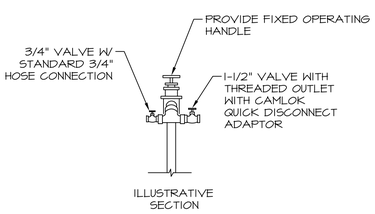
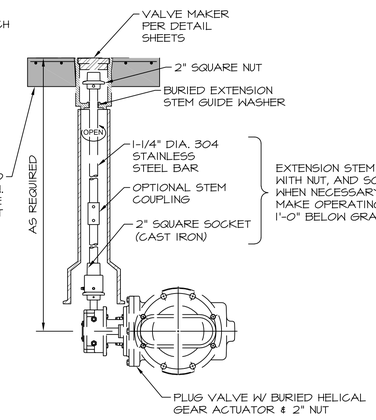
BACKFLOW PREVENTER

N.T.S

NOTES:



1. INSTALL INSIDE INSULATED FIBERGLASS ENCLOSURE, SUBMITTAL REQUIRED.
2. ENCLOSURE TO HAVE ACCESS DOORS ON EACH SIDE.
3. SLOPE FLOOR TO DRAIN WITH CHECK VALVE WHERE NECESSARY (TIDE FLEX)
4. ALL CONNECTIONS SHALL BE THRUST RESTRAINED.



MINIMUM RESTRAINED LENGTH (FT) FOR A TEST PRESSURE OF 100 PSIG						
NOMINAL PIPE SIZE	90 DEGREE	WYE OR 45 DEGREE	22-1/2 DEGREE	11-1/4 DEGREE	TEE BRANCH	TERMINAL PLUG
6	23	18	18	18	39	59
8	30	18	18	18	51	6'-4"
10	36	18	18	18	61	92
12	41	18	18	18	71	107
20	62	26	18	18	110	164
24	72	30	18	18	128	192
30	85	35	18	18	152	228
36	96	40	18	18	175	262
48	118	48	23	18	214	322
54	131	54	26	18	348	344

NOTES:

1. RESTRAIN ALL DUCTILE IRON FITTINGS.
2. TABULATED VALUES ARE FOR 100 PSIG TEST PRESSURE. FOR VALUES AT PRESSURES OTHER THAN 100 PSID, MULTIPLY TABLE VALUES BY THE RATIO OF ACTUAL TEST PRESSURE TO 100 PSIG. TEST PRESSURES FOR EACH SERVICE ARE DEFINED IN THE PIPING SCHEDULE.
3. WHERE LISTED VALUES, OR CALCULATED VALUES (SEE ABOVE), ARE LESS THAN ON STANDARD FULL PIPE SEGMENT (18 FEET), RESTRAIN THE FITTING ONLY.
4. RESTRAINT LENGTHS APPLY TO PIPE RUNS ON EACH SIDE OF A CHANGE IN DIRECTION.
5. WHERE THE PIPING LAYOUT HAS RESTRAINED JOINT LENGTHS FOR TWO OR MORE FITTINGS TO OVERLAP, THRUST RESTRAIN ALL PIPING BETWEEN THE OTHER FITTINGS, ASSUME 1/2 OF THE RESTRAINED PIPE LENGTH BETWEEN THE TWO FITTINGS RESTRAINS EACH OF THE FITTINGS AND ADD ADDITIONAL RESTRAINED JOINT LENGTH TO THE OUTER LEGS OF THE OUTER FITTINGS TO EQUAL THE TOTAL REQUIRED FOR ALL FITTINGS.
6. THRUST RESTRAINT TABLE REFERS TO NEW PIPING.

GENERAL

1. ALL NOTES LISTED ON THIS SHEET APPLY TO ALL SHEETS OF THE DRAWINGS AS IF THEY WERE WRITTEN ON EACH SHEET.
2. NOTIFY OWNER 48 HOURS PRIOR TO CONSTRUCTION.
3. VERIFY ALL EXISTING CONDITIONS AND OBSTRUCTIONS INCLUDING LOCATION AND DIMENSIONS BEFORE STARTING WORK AND SHALL NOTIFY THE ENGINEER OF ANY DISCREPANCIES.
4. PRIOR TO INSTALLATION OF RELEVANT FACILITIES CONTRACTOR SHALL, AT HIS OWN EXPENSE, UNCOVER AND OTHERWISE DETERMINE THE DEPTH OF UTILITIES WHICH, IN HIS OPINION, COULD INTERFERE WITH CONSTRUCTION.
5. ALL DIMENSIONS SHALL BE CONFIRMED BY THE CONTRACTOR ACCORDING TO ACTUAL FIELD CONDITIONS OR EQUIPMENT/STRUCTURE REQUIREMENTS.
6. ALL MISCELLANEOUS REMOVAL ITEMS REQUIRED FOR CONSTRUCTION SHALL BE FIELD LOCATED BY THE CONTRACTOR PRIOR TO BIDDING. THESE ITEMS WILL NOT BE MEASURED FOR PAYMENT AND SHALL BE INCLUDED IN THE PRICE BID FOR ASSOCIATED ITEMS OF WORK.
7. TRAFFIC CONTROL DEVICES SHALL BE FURNISHED AND MAINTAINED BY THE CONTRACTOR THROUGHOUT THIS PROJECT IN ACCORDANCE WITH THE LATEST VERSION OF THE MANUAL OF UNIFORM TRAFFIC CONTROL DEVICES AND/OR AS REQUIRED BY THE DEPARTMENT OF TRANSPORTATION OR COUNTY PERMITS FOR CONSTRUCTION IN RIGHT-OF-WAY.
8. SUBMIT AN EROSION CONTROL PLAN (SWPPP) PRIOR TO CONSTRUCTION AND SHALL MAINTAIN SWPPP THROUGHOUT DURATION OF CONSTRUCTION IN ACCORDANCE WITH SPECIFICATIONS.
9. EXISTING FACILITY AND UTILITY INFORMATION SHOWN ON THE DRAWINGS WAS OBTAINED FROM AVAILABLE RECORDS, LOCATES, AND AVAILABLE FILES. NEITHER THE OWNER NOR THE ENGINEER ASSUMES ANY RESPONSIBILITY FOR FACILITIES AND UTILITIES NOT SHOWN OR NOT IN THE LOCATION SHOWN. THE CONTRACTOR SHALL FIELD VERIFY ALL LOCATIONS, SIZES, MATERIALS, TYPES, AND ELEVATIONS SHOWN AROUND OR NEAR AREAS OF CONSTRUCTION PRIOR TO THE START OF CONSTRUCTION.
10. PERFORM ALL WORK WITHIN DESIGNATED EASEMENTS. CONTRACTOR SHALL NOT ENCROACH OR TRESPASS INTO PRIVATE PROPERTY WITHOUT WRITTEN APPROVAL FROM THE PROPERTY OWNER.
11. MAINTAIN LOCAL AND THROUGH TRAFFIC FOR ALL STREETS AT ALL TIMES WITHOUT CLOSURES OR RESTRICTIONS EXCEPT AS PART OF THE TRAFFIC CONTROL PLAN.
12. MAINTAIN REASONABLE ACCESS TO ALL PROPERTIES AT ALL TIMES. DO NOT RESTRICT DRIVEWAY ACCESS WITHOUT OWNER'S APPROVAL. RESTORE DRIVEWAY ACCESS AT THE END OF EACH DAY. PROVIDE TEMPORARY MEASURES AS NEEDED (SUCH AS GRAVEL) TO MAINTAIN DRIVEWAY ACCESS.
13. KEEP ACCURATE RECORDS OF ALL CONSTRUCTION THAT DEVIATES FROM THE DRAWINGS. THE CONTRACTOR SHALL FURNISH TO THE ENGINEER ACCURATE "AS-BUILT" RED LINE DRAWINGS FOLLOWING COMPLETION OF CONSTRUCTION.
14. TAKE SPECIAL PRECAUTIONS IN THE VICINITY OF ANY OVERHEAD AND UNDERGROUND ELECTRIC LINES. CONTRACTOR SHALL ABIDE BY THE MOST RECENT NATIONAL ELECTRIC CODE FOR WORKING AROUND OVERHEAD ELECTRIC LINES AS WELL AS OTHER LOCAL, STATE OR FEDERALS LAWS / REQUIREMENTS.
15. CONFORM TO ALL APPLICABLE FEDERAL, STATE AND LOCAL LAWS GOVERNING EXCAVATION. TRENCH SIDE SLOPES SHALL MEET OSHA REQUIREMENTS THAT ARE IN EFFECT AT THE TIME OF CONSTRUCTION. CONTRACTOR SHALL SUBMIT A TRENCH SAFETY PLAN PRIOR TO CONSTRUCTION.
16. THIS PROJECT IS SUBJECT TO AMERICAN IRON AND STEEL (AIS) REQUIREMENTS. ALL IRON AND STEEL PRODUCTS FOR CONSTRUCTION, ALTERATION, MAINTENANCE, OR REPAIRS INCORPORATED MUST BE PRODUCED IN THE UNITED STATES.
17. PROVIDE DUST CONTROL AT ALL TIMES DURING CONSTRUCTION.
18. ANY WORK PERFORMED WITHOUT THE KNOWLEDGE OF THE ENGINEER, INSPECTOR OR OWNER'S REPRESENTATIVE IS SUBJECT TO REMOVAL AND REPLACEMENT AT THE CONTRACTOR'S EXPENSE.

EARTHWORK

1. ALL COMPACTED SUBGRADE AND BASE NOT ACCESSIBLE TO MECHANICAL COMPACTION EQUIPMENT SHALL BE HAND COMPACTED USING WHACKER PACKERS.
2. SUBGRADE PREPARATION FOR ALL STRUCTURES AND BUILDINGS ON DRAWINGS SHALL BE AS FOLLOWS: OVER-EXCAVATE 30 INCHES BELOW BASE OF CONCRETE, SCARIFY AND COMPACT TOP 12", COMPACT TO 95% STANDARD PROCTOR DENSITY, INSTALL NON-WOVEN NEEDLE PUNCHED GEOTEXTILE FABRIC, INSTALL 30 INCHES OF CRUSHER RUN AGGREGATE BASE IN 10" LIFTS, COMPACT TO 95% MODIFIED PROCTOR DENSITY. BASE OF CONCRETE SHALL BE CONSIDERED THE BOTTOM OF SLAB AND NOT THE BASE OF FOOTINGS/STEM WALLS. OVER EXCAVATION MAY BE DELETED WHERE ROCK IS PRESENT. #57 ROCK SHALL BE SUBSTITUTED FOR AGG BASE WHERE GROUNDWATER IS PRESENT. ALL FILL MATERIAL REQUIRED TO ACHIEVE FINAL GRADE BELOW THE 30" ROCK LAYER SHALL BE CONSTRUCTED WITH ONSITE OR IMPORTED FILL MATERIAL COMPACTED TO 95% STANDARD PROCTOR DENSITY.
3. ELEVATIONS GIVEN ARE FINISHED GRADE UNLESS OTHERWISE NOTED.
4. NO FIRES WILL BE ALLOWED UNLESS OTHERWISE NOTED. TREES AND BRUSH SHALL BE REMOVED AND DISPOSED OF OFF SITE.
5. NO BLASTING WILL BE ALLOWED.
6. ALL SURFACE DRAINAGE IMPACTED SHALL BE RESTORED TO AS GOOD OR BETTER CONDITION.
7. ALL DISTURBED AREAS SHALL BE LEFT FREE OF RUTS AND TRACKS AND SHALL BE FULLY GRADED TO DRAIN.

GRASSING

1. ANY AND ALL DISTURBED AREAS OUTSIDE OF PLANT FENCING SHALL BE TOPSOILED, HYDROMULCHED, AND WATERED UNTIL ESTABLISHED. ANY AND ALL DISTURBED AREAS INSIDE PLANT FENCING SHALL BE SOLID SLAB SODDED PER SPECIFICATIONS & WATERED UNTIL ESTABLISHED.
2. FOR PIPELINE CONSTRUCTION EXTERNAL TO THE TREATMENT PLANT, ANY AND ALL DISTURBED AREAS SHALL BE TOPSOILED, HYDROMULCHED, AND FERTILIZED, WITH THE EXCEPTION OF RESIDENTIAL YARDS AND IMPROVED GRASS AREAS WHICH SHALL RECEIVE SOLID SLAB SOD IN LIEU OF HYDROMULCHING PER SPECIFICATIONS. THIS WORK WILL NOT BE MEASURED FOR PAYMENT. COST SHALL BE INCLUDED IN THE PRICE BID FOR ASSOCIATED ITEMS OF WORK.

DUCTILE IRON PIPE & FITTINGS

1. ALL BURIED DUCTILE IRON PIPE AND FITTINGS SHALL BE PROTECTED IN ACCORDANCE WITH ANSI/AWWA C105/A21.5 "POLYETHYLENE ENCASEMENT FOR GRAY AND DUCTILE IRON PIPE FOR WATER AND OTHER LIQUIDS." THIS ITEM SHALL NOT BE MEASURED FOR PAYMENT AND SHALL BE INCLUDED IN THE PRICE BID FOR ASSOCIATED ITEMS OF WORK.
2. ALL AIR PIPING SHALL BE UNLINED WITH EPDM GASKETS RATED FOR COMPRESSED AIR USAGE (PRESSURE & TEMPERATURE.)
3. ALL DUCTILE IRON PIPING SHALL BE RESTRAINED JOINT.
4. ALL DUCTILE IRON PIPE CONNECTIONS TO P.V.C. SHALL BE MADE WITH A BOLTED CAST TRANSITION COUPLING.
5. ALL EXPOSED FITTINGS SHALL BE FLANGED FITTINGS W/ STAINLESS STEEL BOLTS AND APPURTENANCES.
6. ALL MECHANICAL JOINT, FLANGE & MISC. FITTINGS TO HAVE STAINLESS STEEL BOLTS, NUTS & WASHERS.
7. ALL BURIED FITTINGS SHALL BE D.I. MECHANICAL JOINT (M.J) RESTRAINED (MEGALUG.)
8. WALL PIPES SHALL BE USED WHEREVER PIPING PASSES FROM A STRUCTURE TO EARTHEN BACKFILL.
9. PROVIDE 1/4" ANTI-SEEPAGE RINGS A MINIMUM OF 2" WIDE WELDED TO ALL PIPES PIERCING WATER HOLDING TANKS TO PREVENT SEEPAGE OF WATER BETWEEN PIPE AND CONCRETE. WALL PIPES MAY BE USED IN LIEU OF WELDED RINGS.
10. ALL DUCTILE IRON PIPING LARGER THAN 10" DIAMETER SHALL HAVE CONCRETE SUPPORTS UNLESS OTHERWISE DETAILED. SMALLER PIPING MAY HAVE METAL STAND TYPE SUPPORTS.

CONCRETE

1. CONSTRUCTION JOINTS TO FACILITATE CONSTRUCTION SHALL BE LOCATED AND DETAILED ON THE SHOP DRAWINGS FOR REVIEW. UNLESS INDICATED OTHERWISE, ALL CONSTRUCTION JOINTS SHALL BE KEYED. HORIZONTAL CONSTRUCTION JOINTS SHALL NOT BE PERMITTED IN WALLS AND BEAMS, UNLESS SHOWN ON THE DRAWINGS OR APPROVED BY THE ENGINEER.
2. ALL EXPOSED CORNERS OF CONCRETE STRUCTURES REGARDLESS OF LOCATION SHALL HAVE A 3/4 INCH MINIMUM CHAMFER.
3. NOT USED.
4. ALL GROUTED AREAS OVER 8" THICK SHALL BE REINFORCED WITH WELDED WIRE MESH, 6x6-W2.0xW2.0 MATTS AT 8'-0" CTRS MAX.
5. ANCHOR BOLTS NOT SPECIFIED BY ENGINEER SHALL BE DESIGNED AND STAMPED BY A REGISTERED PROFESSIONAL ENGINEER, RETAINED BY THE CONTRACTOR IN ACCORDANCE WITH APPLICABLE PROJECT AND CODE REQUIREMENTS. SUBMIT AS A SHOP DRAWING FOR REVIEW AND APPROVAL BY THE ENGINEER. COORDINATE LOCATION, SIZE AND EMBEDMENT PRIOR TO CASTING OF CONCRETE.
6. EXPANSION JOINTS SHALL BE USED WHERE EXTERIOR OF ALL EXISTING AND PROPOSED STRUCTURES AND BUILDINGS ABUT CONCRETE PAVING WHETHER SHOWN ON THE DRAWINGS OR NOT.
7. NO FLY ASH SHALL BE PERMITTED IN CONCRETE MIX DESIGN.
8. TREMIES REQUIRED ON ALL POURS DEEPER THAN 10 FEET.
9. VAPOR BARRIER (10 MIL) REQUIRED BENEATH ALL SLABS.
10. WALKWAYS AND SIDEWALKS SHALL BE POURED WITH SLIGHT SLOPE AND NO LOW SPOTS SO THEY WILL DRAIN FREELY.
11. ALL STRUCTURAL JOINTS SHALL RECEIVE 6" RUBBER CENTER BULB PVC WATERSTOP PLACED AT ALL WATERTIGHT JOINTS.
12. VERTICAL WATERSTOP SHALL BE FULLY EMBEDDED IN SLAB POUR AND WELDED TO ALL ADJACENT WATERSTOP.
13. WHEN WATERSTOP IS PLACED HORIZONTALLY IN SLABS, THE CONTRACTOR SHALL TEMPORARILY TIE UP OR CLAMP UP THE WATERSTOP UNTIL THE CONCRETE IS PLACED TO SLIGHTLY ABOVE THE DEPTH OF THE WATERSTOP.
14. CONCRETE SHALL HAVE XYPEX ADMIXTURE PER SECTION 03_30_00 AND MANUFACTURE'S SPECIFICATIONS.

BUILDING

1. ALL EXTERIOR DOORS ON ALL BUILDINGS SHALL HAVE R-PANEL AWNING SUPPLIED INTEGRAL WITH METAL BUILDING. AWNING ROOF PANELS SHALL MATCH MAIN BUILDING ROOF. AWNINGS SHALL INCLUDE FULL WIDTH GUTTER WITH DOWNSPOUTS.
2. ALL EXTERIOR EXPOSED CMU SHALL BE SPLIT FACE ARCHITECTURAL BLOCK UNLESS OTHERWISE NOTED.
3. ANY R-PANEL USED IN THE BUILDING CONSTRUCTION WHERE NO GAUGE IS SPECIFIED SHALL BE 24 GA. MINIMUM.

PIPING & APPURTENANCES

1. MANHOLES SHALL BE GROUTED INSIDE AND OUT AT ALL JOINTS.
2. ALL NON-POTABLE WATER LINES SHALL BE IN PURPLE COLORED PIPE AND LABELED "DO NOT DRINK". THE WARNING LABEL SHALL BE LOCATED ON OPPOSITE SIDES OF ALL PIPES AND REPEATED EVERY THREE (3) FEET OR LESS.
3. ALL PIPING THAT CROSS VERTICALLY SHALL HAVE AT LEAST 6" SEPARATION.
4. ALL UNDERGROUND FITTINGS SHALL BE DUCTILE IRON MECHANICAL JOINTS (MEGALUG), UNLESS OTHERWISE NOTED.
5. ALL VALVE ASSEMBLIES, VAULTS, PULLS BOXES AND MANHOLES CONSTRUCTED SHALL BE ADJUSTED TO BE FLUSH WITH FINISHED GRADE UNLESS OTHERWISE NOTED. MANHOLES SET IN OPEN FIELDS SHALL BE SET TWELVE INCHES ABOVE FINISHED GRADE AND VAULTS SHALL BE SET 6 INCHES ABOUT FINISHED GRADE.
6. NOT USED.
7. ANY BY-PASS PUMPING AND/OR BY-PASS PIPING INSTALLED SHALL BE OPERATED AND MAINTAINED BY THE CONTRACTOR AT CONTRACTOR'S EXPENSE. THE CONTRACTOR IS RESPONSIBLE FOR ANY UNAUTHORIZED DISCHARGES.
8. CONNECTIONS TO EXISTING UTILITIES SHALL BE MADE IN A TIME AND UNDER CONDITIONS WHICH WILL LEAST INTERFERE WITH SERVICE OF THE OWNER, AND AS AUTHORIZED BY THE ENGINEER AND OWNER. FACILITIES SHALL BE PROVIDED FOR PROPER DEWATERING AND FOR DISPOSAL OF ALL WATER/WASTEWATER REMOVED TO ADJACENT PROPERTY FROM DEWATERED LINES WITHOUT DAMAGE.
9. MAINTAIN THE REQUIRED 10 FOOT HORIZONTAL AND 2 FOOT VERTICAL SEPARATION BETWEEN SANITARY SEWER AND POTABLE WATER MAINS. ALL OTHER PIPING SHALL MAINTAIN A MINIMUM OF 5' SEPARATION.
10. ORDER MANHOLES IN PAVEMENT LOWER THAN PROPOSED GRADE AND BRING THEM TO EXACT GRADE WITH LEVEL RINGS.
11. PROVIDE FREEZE PROTECTION FOR ANY EXPOSED PIPING. FREEZE PROTECTION SHALL CONSIST OF WRAPPED PIPE W/ RIGID ALUMINUM COVERS UNLESS OTHERWISE SPECIFIED. FREEZE PROTECTION/INSULATION WILL NOT BE REQUIRED FOR PIPING INSIDE BUILDING, AIR PIPING OR SCADA INSTRUMENTATION CONDUIT.
12. CONTRACTOR SHALL SCHEDULE AND CONDUCT OPERATIONS TO LIMIT AMOUNT OF TRENCH OPENED TO INCLUDE ONLY THAT WHICH MAY BE COVERED IN 2 (TWO) DAYS TIME TO A MAXIMUM OF 200'. ANY TRENCH LEFT OPEN OVERNIGHT SHALL BE BARRICADED AND PROTECTED AS DETAILED IN THE MOST CURRENT EDITION OF THE MANUAL OF UNIFORM TRAFFIC CONTROL DEVICES.
13. SEWER MAINS SHALL BE CONSTRUCTED UTILIZING A LASER WITH GRADE ESTABLISHED THROUGH SEWER PIPE.
14. WHEN TIE-INS TO EXISTING MANHOLES ARE TO BE MADE, CONTRACTOR SHALL VERIFY MANHOLE FLOW LINE AT AN INTERVAL PRIOR TO MANHOLE TO ENSURE ADEQUATE DEPTH OF NEW LINE. WHEN CONSTRUCTING A MANHOLE OVER AN EXISTING LINE, CONTRACTOR SHALL VERIFY EXISTING LINE DEPTHS PRIOR TO MANHOLE CONSTRUCTION.
15. MATERIAL EXCAVATED FROM TRENCH & PIPE BEDDING MATERIALS SHALL NOT BE PLACED ON ADJACENT ASPHALT OR CONCRETE PAVING.
16. A SILT AND VARMINT CAP AND/OR PLUG SHALL BE IN PLACE ON THE OPEN END OF PIPES AT ALL TIMES.
17. DO NOT EXCEED 75% OF MANUFACTURE'S RECOMMENDED MAXIMUM DEFLECTION FOR PIPE JOINTS UNLESS OTHERWISE NOTED.
18. INSTALL TEMPORARY FENCES TO PROTECT HORSES AND LIVESTOCK WHEN NECESSARY.
19. REMOVAL AND REPLACEMENT OF STREET TRAFFIC SIGNS, MAIL BOXES AND OTHER STRUCTURES BY THE CONTRACTOR TO FACILITATE CONSTRUCTION SHALL BE CONSIDERED INCIDENTAL AND BE INCLUDED IN THE PRICE BID.
20. ALL EXISTING PAYMENT TO REMAIN SHALL BE SAWCUT TO ENSURE A STRAIGHT SMOOTH SURFACE. ALL CUTS MADE IN DRIVEWAYS OR OTHER PAVEMENTS SHALL BE MADE IN STRAIGHT PERPENDICULAR LINES. COST TO BE CONSIDERED SUBSIDIARY TO CONTRACTOR'S BID.

TREATMENT PLANT

1. ALL EXPOSED COMPONENTS REGARDLESS OF LOCATION TO BE CORROSION RESISTANT (GALVANIZED, ALUMINUM, SST, FRP, ETC).
2. PROPERLY INSULATE, GASKET AND PROTECT TRANSITIONS TO DISSIMILAR METALS (DUCTILE-STAINLESS).
3. ALL EXPOSED VALVES SHALL HAVE HANDWHEELS OR LEVERS. CHAINWHEELS TO BE PROVIDED ON ALL ELEVATED VALVING.
4. ALL PLANT PIPING, CONDUIT, DRAINS, EQUIPMENT, PIPING, ELECTRICAL, COMPONENTS, ETC., SHALL BE PROVIDED WITH PIPE AND EQUIPMENT SUPPORTS. PIPE AND EQUIPMENT HANGERS FOR ALL BRACING AND STABILIZATION FOR A COMPLETE SYSTEM AND PROVIDE WALKING ACCESS AREAS FREE AND CLEAR. ALL PIPE SHALL BE PROPERLY PAINTED OR COATED WITH APPROVED PAINT. CONTRACTOR SHALL LABEL UNITS, PIPING, VALVES, TANKS, ETC., WITH PROPER FLOW DIRECTION AND TYPE. LOCATION AND NUMBER OF PIPE HANGERS AND PIPE SUPPORTS SHOWN IN ONLY APPROX. CONTRACTOR SHALL DESIGN SUPPORTS AS SPECIFIED.
5. ALL PVC/CPVC VALVES AND COMPONENTS FOR USE IN CHEMICAL FEED AND AIR PIPING SHALL HAVE VITON SEALS AND SHALL BE RATED FOR PRODUCT BEING CARRIED.
6. ALL SUSPENDED PIPING SHALL BE SUPPORTED AT NOT LESS THAN EVERY 10 FEET. ALL PIPING LARGER THAN 6" DIAMETER MAY REQUIRE ADDITIONAL SUPPORTS PER SUPPORT SUPPLIERS RECOMMENDATIONS AND/OR SPECIFICATION REQUIREMENTS.
7. ALL WATERTIGHT STRUCTURES CONCRETE SHALL HAVE 72 HOUR WATER TEST FOR LEAKAGE ON STRUCTURE BEFORE BACKFILL.
8. DISSIMILAR METALS IN CONTACT SHALL BE PROVIDED WITH GALVANIC SEPARATION.
9. CONTRACTOR SHALL COORDINATE WITH SUPPLIERS AND PROVIDE DRAIN CONDUIT (2" MINIMUM) FOR ANY/ALL ANALYZERS, RPZ, AIR/VAC VALVES, SAMPLERS OR ANY OTHER ITEM INSIDE BUILDING WHICH DISCHARGES INTERMITTENT WATER AND ROUTE TO DRAIN. NO SURFACE DRAINAGE WILL BE PERMITTED.
10. NOT USED.
11. SUBMIT FOR REVIEW ALL EQUIPMENT SIZES, OPERATING WEIGHTS, VIBRATION FORCES, SUPPORT LOCATIONS, ALONG WITH ANY FLOOR OPENINGS, NOTCHES, AND RECESSES REQUIRED BY SUCH EQUIPMENT. CONCRETE SUPPORT PADS AND/OR FRAMING REQUIRED TO SUPPORT SAID EQUIPMENT SHALL NOT BE FABRICATED AND PLACED UNTIL THE CONCRETE SUPPORT PADS AND/OR FRAMING IS APPROVED TO SUPPORT THE EQUIPMENT.
12. PROCESS EQUIPMENT DELIVERIES SHALL BE COORDINATED SO THAT EQUIPMENT COMES TO SITE NO MORE THAN 60 DAYS PRIOR TO INSTALLATION, UNLESS STORED INDOORS WITH CLIMATE CONTROL.
13. AT ALL POINTS UNDERGROUND WHERE PIPING EXITS STRUCTURES AND TRANSITIONS TO NATURAL GROUND OR OTHER AREAS SUBJECT TO GROUND SETTLING OR OTHER POTENTIAL INTRODUCED STRESSES AFTER INSTALLATION, A BELL-FLANGE WALL PIPE W/SEEP RING AND RESTRAINED MECHANICAL JOINT SHALL BE PROVIDED TO ALLOW FOR DEFLECTION WHETHER BEING SHOWN ON DRAWINGS OR NOT. NO EXCEPTIONS.
14. ALL PIPING 18" AND LARGER SHALL HAVE A MINIMUM COVER OF 48"; AND PIPE SMALLER THAN 18" SHALL HAVE A MINIMUM COVER OF 36" UNLESS OTHERWISE NOTED. PIPE SHALL BE ROUTED AS SHOWN UNLESS MINOR REVISIONS ARE NECESSARY TO AVOID EXISTING PIPES, STRUCTURES, ETC. CONTRACTOR SHALL BE RESPONSIBLE FOR FURNISHING ALL FITTINGS AND ADAPTERS REQUIRED TO MAKE THE ROUTING CHANGES. CONTRACTOR SHALL INCLUDE COST IN PRICE BID.
15. WHERE CONFLICTS OCCUR BETWEEN CIVIL AND MEP DRAWINGS SHALL GOVERN. ELECTRICAL CONTRACTOR IS RESPONSIBLE FOR VERIFICATION AND ANY MINOR MODIFICATIONS REQUIRED TO FACILITATE INSTALLATION AS OUTLINED ON CIVIL DRAWINGS.
16. REVIEW OF ANY/ALL SCOPE AND PROPOSALS FURNISHED BY EQUIPMENT SUPPLIERS AND SHALL VERIFY ALL REQUIREMENTS OUTLINED IN PROPOSED EQUIPMENT SCOPE/PROPOSAL HAVE VERIFIED AGAINST THE DRAWINGS PRIOR TO BID. ANY ADJUSTMENTS AND/OR ADDITIONAL WORK/MATERIALS REQUIRED ARE THE RESPONSIBILITY OF THE CONTRACTOR AND NO ADDITIONAL COMPENSATION WILL BE PROVIDED.
17. MAKE CONNECTIONS TO EXISTING PIPE, EQUIPMENT, ETC. AS REQUIRED AND SHALL PROVIDE ALL FITTINGS, ADAPTERS AND APPURTENANCES REQUIRED TO MAKE THE CONNECTIONS. PROVIDE SUPPORTS REQUIRED FOR A RIGIDLY SUPPORTED SYSTEM.
18. TEMPORARILY RELOCATE PIPING AS REQUIRED TO MAINTAIN SERVICE TO THE EXISTING PLANT.
19. MECHANICAL AND ELECTRICAL EQUIPMENT SUPPORTS, ANCHORAGES, OPENINGS, RECESSES, AND REVEALS NOT SHOWN ON THE STRUCTURAL DRAWINGS THAT ARE REQUIRED BY OTHER CONTRACT DRAWINGS SHALL BE PROVIDED PRIOR TO CASTING CONCRETE.
20. PRIOR TO FABRICATION OF NEW PIPING, INCLUDING SPECIAL FITTINGS AND EXCAVATIONS FOR NEW STRUCTURES, ELECTRICAL CONDUIT AND/OR OTHER PROPOSED UTILITIES, CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING THE LOCATION OF ALL EXISTING PIPING AND UTILITIES IN THE CONSTRUCTION AREA. AT TIE-IN LOCATIONS, VERIFY THE SIZING OF EXISTING PIPING BEFORE FABRICATION OF NEW PIPING AND FITTINGS. THE CONTRACTOR SHALL INCLUDE THE COST IN HIS BID FOR TEMPORARILY RELOCATING AND REINSTALLING EXISTING UTILITIES AS REQUIRED FOR CONSTRUCTION OF PROPOSED ITEMS.
21. ANY PLANT UTILITY, PIPING, CONDUIT, COMMUNICATION SYSTEM, ELECTRICAL OR INSTRUMENTATION WIRING DAMAGED DURING CONSTRUCTION SHALL BE REPAIRED AND PLACED BACK IN SERVICE BY THE CONTRACTOR ON THE SAME DAY THAT THE DAMAGE OCCURRED. AFTER 24 HOURS OUT OF SERVICE, OWNER WILL HAVE THE OPTION OF HAVING THE REPAIRS MADE BY A SEPARATE CONTRACTOR AND DEDUCTING THE COST OF SAID REPAIRS FROM THE CONTRACT AMOUNT.
22. GALVANIZED STEEL PRODUCTS SHALL NOT BE USED FOR ANY TREATMENT PLANT STRUCTURE / EQUIPMENT CONSTRUCTION UNLESS SPECIFICALLY CALLED OUT / APPROVED.
23. ALL NEW UNISTRUT, ANCHORS, SUPPORT SYSTEMS AND FASTENING HARDWARE TO BE 316 STAINLESS STEEL.
24. BACKFILLING AGAINST STRUCTURES WHICH HAVE A TOP SLAB SHALL BE DONE ONLY AFTER THE TOP SLAB IS IN PLACE AND THE CONCRETE HAS CURED TO 2/3 OF ITS DESIGN STRENGTH, BUT IN NO CASE LESS THAT 4 DAYS.
25. STAGING AREA WILL ONLY BE USED FOR CONSTRUCTION EQUIPMENT AND MATERIALS USED IN THE CONSTRUCTION OF THE PROJECT. CONSTRUCTION DEBRIS SHOULD NOT BE ALLOWED TO ACCUMULATE AND SHOULD BE REMOVED ON A WEEKLY BASIS.
26. INSTALL METAL TRACER WIRE AND COLOR CODE FOR ALL PIPE INSTALLED.
27. IN ACCORDANCE WITH OAC 252:656-5-4(C)(1), SANITARY SEWER MUST BE AT LEAST 10-FEET FROM AN EXISTING OR PROPOSED WATERMAIN AND AT LEAST 5-FEET ELECTRICAL OR PETROLEUM LINES. SANITARY SEWERS MUST CROSS AT LEAST 24 INCHES ABOVE OR BELOW WATERMAINS.
28. THE CONTRACTOR SHALL NOT OPEN OR CLOSE ANY VALVES AT THE TREATMENT PLANT AND SHALL ASK FOR THE OWNER'S ASSISTANCE.

ELECTRICAL/CONTROLS/SCADA

1. ALL ELECTRICAL CONSTRUCTION SHALL BE IN STRICT ACCORDANCE WITH ALL N.E.C. AND LOCAL ELECTRICAL CODES.
2. ALL EQUIPMENT (INCLUDING MCC & PANELS) SHALL RECEIVE HOUSEKEEPING PADS WITH #4 BARS @ 12" O.C.E.W. MINIMUM THICKNESS SHALL BE 6" OR AS REQUIRED FOR ANCHOR BOLT CLEARANCE. ANCHOR BOLTS SLEEVES MAY BE USED PROVIDED THE SLEEVES ARE NON-SHRINK GROUT FILLED WITH 1-1/2" GROUT UNDER EQUIPMENT BASE. ALL PADS SHALL BE ANCHORED TO CONCRETE SLABS WITH J BARS (#3 @ 12" O.C.) OR EPOXY ANCHORS.
3. ALL SCADA SYSTEM WIRING SHALL BE CONDUIT ENCASED AND IS NOT SHOW FOR CLARITY. CONTRACTOR TO PROVIDE PROPOSED CONDUIT LAYOUT WITH SCHEDULE TO ENGINEER FOR APPROVAL PRIOR TO CONSTRUCTION.
4. ALL SURFACE MOUNTED PANELS AND PANEL BOARDS ON THE INTERIOR OF EXTERIOR WALLS OR IN OTHER LOCATIONS CONSIDERED DAMP OR WET AND SHALL BE MOUNTED SO AS TO MAINTAIN A 1/4" MINIMUM AIR SPACE BETWEEN THE ENCLOSURE AND THE WALL.
5. ALL EXTERNAL DISPLAYS SHALL BE PROVIDED WITH A WEATHER SHIELD.
6. REVIEW ANY/ALL SCOPE AND PROPOSALS FURNISHED BY EQUIPMENT SUPPLIERS. VERIFY ALL ELECTRICAL REQUIREMENTS OUTLINED IN PROPOSED EQUIPMENT SCOPE/PROPOSAL HAVE BEEN ACCOMMODATED FOR BY ELECTRICAL CONTRACTOR.
7. THE WIRING DIAGRAMS, QUANTITY AND SIZE OF WIRES AND CONDUITS REPRESENT A SUGGESTED ARRANGEMENT BASED UPON SELECTED STANDARD COMPONENTS OF ELECTRICAL EQUIPMENT. IF EQUIPMENT SUPPLIED BY THE MANUFACTURER HAS A LARGER LOAD THAN THE VALUE SHOWN OR INDICATED, THE CABLE, CONDUIT AND ELECTRICAL EQUIPMENT SHALL BE ENLARGED AS REQUIRED TO ACCOMMODATE THE HIGHER LOADING. HOWEVER, THE BASIC SEQUENCE AND METHOD OF CONTROL MUST BE MAINTAINED AS INDICATED ON THE DRAWINGS AND/OR SPECIFICATIONS. CONTRACTOR TO PROVIDE PROPOSED CONDUIT LAYOUT WITH SCHEDULE TO ENGINEER FOR APPROVAL PRIOR TO CONSTRUCTION.

NOTES:
1. NOT USED.
2. NOT USED.
3. GATE WIDTHS LISTED ARE NOMINAL.
4. CONTRACTOR SHALL ADJUST LOCATION OF GRIT WASHER CONVEYER TO ALLOW FOR USE OF ONE DUMPSTER.
5. THERE SHALL NOT BE ANY GRATING OVER GATES WHICH WOULD INTERFERE WITH OPERATION.
6. NOT USED.
7. GRIT PUMPS SHALL BE EQUIPPED WITH CASE HEATING AND FREEZE PROTECTION PER MANUFACTURERS RECOMMENDATIONS.
8. FW WATER CONNECTION TO EQUIPMENT SHALL BE INSTALLED WITH CONNECTION SOLENOID VALVE SUPPLIED BY MANUFACTURER. FIELD ROUTE ELECTRICAL/CONTROLS PER MANUFACTURERS RECOMMENDATIONS.
9. CONTRACTOR SHALL VERIFY WITH OWNER DUMPSTER DIMENSIONING PRIOR TO PLACEMENT OF CLASSIFIER/COMPACTOR DISCHARGE OUTLETS.
10. ALL PIPING AND CONNECTIONS SHALL BE PER MANUFACTURERS RECOMMENDATIONS.
11. ALL ELECTRONICALLY ACTUATED VALVES TO ALSO BE EQUIPPED WHANDWHEEL OPERATORS.
12. SLIDE GATES TO BE MOUNTED PER MANUFACTURERS RECOMMENDATIONS.
13. CONTRACTOR TO INSTALL A 2" RADIUS FILLET BEFORE AND AFTER THE SCREENS TO PREVENT SEDIMENTATION OF SOLIDS. CONTRACTOR SHALL VERIFY WITH MFR. THAT APPROPRIATE CHANNEL VELOCITY WILL BE MAINTAINED.
14. ACTUATED SLIDE GATE EMERGENCY FLOAT TO AUTOMATICALLY CLOSE GATE IN THE EVENT WATER RISES TO HEADWORKS FLOOR.
15. AT CONTRACTORS OPTION, FLOOR OF HEADWORKS MAY BE POURED LEVEL AT ELEVATION GROUTED TO PROPOSED FLOW LINE ELEVATION.
16. COORDINATE LOCATIONS FOR REQUIRED WASH WATER NON POTABLE WATER MAINS WITH HEADWORKS EQUIPMENT SUPPLIER PRIOR TO INSTALLATION.
17. ELECTRONICALLY OPERATED GATE SHALL BE 480 VOLTS/3 PHASE.
18. CONTRACTOR SHALL SUBMIT A COMPLETE PIPING PLAN FOR APPROVAL.
19. CONTRACTOR SHALL PROVIDE PIPING SUPPORTS AS NEEDED REGARDLESS OF BEING SHOWN ON DRAWINGS.
20. ALL OPEN AREAS OF HEADWORKS STRUCTURE ARE TO RECEIVE GRATING. SOME GRATING IS NOT SHOWN FOR CLARITY.
21. COORDINATE WITH EQUIPMENT SUPPLIER FOR EXACT REQUIREMENTS OF INLET WATER PIPING PRIOR TO BID.
22. EQUIPMENT DRAINS NOT SHOWN IN PIPING SHALL BE FIELD ROUTED TO HEADWORKS CHANNELS PER MANUFACTURER RECOMMENDATIONS.
23. COMPLETE SYSTEM TO BE EQUIPPED WITH A FACTORY DESIGNED FREEZE PROTECTION SYSTEM CONSISTING OF HEAT TAPE, CASE HEATERS AND INSULATION. FREEZE PROTECTION SYSTEM SHALL BE DESIGNED TO ENSURE PROPER OPERATION INDEFINITELY AT -15 DEGREES FAHRENHEIT. PROVIDE INFORMATION ON FREEZE PROTECTION SYSTEM WITH THE EQUIPMENT SUBMITTAL.
24. ALL EXPOSED PIPING IN HEADWORKS AREA 6" AND SMALLER SHALL BE GROOVED 316 STAINLESS STEEL. COMPLETE SYSTEM TO BE FURNISHED AND DESIGNED BY VICTAULIC.
25. ALL HYDRANTS TO BE FURNISHED WITH STAINLESS STEEL SELF SUPPORTING HOSE RACK AND 50' OF HEAVY DUTY COMMERCIAL HOSE (1").

02P103, 02P104	6,000 GPM	36'	STORMWATER	VFD	75	65%

PUMP NOTES:

1. PUMPS SHALL BE PROVIDED WITH BASE ELBOWS, S.S. RAILS, AND S.S. LIFTING CHAINS.
2. CONTRACTOR SHALL PROVIDE FITTINGS AS REQUIRED TO CONNECT BASE ELBOWS TO LIFT STATION PIPING.
3. PUMPS SHALL BE 460 VOLT THREE PHASE.
4. EACH PUMP SHALL BE EQUIPPED WITH A VARIABLE FREQUENCY DRIVE.

NOTES:

1. SEAL CONDUITS TO KEEP WET WELL GASSES OUT OF CONTROL PANEL.
2. LOCATE FLOATS AND CABLE HOLDER AWAY FROM INLET PIPE.
3. WETWELL FLOOR SHALL SLOPE TO PUMPS AS SHOWN.
4. ALL COMPONENTS SUBJECT SHALL BE DUCTILE IRON OR STAINLESS STEEL.
5. ALL ELECTRONICALLY ACTUATED VALVES TO ALSO BE EQUIPPED WITH HAND WHEEL OPERATORS.
6. ALL EXPOSED PIPING SHALL BE FULLY INSULATED AND HEAT TRACED TO PREVENT FROM FREEZING.
7. PIPE SUPPORT LOCATIONS ARE FOR REFERENCE ONLY & MORE MAY BE REQUIRED PER SPECIFICATION REQUIREMENTS AND/OR INDUSTRY STANDARD.
8. WETWELL TO BE EQUIPPED WITH A LEVEL TRANSDUCER AND 3 BACKUP FLOATS (LOW LEVEL, ALARM, INFLUENT CLOSE).
9. ALL HYDRANTS TO BE FURNISHED WITH STAINLESS STEEL SELF SUPPORTING HOSE RACK AND 50' OF HEAVY DUTY COMMERCIAL HOSE (1").

02P103, 02P104	6,000 GPM	36'	STORMWATER	VFD	75	65%

PUMP NOTES:

1. PUMPS SHALL BE PROVIDED WITH BASE ELBOWS, S.S. RAILS, AND S.S. LIFTING CHAINS.
2. CONTRACTOR SHALL PROVIDE FITTINGS AS REQUIRED TO CONNECT BASE ELBOWS TO LIFT STATION PIPING.
3. PUMPS SHALL BE 460 VOLT THREE PHASE.
4. EACH PUMP SHALL BE EQUIPPED WITH A VARIABLE FREQUENCY DRIVE.

NOTES:

1. SEAL CONDUITS TO KEEP WET WELL GASSES OUT OF CONTROL PANEL.
2. LOCATE FLOATS AND CABLE HOLDER AWAY FROM INLET PIPE.
3. WETWELL FLOOR SHALL SLOPE TO PUMPS AS SHOWN.
4. ALL COMPONENTS SUBJECT SHALL BE DUCTILE IRON OR STAINLESS STEEL.
5. ALL ELECTRONICALLY ACTUATED VALVES TO ALSO BE EQUIPPED WITH HAND WHEEL OPERATORS.
6. ALL EXPOSED PIPING SHALL BE FULLY INSULATED AND HEAT TRACED TO PREVENT FROM FREEZING.
7. PIPE SUPPORT LOCATIONS ARE FOR REFERENCE ONLY & MORE MAY BE REQUIRED PER SPECIFICATION REQUIREMENTS AND/OR INDUSTRY STANDARD.
8. WETWELL TO BE EQUIPPED WITH A LEVEL TRANSDUCER AND 3 BACKUP FLOATS (LOW LEVEL, ALARM, INFLUENT CLOSE).
9. ALL HYDRANTS TO BE FURNISHED WITH STAINLESS STEEL SELF SUPPORTING HOSE RACK AND 50' OF HEAVY DUTY COMMERCIAL HOSE (1").

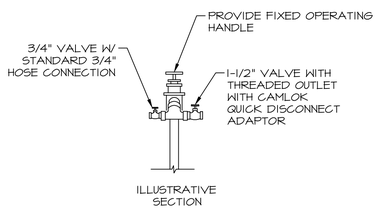
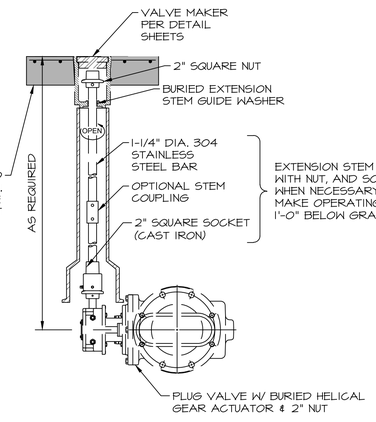
MINIMUM RESTRAINED LENGTH (FT) FOR A TEST PRESSURE OF 100 PSIG						
NOMINAL PIPE SIZE	90 DEGREE	WYE OR 45 DEGREE	22-1/2 DEGREE	11-1/4 DEGREE	TEE BRANCH	TERMINAL PLUG
6	23	18	18	18	39	59
8	30	18	18	18	51	6'-4"
10	36	18	18	18	61	92
12	41	18	18	18	71	107
20	62	26	18	18	110	164
24	72	30	18	18	128	192
30	85	35	18	18	152	228
36	96	40	18	18	175	262
48	118	48	23	18	214	322
54	131	54	26	18	348	344

NOTES:



1. RESTRAIN ALL DUCTILE IRON FITTINGS.
2. TABULATED VALUES ARE FOR 100 PSIG TEST PRESSURE. FOR VALUES AT PRESSURES OTHER THAN 100 PSID, MULTIPLY TABLE VALUES BY THE RATIO OF ACTUAL TEST PRESSURE TO 100 PSIG. TEST PRESSURES FOR EACH SERVICE ARE DEFINED IN THE PIPING SCHEDULE.
3. WHERE LISTED VALUES, OR CALCULATED VALUES (SEE ABOVE), ARE LESS THAN ON STANDARD FULL PIPE SEGMENT (18 FEET), RESTRAIN THE FITTING ONLY.
4. RESTRAINT LENGTHS APPLY TO PIPE RUNS ON EACH SIDE OF A CHANGE IN DIRECTION.
5. WHERE THE PIPING LAYOUT HAS RESTRAINED JOINT LENGTHS FOR TWO OR MORE FITTINGS TO OVERLAP, THRUST RESTRAIN ALL PIPING BETWEEN THE OTHER FITTINGS. ASSUME 1/2 OF THE RESTRAINED PIPE LENGTH BETWEEN THE TWO FITTINGS RESTRAINS EACH OF THE FITTINGS AND ADD ADDITIONAL RESTRAINED JOINT LENGTH TO THE OUTER LEGS OF THE OUTER FITTINGS TO EQUAL THE TOTAL REQUIRED FOR ALL FITTINGS.
6. THRUST RESTRAINT TABLE REFERS TO NEW PIPING.



BACKFLOW PREVENTER

N.T.S

NOTES:

1. INSTALL INSIDE INSULATED FIBERGLASS ENCLOSURE, SUBMITTAL REQUIRED.
2. ENCLOSURE TO HAVE ACCESS DOORS ON EACH SIDE.
3. SLOPE FLOOR TO DRAIN WITH CHECK VALVE WHERE NECESSARY (TIDE FLEX)
4. ALL CONNECTIONS SHALL BE THRUST RESTRAINED.

ADDENDUM NO. 2

TO: ALL PLAN HOLDERS

RE: Shawnee Wastewater System Improvements

DATE: July 21, 2022

The Plans, Specifications and Contract Documents for the above referenced project are hereby modified / clarified as follows.

Please note that changes made to the plans/specs added by addendum will only contain a summary of changes in addendum verbiage and may not contain all modifications. It is the Contractor's responsibility to thoroughly review the revised sheets/specs.

General

A2 – 1 **Approval:** Cummins has been approved as a supplier of backup power equipment.

A2 – 2 **Information:** No additional equipment has been approved beyond the named equipment in the Specifications.

A2 – 3 **Modification:** The largest eight (8) project materials / equipment vendors ranked by taxable value will be direct paid by the Owner and thereby receive a tax-exempt status letter. Do not include applicable taxes in the bid.

A2 – 4 **Information:** Sludge management plan information has been added to CivCast. It contains the site information and summary sludge management plan data.

Northside WWTP

A2 – 5 **Clarification:** Plug valves on piping carrying sludge shall be full port.

A2 – 6 **Addition:** All floor coatings specified in wet areas shall have slip resistant additive (by Tnemec.)

A2 – 7 **Modification:** Section 43_23_31.35 – Replace with revised spec. Pump conditions have been modified

A2 – 8 **Modification:** Millwork referenced on Sheet A602, A603 & A701 is hereby revised as follows:

1. Cabinets – Powder coated steel casework
2. Tops – 1" epoxy resin certified as chemical resistant
3. Island (in 118) to be 5' width

4. Glassware washers, Faucets and Fixtures to be commercial laboratory grade
5. Approved Suppliers / Installers
    a. Best Companies, Edmond, OK (405) 840-1077
    b. MGC, Inc, Addison, TX (214) 477-4784
    c. PSA Lab Furniture, New Berlin, WI (262) 204-7660

A2 – 9 **Modification:** Structural

1. Refer to Drawing ELS-S6, and replace with the revised sheet.
2. Refer to Drawing HW-S10, and replace with the revised sheet.

A2 – 10 **Modification:** Civil

1. Refer to Drawing C-12, and replace with the revised sheet.
2. Refer to Drawing C-13, and replace with the revised sheet.
3. Refer to Drawing SBR-1 and replace with the revised sheet.
4. Refer to Drawing SBR-2 and replace with the revised sheet.
5. Refer to Drawing AD-2 and replace with the revised sheet.
6. Refer to Drawing FEB-2 and replace with the revised sheet.
7. Refer to Drawing SHF-2 and replace with the revised sheet.
8. Refer to Drawing DT-6 and replace with the revised sheet.

A2 – 11 **Modification:** Electrical & Instrumentation modification:

1. Refer to Drawing P10, and replace with the revised sheet.
2. Refer to Drawing P11, and replace with the revised sheet.
3. Refer to Drawing P12, and replace with the revised sheet.
4. Refer to Drawing P13, and replace with the revised sheet.
5. Refer to Drawing P19, and replace with the revised sheet.
6. Refer to Drawing E1, and replace with the revised sheet.
7. Refer to Drawing EA1, and replace with the revised sheet.
8. Refer to Drawing EL1, and replace with the revised sheet.
9. Refer to Drawing EN5, and replace with the revised sheet.
10. Refer to Drawing EP4, and replace with the revised sheet.
11. Refer to Drawing ES1, and replace with the revised sheet.
12. Refer to Drawing ES6, and replace with the revised sheet.
13. Refer to Drawing ES7, and replace with the revised sheet.
14. Refer to Drawing ES8, and replace with the revised sheet.

<u>Southside</u>

A2 – 12 **Clarification:** Sludge removal from stormwater basin will be paid by the CY from Bid Item #8. Section 33_01_33 has been revised.

A2 – 13 **Clarification:** Plug Valves internal to influent lift station / vault shall be full port.

A2 – 14 **Modification:** Electrical & Instrumentation modification:

1. Refer to Drawing C-9, and replace with the revised sheet.
2. Refer to Drawing SW-4, and replace with the revised sheet.
3. Refer to Drawing SW-4A, and replace with the revised sheet.

A2 – 15 Modification: Electrical & Instrumentation modification:

1. Refer to Drawing E4, and replace with the revised sheet.
2. Refer to Drawing E5, and replace with the revised sheet.
3. Refer to Drawing E6, and replace with the revised sheet.
4. Refer to Drawing E7, and replace with the revised sheet.
5. Refer to Drawing E8, and replace with the revised sheet.
6. Refer to Drawing E11, and replace with the revised sheet.
7. Refer to Drawing E13, and replace with the revised sheet.
8. Refer to Drawing E14, and replace with the revised sheet.
9. Refer to Drawing E15, and replace with the revised sheet.
10. Refer to Drawing E16, and replace with the revised sheet.
11. Refer to Drawing E17, and replace with the revised sheet.
12. Refer to Drawing E22, and replace with the revised sheet.
13. Refer to Drawing M1, and replace with the revised sheet.

Conveyance

A2 – 16 Addition: Connection to existing sewermain noted on sheet 42 (near sta 47+50) shall be made by installing a 30" x 24" D.I. Wye in existing 30" discharge main at connection point so that both lines may be operational during testing/startup. Wye to be removed/plugged upon completion of startup/commissioning.

Should you have any additional questions about the above modifications and their intent, please post to the CivCast website.

BID FORM SECTION 5.01 - BID PROPOSAL - ATTACHMENT "A" (ADDN 2) SUMMARY OF BID PRICING (ALL BLANKS MUST BE FILLED)	
SECTION	**BID PRICE**
GENERAL BID ITEMS	
NORTHSIDE	
COLLECTION SYSTEM LIFT STATIONS	
SOUTHSIDE	
CONVEYANCE	
TOTAL PROJECT BID PRICE	

I, General Contractor, do hereby certify that the above TOTAL BID PRICE stated above constitutes all labor, equipment and materials for a complete and operable system as defined by the Contract Documents. Additionally, I certify that any items not specifically outined have been included in the most applicable item, that no items are outstanding that would require an addition to the stated TOTAL BID PRICE, and that TOTAL BID PRICE is not conditional in any manner and constitutes the Lump Sum for completion of work for a complete and operable system as defined by the Contract Documents.

BY:_____ TITLE_____ DATE:_____

BID FORM SECTION 5.01 - BID SUMMARY SHEET - ATTACHMENT "A" GENERAL ITEMS APPLYING TO NORTHSIDE, SOUTHSIDE & CONVEYANCE					
#	**Bid Item, Complete per Plans & Specifications**	**Unit**	**Quantity**	**Cost/Unit**	**Total Cost**
1	SWPPP & Erosion Control	LSUM	1		
2	Mobilization, Demobilization, Bonds & Insurance	LSUM	1		
3	Construction Staking	LSUM	1		
4	Construction Traffic Control	LSUM	1

SECTION 33_01_33

WASTEWATER LIQUID & SOLIDS REMOVAL & DISPOSAL

PART 1 GENERAL

1.1 SUMMARY

A. Removal and disposal of wastewater liquids and solids from the wastewater treatment facilities.

B. Waste sludge handling & disposal to be removed from the following locations:
   1. Southside Drying Beds prior to beginning initial demolition for Southside Improvements (to be included in bid item for "Demolition (Initial)")
   2. Northside Drying Beds prior to beginning initial demolition for Southside Improvements (to be included in bid item for "Demolition (Initial)")
   3. Southside Stormwater Pond prior to beginning stormwater pond improvements (to be paid from bid item "Waste Sludge Handling & Disposal from Existing Treatment Units Prior to Final Demolition (Northisde & Southside).")
   4. Northside existing treatment units prior to beginning final demolition (to be paid from bid item "Waste Sludge Handling & Disposal from Existing Treatment Units Prior to Final Demolition (Northisde & Southside).")
   5. Southside existing treatment units prior to beginning demolition (to be paid from bid item "Waste Sludge Handling & Disposal from Existing Treatment Units Prior to Final Demolition (Northisde & Southside).")

C. Quantity and character of sludge will vary from location to location and bid price should per for waste sludge handling should be an average price for overall quantity.

D. It is the contractor's responsibility to verify the total amounts in each basin prior to bid.

E. No adjustment in price or unit price will be made based on actual quantities.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 02_41_00 Demolition

C. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 DEFINITIONS

A. Process Sludge: This material is the liquid volume of existing tankage and mixture of process water, mixed liquor, organic settled solids and sludge that will be transferred by the Contractor to another treatment basin as approved by the Owner. **The transfer of process sludge will be required prior to complete construction activities (demolition and rehabilitation of Southside stormwater pond.)**

B. Waste Sludge: This material includes an undetermined volume and mixture of grit, inorganic settled solids and sludge that will be removed and disposed by the Contractor. **The disposal of waste sludge will be required to complete construction activities (demolition and rehabilitation of Southside stormwater pond.)**

C. Sludge Management Plan (SMP): A plan for removing, processing, treating, storing, transporting, and disposing of mixed liquor, settled solids, partially digested sludge, and sludge in addition to soils intermixed with the various types of sludge.

D. Sludge Disposal / Disposition Plan (SDP): A plan for sludge removed from the treatment facility and disposed of in a landfill.

E. Added Water: This water is added by the Contractor to aide in the removal of, cleaning of, and transport of the existing solids to be removed from the wastewater facilities and disposed of off-site. The added water is the sole responsibility of the Contractor. The volume of added water is not included in the specified volumes of the bid quantities of material to be removed from the wastewater facilities. The Contractor is responsible for all effort and costs required to provide, use, transport, and dispose of added water used in the tasks associated with liquid and solids removal. The Contractor shall include all costs for added water in the base bid quantity prices and the Bid Form Unit Prices for Sludge Removal. The Contractor's use of added water shall not be grounds for a scope change nor a contract change.

F. Sludge Removal: Construction activities to remove mixed liquor, settled solids, partially digested sludge, and sludge from any wastewater treatment facility in an effort to gain access for subsequent construction activities and/or cleaning of a facility to facilitate inspection, repair, demolition, and/or other construction activities as required by the Contract Documents.

G. Treatment Basin: Structures, both existing and new, whose primary function is to hold, treat and/or process wastewater, wastewater solids, and sludge.

H. Project Locations: Facilities from which sludge is to be removed.

1.5 SCHEDULING & SEQUENCING

A. Conduct sludge removal only after schedule has been approved by the Owner and the Contractor has submitted SMP or SDP and received written approval of same from ODEQ Contractor, with Owner's approval, may make use of existing SMP/SDP in place. Coordinate with Owner prior to bid. Sludge removal schedule and sequencing must allow for continued operation of the facilities. If land application is used for disposal, apply sludge only after adequate erosion and sediment controls are in place.

1.6 MEASUREMENT & PAYMENT

A. Process Sludge Handling:
   1. Measurement: Will not be measured. It is considered to the be the full volume of any tankage that is required to be drained to execute construction activities (demolition and rehabilitation of Southside stormwater pond.)
   2. Payment is subsidiary to Demolition. Payment shall be full compensation for the following: equipment, labor, any added water, gas/fuel, sludge and soil testing, spill clean-up, and temporary pumping and piping. Contractor is responsible for all efforts and costs associated with procuring, transport, and final disposal of any added water.

B. Waste Sludge Handling and Disposal for Initial Demolition:
   1. Will not be measured for payment and shall be included in the price bid for demolition.

C. Waste Sludge Handling and Disposal for Final Demolition:
   1. Measurement: The units scheduled for demolition or rehabilitation will be drained of Process Sludge to the minimum level practical. Prior to removal of any Waste Sludge, the Owner, Engineer, and Contractor will agree on that the remaining sludge is of a nature that cannot be processed by the treatment plant. Upon agreement the sludge depth will be measured at each corner and at least one point in the center of the basin. The depth measurements along with the basin plan view area will used to calculate cubic yards of Waste Sludge to be disposed of. No payment will be made for Added Water.
   2. Payment: Payment for sludge disposal will be by the cubic yard of sludge disposed at the Bid Price listed in the Bid Proposal. The Bid Item will be full compensation for removal of waste sludge, dewatering, hauling, landfill tipping fees, permitting, tools, labor and any other incidentals required to complete the work.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 GENERAL

A. The Contractor with coordination from the Owner will be responsible for transferring Process Sludge from one basin to another.

B. Contractor is responsible for removal, handling and disposal of all Waste Sludge, including the material resulting from the tanks' cleaning.

C. Remove Waste Sludge from the existing basins within the limits shown or specified and dispose of the Waste Sludge in accordance with a ODEQ approved SMP or SDP. The Contractor shall also be responsible for removing and handling any waste sludge from the new basins in accordance with an ODEQ approved SMP or SDP as required for his construction activities within these new basins.

D. Contractor is responsible for all expenses related to Process Sludge removal and transfer, which shall be covered under the base bid.

E. Contractor is responsible for maintaining and protecting all roads, drives, dikes, equipment, structures, etc during sludge removal, processing, land application, hauling, and disposal and shall repair any damaged as a result of their work.

F. The Contractor will be required to keep a Daily Record and a Project Record, of the volume of liquid biosolids land-applied each day. The Daily Record will need to be provided to the Project Manager, or his designee, at the end of each workday. The Project Record will need to be provided to the Owner, or designee, at the end of the project.

G. The Contractor will communicate daily with the Engineer to determine which land application site will be used. This discussion is also designed to ensure that the Contractor does not over apply biosolids to any approved application site.

H. The Contractor will be responsible for biosolids sampling, sample preservation, sample delivery, and storage in accordance with methods developed by the City of Shawnee Wastewater Treatment Plant Laboratory Staff or standard practice is no methods have been developed.

I. The Contractor is required to maintain a cooperative and courteous relationship with the landowner while delivering and land-applying sludge, grit, and biosolids. Care shall be taken to leave the fields and roadway in reasonable condition upon project completion.

3.2 PROJECT LOCATION

A. As follows, but not to extend beyond Project limits.
   1. Northside
      a. All existing units
      b. All piping that requires wastewater and sludge removal
      c. All other treatment plant facilities that require dewatering and cleaning to perform the work.
   2. Southside
      a. All existing units
      b. Existing stormwater pond
      c. All piping that requires wastewater and sludge removal
      d. All other treatment plant facilities that require dewatering and cleaning to perform the work.

3.3 TREATMENT BASIN CLEANING

A. Transfer Process Sludge to another basin designated by the Owner and take measurements of Waste Sludge In-Situ prior to commencing cleaning activities.

B. Remove sludge from the Treatment Basins within limits or as specified or directed.

3.4 EQUIPMENT

A. Provide necessary equipment for Process Sludge transfer from on basin to another Owner designated basin.

B. Provide necessary equipment for Waste Sludge removal, transport from the facility to the disposallocation, and final application or disposal.

C. Provide necessary equipment for added water, procurement, transport from the facility to thedisposal location, and final application or disposal.

3.5 DISPOSAL PERMITTING

A. Contractor will be responsible for registration, authorization, and/or permitting of the land application with the appropriate regulatory agencies and shall pay the related regulatory fees.

B. Contractor will maintain all chain of custody forms and provide documentation of all sludgevolumes land applied and the application sites.

3.6 TESTING

A. Contractor will be responsible for obtaining all sludge and soil samples and their required labanalyses for permitting.

B. Contractor will pay for the lab analysis and will include such lab analysis expenses with as part ofthe Work.

3.7 DISPOSAL

A. Apply the sludge and/or added water for beneficial use as fertilizer/soil amendment or dispose ofthe material using a disposal method approved by the appropriate permitting agency.

B. When sludge application is via the subsoil injection method, such application shall be accordingto sound agronomic rates.

C. Contractor is responsible for determining application rates based on cover crops and analyticaltesting of the sludge.

D. Contractor may remove and separately dispose of oil/grease from the sludge prior to land application.

E. Contractor is responsible for providing commercially reasonable handling of sludge once it hasbeen collected, including cleanup of any spills.

F. Contractor is responsible for meeting the dewatering requirements of landfill disposal.

3.8 RECORD KEEPING

A. Maintain records of sludge application and submit records to Engineer, Owner, and regulatingagencies, as required by this specification and any related permits.

3.9 BIDDING QUANTITIES

A. Process Sludge Removal
   1. Will not be measured for payment and will be included in the price bid for demolition.

B. Waste Sludge (initial demolition)
   1. Will not be measure for payment and will be included in the price bid for demolition.

C. Waste Sludge Removal (final demolition)
   1. Contractor is responsible to remove and dispose of the waste sludge volumes listed in the bid proposal from the designated structures to be demolished.
   2. The volume listed is for reference only, payment will be based on the total quantity of Waste Sludge removed from all facilities. No additional payment will be made if quantities removed exceed the estimated quantity listed for any individual facility unless the total quantity is exceeded (both facilities.) If the total quantity removed meets the total estimated, sludge removal will stop until the Owner and Contractor agree to contract modification to handle the remaining Waste Sludge.

END OF SECTION

SECTION 43_23_31.35

NON-POTABLE WATER PUMPS

PART 1 GENERAL

1.1 SUMMARY

A. This specification covers the work necessary to furnish and install non-potable water pumps as specified herein and as shown on the plans
   1. Northside WWTP
      a. Three (3) (one as shelf spare)
      b. 200 gpm @ 207'
   2. Spare Parts
      a. One (1) shelf spare pump

B. Pumps and all associated components as listed above shall be of the same Manufacturer to obtain standardization of performance, operation, spare parts, maintenance and Manufacturer's services.

C. Supplier / manufacturer to review and match requirements of Belt Filter Press. Those requirements supersede any conflicting information provided herein (including pump sizing.)

D. All listed iron and steel products used in this project must be produced in the United States. The term "iron and steel products" means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials. The deminimis and minor components waiver apply to this contract for minor components.

1.2 RELATED SECTIONS

A. Section 01_00_01 Basic Requirements

B. Section 01_33_01 General Submittal Requirements

C. Section 01_33_02 Pre-bid Equipment Submittal Requirements

D. The Contract Documents are a complete unit and complementary to each other. The individual Specification sections and other Contract Documents do not contain all cross references to "related work" or "related sections." It is the Contractor's responsibility to review the complete Contract Documents in order to properly scope, schedule and coordinate the work of any/all subcontractors, suppliers, and others on this project. Anything called out in one location of the Contract Documents is binding as if it were called out in all sections of the Contract Documents.

1.3 SUBMITTALS

A. Submittals for products and miscellaneous items in this specification section shall be submitted in accordance with Section 01_33_01 General Submittal Requirements and related submittal sections and provisions of the Contract Documents.

1.4 REFERENCES

A. The Contractor and/or Manufacturer shall follow the standards listed below, except as otherwise specified herein. The latest revision or edition in effect at the time of bid opening shall be utilized.

1.5 DELIVERY, STORAGE & HANDLING

A. Equipment shall be delivered to the jobsite completely factory assembled. Individual equipment components shall be crated in structurally adequate packing containers to prevent damage during shipping, facilitate ease of handling and to provide suitable protection from weather for extended storage at the jobsite prior to installation. Packing containers shall be permanently labeled with appropriate equipment identification, shipping address and return address and packing list shall be provided with equipment at time of delivery.

B. Any electrical motors and components shall be kept thoroughly dry at all times and shall be stored indoors. Equipment storage shall be protected and maintained in accordance with the manufacturer's recommendations. Equipment shall not be stored directly on the ground.

C. Contractor shall utilize equipment and tools of adequate size suitable for unloading, transporting, storing and supporting the equipment during installation and in accordance with manufacturers recommendation. Caution shall be employed to prevent equipment damage resulting from abrupt contact with other materials or equipment.

1.6 WARRANTY

A. The manufacturer shall warrant the equipment to be of quality construction, free from defects in materials and workmanship. The warranty shall become effective upon acceptance of the project by the Owner (after completion of final inspection.)

B. The equipment, apparatus, and parts furnished shall be warranted from a period of one (1) year, excepting only those items that are normally consumed in service, such as oil, grease, gaskets, o-rings, etc. The manufacturer shall be solely responsible for the warranty of the equipment and all components.

C. Upon request from the Engineer and/or the Owner, the manufacturer shall demonstrate proof of financial responsibility with respect to performance and delivery date. In addition, the manufacturer shall provide proof of evidence of facilities, equipment, and skills required to produce the equipment specified herein and provide technical service and replacement parts.

D. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of kind to the Owner.

E. It is not intended the manufacturer assume liability for consequential damages or contingent liabilities arising out of failure of any product or parts thereof to operate properly, however caused by or resulting from or arising out of defects in design or manufacture, delays in delivery, replacement, or otherwise.

PART 2 PRODUCTS

2.1 DESCRIPTION

A. Quantity to be Furnished:
1. Non-Potable Supply Pumps - Three (3) (one as shelf spare)

B. Dimensional and Design Information
1. Non-Potable Water Supply Pump

a.	Liquid Pumped	- Final Effluent
b.	Design Flow Rate - gallons / minute	- 200
c.	Total Head Required - ft.(design)	- 207’
d.	Motor - Horsepower (maximum)	- TBD based on flow/head
e.	Motor Service Factor	- 1.15
f.	Motor Enclosure Type	- WP1
g.	Motor Starting Method	- VFD
h.	Motor Ambient Operating Temperature	- 40 C
i.	Electrical Power Volt/Phase/Hz	- 460/3/60
j.	Pump Speed - RPM (maximum)	- 3500
k.	Discharge Size - inches (minimum)	- 6
l.	Discharge Type - ANSI Flange	- Flanged
m.	Casing Working Pressure-PSI(minimum)	- 125

C. Factory Painting
1. Pump, coupling guard and support base shall be prime painted with system compatible with finish coating system specified in Coating Section of these specifications. The motor shall be finished painted with the Manufacturer's standard enamel finish coating and furnished with adequate touch-up paint to repair field damages.

2.2 MATERIALS

A. Non-Potable Water Supply
1. Non-Potable Water Supply
2. Suction Manifold or Bell - A48 Class 30 Cast Iron
3. Bowl - A48 Class 30 Cast Iron
4. Impeller - B584 C83600 Bronze
5. Bowl Wear Ring - B505 C93200 Bronze
6. Bowl Bearings - B505 C93200 Bronze
7. Bowl Sand Collar - B505 C93200 Bronze
8. Impeller Wear Ring - B505 C93200 Bronze

9. Bowl Flange Cap Screw or Stud and Nuts- 303 stainless steel
10. Pump Shaft - A582 - 416 stainless steel
11. Column Pipe - ASTM A 53, grade A, schedule 40 steel pipe
12. Column Line Shafting - AISI 1045 steel
13. Column Coupling - A53 Grade b Steel
14. Column Top Flange Cap Screws - 303 stainless steel
15. Top Bowl Bearing - B505 C93200 Bronze
16. Intermediate Bowl Bearing - B505 C93200 Bronze
17. Suction Bearing - B505 C93200 Bronze
18. Connector Bearing - B505 C93200 Bronze
19. Column Shaft Bearing Retainer Ring - 303 stainless steel
20. Discharge Head – Carbon Steel
21. Packing Container - Class 30 Cast Iron
22. Packing Washer - Brass
23. Packing - Graphited Rope
24. Packing Gland - Cadmium plated Class 30 cast iron
25. Packing Gland T-Bolt - 316 Stainless Steel
26. Packing Gland Clamp - 302 Stainless Steel
27. Packing Gland Nut - 316 Stainless Steel
28. Packing Gland Gasket - Vellumoid
29. Packing Gland Cap Screw - Steel
30. Top Shaft – AISI 1045 Steel
31. Top Shaft Seal Ring - Neoprene
32. Top Shaft Coupling - 410 Stainless Steel
33. Sole Plate - Carbon Steel or CI
34. Sole Plate Gasket - Vellumoid
35. Sole Plate Cap Screws - Carbon Steel

2.3 COMPONENTS

A. Non-Potable Water Supply Pumps

1. The pump bowl assembly shall be of close grained cast iron having a minimum tensile strength of 30,000 pounds per square inch, free from blow holes, sand holes, and all other faults; accurately machined and fitted to close dimensions.
2. The impeller shaft shall be of stainless steel and shall be supported by bronze or neoprene bearings located on both sides of each impeller. The impeller shall be of the enclosed type and shall be of bronze, of heavy construction, accurately fitted and balanced. The impeller shall be locked securely to the impeller shaft with a tapered lock bushing. The bowls and impellers shall be designed with smooth passage to assure efficient operation. The impellers shall be adjustable by means of a top shaft adjusting nut.
3. The pump column pipe shall be furnished in interchangeable sections not over 5 feet in length, and shall be threaded.
4. The line shafting shall be of ample size to operate the pumps without distortion or vibration. The shafts shall be furnished in interchangeable sections not over 5 feet in length, and shall be coupled with extra-long threaded steel couplings machined from solid bar steel. The shaft shall be fitted with stainless steel replaceable sleeves. The column assembly shall have bronze guides fitted into the coupling and secured in place with butted pipe ends. Each guide shall contain a water lubricated rubber bearing designed for vertical turbine pump service.

5. The discharge head shall be the above ground discharge type with machined mounting surface designed for standard NEMA 1 flange motor, the discharge flange shall be furnished with 125-pound ANSI drilling the discharge head shall be fitted with a packing container designed for lubrication with the pumped liquid. A threaded connection shall be provided to allow the lubrication liquid collected in the interior ring of the discharge head to be piped to a local drain. A seal ring shall provided to prevent the lubrication liquid from leakage up onto the motor bearings. Hand hole openings large enough to provide easy access to all adjustable components shall be furnished. Lifting lugs adequately designed to support the entire weight of the pump assembly shall be integrally cast into the discharge head.
6. Sole plate with gasket and cap screws shall be furnished to provide a water tight seal between concrete base and pump and to allow for removal of pump from base without permanently damaging the water tight seal.
7. Drive Motor - The motor shall be the squirrel-cage induction alternating current inverter duty type. The motor nameplate horsepower rating shall not be exceeded at any head capacity point on the pump curve. The motor shall conform to the following:

a.	Synchronous Speed	3600 RPM or as approved
b.	Slip	3 percent maximum at full load
c.	Voltage, phase, & Frequency	460 volts, 3 phase, 60 Hz
d.	Mounting	Vertical, hollow shaft
e.	Enclosure	Weather protected, Type I
f.	Service Factor	1.15
g.	Duty Cycle	Continuous
h.	Ambient Temperature Rating	40 degrees C
i.	Starting Method	VFD
j.	Bearing Lubrication	Manufacturer's standard
k.	Bearing Bio Life	B10 Life-Ave. 25 Years, min 5 Yrs.

PART 3 EXECUTION

3.1 INSTALLATION

A. The general contractor shall assume full responsibility for coordination of the entire project, including verification that all structures, piping, coating systems and equipment components are compatible. The general contractor shall initially operate each equipment system, and shall make all necessary adjustments so that each system is placed in proper operating condition.

B. Equipment and materials utilized for this project must be approved by the Engineer prior to installation. Approval for installation or incorporation in this project will be made only after submittal of manufacturer's shop and installation drawings, test results or other data as required and as specified herein.

C. Installation of equipment shall be in full conformance with the manufacturer shop drawings and requirements as approved by the Engineer. Wherever a conflict arises between manufacturer's instructions and the contract documents, the contractor shall follow the Engineer's decision at no additional cost to the owner.

3.2 WORKMANSHIP

A. Handle carefully and protect the pump and appurtenances to avoid damage. If the pump and column are laid down, support them with blocks to prevent damage.

B. Mount pump and driver on suction barrel as shown on the Drawings. The size of the suction barrel shall be in accordance with pump manufacturer's recommendations.

C. Adjust pump assembly such that the driving unit is properly aligned, plumb, and level with the driven unit and the interconnecting shaft and coupling. Flexible coupling shall not be considered to compensate for misalignment. Install all equipment in accordance with manufactures instructions.

D. Any evidence of pump or driver misalignment, noisy operation, or other signs of improper setting shall be corrected by the Contractor. Care during storage, installation and lubrication shall be in strict accordance with the manufacturer's recommendations.

3.3 ANCHORAGE

A. Anchor bolts shall be furnished for each item of equipment. Anchor bolts, together with templates or setting drawings, shall be delivered sufficiently early to permit setting the anchor bolts when the structural concrete is placed. Two nuts shall be furnished for each bolt. Anchor bolts shall be in place prior to concrete pour.

B. Types of anchorage:
   1. All cast-in-place anchorage shall be 304 stainless steel.
   2. Drill-in anchorage shall be epoxy adhesive type and shall be used only if recommended and allowed by manufacturer.

3.4 LUBRICATION

A. Equipment shall be adequately lubricated by a system which does not require more than once-a-week operator attention, does not require attention during start-up or shutdown and does not waste lubricants.

B. The contractor shall provide lubricants of the type recommended by the equipment manufacturer in sufficient quantity to fill all lubricant reservoirs and to replace all consumption during equipment initial operation, performance testing and operation prior to acceptance of equipment by the owner.

3.5 FIELD PAINTING

A. Painting shall be in accordance with the high performance coating section of these specifications. All ferrous materials which are not non-corrosive shall be painted with epoxy paint systems. Items to be painted which will be exposed to submerged or wet conditions shall be painted with the coal-tar epoxy paint system. Paint systems in contact with water to be used for potable public water supply systems shall be approved by the FDA for this application.

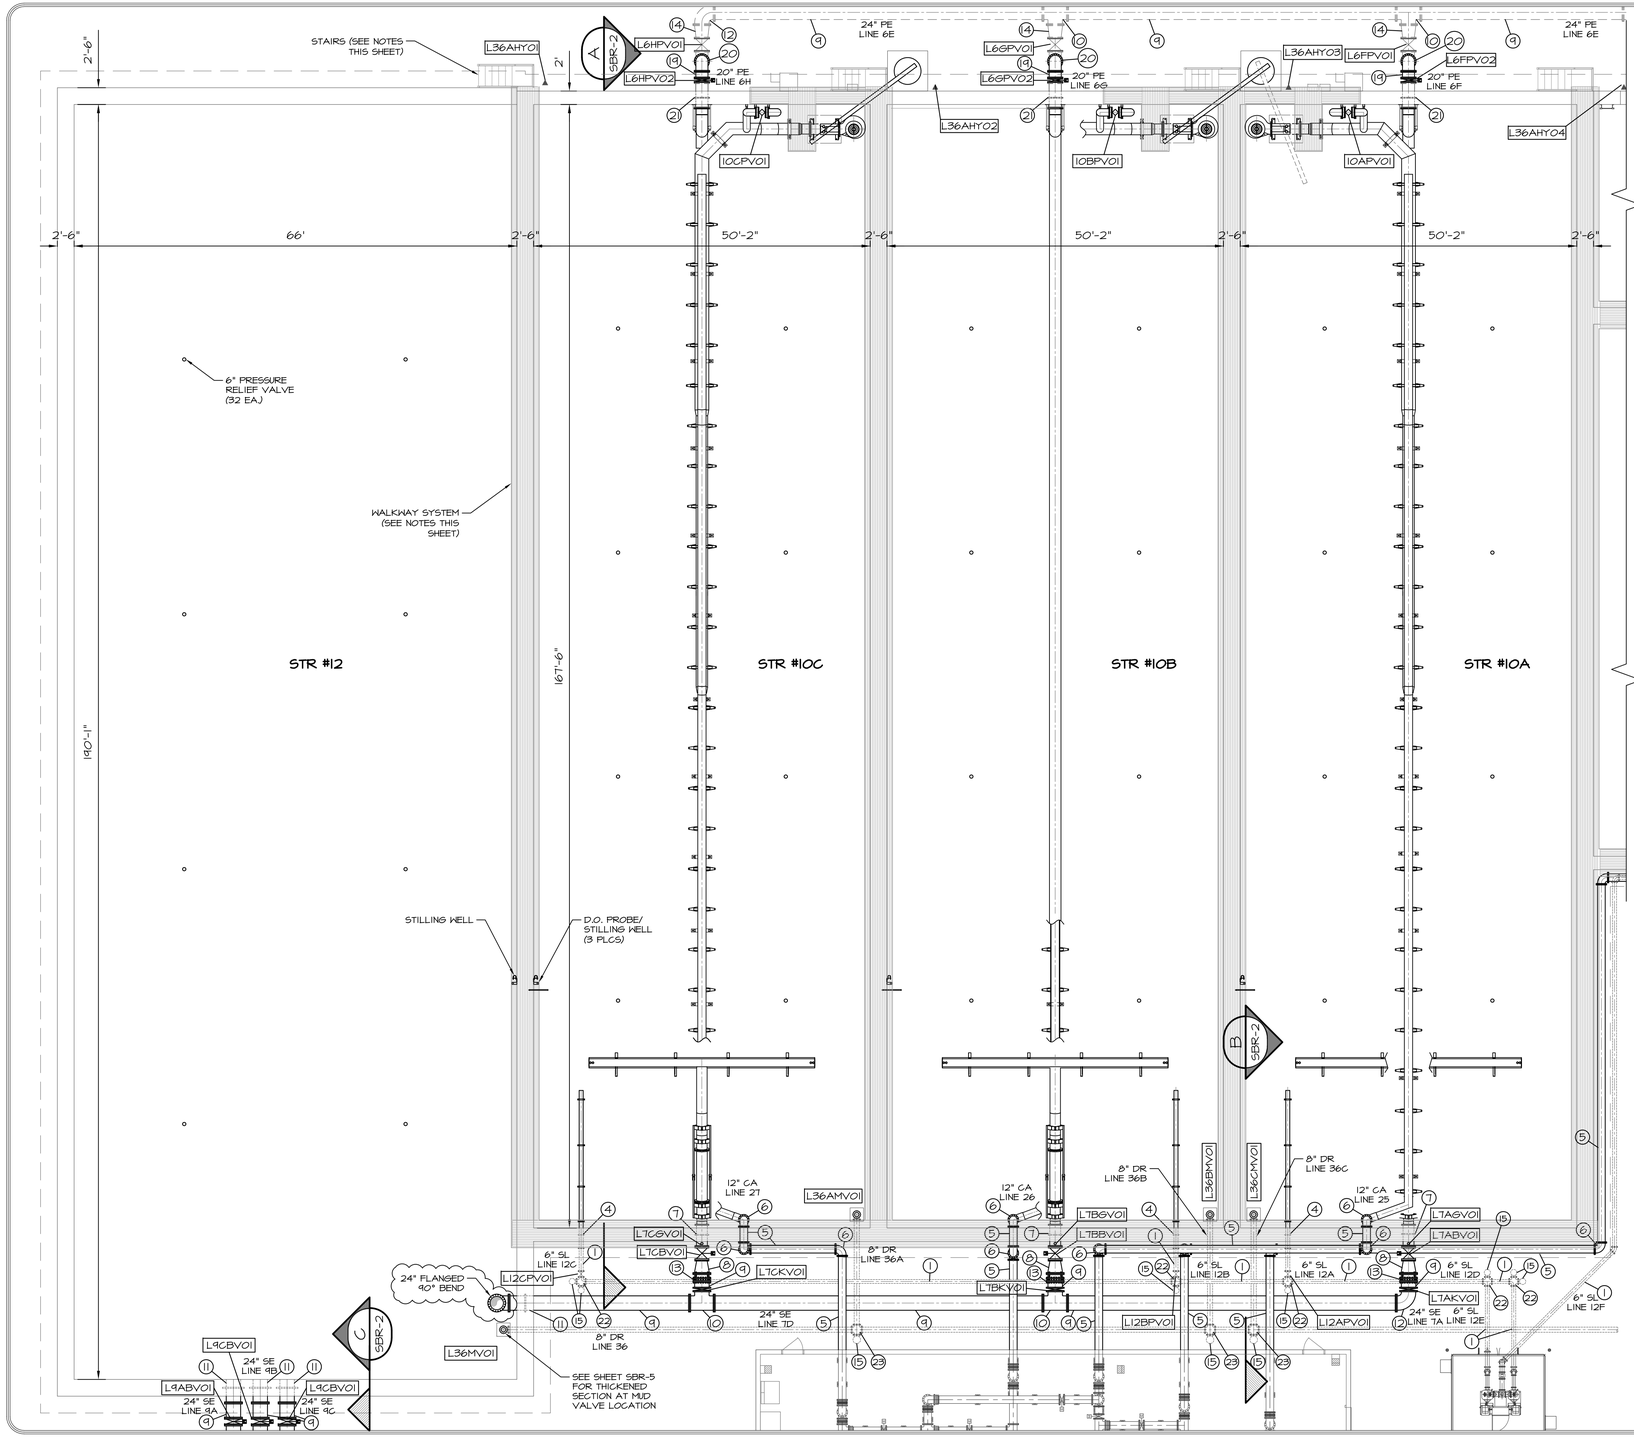
B. Minor defects in the hot-dipped galvanized coating caused by shipping, handling or installation shall be repaired after equipment installation. The defects shall be thoroughly

cleaned and wire-brushed to remove all foreign substances, wiped clean with a damp rag, thoroughly dried, and coated with at least 6 mils of zinc-rich compound.

3.6 MANUFACTURER'S SERVICES

A. The Contractor shall require the manufacturer to furnish the services of a qualified field engineer to perform the following functions in the designated periods of time. These services are to be performed at the jobsite.
   1. Check-out of installation, start-up of equipment and initial operator instruction. This service shall take place after all mechanical equipment associated with the control system is installed and mechanically operable.
   2. After equipment is fully operational, and before Owner will assume responsibility for the operation of the equipment, the equipment manufacturer's operation specialists shall instruct the Owner's operating personnel in the care, maintenance and proper operation of the equipment.

B. Field Test
   1. Prior to plant startup, all equipment described herein shall be inspected for proper alignment, quiet operation, proper connections, and satisfactory performance by means of a functional test.
   2. The pump and motor assembly shall be field tested to verify vibration is not in excess of the limits stated in the latest revision of Hydraulic Institute and NEMA MG 1.
   3. The pumps, motors, and controls shall be given an operational test in accordance with the standards of the Hydraulic Institute. Recordings of the test shall substantiate the correct performance of the equipment at the design head, capacity, suction lift, speed and horsepower as herein specified.
   4. Units failing to meet the Specifications and to the satisfaction of the Owner must be more accurately tested in accordance with Hydraulic Institute Standards. If the pump fails the second test, the unit will be rejected, and the Contractor shall remove the unit that is rejected, and the Contractor shall furnish a unit that will perform as specified.



C. Instructions for installation of the pump and related appurtenances shall be written and furnished by the manufacturer. Contractor shall follow these instructions in installing the equipment.

D. Operation and maintenance materials
   1. The pump manufacturer shall be responsible for supplying written instruction, which shall be sufficiently comprehensive to enable the operator to operate and maintain the pump and all equipment supplied by the manufacturer. Instructions shall assume that the operator is familiar with pumps, motors, piping, valves, and controls, but that he has not previously operated and/or maintained the exact equipment supplied.
   2. The instruction shall be prepared as a system manual applicable solely to the pump and equipment supplied by the manufacturer to these specifications, and shall include those devices and equipment supplied by him.
   3. Operation and maintenance instruction shall be specific to the equipment supplied in accordance with these specifications. Instruction manuals applicable to many different configurations and pump stations, and which require the operator to selectively read portions of the instructions shall not be acceptable.

E. All costs for the above manufacturer functions including travel, lodging, meals, and incidental shall be considered to have been included in the Contractor's lump sum bid price.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK FOR DOUBLE SIDED PRINTING

HANDRAIL/WALKWAY NOTES:

1. COMPLETE HANDRAIL SYSTEM (INCLUDING STAIRS AND PUMP MAINTENANCE PLATFORM) TO BE FURNISHED AS A SYSTEM (INCLUDING PRE-EQ BASIN) FROM A SINGLE SUPPLIER. COMPLETE SYSTEM TO BE STAMPED BY AND OKLAHOMA STRUCTURAL ENGINEER (S.E.).
2. COORDINATE WITH PUMP SUPPLIER TO VERIFY CLEARANCE REQUIRED FOR MOTIVE PUMP REMOVAL.
3. STAIRS TO BE AS CLOSE AS PRACTICAL TO SBR WALL.

NOTES:
1. CONTRACTOR TO PROVIDE A ¾" NIPPLE AND GLOBE VALVE BETWEEN OUTSIDE OF DECANTER SPOOL PENETRATION AND EFFLUENT CONTROL VALVE TO SERVE AS A FILL PORT TO SINK DECANTER AT START-UP (SEE SBR-1).
2. DECANTER OUTLET PIPING MUST BE DESIGNED WITH A SUBMERGED OUTLET OR TRAPS TO PREVENT AIR FROM ENTERING THE DECANTER.
3. ALL PIPE ELEVATIONS SHOWN ARE CENTER OF PIPE UNLESS OTHERWISE INDICATED.
4. ALL FRP PIPE AND FITTINGS SHALL BE 75 PSI MIN. PRESSURE RATING.
5. ALL FLANGES FURNISHED BY SUPPLIER SHALL MEET OUTSIDE DIAMETER, BOLT CIRCLE DIAMETER, NUMBER AND SIZE OF HOLES PER ANSI B.16.1 125 LB. CAST IRON, AND ANSI B16.5 150 LB. STEEL FLANGE SPECIFICATIONS.
6. GASKETS PROVIDED BY SUPPLIER SHALL BE 3/16" THICK, FULL FACE BUNA-N RUBBER, WITH A DUROMETER HARDNESS OF 40-50.
7. COORDINATE DECANTER REST ELEVATION W/SUPPLIER.
8. COORDINATE SBR INTERNAL COMPONENTS WITH SUPPLIER TO ESTABLISH SCOPE OF SUPPLY AND VENDER/CONTRACTOR RESPONSIBILITIES.
9. INSTALL 1-1/2" SAMPLE WITH VALVE (ONE FOR EACH SBR BASIN) AND FREEZE PROTECT. SAMPLE LINE TO BE INSTALLED AT ELEV. 971.00' AND ROUTE TO 36".

MANUFACTURER–DESIGNED EQUIPMENT SYSTEM NOTES:

1. THIS PROJECT INCLUDES THE CONSTRUCTION OF MANUFACTURER–DESIGNED EQUIPMENT SYSTEMS.
2. POWER, SIGNAL AND CONTROL CIRCUITS ARE SHOWN ON THESE DRAWINGS BASED ON SIMILAR MANUFACTURER–DESIGNED EQUIPMENT SYSTEMS.
3. THE FINAL POWER, SIGNAL AND CONTROL CIRCUIT REQUIREMENTS SHALL BE DETERMINED BY THE APPROVED MANUFACTURER.
4. DRAWINGS, SPECIFICATIONS, INSTALLATION MANUALS, AND OTHER REQUIRED DOCUMENTATION SHALL BE PROVIDED BY THE APPROVED MANUFACTURERS AND MAY INCLUDE ADDITIONAL AND/OR ALTERED REQUIREMENTS THAN SHOWN ON THESE DRAWINGS.
5. THE CONTRACTOR SHALL COORDINATE WITH THOSE APPROVED SUBMITTAL DRAWINGS AND PROVIDE ALL REQUIRED LABOR AND MATERIALS NECESSARY FOR A COMPLETE AND ACCEPTED SYSTEM AT NO ADDITIONAL COST TO THE OWNER.

KEYED NOTES:

1. CCTV LOCATION POLE MOUNT. ROUTE (3#12)3/4"C TO 120 VOLT PANEL SCHEDULES.
2. CCTV LOCATION BUILDING MOUNT
3. FURNISH AND INSTALL CIRCUIT 1F20N FROM PANEL IPCL1 TO MAG METER IN VAULT. CONNECT TO 20A/1P CIRCUIT BREAKER. FURNISH AND INSTALL (1ISP16)1"C FROM MAG METER TO PANEL RTU–A.
4. FURNISH AND INSTALL CIRCUIT F20 FROM PANEL HP–1 TO ACTUATED VALVE. CONNECT TO 20A/3P CIRCUIT BREAKER. FURNISH AND INSTALL (8#14)1"C AND (2ISP16)1"C TO PANEL RTU–A.

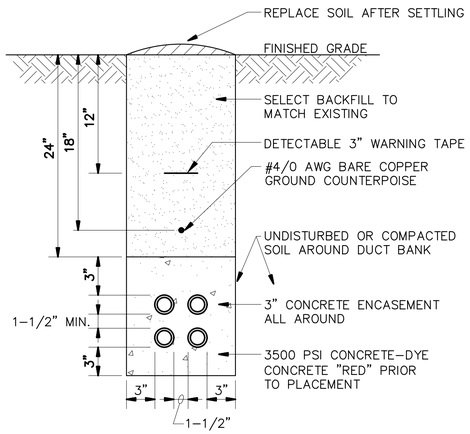
3. APPROVED BY THE ENGINEER/OWNER.
4. CABLE BRACKETS SHALL BE A BRACED CHANNEL STRUT WITH INSULATED CABLE CLAMPS.
5. INSTALL CABLE BRACKETS AND PULLING IRONS IN EACH FACE.
6. PROVIDE WATER STOPS AT ALL JOINTS; SPLICE WHERE REQUIRED.
7. PROVIDE 0.006" PLASTIC MEMBRANE VAPOR BARRIER AT BOTTOM; PROVIDE 2 COATS WATERPROOF COATING COLD METHOD. ALLOW TO DRY 24 HOURS BETWEEN EACH COAT AND BACKFILLING.
8. COLOR CODE, TAG, AND IDENTIFY ALL CABLES IN MANHOLE.
9. PROVIDE MINIMUM 5' SLACK CABLE LOOP FOR EACH CABLE.
10. PROVIDE 3' MINIMUM CONDUIT PER CAPPED STUBOUT. PROVIDE CONDUIT BUSHINGS AND WATERTIGHT SEALS FOR
11. ALL DIRECET BURIED CABLES AND COUNTERPOISE ENTERING THE MANHOLE VIA A CONDUIT STUBOUT. PROVIDE SLEEVES FOR 8 WAY EXITS AT MANHOLES.
12. SLEEVES AND STUBOUTS SHALL BE CAPPED WATERTIGHT. BOND AND GROUND COVER AND FRAME TO GROUND ROD
13. USING BRAIDED COPPER GROUND STRAP EQUIVALENT TO #6 AWG COPPER WIRE.

TRANSFORMER PAD KEYED NOTES:

1. INSTALL NEW COPPER CLAD GROUND ROD, 3/4" x 10"-0", TYPICAL OF 4.
2. INSTALL NEW #2/0 BARE COPPER CONDUCTOR (TYPICAL).
3. INSTALL NEW #2 BARE COPPER CONDUCTOR.
4. INSTALL NEW EXOTHERMIC WELD, TYPICAL OF 5.
5. INSTALL NEW SECONDARY CONDUITS, SEE SITE PLAN.
6. INSTALL NEW PRIMARY CONDUITS, SEE SITE PLAN.
7. INSTALL NEW #4 REBAR, 12"O.C. BOTH WAYS.
8. CONSTRUCT NEW PAD USING CONCRETE, 3500 PSI AT 28 DAYS.
9. INSTALL NEW 1" GRSC UNDER PAD FOR GROUND WIRES (TYPICAL).
10. UTILIZE LONG SWEEP 90° BEND PVC CONDUITS ON PRIMARY CONDUITS.
11. UTILIZE LONG SWEEP 90° BEND CONDUITS ON SECONDARY CONDUITS.



2 — **TRANSFORMER PAD DETAIL**
SCALE: NONE

TRANSFORMER PAD NOTES:

1. WHERE POSSIBLE. DO NOT PLACE CONDUIT UNDER THIS SECTION OF FOUNDATION.
2. REINFORCING - #4 BARS 12" O.C. BOTH WAYS.
3. WHEN INSTALLING CONDUIT, DISTURB GROUND IN FOUNDATION AREA AS LITTLE AS POSSIBLE. EXTEND CONDUIT 1" ABOVE FOUNDATION.
4. TOP OF FOUNDATION TO BE SMOOTH AND LEVEL. FINAL GRADE SHALL SLOPE AWAY FROM PAD.
5. CONCRETE SHALL BE 3500 PSI AT 28 DAYS AND 1:2:4 MIXTURE WITH 6 GAL. MAX. WATER CONTENT PER SACK OF CEMENT.
6. CONTRACTOR TO FURNISH 1" CONDUIT UNDER PAD FOR GROUND WIRE.
7. LOCATE CONDUITS UNDER PRIMARY AND SECONDARY BUSHINGS.
8. TRANSFORMER LOCATION TAG SHALL BE ATTACHED TO PAD WITH CONCRETE NAILS OR SHEET METAL SCREWS.
9. TRANSFORMER PAD REQUIRES A MINIMUM 3'-0" CLEARANCE AROUND EACH SIDE AND BACK OF PAD. A 15'-0" CLEARANCE IS REQUIRED ON FRONT SIDE OF PAD.

ELECTRICAL DUCT NOTES:

1. CONTRACTOR SHALL STAKE THE DUCT INSTALLATION IN PLAN AND ELEVATION FOR NEW ELECTRICAL DUCTS TO AVOID EXISTING UTILITIES.
2. CONTRACTOR SHALL ADJUST THE DEPTH OF THE ELECTRICAL DUCTS AS REQUIRED TO MAINTAIN THE MINIMUM COVER REQUIREMENT INDICATED AND AVOID EXISTING UTILITIES.
3. SIMILAR CONSTRUCTION FOR OTHER DUCT SIZES. SEE DUCT BANK SCHEDULE FOR QUANTITY AND SIZES.
4. INSTALL DUCT CONDUIT SUPPORTS AT 5'-0" O.C. MAXIMUM SPACING (TYPICAL ALL DUCTS).
5. OFFSETS AND BENDS OVER 10 DEGREES AND ELBOWS IN PVC CONDUIT RUNS SHALL BE PVC COATED GALVANIZED RIGID STEEL CONDUIT.
6. NO PVC SHALL EMERGE FROM THE GROUND OR CONCRETE SLAB OR ENCASEMENT, PVC SHALL CONVERT TO PVC COATED GALVANIZED RIGID STEEL CONDUIT PRIOR TO ITS EMERGENCE.
7. INSTALL GROUND RODS AT ENDS OF ELECTRICAL DUCT OR CONNECT TO GROUND RING.
8. INSTALL CONDUCTORS AND CABLES AS NOTED ON DRAWING. INSTALL PULLWIRE IN ALL SPARE DUCTS.
9. MINIMUM COVER REQUIREMENT FOR DUCT BANKS UNDER ROADS, DRIVEWAYS AND PARKING LOTS SHALL BE 24".
10. MINIMUM COVER REQUIREMENTS FOR ELECTRICAL SECONDARY SERVICE DUCT BANKS SHALL BE 30".
11. MINIMUM COVER REQUIREMENTS FOR ELECTRICAL PRIMARY SERVICE DUCT BANKS SHALL BE 36".

4 — **CONCRETE ENCASED ELECTRICAL DUCT**
SCALE: NONE

CABLE SCHEDULE NOTES:

1. INSTRUMENT DEVICE SCHEDULE SHOWN ABOVE SPECIFIES THE REQUIRED CIRCUITS AND CIRCUIT ROUTING FOR EACH DEVICE.
2. FURNISH AND INSTALL ANALOG CABLING FROM LOCATION INDICATED IN COLUMN "ANALOG_CABLE" TO LOCATION SHOWN IN COLUMN "I&C_ROUTE_TO".
3. FURNISH AND INSTALL DIGITAL CABLING FROM LOCATION INDICATED IN COLUMN "DIGITAL_CABLE" TO LOCATION SHOWN IN COLUMN "I&C_ROUTE_TO".
4. FURNISH AND INSTALL POWER CABLING FROM DEVICE TO LOCATION SHOWN IN COLUMN "PWR_ROUTE_TO".
5. SIZE POWER CIRCUIT AS REQUIRED OR AS INDICATED IN COLUMN "LOAD/CIRCUIT".
6. REFER TO PLAN SHEETS FOR OTHER CIRCUIT REQUIREMENTS.
7. SUBSCRIPT "a" ON PLAN SHEET CABLE CALL OUT INDICATES THE ANALOG CIRCUIT.
8. SUBSCRIPT "d" ON PLAN SHEET CABLE CALL OUT INDICATES THE DIGITAL CIRCUIT.
9. SUBSCRIPT "p" ON PLAN SHEET CABLE CALL OUT INDICATES THE POWER CIRCUIT.
10. CABLE TYPE "ISP16/P-OS" IS DEFINED AS EQUAL TO OKONITE OKOSEAL-N TYPE P-OS, TC, 600V, 16 AWG, SINGLE PAIR INSTRUMENTATION CABLE WITH OVERALL SHIELD.
11. CABLE TYPE "**-ISP16/SP-OS" IS DEFINED AS EQUAL TO OKONITE OKOSEAL-N TYPE SP-OS, TC, 600V, 16 AWG, **PAIRS, MULTIPLE SHIELDED PAIR INSTRUMENTATION CABLE WITH OVERALL SHIELD.
12. CABLE TYPE "**PR#14/P-OS" IS DEFINED AS EQUAL TO OKONITE OKOSEAL-N TYPE P-OS, TC, 600V, 14 AWG, **PAIRS, MULTIPLE SHIELDED PAIR INSTRUMENTATION CABLE WITH OVERALL SHIELD.
13. CABLE TYPE "THWN" IS DEFINED AS INDIVIDUAL #14 AWG THWN CONDUCTORS.

REGISTERED PROFESSIONAL ENGINEER
07/11/22
BRANDON WALL
21108
OKLAHOMA

NOTES:

1. ALL CONCRETE SHALL BE 6" THICK.
2. CONTRACTOR SHALL SUBMIT TO THE ENGINEER FOR APPROVAL A JOINT SEALING METHOD FOR ALL CONSTRUCTION JOINTS REQUIRED IN THE CONCRETE LINER.
3. CONTRACTOR SHALL SUBMIT A JOINTING PLAN AND SLAB POURING SEQUENCE FOR APPROVAL BY THE ENGINEER.
4. JOINTS SHALL BE 20'-0" O.C. MAX.
5. THE SECONDARY FLOW EQUALIZATION BASIN SHALL BE EQUIPPED WITH ONE LEVEL GAUGE. THE LEVEL GAUGE SHALL CONSIST OF A 4" Ø 17-FEET LONG STEEL POST. THE POST SHALL HAVE A 2.5 MIL COAT OF TNEMEC 3TH-71 CHEM-PRIME, 4.0 MIL COAT OF TNEMEC SERIES 66 EPOXOLINE, AND ONE COAT OF TNEMEC SERIES 74 HIGH-BUILD ENDURA SHIELD OR EQUAL PAINT SYSTEM. STEEL POST SHALL BE EMBEDDED 3-FEET IN THE GROUND WITH A MINIMUM OF 12" Ø CONCRETE 3-FEET DEEP. LETTERING SHALL CONSIST OF AN ALTERNATING PATTERN OF WHITE BACKGROUND W/BLACK NUMBERS (EVEN NUMERALS) AND BLACK BACKGROUND W/WHITE NUMBERS AT 1-FOOT INTERVALS IN TENTHS FOR A TOTAL OF 14-FEET. LEVEL GAUGE SHALL BE FIELD LOCATED BY THE OWNER.
6. INFLUENT & EFFLUENT PIPE ENDS SHALL BE CUT TO MATCH BASIN SLOPE.
7. CONTRACTOR TO REMOVE AND DISPOSE OF APPROXIMATELY 10,880 C.Y. OF WASTE SLUDGE DOWN TO ELEVATION 974.00'. PER SECTION 31_01_33.
8. SLOPED WALLS & FLOOR TO BE CUT TO GRADES SHOWN & COMPACTED PRIOR TO CONCRETE PLACEMENT. PER SECTION DETAILS.
9. CROWN ROAD 2" @ ℄ ALONG TOP OF DIKE TO PROVIDE DRAINAGE AND ASSURE WATER DOES NOT POND ON ROADWAY.
10. QUANTITIES ARE APPROXIMATE. CONTRACTOR TO FIELD VERIFY PRIOR TO BID.

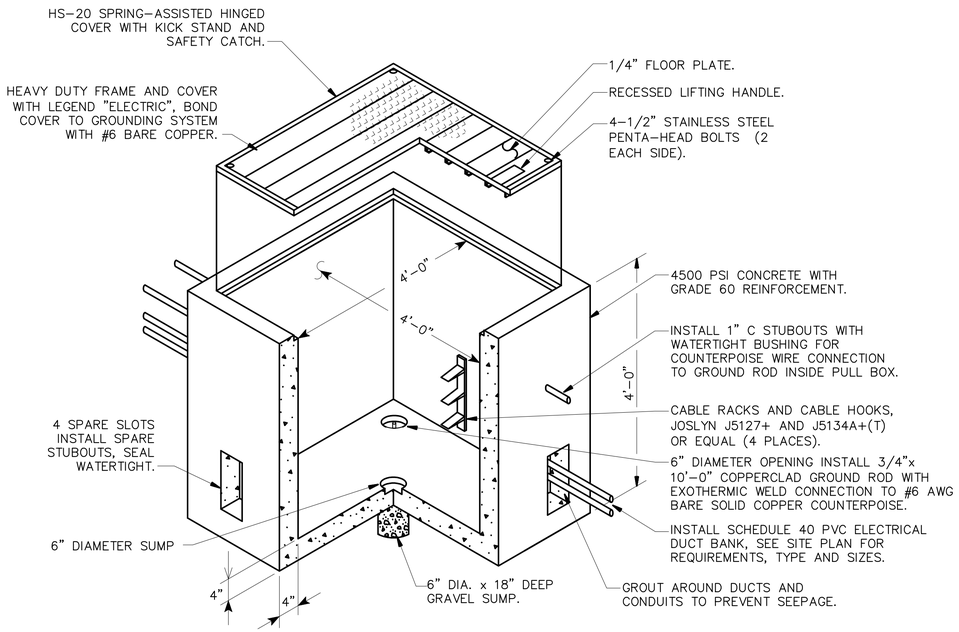
1 — **ELECTRICAL DUCT DETAIL**
SCALE: NONE

ELECTRICAL DUCT NOTES:

1. CONTRACTOR SHALL STAKE THE DUCT INSTALLATION IN PLAN AND ELEVATION FOR NEW ELECTRICAL DUCTS TO AVOID EXISTING UTILITIES.
2. CONTRACTOR SHALL ADJUST THE DEPTH OF THE ELECTRICAL DUCTS AS REQUIRED TO MAINTAIN THE MINIMUM COVER REQUIREMENT INDICATED AND AVOID EXISTING UTILITIES.
3. SIMILAR CONSTRUCTION FOR OTHER DUCT SIZES. SEE DUCT BANK SCHEDULE FOR QUANTITY AND SIZES.
4. INSTALL DUCT CONDUIT SUPPORTS AT 5'–0" O.C. MAXIMUM SPACING (TYPICAL ALL DUCTS).
5. OFFSETS AND BENDS OVER 10 DEGREES AND ELBOWS IN PVC CONDUIT RUNS SHALL BE CGRS CONDUIT.
6. NO PVC SHALL EMERGE FROM THE GROUND OR CONCRETE SLAB OR ENCASEMENT, PVC SHALL CONVERT TO CGRS CONDUIT PRIOR TO ITS EMERGENCE.
7. INSTALL GROUND RODS AT ENDS OF ELECTRICAL DUCT OR CONNECT TO GROUND RING.
8. INSTALL CONDUCTORS AND CABLES AS NOTED ON DRAWING. INSTALL PULLWIRE IN ALL SPARE DUCTS.
9. MINIMUM COVER REQUIREMENT FOR DUCT BANKS UNDER ROADS, DRIVEWAYS AND PARKING LOTS SHALL BE 24".
10. MINIMUM COVER REQUIREMENTS FOR ELECTRICAL SECONDARY SERVICE DUCT BANKS SHALL BE 30".
11. MINIMUM COVER REQUIREMENTS FOR ELECTRICAL PRIMARY SERVICE DUCT BANKS SHALL BE 36".



BASE PLAN

BASE ELEVATION

NOTE:
WHEN POURING CONCRETE DO NOT DROP CONCRETE THROUGH WATER IF WATER IS PRESENT IN HOLE.

3 — **LIGHT POLE BASE DETAILS**
SCALE: NONE

1. VERIFY BOLT CIRCLE AND MOUNTING WITH MANUFACTURER

2 — **PREFABRICATED CONCRETE PULL BOX**
SCALE: NONE

GENERAL NOTE:

1. MINIMUM SIZE OF PULL BOX SHALL BE PER NEC.

NOTES:

1. EACH CABLE SHALL BE IDENTIFIED WITH BRADY WIRE MARKER GIVING CIRCUIT NUMBER (#PWC–PK–6 OR APPROVED EQUAL).
2. ALL CABLE THROUGH BOX SHALL HAVE SUFFICIENT SLACK SO CABLE CAN BE BROUGHT TO SURFACE FOR SPLICING, MINIMUM 5' SLACK CABLE LOOP.
3. COVER AND PULL BOX SHALL BE DESIGNED FOR A 60 KIPS CONCENTRATED WHEEL LOAD OVER A 12" x 24" AREA.
4. GROUND ROD INSIDE OF PULL BOX SHALL BE DRIVEN PRIOR TO PLACEMENT OF BOX AND CAST IN BOTTOM OF BOX. IT WILL NOT BE CONNECTED TO ANY CIRCUIT.
5. PROVIDE HANDHOLES WITH 2–4"C SCHEDULE 40 PVC SPARE STUBOUTS IN EACH FACE, EXTENDED 3' MINIMUM BEYOND HANDHOLE, CAPPED WATERTIGHT.
6. EXCAVATION AND BACKFILL NECESSARY FOR THE CONSTRUCTION OF THE HANDHOLE SHALL BE PERFORMED IN ACCORDANCE WITH THE SPECIFICATION REQUIREMENTS.
7. PROVIDE WATERTIGHT CONDUIT BUSHING AND WATERTIGHT SEALS FOR ALL DIRECT BURIED COUNTERPOISE ENTERING THE HANDHOLE VIA A CONDUIT STUBOUT.
8. HANDHOLE COVER SHALL BE 1" MAXIMUM ABOVE FINISHED GRADE. AREA SURROUNDING HANDHOLE SHALL BE GRADED TO DRAIN AWAY FROM HANDHOLE.
9. BOND AND GROUND COVER AND FRAME TO ROD USING BRAIDED COPPER GROUND STRAP EQUIVALENT AMPACITY TO #6 AWG COPPER WIRE.
10. GRADE THE AREA AROUND THE HANDHOLE 10' IN ALL DIRECTIONS SUCH TO PREVENT WATER AND DIRT ACCUMULATION ACROSS THE TOP OF THE COVER AND ALLOW WATER TO DRAIN AWAY FROM THE HANDHOLE.

1 BUILDING HVAC PLAN
SCALE: 3/8" = 1'-0"

HVAC THERMOSTAT SETTINGS:

MOUNT ALL THERMOSTATS AT APPROX. 44" PER ADA REQUIREMENTS. SET ALL THERMOSTATS ASSOCIATED WITH HVAC EQUIPMENT PER THE FOLLOWING:

1. TWPU-1,2: 80°F COOLING. 65°F HEATING.

PROVIDE LEAD/LAG CONTROLLER FOR TWPU-1,2 THERMOSTATS EQUAL TO MARVAIR COMMSTAT 3. LEAD/LAG CHANGEOVER SHALL BE EVERY 7 DAYS.

KEYED NOTES:

1. THROUGH WALL PACKAGED UNIT EQUAL TO MARVAIR MGA2072AD090A++2+3CW+1. PROVIDE WITH MANUFACTURER'S 7-DAY PROGRAMMABLE WALL-MOUNT THERMOSTAT AND LEAD-LAG CONTROLS INTERLOCK KIT. COMPRESSORS SHALL BE 2-STAGE R-410A. SYSTEMS SHALL EACH PROVIDE A MINIMUM OF 45,000MBH SENSIBLE COOLING CAPACITY AT 105°F AMBIENT TEMPERATURE WITH LOW AMBIENT COOLING, FAN CYCLE CONTROL, AND EVAPORATOR FREEZE SENSOR OPTIONS. UNITS SHALL HAVE SINGLE POINT POWER AND OPERATE ON 480/3PH POWER, AND REQUIRE 28 MCA AND 30 MOCP. UNITS SHALL HAVE 9kW EMERGENCY STRIP HEAT.

   PROVIDE EXTERNAL P-TRAP PER MANUFACTURER'S RECOMMENDED METHODS AND DISCHARGE TO LANDSCAPING AWAY FROM DOORWAY.

   MOUNT BOTTOM OF UNITS 8" ABOVE FINISH GRADE, MINIMUM. PROVIDE

2. PROVIDE UNITS WITH REVERSE FLOW CONFIGURATION, WITH RETURN GRILL HIGH AND SUPPLY GRILLE LOW. DUCT THROUGH EXTERIOR WALL AND TERMINATE WITH MANUFACTURER'S STANDARD SUPPLY AND RETURN GRILLES AND WASHABLE RETURN AIR FILTER.

3. ROUTE CONTROL WIRING IN CONDUIT, TYPICAL ALL.

GENERAL NOTES:

1. ALL MECHANICAL WORK SHALL COMPLY WITH ALL LOCAL CODES, DRAWINGS, SPECIFICATIONS, AND AUTHORITIES HAVING JURISDICTION. IF DISCREPANCIES ARE FOUND, THE MOST STRINGENT REQUIREMENT SHALL GOVERN WORK. WHERE INSPECTIONS ARE REQUIRED BY AUTHORITIES HAVING JURISDICTION, WORK MUST NOT BE CONCEALED UNTIL INSPECTIONS AND TESTING ARE COMPLETE AND WORK IS ACCEPTED.

2. REFER TO SPECIFICATIONS AND PROJECT MANUAL FOR ADDITIONAL INFORMATION AND REQUIREMENTS.

3. REFER TO ALL PROJECT DRAWINGS FOR DETAILS OF CONSTRUCTION AND INSTALLATION REQUIREMENTS.

4. PRIOR TO BID, CONTRACTOR SHALL BECOME THOROUGHLY FAMILIAR WITH THE REQUIREMENTS OF THESE NOTES AS WELL AS OTHER NOTES SHOWN ON THE CONTRACT DOCUMENTS.

5. THESE DRAWINGS REFLECT A SYSTEM DESIGNED AROUND SPECIFIED REFERENCE PRODUCTS, THE SELECTION OF WHICH HAS INFLUENCED THE DESIGNS OF OTHER TRADES. IF SUBSTITUTE MANUFACTURERS, SIZES, OR MODEL NUMBERS ARE BID OR SUBMITTED, IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO COORDINATE ALL DIFFERENCES PRIOR TO BID. ALL COSTS OF ALL TRADES ASSOCIATED WITH THE SUBSTITUTION SHALL BE INCLUDED IN THE BID.

6. COORDINATION OF ALL MODIFICATIONS TO EACH DISCIPLINE WHICH RESULT FROM SUBSTITUTION OF EQUIPMENT OR MATERIALS SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR. SUBSTITUTIONS WHICH ARE INSTALLED AND SUBSEQUENTLY ARE PROVEN UNSATISFACTORY BY OWNER AND/OR ENGINEER WITHIN THE WARRANTY PERIOD, SHALL BE REMOVED COMPLETELY BY THE CONTRACTOR AND REPLACED WITH THE ORIGINAL DESIGN OR CORRECTED AS DIRECTED BY THE ENGINEER WITHOUT ADDITIONAL COST TO THE OWNER.

7. ALL DRAWINGS ARE DIAGRAMMATIC AND INDICATE THE GENERAL ARRANGEMENTS OR GEOMETRICAL RELATIONSHIPS OF EQUIPMENT AND SERVICES. THEY ARE NOT INTENDED TO SPECIFY OR SHOW EVERY OFFSET, SEQUENCE, DEVICE, OPTION, FITTING, OR COMPONENT.

8. INFORMATION AND COMPONENTS ON DETAILS OR IN SPECIFICATIONS, BUT NOT SHOWN ON PLANS, AND VICE VERSA, SHALL BE PROVIDED AS IF EXPRESSLY REQUIRED BY BOTH.

9. CONTRACTOR SHALL NOT SCALE DRAWINGS. DRAWINGS SPECIFIC TO THIS DISCIPLINE DO NOT LIMIT THE RESPONSIBILITY OF WORK REQUIRED BY THE CONTRACT DOCUMENTS.

10. SEE CIVIL AND STRUCTURAL DRAWINGS FOR BUILDING DETAILS AND DIMENSIONS. COORDINATE PLACEMENT OF MECHANICAL SYSTEMS WITH CIVIL AND STRUCTURAL TRADES.

11. CONTRACTOR SHALL BE RESPONSIBLE FOR COORDINATING ALL WORK WITH THAT OF OTHER TRADES. REFER TO ALL CONSTRUCTION DOCUMENTS FOR COMPLETE INFORMATION PRIOR TO BID.

12. CONTRACTOR SHALL BE RESPONSIBLE FOR FLASHING AND SEALING OF ALL WALL PENETRATIONS AIR AND WATER TIGHT.

13. CLOSELY COORDINATE FINAL LOCATIONS OF INSTALLED EQUIPMENT TO ACHIEVE THE GREATEST ACCESSIBILITY FOR MAINTENANCE PURPOSES.

14. ALL EQUIPMENT, DEVICES, AND FIXTURES SHALL BE INSTALLED AS PER MANUFACTURER'S RECOMMENDATION.

15. CONTRACTOR SHALL VERIFY CLOSELY AT SITE TRANSPORTATION OF NEW HVAC EQUIPMENT INTO MECHANICAL AREAS BEFORE BIDDING. PROVIDE COMPLETE DISASSEMBLY AND RE-ASSEMBLY OF NEW EQUIPMENT AS REQUIRED FOR A COMPLETE INSTALLATION.

16. COORDINATE FINAL PLACEMENT OF ALL THERMOSTATS WITH WALL-MOUNTED DEVICES AND OWNER'S REPRESENTATIVE. MOUNT PER A.D.A. REQUIREMENTS. ANY THERMOSTAT THAT IS REQUIRED TO BE MOUNTED ON AN EXTERIOR WALL SHALL BE MOUNTED ON AN INSULATED PAD.

17. CONTRACTOR SHALL PATCH ALL WALLS, FLOORS, AND CEILINGS TO MATCH NEW FOR ALL OPENINGS CREATED BY INSTALLATION OF EQUIPMENT AND HVAC SERVICE PENETRATIONS.

18. ALL HVAC COMPONENTS WITH ELECTRICAL REQUIREMENTS SHALL BE INSTALLED WITH ELECTRICAL INFRASTRUCTURE NECESSARY TO PROVIDE A FULLY FUNCTIONING SYSTEM. IF NOT SPECIFICALLY SHOWN ON ELECTRICAL SCHEDULE, HVAC FIXTURES REQUIRING ELECTRICAL SERVICE SHALL BE FED FROM BREAKER OF ADEQUATE CAPACITY.

19. ALL CONTROL WIRING SHALL BE INSTALLED IN CONDUIT.

20. ALL EQUIPMENT, DEVICES AND ACCESSORIES SHALL BE INSTALLED PER THE MANUFACTURER'S RECOMMENDATIONS.

21. ALL EQUIPMENT, DEVICES, AND ACCESSORIES SHALL NOT BE INSTALLED IN AREAS WHICH INTERFERE WITH OTHER BUILDING SYSTEMS, EQUIPMENT OR PERSONNEL.

22. ALL HVAC COMPONENTS WITH ELECTRICAL REQUIREMENTS SHALL BE INSTALLED WITH ELECTRICAL INFRASTRUCTURE NECESSARY TO PROVIDE A FULLY FUNCTIONING SYSTEM. IF NOT SPECIFICALLY SHOWN ON ELECTRICAL SCHEDULE, HVAC EQUIPMENT REQUIRING ELECTRICAL SERVICE SHALL BE FED FROM BREAKER OF ADEQUATE CAPACITY.

ADDENDUM NO. 3

TO: ALL PLAN HOLDERS

RE: Shawnee Wastewater System Improvements

DATE: 07/23/22

The Plans, Specifications and Contract Documents for the above referenced project are hereby modified / clarified as follows.

Please note that changes made to the plans/specs added by addendum will only contain a summary of changes in addendum verbiage and may not contain all modifications. It is the Contractor's responsibility to thoroughly review the revised sheets/specs.

GENERAL

A3-1 Modification: Replace bid proposal with the revised.

Should you have any additional questions about the above modifications and their intent, please post to the CivCast website.

BID FORM SECTION 5.01 - BID PROPOSAL - ATTACHMENT "A" (ADDM 3) SUMMARY OF BID PRICING (ALL BLANKS MUST BE FILLED)	
SECTION	**BID PRICE**
GENERAL BID ITEMS	
NORTHSIDE	
COLLECTION SYSTEM LIFT STATIONS	
SOUTHSIDE	
CONVEYANCE	
TOTAL PROJECT BID PRICE	

I, General Contractor, do hereby certify that the above TOTAL BID PRICE stated above constitutes all labor, equipment and materials for a complete and operable system as defined by the Contract Documents. Additionally, I certify that any items not specifically outined have been included in the most applicable item, that no items are outstanding that would require an addition to the stated TOTAL BID PRICE, and that TOTAL BID PRICE is not conditional in any manner and constitutes the Lump Sum for completion of work for a complete and operable system as defined by the Contract Documents.

BY:_____ TITLE_____ DATE:_____

BID FORM SECTION 5.01 - BID SUMMARY SHEET - ATTACHMENT "A" (ADDM 3) GENERAL ITEMS APPLYING TO NORTHSIDE, SOUTHSIDE & CONVEYANCE					
#	**Bid Item, Complete per Plans & Specifications**	**Unit**	**Quantity**	**Cost/Unit**	**Total Cost**
1	SWPPP & Erosion Control	LSUM	1		
2	Mobilization, Demobilization, Bonds & Insurance	LSUM	1		
3	Construction Staking	LSUM	1		
4	Construction Traffic Control	LSUM	1		
5	Trench Safety System	LSUM	1

ADDENDUM NO. 4

TO: ALL PLAN HOLDERS

RE: Shawnee Wastewater System Improvements

DATE: 07/26/22

The Plans, Specifications and Contract Documents for the above referenced project are hereby modified / clarified as follows.

Please note that changes made to the plans/specs added by addendum will only contain a summary of changes in addendum verbiage and may not contain all modifications. It is the Contractor's responsibility to thoroughly review the revised sheets/specs.

General

A4 – 1 Modification: The time of completion for the project is hereby extended as follows:

The Work shall be substantially complete within 1,095 days (36 months) after the date when the Contract Times commence to run as provided in Paragraph 4.01 of the General Conditions, and completed and ready for final payment in accordance with Paragraph 15.06 of the General Conditions within 1,275 days (42 months) after the date when the Contract Times commence to run.

All other provisions relating to time of completion remain the same.

Conveyance

A4 – 2 Clarification: All steel encased boring will be auger bore.

Should you have any additional questions about the above modifications and their intent, please post to the CivCast website.
